At present, taxpayers are entitled to 100% deduction in respect of donations made to approved institutions engaged in carrying out programmes of rural development. I propose to extend this concession to donations made to approved institutions for use in programmes of conversation of natural resources.

Hon'ble members will be happy to hear that I propose to place donations made to the national children's fund at par with donations made to other funds of national importance such as the National Defence Fund, the Jawaharlal Nehru Memorial Fund, and the Prime Minister's National Relief Fund.

Capital gains

I consider that some rationalisation of the taxation in respect of capital gains is desirable. In the case of non-corporate taxpayers, long-term capital gains up to Rs. 5,000 are deducted in full. Of the balance amount, a deduction of 25% is allowed where the gains relate to lands and buildings and of 40% where the gains relate to other assets. I propose to modify these provisions so as to relate the deduction to the period for which the capital asset has been held by the taxpayer, and allow a larger deduction in cases where the asset has been held for a longer period. The aggregate deduction in respect of capital gains relating

© 1982 International Bureau of Fiscal Documentation – BULLETIN

to gold, bullion or jewellery will, however, be restricted to Rs. 50,000 only.

There is an acute shortage of housing, and house building activity has to be given impetus. With a view to providing an incentive to taxpayers who do not own a residential house, I propose to exempt from tax long-term capital gains arising from the transfer of other assets where the net consideration is invested by the taxpayer in a residential house.

At present, capital gains arising from the transfer of a house used for personal residence by the taxpayer are exempt from income-tax to the extent that such gains are utilised by the taxpayer for constructing or purchasing a house for purposes of personal residence within a specified period. These conditions often lead to hardship. I, therefore, propose to remove these restrictive conditions.

Charitable and religious trusts are required to conform to the investment pattern laid down in the Income-tax Act. Any trust which has not changed over to this pattern of investment will forfeit exemption from tax from the assessment year 1982-83. These trusts have been given adequate notice to change their investment pattern and, ordinarily, I would not have proposed any modification in these provisions. However, I find that the whole gamut of the provisions relating to charitable and religious trusts is under consideration by the economic administration reforms commission. As the government would like to carefully consider the recommendations of the commission in this matter, I propose to amend the relevant provisions so that such trusts do not forfeit exemption from income-tax for the assessment year 1982-83.

My distinguished predecessor had made an announcement in the Lok Sabha on March 31, 1981 that the provisions of the Income-tax Act relating to the investment pattern of trust funds would be modified. So as to permit charitable and religious trusts or institutions to invest the trust funds in immovable properties as well, I am proposing an amendment of the relevant provisions of the Income-tax Act to fulfil the assurance given by him.

Wealth tax

While the levy of wealth tax on agricultural property was discontinued by the Finance (No. 2) Act, 1980, owners of tea, coffee, rubber and cardamom plantations continue to be chargeable to wealth tax. Our experience is that the valuation of agricultural land forming part of such plantations leads to administrative difficulties, complaints of harassment and litigation. The yield from this levy is also insignificant. I, therefore, propose to discontinue to levy of wealth tax on such plantations as well.

The value of tools and instruments necessary to enable the taxpayer to carry on his profession or vocation is exempt from wealth tax up to an aggregate amount of Rs. 20,000, which appears inadequate. I propose to raise it to Rs. 50,000. I also propose to raise, from the present Rs. 30,000 to Rs. 75,000, the ceiling of the value of conveyances, including motor cars, for the purpose of exemption from wealth tax.

Gifts

Stamp duty paid on an instrument relating to the gift of any property is allowed as a deduction from the gift tax payable by the taxpayer in cases where the amount of gift tax exceeds Rs. 1,000. I propose to allow the benefit of this deduction even where the gift tax payable does not exceed Rs. 1,000.

Luxury hotels

The Hotel Receipts Tax Act, 1980 provides for the levy of a tax on the gross receipts of luxury hotels. As the levy of this tax may adversely affect the flow of foreign tourists into India, I propose to discontinue this levy in relation to the chargeable receipts of such hotels accruing or arising or received by them after the 27th February, 1982. The revenue loss would be about Rs. 6 crores.

. . .

Auxiliary customs duties

Mr. Speaker, sir, I now turn to the area of indirect taxes. Taking customs duties first, my principal proposal is with regard to auxiliary duties of customs. This levy, which has been imposed on an annual basis since the 1973 budget, is proposed to be continued during 1982-83. The balance of payments position has been continued during 1982-83. The balance of payments position has been under pressure in recent times and will continue to be so for some time to come. However, a liberalised regime of imports has been a feature of our economic policies. This will be continued in order that investment and production, particularly in essential and priority sectors, are not hampered or slowed down. There is no strong reason, however, where those who have access to imports in a difficult situation should grude to pay a little more. I accordingly propose to increase the rates of auxiliary duties by five percentage points on all categories of imports, which some exceptions.

I am excluding from the proposed increase in auxiliary duty essential items like crude petroleum, bulk petroleum products, such as kerosene and high speed diesel oil, and some other items on which import duty rates have been adjusted in the recent past on price parity considerations. Fuller details of these proposals are available in the budget papers.

My proposals relating to auxiliary duties of customs are expected to yield an additional revenue of Rs. 290 crores.

Basic customs duties

In the light of the present market conditions, and the need for encouraging a few selected industries, it is necessary to effect certain changes in the basic customs duties. I propose to raise the basic customs duty on cork and cork articles from 40% to 60% ad valorem; on certain categories of dyestuffs, from 60% to 100% ad valorem; and on certain other categories of dyestuffs, pigments and colours and paints and varnishes, from 100% to 150% ad valorem. I also propose to increase the basic customs duty on certain items of iron and steel, such as melting scrap of stainless steel and heatresisting steel, and certain categories of alloy steel excluding stainless steel and heat-resisting steel, from the existing levies to 60% ad valorem. The effective rate of basic customs duty on copper pipes and tubes, blanks and hollow bars of prescribed specifications will be increased from 40% to 60% ad valorem. The basic customs duty on polyester chips is being increased from 100% to 140%. These proposals are likely to result in additional revenue of Rs. 42 crores.

It may be recalled that in the last budget, an effective customs duty of 15% ad valorem was imposed on imported newsprint on which there continues to be large foreign exchange outgo. The government has received representations against this levy. I propose to convert the ad valorem levy to a specific total levy of Rs. 825 per metric tonne so as to obviate automatic increase in its incidence on account of rising international prices. There will be no revenue loss.

The indigenous zinc and lead industries are facing difficulties owning to escalation of input costs, particularly of imported concentrates. In order to enable them to increase their capacity utilisation, I propose to reduce the total customs duty incidence on imported zinc concentrates from 50% to 15% ad valorem and that on lead concentrates from 50% to 5% ad valorem. Simultaneously, I propose to increase the customs duty on imported zinc metal from 50% advalorem to 60% ad valorem. In order partly to offset the revenue loss, I propose to increase excise duties on indigenously produced, zinc metal, zinc scrap and zinc products by Rs. 715 per metric tonne and that on lead metal and scrap by Rs. 374 per metric tonne. The excise duty on zinc pipes and tubes will go up from 38.5% to 49.5% ad valorem. These measures, taken together, would result in an overall loss of about Rs. 41 lakhs.

With a view to improving the competitive position of Indian chromite ore in the context of falling prices in the export market, I propose to convert the existing specific rates of export duty applicable to different grades of the ore and concentrates to an ad valorem duty of 10%. The revenue sacrifice is of the order of Rs. 1 crore.

I also propose to fully exempt two fertilisers – calcium ammonium nitrate and ammonium sulphate from customs duties. The import duty on internal combustion engines and non-interchargeable parts of such engines for manufacture of power tillers is also proposed to be reduced from 125% to 50%.

I propose to fully exempt 10 more bulk drugs imported for manufacture of life-saving drugs and medicines. Details are being notified.

During the past few years, the government has been using the fiscal mechanism for accelerating the growth of the electronics industry. As a further step in this strategy, I propose to raise the basic customs duty on electronic items such as computers, calculating machines, accounting machines, cash registers and certain electronic sub-assemblies

© 1982 International Bureau of Fiscal Documentation – BULLETIN

from the existing levels of 40, 50 and 60% to 100% ad valorem. On the other hand, I propose to extend the scope of the present import duty concessions to cover 45 new items of capital equipment and 13 new items of raw materials and components used by the electronics industry. The customs duties leviable on these items are proposed to be reduced from the respective existing rates to 53% ad valorem in the case of machinery and instruments and to 55% ad valorem in the case of raw materials and components. The net revenue gain from these proposals is Rs. 13 crores.

Free trade zones

Representations have been received that it is not always possible for units in the free trade zones to export their entire production, and that a provision should be made to allow a proportion of the goods manufactured in these zones to be cleared into the domestic tariff area. It has been decided, subject certain conditions, to allow such removals up to 25% of the production of a unit for sale or use within the country on payment of appropriate duties. Provision is being made in the Finance Bill to amend the Customs and Central Acts for the purpose.

Excises

On the Central excise side, the levy of special duties of excise is proposed to be continued at the existing rates during the year 1982-83. The existing exemptions from the special duty are also proposed to be continued.

As I said earlier, my basic approach has been that additions to revenue from Central excise duties should essentially come from increased production. I am also avoiding recourse to measures which could affect retail prices over a wide spectrum of goods. I have accordingly selected only a very few items for increased taxation. In selecting these items, I have kept in view the demand and supply situation which has resulted in undue profits to trading channels, the scope for subjecting certain articles of elite consumption to a higher rate of tax, and the need to restructure the excise and customs duties applicable to certain basic industries.

The government has decided to introduce scheme of "levy" and "free" sale of cement, and a dual pricing policy based on this concept. Details of the new scheme are being notified by the government separately. There has been no increase in the low level of basic excise duty on cement since January, 1977, even though thereafter the price of cement has increased very substantially. I propose to increase the total excise duty on ordinary portland cement, portland pozzolana cement, blast furnace slag cement and masonry cement, from Rs. 71.50 to Rs. 135 per metric tonne. The more expensive special varieties of cement will be subject to higher rates of duty. The effective total excise duty on cement produced in mini cement plants is proposed to be fixed at Rs. 100 per tonne.

I also propose to impose a basic customs duty of 10% ad valorem on imported cement, together with full countervailing duty. No auxiliary duty would be leviable on imported cement. These proposals will give additional revenue of Rs. 158.73 crores on the central excise side and Rs. 39.60 crores on the customs side. The impact of the proposed increase in excise duty per bag of cement of 50 kilograms would work out to Rs. 3.175.

Electronic appliances

In the recent past, certain expensive electronic goods favoured by the affluent are being produced in increasing quantities. These are now subjected to a very low incidence of duty at eight percent ad valorem under item 68 of the central excise tariff. I now propose to carve out new entries in the excise tariff, and subject video cassette recorders and reproducers, television cameras and video cameras, and similar goods to a basic excise duty of 25% ad valorem. Blank and recorded video and audio tapes of the spool and cassette types, as also video discs, are also proposed to be subject to a basic duty of 25% ad valorem. Recordings which are not for commercial purposes will be exempt. I also propose to levy basic duty at a higher rate of 40% on electronic machines for games of skill or chance, including those used for television games and video games. These proposals would yield revenue of Rs. 3.83 crores.

Toilet preparations

Toilet preparations not containing alcohol are liable to central excise duty at the basic rate of 100% ad valorem whereas those containing alcohol attract duty under the Medicinal and Toilet Preparations (Excise Duty) Act at only 60% ad valorem or Rs. 13.20 per litre of pure alcohol content, whichever is higher. Some misuse because of these differential rates has come to notice. I, therefore, propose to raise the alternative ad valorem rate of 100% ad valorem so as to place both categories of toilet preparations more or less at par. The revenue yield from this measure is expected to be Rs. 2.3 crores and would accrue mostly to the states.

Textiles

Hon'ble members may recall that the textile policy statement of March, 1981 envisaged a review of fiscal levies on man-made fibres and yarn. While cotton will continue to enjoy the predominant position in textiles, it is necessary to encourage increased consumption of blends of cotton and man-made fibres and yarns, if we are to achieve the plan target of even a modest increase in the per capita availability of cloth. For some time past, blended fabrics containing polyester fibre in proportions too small to impart the requisite durability and easycare properties to the fabrics are flooding the market with stampings thereon which would mislead the public.

From the point of view of better utilisation of polyester fibre, it is necessary to encourage blends of desirable proportions, and discourage blends which do not really serve the intended purpose. I therefore propose to make certain changes in the fiscal levies applicable to man-made fibres and yarns. I propose to increase the duty on blended cotton yarn and cellulosic spun yarns containing up to one-sixth by weight of polyester fibre from the existing average total incidence of Rs. 1.63 per kilogram to Rs. 7.5 per kilogram. The total incidence on such blended yarns containing more than one-sixth but less than 50% of polyester fibre, which seems to be desirable blends in Indian conditions, is proposed to be reduced from Rs. 22.50 per kilogram to Rs. 11.25 per kilogram. Similarly, the incidence on blends containing 50% or more but less than 70% of polyester fibre is being reduced from Rs. 30 per kilogram, to Rs. 22.50 per kilogram. There will be no change with regard to blends containing 70% or more of polyester fibre.

It is proposed to increase the total incidence of central excise duty on acrylic fibre from Rs. 12.50 to Rs. 17.50 per kilogram and simultaneously to reduce the countervailing duty on imported fibre from Rs. 37.50 to Rs. 30 per kilogram.

Turning to viscose staple fibre the excise duty is being raised from Rs. 3.12 per kilogram to Rs. 4 per kilogram and the duty on polysonic and high wet modulus fibres is being reduced from Rs. 5 to Rs. 4 per kilogram.

Acetate filament yarn which is used in the decentralised sector is not produced in adequate quantities in the country. It is proposed to reduce the customs duty on it from 125% to 20% ad valorem so as to facilitate imports of this yarn.

I do not propose to change the excise or basic customs duty rates applicable to other fibres such as acetate fibre and polyester fibre and other filament yarns such as viscose, nylon and polyester filament yarn.

These proposals would result in a net loss of Rs. 13 crores on the central excise side and a gain of Rs. 12.94 crores on the customs side.

At present, there is no basic duty leviable on man-made fabrics, the incidence of such duties having been shifted to the fibre and yarn stages. These fabrics attract only additional excise duties in lieu of sales tax. While the present rate structure is progressive on fabrics having ex-factory price up to Rs. 10 per square metre, it is not so in respect of the higher priced fabrics since the duty applicable to them is a uniform 5.5% ad valorem. There are very high-priced fabrics in this range, catering to affluent consumption, and these fabrics can well bear a moderate increase in duties. I therefore propose to introduce further progression in the rate structure in such a way that fabrics having ex-factory prices of more than Rs. 20 per square metre would attract duty at 7.5% ad valorem. The additional revenue from this proposal is estimated at Rs. 35 crores, which will go to the States. The proposal would also be a step towards fulfilment of the Centre's commitment to the State to increase the overall incidence of additional excise duties in lieu of sales tax, as a percentage of the value of clearances. I am sure that Parliament and the States would whole-heartedly welcome this step.

The overall effect of the duty changes on blended fabrics containing cotton, cellulosics and polyester would be a decrease in the price

© 1982 International Bureau of Fiscal Documentation – BULLETIN

of desirable blends and an increase in the price of the other less desirable blends.

I have included in the Finance Bill some provisions designed to achieve simplification and greater clarity in the tariff nomenclature and thereby minimise the scope for classification disputes. These measures are not designed as revenue raising exercises, but because of the changes in classifications, some revenue will accrue. The proposals cover, among others, major petroleum products, artificial and synthetic resins and plastic materials.

Paper

I also propose to rationalise and restructure the tariff relating to paper and paper boards, the primary objective being to exempt small scale paper converters from payment of excise duty and to release them from excise control. In order to recoup the consequent loss in revenue, I propose to raise the basic excise duty on industrial varieties of paper and paper boards by a small margin of 2.5% ad valorem. However, certain converted papers of high value-added categories are proposed to be subject to basic excise duty at 32.5% ad valorem. Similarly, specified articles made of paper and paper board are proposed to be brought within the purview of the tariff item but effectively restricting the levy to printed cartons and printed boxes.

Tyres

In recent years, the scheme of input excise duty relief has been extended to cover certain specified industrial products. I propose to further extend input duty relief in respect of synthetic rubber, carbon black and rubber processing chemicals going into the production of tyres. To make up for the revenue loss, I propose to raise the duty leviable on tyres from a total of 60.5% to 66% ad valorem. While tyres for tractors and scooters will also enjoy the benefits of the input duty relief, I do not propose to increase the final duty rates on them. As this is intended to be a balancing exercise, no credit for additional revenue is being taken.

Aluminium

As the House is aware, the administered price of aluminium metal is revised periodically, keeping in view escalations in input costs. In order to contain the incidence of excise duty, it is proposed to levy duty at specific rates. The rates would be Rs. 3,085 on electrolytic grade ingots, Rs. 3,125 on billets, Rs. 3,330 on wire rods produced by primary producers and Rs. 3,280 on wire bars. There would be no change in the rates of countervailing duties. The proposal will give some relief to the finances of State Electricity Boards.

Glass

As an anti-avoidance measure, I propose to add to the present ad valorem levy on flat glass, a specific levy at the rate of Rs. 5.50 per millimetre thickness per square metre. Effective rates of duty are being prescribed at lower levels for different categories of flat glass.

Biri

The Government has received a large number of representations alleging malpractices in the biri industry, on account of the present differential rates of excise duty applicable to branded and unbranded biris. Many state governments and associations have urged that this distinction should be done away with. A suggestion to the same effect has also been made in a recent meeting of labour ministers. Taking note of these points, I propose to do away with the existing duty differential and to subject both branded and unbranded biris to a uniform composite duty rate of Rs. 3.60 per thousand. Simultaneously, the existing quantum of unbranded biris eligible for duty free clearance is also being reduced from 30 lakhs to 20 lakhs in a financial year. This would still leave self-employed family units, petty shop-keepers, etc. out of the tax net.

Aerated water

The general scheme of excise duty concession applicable to small manufacturers of 72 specified groups of commodities is being extended to manufacturers of asbestos fibre and yarn. Some misuse of the scheme with a view to avoiding excise duty on popular brands of aerated waters has come to notice. I therefore propose to take aerated waters out of the scope of the general scheme and devise a new scheme for it. Essentially, small manufacturers who sell their products under their own brand or trade names would continue to enjoy the benefits available under the present scheme. However, manufacturers who produce and bottle aerated waters under brand or trade names in pursuance of agreements with the owners of such brand or trade names would not be eligible for the concession. This also is purely an anti-avoidance measure.

Dyestuffs

The general scheme referred to earlier seems to have been similarly exploited by certain small manufacturers of synthetic organic dyestuffs. Under the present scheme, clearances up to Rs. 7½ lakhs are fully exempt and an additional Rs. 7½ lakhs are subject to duty at ¾ths of the duty rate applicable to the organised sector. In view of the relatively high rate of duty on dyestuffs and the fact that techniques of production of some dyestuffs are comparatively simple, it appears there has been a proliferation of small units with consequent deleterious effects on the quality, and also on the industry as a whole and on exports. I, therefore, propose to delete dyestuffs from the purview of the general scheme.

Under a new scheme which is being announced in respect of dyestuffs, very small manufacturers whose clearances do not exceed Rs. 1 lakh per annum will be fully exempt from excise duty. In the case of other small manufacturers, clearances up to Rs. 15 lakhs of dyestuffs will be subject to 50% of the duty applicable to the organised sector. All manufacturers will be brought under excise control. The monetary content of the present scheme of relief is, by and large, maintained under the new scheme.

Electronic goods

At present, certain specified consumer electronic goods manufactured in the small sector attract duty rates lower than the normal rates. To restrict this duty concession to genuine small manufacturers, it is proposed to restrict the scheme of duty exemption to manufacturers with total anmnual turnover not exceeding Rs. 2 crores.

Matches

With regard to the match industry, I do not propose to disturb the existing duty structure. Small manufacturers whose clearances have not exceeded 150 million matches in the preceding financial year would continue to be eligible for the concessional rate of duty of Rs. 1.60 per gross boxes on clearances up to 120 million matches in the financial year. The concession will not be available if the matches are marketed under the labels of manufacturers who pay duty at Rs. 4.50 or Rs. 7.20.

As Hon'ble members are aware, the government has been using the excise duty mechanism as a powerful incentive for the growth of the cottage sector of the match industry. A number of manufacturers in the middle sector have, however, challenged in courts of law, the excise concession scheme for the cottage sector and obtained judgements in their favour. This may result in refund of substantial amounts of duty to the middle sector units. As the element of duty at the higher rate would have already been passed on to the millions of consumers, any refund of such duties would only result in unjust enrichment. A provision has been made in the Finance Bill to obviate this contingency.

Assessable value

There have been some disputes in the recent past regarding the determination of assessable values of excisable goods from a given cum-duty price, resulting in considerable litigation. This has resulted in locking up substantial amounts of revenue. It is proposed to suitably amend section 4 of the Central Excise and Salt Act to make it clear that in computing the amount of duty of excise deductible from the cum-duty price, the effective amount of duty of excise payable on the goods under assessment shall alone be taken into account. This amendment is being given effect to, retrospectively from 1st October, 1975.

Captive consumption

It has been the long-standing practice to

© 1982 International Bureau of Fiscal Documentation – BULLETIN

charge excise duty on goods used for captive consumption within the factory where they are produced. Some doubt had, however, been cast on this position as a result of judgements of some High Courts, which interpreted certain provisions of the Central Excise Rules to hold that duty could not be collected on such goods as they had not been 'removed' from the factory. A number of manufacturers have also obtained stay orders from courts based on the same grounds. The matter has been taken up in appeal. Nevertheless, in order to place the position beyond doubt, the relevant Central Excise Rules have been suitably amended. A provision has also been included in the Finance Bill so that these amendments will have retrospective effect and the collections of duty made in accordance with the existing practice will also be validated.

Productivity Year

As the House is aware, 1982 has been designated by the Prime Minister as the "Productivity Year". With the improvement in infrastructural facilities, it is hoped that industrial production would register further growth in the current year. The fiscal mechanism could be judiciously deployed in furthering this objective. With this in view, I propose to formulate a scheme of excise duty concession for increased production of goods during the period of 12 months commencing on the 1st March, 1982 and ending on the 28th February, 1983. The scheme would cover 38 tariff items including some basic raw materials, other important industrial inputs and certain finished products. Some of the items are caustic soda, fertilisers, synthetic resins, steel ingots and steel products, internal combustion engines, wires and cables, two and three wheeled motor vehicles, light and heavy commercial vehicles, tractors, railway wagons, man-made fibres and filament yarn, tyres and writing and printing paper. A full list may be found in the Budget papers. The benefits of the scheme would accrue only in cases where the production in the 12 months period referred to above exceeds 110% of the production during the base period, namely, the 12 months ending on the 28th February, 1982. The duty concession would be 1/5th of the total amount of duty paid on the excess production computed, as explained earlier, in respect of goods carrying basic excise duty of 20% ad valorem or less, and 1/10th of the duty in other cases. The amount so computed for the whole period would be given as a credit which may be utilised for payment of Central excise duty during the financial year 1983-84.

The scheme will apply also to small scale manufacturers, who actually pay duty. It is proposed to ensure that those small scale units which are eligible for the benefits of the relevant excise duty concession schemes and are within the respective cut-off points during the year 1981-82, would continue to be eligble to the said benefits in 1983-84, even if they produce and clear goods in excess of the eligibility limits in the productivity year.

I am sure that industry will rise to the occasion and respond to this generous gesture of the government and achieve new peaks of production. Since the government would also be a beneficiary of the higher production in the shape of increased collection of excise duties, I do not propose to take any amount as revenue loss on account of the proposed concession.

Common consumption

I have already referred to the need to minimise the impact of my proposals on the middle and poorer sections of society. I propose to go further and give some concessions on articles of special interest to those sections. I propose to partially or fully exempt from excise duties several articles of common consumption. Some of these products are of interest to the student community, some are of general utility, yet others of interest to the disabled and one in the interest of horticulture. I propose to fully exempt from excise duty, pencils, erasers, pens including ball point pens and refills, laboratory glassware, enamelware, thermos flasks and parts, water coolers, candles, tooth brushes, spectacles and spectacle frames, one-day alarm clocks, domestic water filters, handpumps, Braille typewriters, invalid carriages and helmets. Further, I propose to reduce the basic excise duty on specified fruit and vegetable preparations from 15% to 10% ad valorem. I also propose to increase the present value limits of Rs. 15 per pair of footwear for eligibility to full duty exemption, to Rs. 30 per pair. Lac is also being exempted. In order to reduce the packaging cost involved in the sale of milk in laminated paper packs, I propose to exempt from excise duty low density polyethylene film and paper to be used by the Indian Dairy Corporation for the manufacture of such paper packs. This measure should enable larger marketing of milk in paper packs which have a longer shelf life, and also help in the fuller utilisation of surplus milk produced in flush seasons.

At present, mopeds of engine capacity up to 75 cc bear a reduced rate of excise duty of 10% ad valorem. This fuel-saving personalised conveyance is becoming increasingly popular particularly in urban and semi-urban areas. I propose to extend the concession to mopeds of engine capacity to 100 cc which are expected to be more fuel-efficient.

I had referred earlier to certain adjustments of excise and customs duties consequent on a review of the fiscal levies on man-made fibres and yarn. The production of blended cloth in the handloom sector is at present around 12 million metres. In order to enable the handloom sector to register faster growth, I propose to fully exempt from excise duties polyester blended fabrics woven on handlooms from processing stage duties if they are processed in factories set up by the state handloom development corporations or apex cooperative societies approved in this behalf by the Central government. This concession involves a revenue loss of Rs. 4 crores. I also propose to exempt metallised man-made filament yarn from the whole of the excise duty considering its use in saris and the like. The value of this concession is about Rs. 1 crore.

These excise duty concessions I have just referred to entail a total revenue sacrifice of Rs. 13.77 crores in a full year.

Where the changes are to be made by notifications effective from 28th February, 1982, copies thereof will be laid on the table of the House in due course.

My proposals will yield a net sum of about Rs. 196.13 crores from excise duties and Rs. 391.35 crores from customs duties. The yield from duties under the Medicinal and Toilet Preparations (Excise Duties) Act will be Rs. 2.30 crores in a full year. Taking all the proposals together, the net accrual to the Central exchequer in a full year will be Rs., 487.60 crores and that to the states will be Rs. 102.23 crores.

UNITED KINGDOM:

Budget 1982-83

A Budget for Industry and Jobs

Extracts from the Budget Speech pronounced on 9 March 1982 by the Chancellor of the Exchequer, Sir Geoffrey Howe.

A discussion of the U.K. Budget will appear in the International Bureau of Fiscal Documentation's tax journal: EUROPEAN TAXATION.

. . .

This will be a Budget for industry – and so a Budget for jobs. But it will be a Budget for people as well. It is a Budget that will strengthen the foundations of economic recovery.

. . .

So this afternoon, I want to remind the House once more of two figures that virtually tell it all. Since 1960 the real purchasing power of the average citizen in Britain has risen by over two-thirds. But the real rate of return on the capital employed in British industry has fallen by five-sixths. In other words, our present living standards have for years been plundered from the store of investment for the future.

Nor have we put to good use the investment that has been made. Too often we have tried to mitigate the inescapable consequences of poor productivity and shrinking international competitiveness, by clinging to manning levels that could not be sustained.

. . .

REDUCTIONS IN TAXATION

Although most of the measures which I shall announce today involve reductions in taxation, I am also proposing some additions to public expenditure, totalling some £350m in 1982-83. This includes an increase of £150m in the Contingency Reserve to accommodate some of the expenditure measures: this brings the reserve in 1982-83 to £2,400m. The planning total for 1982-83 given in the White Paper is £115.15bn, in cash, compared with £110.2bn which is the cash equivalent of last year's projections for 1982-83. But the increases I now propose will be more than offset by other changes in costs, and the total will therefore be £114.9bn.

. . .

CHARITIES

The Government is deeply conscious of the contribution to our national life that is made by many of our charitable organisations. Two years ago, I introduced substantial new tax relief for convenated donations to charities. I also doubled the exemption from capital transfer tax for charitable bequests or gifts made within one year of death.

We have been urged to relieve charities from VAT on their purchases. The attractions of this are obvious. But it raises substantial difficulties. The more one studies how it might be done – and we have looked into it exhaustively – the more insuperable appear the problem of definition of administration and of equity that stand in its way. So, reluctantly, I have had to be satisfied with other ways of helping charities instead.

First, I propose to take the Capital Transfer Tax exemption for qualifying gifts to charities a stage further, by increasing it, for gifts made within a year of death, from £200,000 to £250,000.

Secondly, I intend to abolish Stamp Duty completely on transfers of assets to charities.

Thirdly, as the National Council for Voluntary Organisations has suggested, I propose to remove beyond all doubt any liability to Development Land Tax where a charity disposes of property which has been subject to roll-over relief.

Taken together, these measures constitute significant new assistance to charities and voluntary organisations. They build still further upon the significant benefits which charities have derived from earlier action by this Government. Our record continues to be one in which we can justifiably take pride.

DISABLED

I now come to the particular problem of the disabled which we have always had very much in mind. Last year, the International Year of the Disabled, I introduced a range of value added tax reliefs for charities concerned with the disabled. I am now able to announce three further measures of help.

First, there will be some extension of the existing VAT reliefs for disabled people and the charities serving them.

Secondly, mobility allowance. The rate will be increased – by more than the expected rise in prices – from £16.50 a week to £18.30. This will mean that it has risen by over 80% since the Government took office. This represents a considerable increase in real terms.

In addition I propose this year to respond to a particularly important request made on behalf of the disabled to successive governments in recent years. I propose that from 6 April the mobility allowance should be wholly exempt from income tax. This is a major step: it means an increase in net income of up to £5 a week for the working disabled. They deserve every encouragement, and the change will, I know, be widely welcomed.

. . .

NATIONAL INSURANCE SURCHARGE REDUCED

I now turn to what can be done in this Budget directly to benefit business, industry, and hence jobs.

Our prime purpose is to help private commerce and industry to help itself, by cutting its costs. And I have no doubt, from the representations I have received, that the single measure business would most welcome is a reduction in the National Insurance surcharge.

This surcharge was imposed and then increased by the previous Government. Indeed, in their last two-and-a-half years in office, the last Government increased the combined charge on employment, the employers' National Insurance contribution and the National Insurance surcharge, from 8½% to 13½%.

The surcharge is, of course, a tax on employment. It raises production costs. It is not rebatable on exports and it either puts up prices or cuts into profits. But it is an extremely cost-effective tax. It raises large amounts of revenue, at little administrative cost. It is much easier to put on a tax of this kind than to take it off.

This Government has already protected businesses, and so employment, from any increase in employers' National Insurance contribution rates for two consecutive years. Had we not done so, employers would have had to find nearly £1 billion more in the coming year than will actually be the case.

It is now time to offer more positive relief. I accordingly propose to cut the rate of the National Insurance Surcharge from 3½ to 2½%. This will help to reduce costs throughout the economy and will be of value to all businesses, whatever their tax position.

The cut will operate from August 2, which is the earliest practicable date.

But I am anxious that industry should not suffer from this unavoidable delay. I shall therefore propose an extra ½% reduction between August 1982 and April 1983. The effect of this will be to ensure that business as a whole will enjoy in the last two-thirds of 1982-83 the equivalent of a whole year's reduction of 1% in the surcharge.

The proposal is intended to reduce business costs in the private sector. However public sector employers also pay the surcharge, and in order to leave them exactly where they would have been without the change, appropriate reductions will be made in the relevant cash limits and the Votes of central government and the NHS, in the Rate Support Grant to local authorities, and in the External Financing Limits of the nationalised industries. The necessary changes will be announced as soon as possible. This will reduce the cost to a net figure of £640m in 1982-83.

The aim of the relief I have just announced is to help business costs and employment. If it were to find its way into higher pay, that would totally defeat the object of the exercise, and would obviously have to be taken into account in future.

It is crucial that this should not happen. In proposing this reduction, we are offering business and industry, management and workforce, an exceptional opportunity to im-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

prove their own performance and prospects. I believe that they will take it.

NO CHANGES OF VAT RATES: EXCISE DUTIES UP

I come now to the indirect taxes. I propose no change in the rate of VAT.

For the excise duties there has grown up in recent years a sensible presumption that they should be adjusted in line with the movement in prices from one year to the next. That, after all, is what happens automatically with VAT and the ad valorem duties, and also to the personal tax allowances, unless parliament decides otherwise. And that is the basis of my approach to excise duty changes this year.

I start with the duty on tobacco. Last year the duty was increased twice – March as part of the Budget measures and in July to help recoup the loss of revenue from the derv duty reduction.

I have taken account of that in proposing this year an increase that is the equivalent of 5p, including VAT, on the price of a typical packet of 20 cigarettes. There will be consequential increases for other tobacco products. These changes will take effect from midnight on Thursday.

Next, alcoholic drinks. I propose to increase the duties from midnight tonight by amounts which represent about 2p on the price of a typical pint of beer, 10p on a bottle of table wine, and 13p on a bottle of sherry – all including VAT. The full increase in the price of a bottle of spirits necessary to take account of inflation would have been over 50p. However, in the light of the representations about the state of the Scotch whisky industry which I have received from hon. friends representing Scottish constituencies and others, I have decided that it would be appropriate to limit the increase on spirits to 30p a bottle, again including VAT.

Next, the oil duties. Last year, as the House will recall, I felt it right to go some way to meet the representations made to me by hon. members in favour of a lower increase in the case of derv than of petrol, in view of the impact of derv duty on industrial and distribution costs. I have decided this year slightly to widen that differential.

There is a strong case for a larger increase in the petrol duty than in the other duties, for our average pump prices are currently among the lowest in the European Community. They have moreover been favourably affected by the recent changes in the price of oil. Pump prices have been falling rapidly.

Against this it has been impressed upon me by a number of my hon. friends from rural constituencies, in all parts of the kingdom, that pump prices in remote areas are very much higher than those in more heavily populated areas. Yet dependence on cars for transport is greatest in the more scattered communities.

On balance, I think it would be right, at least at this stage, not to impose any real increase in the oil duties. I propose, therefore, to limit the increases in the duties on both petrol and derv to amounts which no more than compensate for one year's inflation. The duty on petrol will accordingly increase by the equivalent, including VAT, of about 9p a gallon or 2p a litre. This will still leave most pump prices lower than they were at the end of last year. The duty on derv will increase by the equivalent, including VAT, of about 7p a gallon or 1.5p a litre. As almost all derv is used by businesses, this smaller increase will help to hold down business costs.

As last year, I propose no change in the rate of duty on heavy fuel oil. I am not able, as some would wish, to cut the rate, but leaving it unchanged will help industry as the duty burden continues to fall in real terms.

Last year I undertook to review the rate of duty applied to aviation gasoline, or AVGAS. I have given very careful consideration to the reppresentations which I have received on behalf of air taxis, flying schools, crop-spraying and other specialist services, and from those concerned with air travel in the Highlands and Islands of Scotland.

I cannot accept in full the arguments which have been put to me, but I have decided that it would be right to reduce the AVGAS duty rate to one-half of that on petrol. Including VAT, this amounts to a reduction of about 32 pence a gallon or 7 pence a litre.

All these changes take effect for oil delivered from refineries and warehouses from 6 pm tonight.

I also propose to increase most rates of vehicle excise duty. For the motorist the increase will be £10, from £70 to £80. Duty levels on most other groups of vehicles will be increased by about 12%.

I propose to make two important changes in the VED on commercial vehicles, I have decided that it would offer a substantial, and justifiable, help to small and medium sized businesses at this time to bring the duties on about half a million light commercial vans more closely into line with those on cars.

On the other hand, it would be appropriate, in the light of the conclusions of the Armitage Report, to impose on the heavier lorries – the 80,000 or so of more than 9 tons unladen weight – a licence duty which more closely reflects the actual cost which they impose on the road network.

So the duty on this category will be increased by about a quarter. These changes have effect for licences taken out after today.

The changes I propose for commercial vehicles reflect the Government's intention to get a fairer balance between the taxation burden on different groups of lorries and their road costs. I propose to take a further step in this direction by including in the Finance Bill provisions for restructuring the basis of VED on heavy lorries, to a gross weight method of assessment, and for taxing all light commercial vehicles in due course at the same rate as cars. The House will recall that the framework for this major reform of the VED system was set out in the 1981 Transport Act. It will involve substantial changes in the pattern of commercial vehicle taxation and I think it right that the road transport industry should have time to adjust. I therefore propose that the rates of duty on the new gross-weight basis should take effect from October 1.

And, last of the excise duties, taxes on betting and gaming. Many of my Hon. Friends pressed last year for substantial increases here; and I made some changes in July. I now propose no further increase in the rates of duty on general betting and bingo, both of which were increased then.

But I have decided that pool betting duty, which has been unchanged since 1974, should go up from 40% to 42½% from 1 April. I also propose increases from the same date in the rates of duty on casinos, where I believe the existing rates are too low. Full details of the new rates, and other changes which I shall be announcing today, will be given in press notices this afternoon.

My rt. hon. friend, the Chief Secretary, announced last summer that Customs and Excise would undertake a comprehensive review of gaming machine taxation. A very large number of representations were received during the course of this review, from and on behalf of clubs, public houses, amusement arcades, and others. In the light of these representations I have decided that it would not be appropriate to introduce an ad valorem duty on gaming machines, or to impose an excise duty on amusement machines, such as Space Invaders. I have also decided that duty should no longer be charged on 2p gaming machines which are mostly to be found in the seaside arcades.

However, I have decided that there should be significant increases from October 1 in most rates of the existing licence duty on 5p and 10p gaming machines.

The total effect of all these changes on excise duties will be to raise an additional £1,150m in 1982-83 and £1,165m in a full year. The impact effect on the RPI will be about three-quarters of 1%. This has been fully taken into account in my forecast of falling inflation in the year ahead.

OIL FIELDS

I have spoken of the oil duties: I now turn to the oil-fields. The development of the North Sea has been a story of enterprise and success, which is almost entirely due to the skill and enterprise displayed, and risks accepted, by the private sector. As a nation, we must never forget the great debt we owe to those on the oil rigs and elsewhere, who have been responsible for exploration and development. It is important for them as well as for the British people that the rewards should be fairly shared.

Last year, in the light of the massive increase in oil prices which had occurred in earlier years, we changed the structure of North Sea tax, to make it more responsive to changes in price. At the same time tax revenue from the North Sea was brought forward, with an increase in the total level of taxation. I also invited the industry to suggest better ways of raising the revenue we needed. I am grateful to them, and others who have commented, for their careful and considered response.

As I have mentioned, the current fall in oil prices reduced the revenue the Exchequer receives. I recognise that it reduces the revenues of the oil companies as well – but it also reduces the tax they have to pay.

Detailed study has convinced me that, subject to some marginal adjustment, the total tax burden is not such as to discourage exploration or development. Nor is it so high as to de-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

prive the oil industry of a reasonable and often attractive yield.

In these circumstances I cannot reduce the overall tax burden to the extent that the industry would have wished. But I do agree with them on the need for some change of structure.

ABOLITION OF SUPPLEMENTARY PETROLEUM DUTY

I see, in particular, the advantage of profit-related taxes in relation to additional investment in existing fields. The Supplementary Petroleum Duty will therefore be abolished with effect from the end of this calendar year.

INCREASE OF PETROLEUM REVENUE TAX

I propose at the same time that the rate of Petroleum Revenue Tax should be increased from 70% to 75%; and that arrangements should be introduced for advancing PRT payments. Advance payments of PRT, although computed in the same way as SPD, will not be a separate tax but simply an acceleration of the existing tax.

They will thus differ fundamentally from SPD in being fully set off without limit against ordinary PRT liabilities when these arise. This structural change is one which representatives of the industry have proposed.

As from mid-1983, there will also be a monthly instalment system of payment of PRT in order to secure a smoother public sector cash flow.

These changes will not affect the revenue yield of rather over £6bn in the coming year. But in 1983-84 there will be a net cost, after allowing for the saving in interest due to the new system of instalment payments, of some £70m.

I have spoken earlier about current uncertainties in relation to oil prices and the future yield of tax from the North Sea. But I am aware of the concern felt by the industry about the number of changes in the regime there have been in recent years.

For this reason, my hope is that the new tax structure I have proposed will provide a more secure and stable regime for the future, permitting development to go ahead, uninhibited by major fiscal uncertainties.

I propose a number of other minor changes partly in response to the views put forward by the industry. And I propose that regional development grants paid in respect of expenditure incurred after Budget Day should be taken into account for the purposes of PRT and ring fence Corporation Tax.

We shall also need to legislate next year to deal with certain special problems affecting PRT expenditure reliefs, pipeline tariffs, and other non-oil receipts: these will be the subject of a consultation document which will be issued shortly.

These fiscal measures, combined with the decisions we have already announced on the abolition of the state's sole right to buy gas, and on the creation of the new private sector oil company, will provide a sound basis for another decade of successful enterprise in the North Sea.

MICROELECTRONICS

I turn now to the continuing effort to encourage innovation in industry. If we are to win still more worthwhile orders both at home and abroad British industry must continue to improve its design and production techniques.

There is no more important area to which this applies than microelectronics and information technology. The Government have already given a lead by designating 1982 as Information Technology Year. We have already authorised investment of well over £2bn in the British Telecommunications network in the coming year – more in real terms than at any time since 1974-75. This investment will breed new services, new firms and new jobs. So will the development of alternative and competing services for electronic communication such as the new Mercury network for business.

Because new technology is important on a wider front, I propose to make a further allocation for this purpose. My Rt. Hon. Friend, the Secretary of State for Industry, will shortly be announcing a series of new and expanded schemes. These will include additional assistance towards space technology, and production engineering – including the introduction of a special scheme of assistance to small engineering firms.

And the 100% first-year allowances for leased television sets, which were due to be phased out this June, will be extended for a further year for sets incorporating a teletext facility. This will encourage the wider use of a leading product of British Information Technology.

FISCAL JUSTICE

These measures will be worth £130m over three years.

I have now virtually completed my review of proposals involving spending, and spending foregone. I have described my decisions on excise duties, and the major cut in National Insurance Surcharge which we propose. In the remainder of my speech I shall be dealing primarily with fiscal issues.

I wish to deal first, and briefly, with the key issue of fiscal justice. All Chancellors of the Exchequer come under pressure every year to remedy hardships and anomalies in the tax system. This year has been no exception, and by the end of this afternoon I shall have been able to meet a large number of such points.

But there is another side to this medal. Justice is indivisible. Justice to the taxpayer must be matched by justice to the Exchequer. The revenue must be protected and maintained if the burden is not to fall more heavily on the general body of taxpayers.

We must all be glad to see the courts adopting a new approach towards artificial avoidance schemes. As a direct result, we expect to collect a very large sum of tax, possibly as much as £400m, which might otherwise have been avoided.

TAX EVASION

The proper vigilance of the Revenue Departments in these matters needs to be matched by the determination of Parliament to legislate where this is needed. Last year I asked Parliament to do so on a number of important matters. This year I propose further action.

We must, however, tread a very careful path between safeguarding the interest of the taxpaying community on the one hand and avoiding economic damage on the other.

This need for caution applies, for example, to the proposals affecting the tax liability of companies engaged in international business, on which the Inland Revenue put out consultative papers last year.

COMPANY RESIDENCE

These papers and the draft clauses dealing with these matters have caused considerable anxiety. In the case of company residence the primary objective was simply to replace the present ill-defined rules with ones which were clearer and more certain. This was not an attempt to extend the coverage of the tax. But I accept that some people might be adversely affected. The matter therefore needs to be looked at again.

TAX HAVENS

The problem of tax havens was a different one. If one has an open world in which there is free movement of capital and of persons – something which in itself is a good thing – this offers increased opportunities for tax avoidance. We must be very careful not to prejudice legitimate business, particularly because of the importance of London as a financial centre. We need to find the right middle road, and one which is accepted as right. It is to this end we shall be directing our efforts. Clearly this precludes legislation this year on any of these topics.

INTERNATIONAL LEASING

I now turn to the areas in which I do propose to take action in this Finance Bill.

First, international leasing. At present, assets leased abroad attract capital allowances at what is, in many cases, a favourable rate of 25% per annum. Leasing of this kind has grown sharply.

Moreover, there is evidence of U.K. tax incentives being used to subsidise deals between other countries – deals by foreign businesses in foreign-made goods, competing with our own home producers. I therefore propose, for new commitments after today, to reduce from 25% to 10% the rate of writing-down allowance for all assets leased abroad.

FILMS

Second, films. Investment in films qualifies for 100% first year allowances. As with other capital provisions, these investment incentives are available without regard to whether the film is made in this country or overseas.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

There is evidence that schemes for investment of this kind – primarily in foreign-produced films – are currently being marketed actively in this country. The potential loss to the revenue is very great.

I propose, therefore, to withdraw the 100% first year allowance for films and to introduce in its place a provision which will, in broad terms, allow companies to write off expenditure over the income-producing life of the film.

A change of this kind could have serious implications for the British film industry, if introduced immediately, at a time when there are signs that it is just beginning to establish a new and more competitive position.

I intend therefore to introduce transitional relief for British-made films – broadly speaking, films registered for the purposes of the Eady levy arrangements – for a two-year period. I shall be consulting the industry about the form which this assistance might take.

SHIPPING

Third, shipping. Here again, arrangements are being made to exploit U.K. investment incentives for the benefit of foreign businesses. In this case, a typical arrangement may involve a foreign shipping company chartering a vessel built abroad from a company specially set up in the U.K. to attract 100% capital allowances. I propose to reduce the rate of capital allowance in these cases to the 10% rate for international leasing generally. I am concerned to safeguard the position of British companies chartering their vessels abroad in the course of a genuine shipping business, and I shall be discussing with the shipping industry how best to do this.

On each of these three subjects – international leasing, films, shipping – the changes will take effect from today. I shall be bringing forward the necessary detailed legislation at Committee Stage.

LOANS

Fourth, so-called Section 233 loans. These are contrived arrangements under which interest paid on certain bank loans escapes liability to corporation tax in the hands of the banks. In future these payments will be taxed like other interest payments. The new rules will apply from today. In the case of contracts entered into before today, the new rules will apply to payments due on or after 1 April 1983.

DOUBLE TAX RELIEF AND BANKS

Fifth, by taking advantage of double tax relief banks can lend overseas at abnormally low interest rates at the expense of the U.K. taxpayer.

I propose to include in the coming Finance Bill measures to stop this exploitation of our tax system. They will take effect from 1 April 1982 but in the case of existing loans will apply only to interest arising from 1 April 1983.

While the measures I have announced will help, we shall need to give much further thought in the coming year to the problem of how best to ensure a sufficient contribution to tax revenues from the banking sector. The problem is not an easy one, as the benefit of some of the devices I have just described is shared between the banks and their domestic customers. There is a danger that measures directed to ensuring that the banks pay a more equitable amount of tax are all too simply bypassed by the banks shifting the burden on to their customers. For these reasons I have forborne from taking action earlier, but as Burke said, "There is however a limit at which forbearance ceases to be a virtue."

BUILDING SOCIETIES

On a different note, a number of building societies have recently issued a new form of negotiable bond. I have no reason to believe that any improper use has been made of these new bonds. But as an obvious precaution, I propose to extend to these bonds, from today, the existing provisions dealing with the "manufacture of dividends."

GOLDEN HANDSHAKES

I also propose some tighten-up of the law relating to very large golden handshakes. The tax relief will be withdrawn on a sliding scale with the effect that the excess of sums over £75,000 will be fully charged to tax.

We owe it to the ordinary taxpayer to take action in these fields. It is on him that the cost would fall if we did not do so.

HELP FOR BUSINESS AND INDUSTRY

I now revert to my principal theme: help for business and industry, and hence for jobs and people. Last year's Budget contained a number of measures to help the construction industry, an industry which can make a particularly significant contribution to the creation of new jobs. It is, accordingly, right to give it further help this year.

HOUSING

As I have already mentioned, our new public spending plans provide work for the construction industry in 1982-83 worth about £10¼bn – an increase of 14%.

This year local authorities have greatly underestimated the success of our policy of selling council houses and land. The extra revenue which this is bringing in has not been spent. For 1982-83, they have been assured that they can spend up to a total of some £3bn on housing.

This will include about £1bn of funds which they can expect to receive mainly as a result of the success of the right-to-buy legislation. This should allow an increase of nearly one third in the scale of their capital spending, compared with what they seem likely to spend in 1981-82.

In addition I now propose a charge for 1982-83, designed to help private home-owners whose houses fall well short of today's standards.

The value of grants given for major repairs, and for the provision of basic amenities in the home, under the Home Improvement Grant System, will be increased for a limited period, to a maximum 90% of the eligible cost, instead of the 75% currently available.

This increased rate of grant will apply only to applications received before the end of 1982. The purpose is not to add to longer term demands on the industry but to encourage the take-up of immediate spare capacity. We also intend both to enable more people to get grants for home insulation and to increase the value of these grants.

To pay for these changes and to encourage local authorities to make more general improvement grants available, their capital allocations in 1982-83 will be increased by £100m. This will be over and above the expenditure provided for in the White Paper.

My Rt. Hon. Friend, the Secretary of State for the Environment, has already announced measures for 1982-83 to give priority to inner city projects that offer the greatest degree of participation by the private sector.

Building on this, up to £70m of the provision for the Urban Programme and for Derelict Land reclamation in 1983-84 will be earmarked for projects that encourage participation by the private sector.

DERELICT LAND

We have also decided to offer further encouragement to the private sector and nationalised industries to bring derelict land into productive use; we shall increase the grant payable from 50% of the cost of reclamation to 80%, in Assisted Areas and Derelict Land Clearance Areas when legislation can be brought forward. The cost will be contained within the existing programme.

In addition, we shall give further encouragement to new private investment in housing for rent. I now propose to introduce capital allowances, at the rate of 75% for the first year only, for expenditure on the construction of properties wholly for letting as assured tenancies by bodies approved by the Secretary of State. The scheme will run for an experimental period of five years. Allowances may be claimed for expenditure incurred as from today.

In my Budget two years ago, I introduced the small industrial workshop scheme, under which industrial buildings allowance can be claimed on the construction of small buildings at the rate of 100%. The scheme has been a resounding success.

SMALL BUSINESSES

Over 5,000 new workshops have already been constructed for letting to small businesses, at an estimated Exchequer cost spread over several years, of £125-£150 million.

The scheme has succeeded in increasing the stock of industrial workshops at or near the upper size limit. But there has been relatively little investment at the very small end of the range. I therefore propose to extend the scheme for very small workshops, of not more than 1,250 square feet, for a further two years, until March 1985.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

I also propose to bring within the scope of the industrial buildings allowance certain kinds of servicing, repairing and warehousing activities. This too will improve the small workshop scheme.

I also propose to deal with the liability to VAT of certain kinds of building alterations, where there has in the past been serious doubt about what was liable to charge. A recent judgment of the House of Lords would have led, if applied in its entirety, to VAT being charged at the standard rate on a range of non-structural building alterations which had previously been free of charge. Though clarifying the law, this judgment would have imposed an extra £80 million of tax on the industry, which it can ill afford at present.

So I intend to re-establish the clarity needed, but in a way which will relieve the industry of all but £10m of the extra tax burden. I shall, in due course, lay before the House an Order, which will have the effect of continuing to zero-rate three important kinds of alterations which might otherwise be adversely affected by the House of Lords' judgement.

These are the most commonly recognised forms of double glazing, loft and cavity wall insulation and damp-proof coursing. This useful simplification of the law will cost the revenue about £70m a year.

The other kinds of non-structural alteration covered by the judgement will become subject to VAT but, pending the completion of discussions with the industry, no steps will be taken to apply the tax before about the beginning of September.

My final proposal in this area concerns Stamp Duty on house purchase. I propose to raise the exemption by £5,000, to £25,000, and the other thresholds also by £5,000, at a total cost of £70m in 1982-83.

This change should be widely welcomed. It will help to improve job mobility and give some encouragement to house construction. But most of all it will help those who have been saving to buy their first homes. By the end of this Parliament, nearly three out of five families will own their own homes. This will represent a significant extension of the property-owning democracy.

And, taken together, these proposals will mean more work for the construction industry, and more jobs for those who work in it.

Evident in the measures I have announced so far is the Government's consistent determination to help create the right conditions for the new investment needed to create new jobs. But this Budget, like its two predecessors, is designed also to provide a special tonic for small businesses.

BUSINESS START-UP SCHEME

There can be no doubt that higher rates of interest and the consequent reluctance of companies to borrow long-term at high fixed rates have caused a distortion of balance sheets. Too much reliance is now placed on short-term bank finance. As a result there is additional pressure on monetary growth.

A number of suggestions have been made for reducing the burden of interest rates on companies. We are all indebted to my hon. friend, the member for North-West Surrey, and others, for the way in which they have focused public attention on this problem. In many cases, the selectivity in the remedies proposed would favour lending by the banks and lending to "tax-exhausted" companies. We have considered these ideas very carefully. But they raise difficult questions of principle, and we are not persuaded that they offer the best solutions to the problems they are designated to solve. Moreover, consultations are still not complete on the Corporation Tax Green Paper, which raises major questions about incentives to investment, and we are still considering how best to ensure a proper contribution to tax revenues by the banking sector.

However, we can all agree that the basic problem of financing profitable expansion and investment demands urgent and continuing attention. A particularly important aspect of this is the provision of equity capital, about which I have some new proposals to make.

The Business Start-Up Scheme, which provides income tax relief for investments of up to £10,000 in the equity of companies starting new trades, has been widely welcomed. I propose for 1982-83 and 1983-84 to increase the annual limit from £10,000 to £20,000. As less than a full year has elapsed since it became law, some potential investors may have been unable to use up the full £10,000 limit in 1981-82.

I therefore propose that, in addition, any unused balance of this year's limit should be added to next year's. This means that, in some cases, the effective limit for 1982-83 will be as much as £30,000. These improvements should provide a further stimulus to investment in new enterprises.

Where capital for small businesses generally is concerned, many people have emphasised the importance of the new provisions introduced in the 1981 Companies Act for companies purchasing their own shares. Clearly, it would be wrong to change the tax law in such a way that these provisions could be used to pay out what would amount to tax-free dividends. But there is scope for tax changes which will significantly increase the attractions of equity capital, both to the investor and to the entrepreneur.

I now propose that certain purchases of their own shares by unquoted trading companies, mainly small and family businesses, should not be subject to ACT and income tax. They will be treated instead as sales of shares by the shareholder, and therefore, subject in most cases to Capital Gains Tax only. This measure will be of special benefit to small companies which have a limited market for their shares.

EMPLOYEE PARTICIPATION

Two years ago, I relaxed the conditions governing profit-sharing schemes and reintroduced legislation enabling employees to take up options to buy shares in their companies without incurring income tax liability.

I did this because I have no doubt that employees who own shares in the company for which they work develop a greater sense of commitment to the success of the business. Since I made my first changes two years ago, the increase in the numbers of employee share schemes has been extremely encouraging. In 1979 there were only 30 such schemes. Now there are over 400.

This is exactly as we should wish. Wider share-ownership is good for the business, good for the worker and good for Britain.

It is important to maintain and extend this progress. Accordingly, I now propose to increase the value of shares that can be allocated each year to any one employee from £1,000 to £1,250. I also propose to amend the detailed rules to help simplify the administrative problems arising on rights issues. We should also give some help and incentive to those who acquire share options outside the ambit of approved schemes. I therefore propose to make it easier for them to pay the income tax chargeable on the exercise of such an option by providing that it should be collected over three years rather than in a single sum.

In the last two years we have substantially relaxed the rules for tax relief for interest on money borrowed to invest in small companies. This year I propose to move a stage further. If a shareholder works full-time in the management of a business he will in future be able to qualify for tax relief to invest in that business even though he does not have more than 5% of the shares.

PILOT LOAN GUARANTEE SYSTEM

Now, loan finance. In my last Budget I announced the establishment of a pilot loan guarantee scheme. The scheme started in June 1981. Since then the demand for loans has far exceeded expectations.

Last October, in response to that demand, we increased the allocation for the first year from £50 million to £100 million; but with 2,700 loans worth almost £100 million already approved after only nine months, some further increase is desirable. Accordingly, I propose to increase the amount which the participating institutions may lend to £150 million for the first year. In addition a further £140 million will be available for loans under the scheme during its second year, to June 1983.

CORPORATION TAX RATE FOR SMALL COMPANIES

I also propose that the limits for the "small companies" rate of corporation tax should go up again from £80,000 to £90,000, and from £200,000 to £225,000. This will mean that this Government has increased the lower limit by 80% and the upper limit by more than 150%.

PRE-TRADING RELIEF

As a further help for new businesses, the period for income and corporation tax relief for pre-trading expenditure will be extended from one to three years.

ENTERPRISE AGENCIES

Many hon. members, I know, have been impressed by the value of the work done by local

© 1982 International Bureau of Fiscal Documentation – BULLETIN

enterprise agencies. These agencies depend in the main on businesses already established in the local community. They clearly play a valuable part in helping small local firms to start and to prosper.

I therefore propose to allow businesses to deduct for tax purposes the contributions they make to certain enterprise agencies, which concentrate on helping small firms. I hope this measure will encourage more widespread support for such agencies. The relief will be available from March 31 and will run for 10 years.

VAT

On VAT, I have two principal changes to propose. The registration threshold will be increased from £ 15,000 to £ 17,000. And I propose to introduce VAT relief for services supplied before registration. This measure, and the extension of relief for pre-trading expenditure, will reduce the costs of starting a new business.

The total revenue cost of these measures to help small firms is about £ 80m in a full year.

I also want to make it easier for those who have recently left school or college to start a business. Hitherto they have not been able to qualify for the socalled 714 certificates under the construction industry tax deduction scheme. The present system, designed to prevent tax evasion, may actually keep young people out of work as sub-contractors in the industry. The certificates are widely used in the industry but the existing rules require an individual to show that he already has three years good record as a taxpayer before he can secure a certificate.

By definition, someone who has just left school or college cannot qualify under this three-year rule. I now propose to change it, so as to enable school and college leavers to obtain special certificates. I also propose a guarantee scheme which may help others to obtain these special certificates.

PENSION RELIEF

Finally, the self-employed. A decade of inflation has eaten into the value of money which they had put aside to provide for their retirement. I therefore propose to increse the limits on retirement annuity relief for contributors who are now in their 50s and 60s - to 20% for those born between 1916 and 1933, to 21% for those born in 1914 or 1915, and to 24% for those born in 1912 or 1913. I also propose to alter the present restricions on the relief to allow more self-employed people to benefit from these higher levels. These changes will cost £ 12 million in 1982-83 an £ 25 million in a full year. They will provide a significant improvement in the position of the older contributor whose lifetime savings have suffered particularly from high rates of inflation in the 1970s.

The self-employed play a key role in the economy. Their contribution to its vitality, its adaptability, is apparent to all. A long with small businessmen, they fully merit this extra encouragement.

CAPITAL TRANSFER TAX

I turn now to a part of our tax system which is impeding the efficient working of capital markets and doing injustice to individuals and businesses alike: the capital taxes.

There is room for wide differences of view about the principle of taxing capital. But there is no case whatever for maintaining a system of capital taxes which, by holding back business success and penalising personal endeavour, does serious economic and social damage.

In each of the last two budgets, we have taken significant steps to reduce such damage. I propose carrying this process a stage further today.

The threshold for Capital Transfer Tax will now be increased to £ 55,000. The rate bands which apply above the thresholds have remained virtually unaltered since the tax was introduced in 1975. It is time they were extended. Under the new scale, details of which will appear in the FSBR, the top rate of tax will be reached at £ 2.5m.

In real terms, this is still not as high as the figure set by my predecessor, when he introduced the tax, in 1975. The lifetime scale will be improved to a similar extent. The cost this year will be £ 35m: and in a full year £ 85m.

I also propose that the indexation principles, already applied to income tax allowances, should in future apply as well to the CTT threshold and bands.

I should add that it is my intention that the Finance Bill should deal with the new regime for settled property. Draft clauses were published in December. The comments we have received will help us to clarify and improve the provisions. They have more than justified this exercise in open Government. I am grateful to all those who have contributed. There will also be a number of technical provisions related to the heritage. I have decided, in the light particularly of the reductions in the lifetime rates of charge I made last year, not to alter the rate at which the periodic charge is payable.

I also propose that foreign currency accounts belonging to individuals who have no connection with the U.K. should not be caught by the CTT. It is important for London's position as the world's leading financial centre that this matter should be cleared up.

CAPITAL GAINS AND INFLATION

I now come to the incidence of Capital Gains Tax on inflationary gains. This is a matter which has rightly given rise to a great deal of discontent. No-one has yet succeeded in finding a solution to this problem.

Innumerable proposals for full indexation, for tapering and other ingenious devices have been put forward. None, unfortunately, overcame all the practical difficulties. I cannot, however, allow this injustice to continue. It is intolerable for people to be permanently condemned to pay tax on gains that are apparent but not real – that exist only on paper.

I propose, therefore, that, as from this April, gains, including those of companies, will, in principle, be calculated after taking account of inflation which occurs after that date. No relief will, however, be given in respect of the first year of ownership. The problem we seek to solve is one which relates essentially to assets held for a period of years, and it would not be appropriate to extend relief to assets bought and sold within a comparatively short period of time.

Because we have not found it possible to extend the new scheme to cover past gains, I propose also that the exempt slice should be increased to £ 5,000. That is the best solution to the problem of the past and will simplify administration both for the taxpayer and the Revenue. For the future, I intend that this threshold too should be statutorily indexed.

There will be no revenue cost in the coming year. In 1983-84 the cost of these two measures will be £ 55m.

But this ought not to be looked at as a measure of the cost to the Exchequer. It is rather a measure of the tax which ought never to have been levied in the first place. This change is no more than simple justice, which should be welcomed on all sides of the House.

The benefit of these measures will be of substantial help to business as well as the individual. They will significantly increase the attraction of equities to U.K. taxpayers. One result should be that companies can raise more equity at lower cost than would previously have been possible. An increase in the scale of equity issues by companies will help to reduce their dependence on bank borrowing.

ROLLOVER RELIEF

I also propose a number of other specific changes: in future, rollover relief will be available on compulsory purchase; and, completing our policy of avoiding a double charge of CGT and CTT on the one event, rollover relief will also be available on assets coming out of trust. These proposals invoice no cost this coming year and a cost of £ 11m in 1983-84.

I believe that these changes, taken together, will be widely welcomed as a further major reform of the capital taxes.

REDUCTION OF THE PERSONAL INCOME TAX

But for the vast majority of individuals what really matters is income tax. And income tax is far and away the biggest source of Government revenue. This year about 26m income taxpayers wil contribute, in round figures about £ 30m to the Exchequer.

Quite rightly people look for some reduction in their own tax burden. As I have explained at the outset, and demonstrated by my proposals, the paramount aim of this Budget is to help industry, to encourage business, to create jobs.

But I want also to assist people directly. The one helps the other. People need industry but industry also needs people - as workers, as customers, as investors. We remain firmly

© 1982 International Bureau of Fiscal Documentation – BULLETIN

committed as ever, over the years, to reduce the burden of direct taxation. It is essential to do so: to improve incentives: to remove disincentives: te reduce the poverty trap.

There are always, of course, competing arguments as to whether one should reduce the rates of income tax or raise the thresholds at which people pay tax. Any Chancellor would like to be able to do both. But this year, given my principal aim, I have had to make a choice.

We have already reduced the basic rate of tax from 33% to 30%, and reduced the higher rates of tax as well. I propose, therefore, to concentrate the relief that is available this year on raising the tax thresholds.

The single personal allowance will accordingly be increased by £ 190 to £ 1,565 and the married allowance by £ 300 to £ 2,445.

The additional allowance for single parents will, as a consequence, rise by £ 110 to £ 880. So too will the widow's bereavement allowance. And there will be corresponding increases in the age allowances, the higher rate threshold and bands, and the threshold for the Investment Income Surcharge. Effect will be given to changes under PAYE as from the first pay day after 26 April.

These increases are up to 2% points *more* than the 12% required to take account of inflation in 1981. They are worth £ 1.8bn this year and almost £ 2½bn in a full year. As a result some 1.2m people who would have paid tax next year will not now have to do so. This news will be very welcome both to the House and to the country at large.

In framing this year's Budget, Mr. Speaker, it has been my purpose to give as much encouragement as I believe we can afford to an economy which is now moving in the right direction.

To hearken to the voices that urge us only to "borrow, borrow, borrow" would perform no service to British industry or to the unemployed. On the contrary, it would lead only to the dead end of a plummeting exchange rate or a rocketing rate of interest - most probably to both.

Better by far to secure, as I have done, a prospective level of borrowing that is below that of the year now ending and so to maintain our progress towards stables prices.

And at the same time, as in each of my three earlier Budgets, to achieve substantial tax reforms, to promote the wider ownership of wealth, and to encourage the productive private sector, which in these past three years has made giant strides towards the restoration of our reputation as a trading nation.

This is a Budget that will give confidence at home that growing markets will be there for those prepared to go out and win them. And so a better prospect of employment opportunities for those who look only for the chance to work.

And confidence abroad that Britain stays on course, to put a dismal record of performance behind us once and for all.

This Budget is designed to give that double boost to confidence. I commend it to the House and to the nation.

THE FINANCIAL STATEMENT

INCOME TAX

It is proposed: to increase the single person's allowance and the maximum wife's earned income relief from £ 1,375 to £ 1,565 and the married allowance from £ 2,145 to £ 2,445.
– to increase the additional personal allowance and widow's bereavement allowance from £ 770 to £ 880.
– to increase the age allowance for the single person from £ 1,820 to £ 2,070, for the married from £ 2,895 to £ 3,295 and the age allowance income limit from £ 5,900 to £ 6,700.
– to increase the basic rate limit to £ 12,800.
– to increase the width of the 40% band to £ 2,300, the 45% band to £ 4,000 and the widths of the 50% and 55% bands to £ 6,200.
It is proposed: to raise the threshold for the investment income surchage for 1982-83 from £ 5,500 to £ 6,250.
– to revise the system of reliefs available to individuals receiving payments above £ 25,000 on termination of employment.
– to exempt mobility allowance from tax.
– to raise from £ 1,000 to £ 1,250 the maximum annual value for appropriations of shares to an employee under an approved profit sharing scheme.
– to alter the basis for the exemption limit for capital receipts arising from shares held under approved profit sharing schemes.
– to allow the income tax payable on the exercise of a share option by a director or employee to be paid by instalments over three years.
– with effect from 1983-84, to change the arrangements for giving mortgage interest relief.
– to increase the percentage limit on retirement annuity relief from 17½% to 20% for individuals born between 1916 and 1933, from 20½% to 21% for those born in 1914 or 1915 and from 23½% to 24% for those born in 1912 or 1913, and to remove the existing ban on the provision of these higher rates of relief for individuals with pensions or pension rights under sponsored superannuation schemes in respect of any previous full-time employment.
– to extend relief for interest paid on money borrowed for investment in a close company to borrowers who own 5% or less of its ordinary share capital, provided that they act for the greater part of their time in the management or conduct of the business.
– in respect of the relief for investment by outsiders in certain new corporate trades ("Business Start-up Scheme") to increase the limit for each of 1982-83 and 1983-84 by £ 10,000 and for 1982-83 by any unused balance of the limit for 1981-82.

INCOME TAX AND CORPORATION TAX

It is proposed: to extend the definition of an industrial building for industrial buildings allowance purposes to include buildings used for certain repairing and servicing activities.
– to extend the small industrial workshop scheme for a further 2 years, for industrial buildings not exceeding 1,250 sq ft.
– to allow relief for contributions to certain enterprise agencies.
– to extend, for one year, the 100% first year allowance for expenditure on rented television sets incorporating a teletext facility.
– to introduce a first year capital allowance, at the rate of 75%, for expenditure in the construction of certain buildings for letting as private residential accommodation, under the assured tenancies scheme.
– to extend the relief for pretrading expenditure.
– to exempt dealers in Eurobonds from the provisions designed to prevent loss of tax through bond-washing.
– to bring certain securities issued by building societies within the provisions designed to prevent loss of tax through the manufacturing of interest.

INCOME TAX, CORPORATION AND CAPITAL GAINS TAX

It is proposed in appropriate cases to change the tax treatment of distributions made by companies in purchasing their own shares.

CORPORATION TAX

It is proposed: for the financial year 1981 to increase the limit for the "small companies" rate of corporation tax from £ 80,000 to £ 90,000 and the limit for marginal relief from £ 200,000 to £ 225,000.
– to amend the definition of "distribution" as it affects borrowing in the form of "equity loans".

CORPORATION TAX AND CAPITAL GAINS TAX

It is proposed: to adjust expenditure allowable in calculating gains on disposals having regard to future increases in the retail prices index.
– to increase the level of exemption for gains on chattels.
– to introduce a rollover relief for compensation paid on compulsory purchase.

OIL TAXATION

It is proposed: to extend Supplementary Petroleum Duty (SPD) for the chargeable period ending on 31 December 1982, only.
– to increase the rate of Petroleum Revenue Tax (PRT) from 70 to 75% for chargeable periods ending after 31 December 1982, and to spread its collection in monthly instalments after 30 June 1983.
– to introducing a system of advance payments of PRT for chargeable periods ending after 31 December 1982, at a rate of 20% of gross profits less an oil allowance of ½m tonnes per chargeable period, the advance payments to be set off against current or later liability to PRT or, failing set-off, repaid at the end of field life.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

– to amend the point of charge for PRT an SPD for certain arm's-length sales of gas and to provide alternative rules for determining the market value of ethane used for petrochemical purposes.
– to allow Corporation Tax relief for certain losses and charges outside the oil production "ring fence".
– to disallow for the purposes of PRT and ring fence Corporation Tax expenditure incurred after Budget day to the extent that it is met by Regional Development Grants.

CAPITAL GAINS TAX

It is proposed: to increase the threshold from 1982-83 so as to exempt individuals on the first £ 5,000 of capital gains in a year and most trusts on the first £ 2,500.
– to require for the future an annual revision of the thresholds for individuals and trusts in the light of changes in the retail prices index.
– to extend the rollover relief for lifetime gifts to transfers out of settlement.
– to revise the rules for gains arising on the termination of a life interest in settled property.

CAPITAL TRANSFER TAX

It is proposed: to introduce new rate schedules for both death and lifetime transfers as follows:

Band of chargeable value £ '000	*Rate on death %*	*Lifetime rate %*
0 - 55	Nil	Nil
55 - 75	30	15
75 - 100	35	17½
100 - 130	40	20
135 - 165	45	22½
165 - 200	50	25
200 - 250	55	30
250 - 650	60	35
650 - 1,250	65	40
1,250 - 2,500	70	45
Over 2,500	75	50

It is proposed: to require for the future an annual revision of the rate bands in the light of changes in the retail prices index.
– to increase the exemption limits for transfers within one year of death to charities to £ 250,000 and for transfers to non-domiciled spouses to £ 55,000.
– to restructure the charge to tax on discretionary trusts.
– to exempt from the charge on death non-sterling bank accounts of depositors who are not domiciled, resident or ordinarily resident in the United Kingdom at the time of their death.

CAPITAL TRANSFER TAX AND INCOME TAX

It is proposed: to alter the conditions on which the Treasury may designate trusts as maintenance funds for heritage purposes and to amend the charges to tax which may arise following the setting up of these funds.

VALUE ADDED TAX

It is proposed to amend Section 20(1) and Schedule 1 to the Finance Act 1972 so as to increase the registration and deregistration limits. From 10 March 1982 the registration limits will become £ 17,000 per annum and £ 6,000 per quarter. From 1 June 1982 the deregistration limits will become £ 16,000 per annum where estimated future turnover is concerned, and £ 17,000 per annum where past turnover is concerned.
It is proposed to amend paragraph 11 of Schedule 1 to the Finance Act 1972 in order to restrict the Commissioners' powers to grant discretionary registration to certain traders.
It is proposed to apply, by Order, the zero-rate of VAT to supplies of building alterations by way of the most commonly recognised kinds of double glazing, loft and cavity-wall insulation, and damp-proof coursing.

ALCOHOLIC DRINKS

It is proposed from midnight 9-10 March 1982, to increase:
(a) the rates of duty on spirits from £ 13.60 (for mature spirits) and £ 13.63 (for immature spirits) to a uniform rate of £ 14.47 per litre of alcohol in the spirits;
(b) the rate of duty on beer from £ 18.00 to £ 20.40 per hectolitre and the charge for each additional degree of original gravity above 1030 degrees per hectolitre from £ 0.60 to £ 0.68;
(c) the rates of duty on wine by the following amounts per hectolitre:
Wine of an alcoholic strength:
– not exceeding 15%: from £ 95.20 to £ 106.80.
– exceeding 15% but not exceeding 18%: from £ 122.90 to £ 137.90.
– exceeding 18% but not exceeding 22%: from £ 144.70 to £ 162.30.
– exceeding 22%: £ 162.30 plus £ 14.47 (instead of £ 13.60) for every 1%, or part of 1%, in excess of 22%;
– surcharge on sparkling wine: from £ 20.90 to £ 23.45;
(d) the rates of duty on made-wine by the following amounts per hectolitre:
Made-wine of an alcoholic strength:
– not exceeding 10%: from £ 61.80 to £ 73.10.
– exceeding 10% but not exceeding 15%: from £ 92.50 to £ 103.80.
– exceeding 15% but not exceeding 18%: from £ 113.90 to £ 127.80.
– exceeding 18%: £ 127.80 plus £ 14.47 (instead of £ 13.60) for every 1%, or part of 1%, in excess of 18%;
– surcharge on sparkling made-wine: from £ 9.60 to £ 10.75;
(e) the rate of duty on cider and perry from £ 7.20 to £ 8.16 per hectolitre.

STAMP DUTIES

It is proposed: to raise with effect from 22 March 1982 the level below which transfers of property (other than stocks and shares) are not liable to stamp duty from £ 20,000 to £ 25,000, to adjust the associated bands of reduced rates of stamp duty correspondingly and to alter certain limits affecting stamp duty on new leases.
– to exempt transfers of assets to charities.

HYDRO CARBON OIL

It is proposed, from 6 pm on 9 March 1982, to alter:
(a) the rate of duty on light hydrocarbon oil (other than aviation gasoline), petrol substitutes and spirits used for power methylated spirits from 13.82p to 15.54 per litre;
(b) the rate of duty on heavy hydrocarbon oil for use as road fuel from 11.91p to 13.25p per litre;
(c) the rate of duty on aviation gasoline from 13.82p to 7.77p per litre;
(d) the rate of duty on gas for use as road fuel from 6.91p to 7.77p per litre.

TOBACCO

It is proposed, from midnight 11-12 March, to increase:
(a) the specific element in the duty on cigarettes from £ 19.03 to £ 20.68 per 1,000 cigarettes (the ad valorem element remaining unchanged);
(b) the duty on cigars from £ 35.91 to £ 39.00 per kilogram;
(c) the duty on hand-rolling tobacco from £ 30.96 to 33.65 per kilogram;
(d) the duty on other smoking and chewing tobacco from £ 22.96 to £ 24.95 per kilogram.

POOL BETTING DUTY

It is proposed to increase the rate of pool betting duty from 40% to 42½% on events on and after 1 April 1982.

GAMING LICENCE DUTY

It is proposed, from 1 April 1982, to increase the rates of gaming licence duty. The advance payment will remain at £ 250, but the second payment, to be made up to five months after the licensing period, will be a proportion of the gross gaming yield (stakes less winnings) in each six-monthly period as follows:
5% of the first £ 500,000 plus
12½% of the next £ 1,750,000 plus
25% of the remainder of the gross gaming yield.

BINGO DUTY

It is proposed, from 27 September 1982, to restrict the existing exemptions from bingo duty so that al large-scale bingo (where the value of prizes has exceeded £ 300 in any one day or £ 1,000 in any one week) is made liable to duty.

GAMING MACHINE LICENCE DUTY

It is proposed, from 1 October 1982, to abolish the existing duties on all "2p per play" machines and to increase the annual rates of licence duty on other machines as follows:
(a) Premises with local authority approval: from £ 60 for the first machine and £ 120 for subsequent machines to £ 120 for each "5p per play" machine and £ 300 for each "10p per play" machine;
(b) Premises without local authority ap-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

proval: from £ 200 to £ 300 for each "5p per play" machine and from £ 400 to £ 750 for each "10p per play" machine.

It is proposed to amend the comparable provisions in the Miscellaneous Transferred Excise Duties Act (Northern Ireland) 1972 so that the abolition of duty on "2p per play" machines and the new rates at
(b) above will also apply in Northern Ireland.

SURCHARGES AND REBATES OF EXCISE DUTIES

It is proposed to amend the Excise Duties (Surcharges or Rebates) Act 1979 to allow surcharges or rebates to be applied to individual rates of the duties to which that Act applies.

It is proposed to increase the excise duty on most mechanically-propelled vehicles chargeable under Section 1 of the Vehicles (Excise) Act 1971 and under Section 1 of the Vehicles (Excise) Act (Northern Ireland) 1972 by about 12%. This figure is broadly descriptive. There will be some variations within particular vehicle categories. The duty on most cars will rise by £ 10 to £ 80. The rates of duty on certain groups of light commercial vehicles will be marginally reduced and a larger selective increase of 25% will be applied to all duty levels on goods vehicles over 9 tons unladen weight . These changes have effect in relation to licences taken out after 9 March.
It is additionally proposed to include provision in the Finance Bill for the restructuring of vehicle excise duty on heavy goods vehicles from an unladen weight to a gross weight basis of assessment and to introduce a new taxation regime for light commercial vehicles. These changes, which were foreshadowed in the 1981 Transport Act, will take effect from 1 October 1982.

NATIONAL INSURANCE SURCHARGE

It is proposed to reduce by 1 percentage point to 2½% the surcharge paid in respect of employees by secondary Class I contributors under the provisions of the National Insurance Surcharge Act 1976. This reduction will take effect from 2 August 1982. It is also proposed to reduce the rate of surcharge payable in respect of earnings between 2 August 1982 and 5 April 1983 by a further ½ percentage point.

Approximate direct effects of changes in duty rates on certain product prices

(All except VED* inclusive of 15% VAT)

Spirits duty	30p on a bottle of spirits
Beer duty	2p on a pint of beer of average strength
Wine duty	10p on a bottle of table wine
Fortified wine duty	13p on a bottle of sherry
Petrol duty	9p on a gallon of petrol
Derv duty	7p on a gallon of derv
Tobacco duty	5p on a packet of 20 cigarettes
Vehicle excise duty	£ 10 on a car licence

* Vehicles excise duty

CANADA: SALES TAX REFORM

Implementation date delayed

The following is the full text of a Finance Department Communiqué dated April 13, 1982:

The Honourable Allan J. MacEachen, Deputy Prime Minister and Minister of Finance, today announced the proposed implementation date for conversion of the manufacturer's sales tax to the wholesale level will be January 1, 1983.

The Minister said the postponement from June 1, 1982 to January 1983 is in response to requests from wholesalers and other members of the business community for more time to study the draft legislation and to prepare for its implementation.

The Minister expects to make the draft legislation available by the end of the month for public study and comment. He added that the January 1, 1983, implementation date is tentative and that he will confirm it later in the summer once he has had time to assess public comments on the draft legislation.

This structural change in the sales tax is intended to correct a bias in the application of the tax that now favours imported goods over competing domestic manufactured goods. It will also deal with other inequities and anomalies resulting from the wide variations in the way goods are marketed. The change follows detailed studies and public consultations over the past seven years.

The Minister emphasized that the shift in tax to the wholesale level will yield no additional revenues to the federal government. Any overall revenue gain from adopting the wholesale price base will be offset by the reduction of the general sales tax rate from 9 to 8%.

For some products the tax rate reduction will not fully offset the effect of changing to a wholesale base for the tax. However, it will mean a direct reduction in tax on a wide range of other products – those that do not flow through wholesalers or that are already subject to tax at the wholesale level. For example, it is estimated that on North American automobiles, which are sold by manufacturers directly to dealers, there will be reductions in the federal sales tax averaging between $100 and $200 per car.

The Minister noted that the reduction in the general tax rate from 9 to 8% will take place six months after the conversion to the new tax base in order to offset a one-time revenue loss resulting from refunds of tax already paid on wholesaler's inventories.

THIRD EUROPEAN CONGRESS OF TAX CONSULTANTS

under the auspices of the President of the Federal Republic of Germany

Professor Dr. Karl Carstens

from 30 September – 2 October 1982 in Aix-la-Chapelle, Eurogress

CONGRESS PROGRAMME (PROVISIONAL)

Thursday, 30 September 1982

09.00 Opening of the Congress:
Dr. Wilfried Dann, Steuerberater, President of the C.F.E.

09.15 PAPER:
Count Otto Lambsdorff, Federal Minister of Economic Affairs of the German Federal Republic, Bonn
Increasing Economic Relations in a United Europe

10.00 PAPER:
Christopher Tugendhat, Vice-President of the Commission of the European Communities, Brussels
State of Tax Harmonisation in Europe

11.00 PANEL DISCUSSION I
Open questions and possible conflicts following the implementation of the 6th EEC directive relating to VAT

Languages: English, French, German

Chairman: Dr. Wilfried Dann, President of the C.F.E.

Participants:
Allemagne: Mr. Geist
Belgique: Mr. Timmermann
France: Mr. Ebrad
Italie: Mr. Prof. Croxatto
Pays-Bas: Mr. Warning
Royaume-Uni: Mr. Pyne-Gilbert
Commission of the European Communities: not yet available.

13.00 Luncheon for all participants at the Eurogress

15.00 WORKING GROUP A 1
Tax problems of establishing business activities abroad by medium-sized enterprises

Languages: German, English

Referees:
Allemagne: Mr. Dr. Schelle
Pays-Bas: Mr. Udink
Royaume-Uni: Mr. Stitt

15.00 WORKING GROUP A 2
The application of wealth taxes and taxes arising on death to foreign assets and liabilities

Languages: German, French

Referees:
Allemagne: Mr. Prof. Dr. Wacker
Belgique: Mr. Brandès
France: Mr. Saint-Bauzel

15.00 WORKING GROUP A 3
The professional relationship between the tax consultant and his client

Languages: English, French, German

Referees:
Allemagne: Mr. Mittelsteiner
Irlande: Mr. Johnston
Italie: Mr. Bertorello

17.30 End of the professional part of the first day of the Congress

Friday, 1 October 1982

09.30 WORKING GROUP B 1
The practical application of international tax provisions

Languages: English, German

Referees:
Belgique: Prof. Dr. A. Tiberghien
Danemark: Mr. Jørgen Skou
Royaume-Uni: Mr. Jones

09.30 WORKING GROUP B 2
The taxation of foreign income and gains from foreign possession of individuals

Languages: French, German

Referees:
Allemagne: Mr. Dr. Rädler
Espagne: Mr. Santacana
Pays-Bas: Mr. Booij

09.30 WORKING GROUP B 3
Organizing and equipping a tax consulting practice

Languages: English, French, German

Referees:
Allemagne: Mr. Sebiger
France: Mr. Gumez
Pays-Bas: Mr. Telman

12.30 Luncheon for all participants at the Eurogress

14.00 PANEL DISCUSSION II
International tax control

Languages: English, French, German

Chairman:
Joseph Delattre, President of the Tax Committee

Participants:
Allemagne:
Belgique: Mr. Denys
Espagne: Mr. Gros
France: Mr. Delattre
Irlande: Mr. Bale
Pays-Bas: Mr. Smid
Royaume-Uni: Mr. Jenning
Commission of the European Communities: not yet available

16.30 PAPER:
Dr. Wilfried Dann, President of the C.F.E.

Perspectives for the Future of Tax Consulting in Europe

17.00 End of the Professional part of the second day of the Congress

TAX TREATY:
Netherlands Antilles – United States

On 4 February 1982 the U.S. Treasury released the following text of a joint statement relating to the recently concluded round of negotiations on a new income tax treaty between the Netherlands Antilles and the United States.

The Minister of Finance of the Netherlands Antilles, Mr. Marco J. de Castro, and the Assistant Secretary (Tax Policy) of the United States Treasury Department, Mr. John E. Chapoton, announced today that further negotiations between the Government of the Netherlands Antilles and the Government of the United States, for the purpose of agreeing on a new income tax convention, were held in Washington, D.C. from February 1 through 4, 1982. The chief negotiator for the United States was A.W. Granwell, International Tax Counsel, and the chief negotiator for the Netherlands Antilles was Harold Henriquez, Minister Plenipotentiary.

During these negotiations, there was a review of the main issues. There was a detailed discussion of the possible solutions to reconcile the respective tax, enforcement and economic policy goals of the two governments in light of the historical relationship between the two countries.

The two delegations will resume the negotiations shortly. The next meetings have been scheduled for the spring of 1982.

In the meantime, the present treaty relationship between the United States and the Netherlands Antilles will remain in effect and will be administered in accordance with its terms.

See for the text of the present tax treaty 31 *Bulletin for International Fiscal Documentation* 1977 at 399.

Hong Kong:

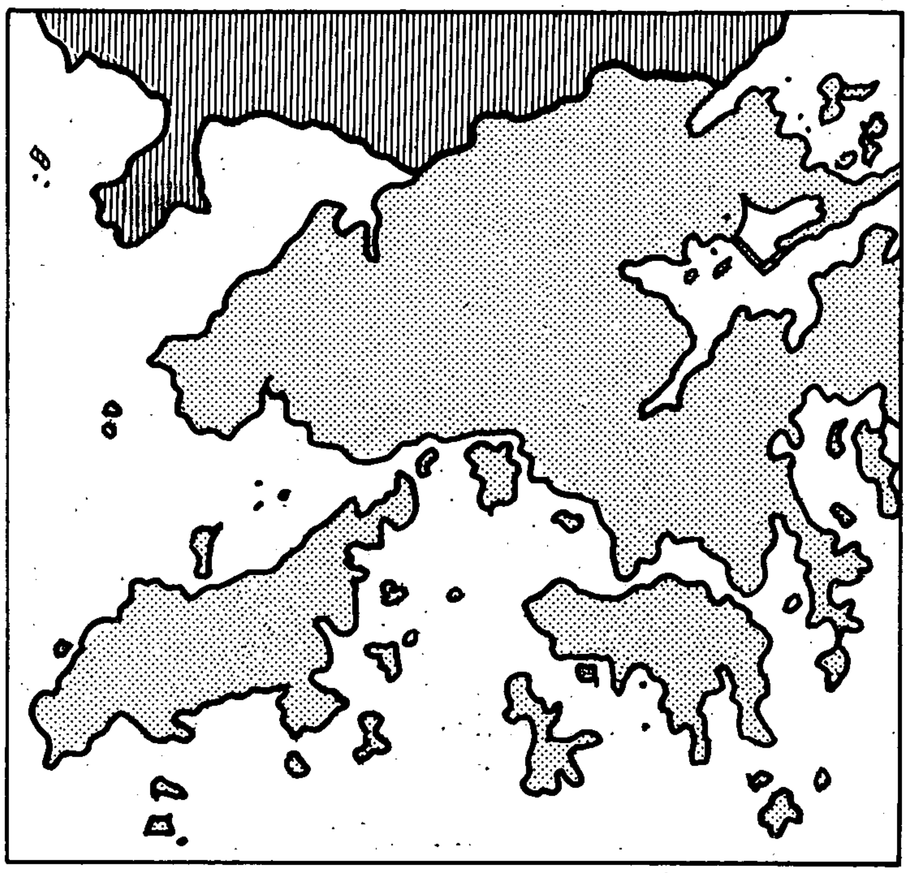
More Tax Concessions

by Y.C. Jao *

In a previous article in this ***Bulletin,*** *the present writer summarized and discussed recent tax changes and reforms in Hong Kong from 1976 to 1981.[1] It was shown there that simplification and rationalization of Hong Kong's tax system in recent years has on balance resulted in a lower burden of personal taxation, a higher tax yield and a greater fiscal surplus. In the latest 1982-83 Budget presented by Hong Kong's new Financial Secretary, Mr. John Bremridge, on 24 February 1982, more tax concessions were announced. Some of the tax cuts, in particular the abolition of the interest withholding tax on foreign currency deposits, clearly have certain international implications. This short article aims to describe the tax concessions and analyze their economic significance.*



Tax concessions for 1982-83

Tax concessions proposed in the latest budget may be discussed under four headings as follows:

(a) Business taxation

In the previous fiscal year, the initial allowance for capital assets was raised from 25 to 35% to provide more incentive for entrepreneurs in replacing and upgrading their capital equipment, machinery and plant. In the latest budget, this initial allowance has been further increased to 55% for expenditure incurred on the provision of qualifying plant and equipment. As an example, an item of spinning or weaving machinery ranking for the annual rate of allowance of 30% will now qualify for a total write-off of 68.5% in the year of acquisition.[2]

A related concession concerns the allowance for industrial buildings. Under existing legislation, allowance for industrial building is granted by reference to the cost of construction only, no account being taken of the profit element in the final purchase price. This has now been amended so that both the initial and annual allowances for industrial buildings will henceforth be computed by reference to the net price paid by the final user. In Hong Kong, where until very recently profit margins in the property market have tended to be very high, the tax saving is not inconsiderable for a manufacturer who buys rather than leases a factory building for industrial production.

These concessions have been taken in recognition of the difficulties Hong Kong industrialists are now facing: world-wide recession, rising protectionism in developed countries, and growing competition from other low-wage developing countries. Such tax concessions may not go far enough in satisfying the clamour for more direct subsidy to the troubled industrial sector, but in the light of Hong Kong's traditional non-interventionist policy and philosophy, they probably represent the most the Government can do.

(b) Interest withholding tax

From the international point of view, a more important, and perhaps also more controversial, concession is the abolition of the interest withholding tax on foreign currency deposits. Debate on the pros and cons of this move has been going on in Hong Kong since at least 1970, when the territory began to emerge gradually as a financial centre. In the late 1960s several multinational banks had plans of establishing the Asian-dollar market – which was in effect an extension of the Euro-dollar market – in Hong Kong, but they were frustrated by the refusal of the Hong Kong Government at that time to abolish the interest withholding tax on foreign currency deposits. As a result, the Asian-dollar market was launched in 1968 in Singapore, whose government was only too glad to grant tax exemption as an inducement to multinational banks for setting up an offshore banking centre. Since then, the two city-states have been competing fiercely for the position of the leading financial centre for the Asian-Pacific

2. 55% + (45% x 30%) = 68.5%.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Region. Both in the process have grown enormously in financial stature. Most analysts agree that, being the host country for the Asian-dollar market, Singapore clearly leads as a funding centre, while Hong Kong – which has a much larger economy, is more centrally situated and is geographically closer to such large borrowers as the Philippines, South Korea, Taiwan, and eventually China – is more favoured as a syndication centre.[3] Hong Kong is reputed to be next to only London and New York in having the largest number of foreign banking institutions represented in one form or another.

With the removal of the interest tax on offshore currency deposits, it is widely expected that at least part of the US$80 billion Asion-dollar market based in Singapore will be repatriated, though not immediately, to Hong Kong. Singpore will still grow as a financial centre, but not at the fast rate as in the past. In any case, it will no longer be in a position to virtually monopolize the Asian-dollar market. Hong Kong in the meantime will grow both as a funding and syndication centre, a trend that will be conducive to the much needed diversification of its economy.

Hitherto there have been at least two major reasons for opposing the abolition of interest tax on foreign currency deposits. The first is the loss in revenue to the Treasury, particularly when interest rates remain at a historically high level. However, the international banking lobby has apparently succeeded in persuading the authorities that the loss in fiscal revenue will be more than offset in the long run by visible and invisible incomes resulting from Hong Kong's further development as a financial centre. The second is the fear that, if the corresponding tax on domestic currency deposits is not also abolished, a large-scale switching from domestic to foreign currency deposits may take place, which in turn will lead to an unacceptable depreciation of the Hong Kong dollar. As a precaution against this danger, it was announced in the Budget that the interest withholding tax on Hong Kong dollar deposits would be simultaneously lowered from 15% to 10%. The critics, however, maintain that this reduction does not go far enough to forestall the possibility of currency switching. Another valid point raised by the critics is that the differential treatment of foreign and domestic currency deposits violates one of the fundamental precepts of public finance, namely, horizontal equity.

(c) Personal taxation

In the previous article, the present writer described how various allowances have been increased over the years, the net effect of which has been to mitigate the tax burden of middle income groups, and to exempt lower income groups from personal tax altogether.

In the current Budget, more allowances have been granted to those liable to Salary Tax and to those who elect for Personal Assessment. First, the level of personal allowances is raised from HK$15,000 to HK$20,500 for single persons and from HK$30,000 to HK$41,000 for married couples. The present supplementary allowance of HK$7,500 each for the taxpayer and his/her spouse remains unchanged, so that the total allowances are now HK$28,000 for a single person and HK$56,000 for a married couple. The new allowances are nearly 25% higher than the existing ones, and considerably in excess of the current rate of inflation (about 15%). Second, child allowances are raised from HK$7,000 to HK$8,000 for the first child, and from HK$5,000 to HK$5,500 for the second child, but present allowances for the third to ninth child remain unchanged. Third, the dependent parent allowance is also increased from HK$7,000 to HK$8,000. All told, these increased allowances will exempt 92,000 persons from tax liability. In addition, an estimated further 55,000 persons who elect Personal Assessment will also benefit through reduced liability.[4] As an illustration, Appendix A shows Salary Tax payable by various taxpayers with the same income but in different personal circumstances. As can be seen clearly, at the same salary income of HK$108,000 (= US$18,462) per annum, which is fairly typical of middle-class income level in present-day Hong Kong, the effective tax rate under the new system of personal allowances ranges from 13.9% for a single person to only 1.7% for a married person with two children and two dependent parents. This compares favourably with those under most tax jurisdictions, with the exception of tax havens.

(d) Estate duty

The exemption limit for Estate Duty (inheritance tax) was raised last year to HK$1 million, and this is now further doubled to HK$2 million, in recognition of rising asset values in an inflationary environment. Concomitantly, the marginal rates applicable to estates over HK$2 million have also been revised, ranging from 10% to 18%. Details of the new schedule are presented in Appendix B. Finally, the principal matrimonial home of the deceased, who leaves a surviving spouse, is also exempted from Estate Duty.

CONCLUSIONS

Hong Kong's low tax policy, in so far as it minimizes disincentive effects on saving, investment and work effort, has been one of the contributing factors for the territory's remarkable economic growth – averaging some 9% per annum in real terms – in the post-World War II period. Further measures have been taken since 1976 to provide more tax relief to middle-income groups and incentives for business investment. In effect, Hong Kong has been pursuing the basic tenets of what is now fashionably called "supply-side economics", without, however,

3. For a more detailed analysis, see S.Y. Lee and Y.C. Jao, *Financial Structures and Monetary Policies in Southeast Asia* (London: Macmillan, 1982), Chapters 2, 3 and 9.

4. The Hong Kong tax system is a schedular one, i.e. taxes are levied separately on different sources of income, such as salary, interest, profits, etc. Personal Assessment is a voluntary option open to resident taxpayers who choose to aggregate their incomes from all sources for tax assessment, against which personal allowances are granted, which would otherwise be confined only to those who pay Salary Tax.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

self-consciously adopting its more extreme dogmas.

Moreover, since various tax concessions have been granted on the basis of a healthy state of fiscal surplus and reserve, Hong Kong has been able to avoid the serious complications arising from an over-hasty and doctrinaire application of "supply-side economics".[5]

5. Despite tax concessions totalling some HK$1,370 million, the Hong Kong Government is still able to budget for a surplus of some HK$2,300 million in the current 1982-83 fiscal year. The accumulated fiscal reserves as at 1 April 1982 are estimated at about HK$23,000 million (approximately US$3,930 million).

15 Percent Tax – and Still Taxpayers Grumble

by Mary Lai

Like all taxpayers around the world, Hong Kong people complain of the tax burden imposed on their shoulders by their government.

However, Hong Kong, the tiny British territory perched on the edge of China, enjoys one of the lowest and simplest forms of taxation in the world. The current standard rate of 15% has been in force since 1 April 1966.

"Despite the low taxation rate, Hong Kong's internal revenue yield has increased from HK$2,896.4 million (£263.31 million; US$526.62 million) in the 1975-76 fiscal year to HK$11,231.4 million (£1,021 million; US$2,042 million) in the 1980-81 fiscal year", said Mr. Anthony Au-Yeung, Deputy Commissioner of the Inland Revenue Department of the Hong Kong Government.

Mr. Anthony Au-Yeung, Deputy Commissioner of Inland Revenue of the Hong Kong Government, said the Government's policy is to keep the rate of taxation low in an attempt to provide an incentive for local investment and there is more than sufficient revenue to cover public expenditure.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

In return for his tax contribution (and a single person earning less than HK$2,333 (£212.12; US$424.24) a month pays nothing), the man-in-the-street gets a first class police force, 9 years of free and compulsory education up to the age of 15, medical services at a nominal charge of HK$3 (27p; US$0.55) per visit and a host of social security schemes.

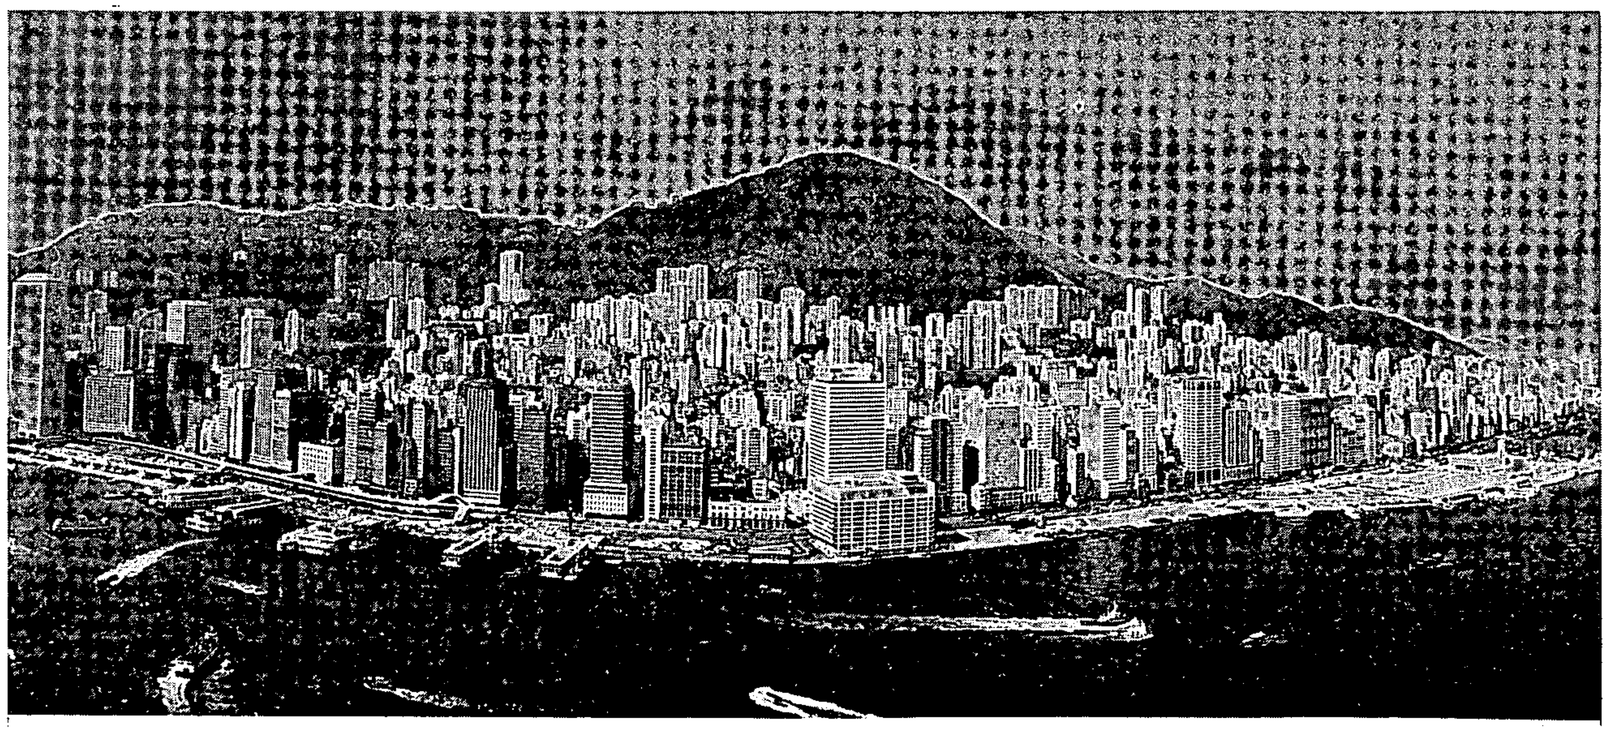
"The government's policy of maintaining a comparatively low level of taxation plays an important role in economic stability and provides an incentive for investment. Furthermore, due to growing prosperity, Hong Kong's recurrent revenue is more than sufficient to finance its public expenditure", said Mr. Au-Yeung.

In his budget speech to the Legislative Council on 24 February 1982, Hong Kong's Financial Secretary, Mr. John Bremridge, said that he does not believe that it is generally appropriate for the Government to raise taxation when it does not need the money – either for its immediate expenditure or in order to further strengthen prudent reserves.

Hong Kong's Inland Revenue Ordinance provides for the levying of four separate direct taxes on income arising in or derived from Hong Kong for a year of assessment which ends on 31 March. Based, as it is, on a territorial source of income criterion (limiting the charge to tax on income from Hong Kong only), residence/non-residence is not a factor in the system. By the same token there are no tax incentives (other than the low tax rates charged) for overseas investors wishing to set up business or work here. The taxes levied under the Ordinance are profits tax, salaries tax, property tax and interest tax.

Profits tax is charged on profits arising in or derived from a trade or business carried on in Hong Kong. Profits of unincorporated businesses are taxed at 15% and corporations at 16.5%. Generally, all expenses incurred in the production of assessable profits are deductible, as are charitable donations to the extent of 10% of net assessable profits. There is no withholding tax on dividends paid by corporations and dividends received from corporations are exempt.

Salaries tax is calculated on a sliding scale which varies from 5 to 25% on HK$10,000 (£909.09; US$1,818.18) segments of assessable income, that is, income after the deduction of personal allowances. However, the overall effective rate is limited to a maximum of 15% of income before the deduction of personal allowances. These allowances are: for the taxpayer HK$28,000 (£2,545.45; US$5,090.91); for his wife HK$28,000; for his children a maximum of HK$25,500 (£2,318.18; US$4,636.36) ranging from HK$8,000 (£727.27; US$1,454.54) for the first child to HK$1,000 (£90.9; US$181.82) for the ninth; and HK$8,000 for each of his or his wife's dependent parents.



Apart from the deduction of expenses necessarily incurred in the production of income, and charitable donations up to 10% of taxable income, there are no other allowances.

With the exception of property occupied by an owner for his own residential purposes, vacant premises and property in certain undeveloped parts of the New Territories, property tax is charged at the standard rate of 15% on the net estimated rental value and is levied annually on the owner of land and/or buildings in Hong Kong.

Property owned and used for business purposes by a corporation carrying on business in Hong Kong is exempt from property tax; although if there is any profit derived from the ownership, it is chargeable to profits tax.

Interest tax is charged on Hong Kong dollar time deposits with banks and deposit-taking companies at a flat rate of 10%. Foreign currency deposits placed with licensed banks and registered and licensed deposit-taking companies are exempt from interest tax. Interest (other than interest on foreign currency deposits placed with licensed banks and deposit-taking companies) in the hands of a corporation carrying on business in Hong Kong is chargeable to profits tax because any interest so received is deemed to be part of the profits of the corporation.

"Unlike many other territories, Hong Kong's tax legislation does not charge any sources of earnings and profits

Hong Kong, the tiny British territory on the edge of China, enjoys one of the lowest and simplest forms of taxation in the world. The current standard rate of income tax of 15% has been in force since 1 April 1966.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

which fall outside these four categories", said Mr. Au-Yeung.

Other sources of internal revenue include estate duty, stamp duty, entertainments tax, betting duty, business registration fees and hotel accommodation tax.

In the current financial year, 1 April 1981 to 31 March 1982, it is estimated that internal revenue will account for HK$14,672 million (£1,333.82 million; US$2,667.64 million) or 41.7% of the Government's total revenue.

The largest contribution to the internal revenue pot comes from profits tax which accounts for HK$7,095 million (£645 million; US$1,290 million) or 48.4% of the total internal revenue.

"Our philosophy is not only to keep each and every taxation levy, be it direct or indirect, simple and easy for the taxpayers, but also productive and inexpensive for the Government to administer", said Mr. Au-Yeung.

The Inland Revenue Department is staffed by some 3,300 officers and is divided into 5 operational units, each of which is headed by an assistant commissioner.

The cost of tax collections in Hong Kong is among the lowest in developing and developed countries. It represents something on the order of 1% of total revenue collections, which is very satisfactory.

While conceding that tax evasion exists in Hong Kong, Mr. Au-Yeung said it is a problem from which no country in the world is spared.

"We have had some measure of success in the detection of evasion over the past several years. In 1981, our Investigation Unit completed investigation into 240 cases of tax evasion involving omitted income and profits amounting to HK$£380 million (£34.55 million; US$69.1 million)."

Under present legislation, the maximum penalty for tax evasion is 3 years imprisonment plus a monetary penalty (over and above the basic back tax) of 300% of the total amount of tax evaded.

Mr. Au-Yeung said a number of statutory provisions were first introduced in 1969 which provided the basic background to the expansion of investigation work. These involved the power to require a statement of assets and liabilities and of outgoings and receipts; the power to apply for a search warrant, with the consent of magistrates, to enter premises and seek books and records; the requirement for taxpayers to maintain sufficient records to enable profits to be ascertained and the requirement to retain those records for not less than 7 years.

Preventive measures include the supply of more intormative and illustrative tax returns to taxpayers and publicity on both television and in the printed media reminding taxpayers of their obligation to notify the department of their income.

There has been pressure in recent years for separate taxation for married women. At the present their income is assessed as part of their husbands' earnings. Mr. Au-Yeung reiterated what the Financial Secretary said in his budget speech – that the Government would have another look at the question of separate taxation next year.

"Separate taxation for married women will cost the Government no less than HK$200 million (£18.18 million; US$36.36 million) in lost internal revenue a year.

"Such a proposal, apart from policy considerations, will involve considerable changes in administrative procedures and computer programmes; these will take time to study and evaluate to ensure a smooth and efficient transition if the decision is taken to implement separate assessment."

Mr. Au-Yeung said given the low level of direct taxation, Hong Kong will not introduce a "pay-as-you-earn" collection system in the foreseeable future because of a variety of reasons. "Firstly, the system is rather complicated and expensive to operate. Certainly, it is not as simple as people think it is.

"Secondly, experience elsewhere has shown that there is a real cost for employers, requiring both money and time in keeping costly tax records. This in a way means that the administration of the collection system will be passed on from the Government to the employer.

"Thirdly, it requires a large policing operation to ensure that the tax is correctly deducted and promptly remitted by employers to the Inland Revenue Department. The chance of losing revenue is obviously much greater.

"Lastly, it deprives taxpayers of the opportunity of profitably utilising the money set aside for paying tax before the tax bill arrives. The Tax Reserve Certificate System is far more satisfactory than the pay-as-you-earn system."

In Hong Kong people liable for tax may purchase these certificates which they can present to the Inland Revenue Department when the bill arrives. These certificates carry interest if they are used for payment of tax.

Turning to the future, Mr. Au-Yeung said the philosophy of keeping taxation simple and inexpensive for both the Government and the taxpayer will be closely adhered to. Under the prevailing economic circumstances and conditions of Hong Kong, it is believed that a comparatively low level of taxation contributes significantly to enlarging the size of the trade sector, generally balances economic prosperity and thus increases revenue yields despite high tax thresholds.

There is no perfect world. People falling into the tax net often complain of the tax burden. Almost without exception, Hong Kong taxpayers join the chorus of complaints about heavy taxation, but perhaps they should count their blessings.

ANNEX

Accelerated depreciation allowance to approved energy-saving equipment in non-industrial enterprises
Summary of new tax concessions in the 1982 budget

On 5 March 1982, the Minister for Trade and Industry, Dr. Tony Tan Keng Yam, presented his 1982 Budget to the Parliament of the Republic of Singapore. This is Dr. Tony Tan's first Budget Speech since taking over in June 1981 from Mr. Goh Chock Tong as Minister for Trade and Industry.

Following established practice, Dr. Tony Tan presented his Budget Statement in three parts. In his first part, he reviewed the progress of the economy in 1981 and the economic policy of the Government. The second part dealt with Main and Development Estimates for the financial year 1982. The Revenue Estimates and tax changes were dealt with in the final part of his Budget Statement.

SECTION I

(1) Singapore's economy in 1981

In his review of the progress of Singapore's economy in 1981, the Minister briefly highlighted the performance and said: "As expected, 1981 was a very difficult year for the world economy. Very low or negative growth rates were recorded in the United States, France, West Germany and Great Britain. The number of people without work in Europe and the United States rose to post-war record levels. In the UK, 3 million people, a number greater than the population of Singapore, were without jobs. In the United States, those jobless numbered 9.5 million. Because of the grim economic conditions in these countries, world trade did not grow at all.

In comparison with the depressing economic conditions in the West, the performance of the Singapore economy in 1981 was an enviable one. Our economy grew at just under 10%, only marginally less than in 1980. We are fortunate that the Asia-Pacific region, with its abundant natural resources and political stability, is one of the growth areas in the world today. The North East Asian developing countries of Hong Kong, Taiwan and South Korea and our ASEAN neighbours, continued to register growth rates of 5-10%. Japan, Australia and New Zealand also did relatively better than other industrialised countries."

© 1982 International Bureau of Fiscal Documentation – BULLETIN

At the end of the review, the Minister pointed out that Singapore's good economic performance had only one unsatisfactory aspect, i.e. a stubborn inflation rate. Mainly because of rising food prices, inflation in 1981 did not subside as much as Singapore would like to see. Consumer prices rose by 8.2%, marginally less than in 1980. However, inflation in Singapore was again lower than the inflation in the industrialised countries and that of her neighbouring countries.

(2) Economic policy

The Minister then proceeded to elaborate on specific areas of economic policy, namely, industrial development, research and development, trade development, financial services, computerisation, tourism, manpower development, enercy development and construction.

(a) Industrial development

On industrial development, the Minister said it was progressing well under the 3-year wage correction policy. Investment commitments (excluding petrochemicals) amounted to S$1.9 billion, a new record.

(b) Research and development (R&D)

On research and development, Dr. Tony Tan reported that considerable success had been achieved in the promotion of R&D activities and that several projects, with significant R&D content, by international firms such as Nestle, Olivetti, Varta and Sord Computer were now in the pipeline. Other firms would also bring in major R&D facilities as part of the investment projects. Further progress was expected to be seen in industrial R&D activities in electronics, computer hardware and software, pharmaceuticals, robotics and automation systems and biotechnology.

(c) Trade development

On trade development, the Minister reported that two overseas trade offices were set up in 1981 in Beijing and Rotterdam and that new offices were planned in Europe and West Asia in 1982. Apart from servicing trade enquiries and coordinating trade fairs and missions, the overseas offices were also active in encouraging multinational companies based in this region to organise missions to source manufactured parts, components and other intermediates for their parent companies at home.

(d) Financial services

Dr. Tony Tan reported that in the last decade, Singapore had laid a sound infrastructure for international financial services. In the next 10 years Singapore will have to develop even more sophisticated services for a larger international clientele. Emphasis was being given in particular to the development of the foreign exchange market, both in the depth and breadth of services provided, and to the loan syndicated market.

Dr. Tony Tan disclosed that in 1981, 11 offshore banks, 4 merchant banks and 5 insurers opened offices in Singapore. He remarked that local banks and financial institutions were becoming increasingly aware of the more computitive domestic and international environment and of the need to be more productive.

Announcing that the Automated Cheque Clearing System would start on 1 January 1982 Dr. Tan said, "This is expected to improve productivity as well as provide better services to bank customers. To increase the spectrum of services provided, new services such as a financial futures market and a US Dollar Clearing system will be investigated. At the same time, efforts will be made to upgrade the quality of services provided by the Gold Exchange of Singapore. Floating rate certificates of deposit denominated in Singapore dollars were issued for the first time last year, giving the public another avenue for investing in medium and long-term instruments."

(e) Computerisation

On computerisation, the Minister said further progress had been made in promoting the wider use of computers in Singapore. The National Computer Board officially came into being on 1 September 1981. It would promote computerisation in the civil service, establish and maintain standards of computer training and develop Singapore into a computer software centre.

(f) Tourism

On tourism, the Minister reported that in 1981, 2.83 million visitors came to Singapore, an increase of 10% despite the more difficult economic conditions in the major tourist-generating countries.

(g) Manpower development

On manpower development, the Minister announced that the Skills Development Fund had widened the scope of its financial assistance under various training schemes. He had plans to upgrade the skills of existing workers on a wider scale through the establishment of an Institute of Continuing Occupational Development.

(h) Energy development

The Minister was very pleased to report that there were indications that Singapore's economy was responding well to the call to conserve energy.

The Minister said that in spite of success, Singapore should continue to encourage energy conservation through persuasion, incentives and disincentives.

It was announced in 1981 that the provision of accelerated depreciation in the Income Tax Act would be extended to cover approved energy saving expenditure incurred by non-industrial enterprises. The guidelines for these incentives had been finalised. (See Annex I.)

(i) Construction

Emphasising the need to promote mechanisation in the construction industry, Dr. Tony Tan announced that the Ministry of National Development and the Ministry of Finance had implemented a loan scheme at concessionary rates of interest to finance the purchase of machinery as well as a scheme for according accelerated depreciation allowances for construction machinery.

To give a further push to the pace of mechanisation in the industry, an investment allowance scheme, similar to that currently applicable to certain manufacturing projects, will be made available to the construction industry.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Approved fixed investment in machinery and equipment by construction firms from 1 April 1982 to 31 March 1987 will enjoy an investment allowance of up to 50%.

(j) Concluding remarks on economic policy

In his concluding remarks on economic policy, the Minister conveyed the following message to Singaporeans: "We must pull up our socks if we want to avoid being dragged into the quagmire of economic stagnation. The Government will govern firmly and fairly, steering our economic engine with the policies I have just presented and the Budget and tax changes that follow. Barring a major adverse turn of events, and this caveat bears repeating, because we live in a troubled world where economic disasters have become the rule rather than the exception; if we cooperate and work with the same determination as last year, we may hope to pull through 1982 with a respectable rate of economic growth yet again."

SECTION II

The financial year 1982 Budget

In the second part of the Budget Statement, the Minister elaborated on Main and Development Estimates for the financial year 1982.

The Minister outlined to the Parliament the following objectives of the Budget:

- Increase the supply of skilled technical and professional manpower needed to facilitate the restructuring and upgrading of the economy.
- Step up infrastructural, industrial and commercial development so as to sustain economic growth and economic restructuring.
- Moderate the construction programme to meet the rising demand for housing units.

SECTION III

(1) Revenue

On the revenue estimates, the Minister reported as follows:
"Income tax, as always, is the largest single source of revenue. Income tax collections in FY 1982 are expected to be high because of the economic growth in 1981. The total collection is estimated at S$2,930 million, representing an increase of S$330 million or 12.7% over the revised estimates for FY 1981. Corporate income taxes account for 72% of the total collection."

(2) Tax changes

For the financial year 1982, the Minister did not announce any new taxes or increase in the rates of existing taxes. Instead he introduced the following concessions for individuals and companies:

(i) Tax changes for individuals

(a) Tax on PUB bills

With effect from 1 April 1982, the fixed charges in the PUB bill will not be included for the purpose of computing the 10% tax. These changes are sanitary appliance fee, domestic refuse charge, rental for appliances and night soil removal fee. The tax, therefore, will be imposed on only the total of electricity, gas and water charges, and water-borne fee where these charges exceed S$80. The tax will remain at 10% of the amount in excess of S$80.

(b) Contributions to Central Provident Fund (CPF) and approved pension and provident funds

With effect from Year of Assessment 1983, all statutory CPF contributions and contributions to designated approved pension and provident funds will be fully tax deductible. Where such contributions exceed S$5,000, no deductions will be allowed for life insurance premiums and other voluntary contributions to superannuation schemes. Where the statutory contributions do not exceed S$5,000, the maximum amount deductible for all contributions to CPF and approved pension and provident funds and life insurance premiums will be S$5,000.

(c) Aged dependant relief

The Minister said he intended to make two revisions to the aged dependant relief. A taxpayer can currently claim a relief of S$750 for each aged parent or grandparent living with him, subject to a maximum of two. For the relief to be allowed, one of the conditions is that the aged dependant must not have an income of more than S$750 in the year.

With effect from Year of Assessment 1983, the relief will be raised to S$1,000 per aged dependent. As a further relaxation of the conditions for eligibility of the relief, the relief will be allowed so long as the dependant has income no greater than S$1,500 in the year.

(d) Estate duty

On estate duty the Minister said, "On 1 January 1981 the specific exemption for residential properties was raised from S$200,000 to S$600,000. The exemption limit for assets other than residential properties remained at S$100,000.

"As a further concession to promote home ownership, the exemption limit for residential properties will be extended to include the *full* value of any one residential property. In other words, the exemption limit will be S$600,000 or the full value of any one residential property, whichever is the higher.

"In line with income tax deductibility of CPF contributions, exemption will be given on *all* CPF balances of the estate with the Fund. It will not include amounts withdrawn by the deceased during his lifetime under the approved schemes and not refunded to the CPF. Where the CPF balance exceeds S$100,000 no further exemption will be given for other assets, except for those qualifying for the exemption on residential properties. Where the CPF balance does not exceed S$100,000, the exemption limit of S$100,000 for assets other than residential prop-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

erties will apply to all such assets, including the CPF balance.

"This concession will also apply to all approved provident funds which were *in lieu* of CPF.

"To encourage offshore gold transactions as well as to further develop the gold market, gold deposits with bullion companies held by foreigners, who are neither resident nor domiciled in Singapore, will not be liable to estate duty."

The above concessions will take effect from 1 April 1982.

(ii) Tax changes for companies

(a) Stamp duty

Stamp duty on ACU offshore loan agreements was abolished on 1 April 1980. However, loan agreements which were signed outside Singapore will still be subject to ad valorem stamp duty up to a maximum of S$500 when repatriated to Singapore. As a modest concession towards facilitating loan syndication activities in Singapore, the Minister had agreed to allow ACU offshore loan agreements which were signed prior to 1 April 1980 to be repatriated to Singapore without being liable to stamp duty as from *1 April 1982.*

(b) Road tax on SBS and CSS buses

Irrespective of the size or engine capacity of the bus, road tax will be rationalised with effect from 1 April 1982.

(c) Capital allowances for company registered cars

Under the current Income Tax legislation, capital allowances can be claimed on company registered cars. The ceiling of the capital allowances was last raised from S$15,000 to S$25,000 on 1 April 1979. The Minister has decided to increase this ceiling further to S$35,000 to bring it more in line with present prices of cars, with effect from 1 April 1982.

(d) Financial leasing

Various representations had been made by leasing companies and financial institutions for liberalisation of the present tax laws in order to promote financial leasing in Singapore. One of the proposals was that the residual value of the end of the lease period should be nominal or of a minimum acceptable value. The basic tax principle has always been adopted by the Tax Department that if an asset is disposed of, it must be or so deemed to be sold at the open market price.

The Minister has now agreed with the recommendation of the Tax Department to adopt the basis of open market price of determination of the residual value at the end of the lease period.

A balancing charge will be imposed if the open market price is higher than the written-down value at the time of disposal. If the open market price is lower than the written-down value, then a balancing allowance will be given.

The Minister emphasised, "It is important that a distinction should be made between a sale agreement and a lease agreement. For tax purposes, an agreement will not be considered as a genuine lease agreement if it provides for any of the following:

(i) The lessee is given an option to purchase the asset during the lease period or at its expiry;
(ii) Where there is no option to purchase, the lessee during the lease term or upon its expiry acquires the asset at below open market price;
(iii) The rental payments during the initial lease term constitute almost all or at least 90% of the acquisition cost and incidental expenses.
Additionally, either the lease term is shorter than the useful life of the leased asset, or the leased asset is not marketable and is a special purpose property, and the lessor has no intention to recover the asset;
(iv) The original lease agreement provides for extension or renewal of the agreement at less than 15% of the rental in the primary lease agreement; and
(v) The periodic lease payments are uneven and/or exceed the current fair rental value.

"Transactions involving members of a group or related persons which are primarily motivated by tax manipulations will not be treated as genuine lease agreements. However, transactions which are done at arm's length are acceptable. A transaction is not considered to be at arm's length if a member of the lessee group lends to the lessor funds for the acquisition of the asset or guarantees any debt of the lessor incurred in connection with the lease. A transaction will also be disqualified if the leasing company is specially incorporated for the purpose of leasing the assets to the related companies. It is deemed to be so incorporated if, for any of its financial years, the value of its contracts entered with independent persons constitutes less than 50% of the total value of its contracts for that year.

"Sale and lease-back transactions are generally not accepted as genuine lease agreements. They are treated as loans rather than lease agreements. However, the Tax Department will accept sale and lease-back transactions as genuine lease transactions if the equipment is sold to the lessor before it is put to use in the lessee's trade and the sale is made at not more than the acquisition price which the lessee pays to the supplier. The lessee must also not be given capital allowances for the equipment before its sale to the lessor.

"Leveraged leases will be treated on an individual basis, upon application to the Tax Department.

"The Tax Department will give accelerated depreciation to the lessor on equipment leased to a lessee who would be eligible for the accelerate depreciation allowances if the equipment is subsequently leased to another lessee who is also eligible for such allowances. Otherwise the depreciated value of the equipment will be written off on a straight line basis over the remaining statutory life of the equipment. However, the terminal payment paid by the lessee to the lessor as compensation for terminating the lease will be subject to tax."

(3) Pensions

On pensions, the Minister announced, "From 1 April 1982, the Singapore Allowance which will replace the present New Singapore Allowance will be paid to all locally domiciled Government pensioners whose gross pensions (i.e. pensions plus New Singapore allowance) are less than S$850 a month.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

"Those who are drawing pensions, excluding the current new Singapore Allowance, of S$775 per month or less will be paid a Singapore Allowance at the flat rate of S$75 per month. Those drawing pensions of more than S$775 per month but less than S$850 per month will be paid the Allowance on a reducing scale such that the pension plus the Singapore Allowance equals S$850 per month."

(4) Conclusion

In concluding his Budget Statement the Minister said, "This Budget reflects our economy which is on an even steady keel. I have deliberately not introduced any new taxes or raised the rates of existing taxes in order not to increase the tax burden. However, I hope that Singaporeans will not look on this Budget as an occasion for rejoicing but rather as a respite to enable them to consolidate and improve their position.

"To perform better we must upgrade our present skills and seek to acquire new ones. There is no other way and we must not be deflected from this task. We have to work as a team in our homes, in our work places, in our community and as a nation. Other than a favourable location, we have no natural resources. It is only by working harder than others that we can make a future for ourselves and our children.

"In the process of assimilating new technology and modern management methods, we must not forget the traditional values which have served as the bed-rock of our society. We must not abdicate our moral duty to look after those wo are weak, old and infirm. Children must not forsake their parents and grandparents. The aged and the weak need more than material care; they have emotional and spiritual needs which only their children and their family can provide. It is the responsibility of the young to look after the aged. After all, the success of children in later life is built on the sweat and toil of their parents. Children therefore owe it to their parents to enable them to live out the autumn of their lives not only with pride and dignity, but also surrounded by affection and care.

"1982 will be a grim year. The problems of unemployment and protectionism in the industrialised countries will not abate. Indeed we will be lucky if these problems do not escalate. Singapore will, before very long, be buffeted by the turbulence of the international economic storm. We can go under, or we can resolve to ride out the storm. To do this we must keep trim and be prepared to lend each other a hand when the need arises. Then, when the storm subsides we shall surge forward again."

COMMENTARY ON THE 1982 BUDGET

(1) Man in the street

Some Singaporeans feel that the 1982 Budget is reasonable as it caters for both high and low income earners. It shows trends in the right direction especially where helping the poor and the aged is concerned.

However, some feel that the pensioners should get a little more increase in the Singapore Allowance and there should be some increases in personal reliefs such as reliefs for maintaining wife and children and further increases in reliefs for dependants.

Most people welcome the Budget as it has not introduced any new taxes or increases in the rates of taxes. While rejoicing over the tax concessions, some feel that these are on the small and simple things and accordingly they have only marginally impact.

(2) Leaders in commerce and industry

While welcoming the Budget, some leaders in commerce and industry are of the view that more incentives could have been given in the industrial and commercial sectors. In view of the gloomy economic scenario in 1982, more liberal concessions should have been incorporated.

Financial leasing companies express some satisfaction over the liberalisation of tax law to help promote the financial leasing business in Singapore. They are very pleased over the accelerated depreciation concession to be granted on equipment leased to lessees.

Bankers are disappointed that the Minister did not react to Hong Kong's decision to abolish taxes on all foreign currency deposits. They think this will undermine Singapore's competitive position.

Bullion companies do not react very positively to the tax concession that a foreigner's gold deposits will not be liable to estate duty, as they feel such concessions will not have an immediate effect on the daily turnover of the Gold Exchange of Singapore.

Other leaders in commerce and industry feel that the waiver of the stamp duty on ACU offshore loan agreements is but a modest concession. It is unlikely to have any major impact on Singapore's effort to be competitive with other financial centres in the region.

While welcoming the tax changes in relation to ACUs and leasing, some businessmen are surprised that there are no new or additional measures to boost the economy in view of the difficult times ahead. They are disappointed over the following:

(a) no reduction in the 40% corporate tax; and
(b) no reduction in the 2% payroll tax.

On the whole, most people regard the Budget as an acceptable one although they expect the Minister to grant more tax incentives or concessions.

ANNEX

Accelerated depreciation allowance to approved energy-saving equipment in non-industrial enterprises

Accelerated depreciation allowance will be granted to non-industrial enterprises for capital expenditure on two categories of energy equipment:

(A) Replacements for machines and equipment which consume large amounts of energy. The objective is to encourage enterprises to undertake more frequent changes of major energy utilising machines in order that old and energy wasteful machines could be re-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

placed by new energy efficient machines. The incentive is aimed at the major and not the minor energy utilising machines.

(B) Specialised energy-saving equipment and devices which reduce the usage of energy. The objective is to induce enterprises to invest in these specialised energy-saving equipment and devices.

The non-industrial enterprises that can qualify for this accelerated depreciation allowance are as follows:

(a) Hotels
(b) Restaurants
(c) Commercial buildings
(d) Shopping complexes
(e) Hospital buildings
(f) Apartment buildings
(g) Recreation centres
(h) Theatres/cinemas

This list may be modified or updated from time to time.

Under this scheme, the accelerated depreciation allowance will be for a period of three years at an annual rate of 33⅓% in respect of the capital expenditure approved.

Category A

Criteria for Granting Accelerated Depreciation Allowance to Replacement Machines and Equipment

(1) The machine or equipment will have to be in the List of Approved Replacement Machines and Equipment.
(2) A professional engineer will have to certify that energy will be saved by installing the replacement machine or equipment.

List of Approved Replacement Machines and Equipment

(i) Central air-conditioning system excluding ducts and pipes
(ii) Boilers
(iii) Water pumping systems
(iv) Washing/dry-cleaning machine systems
(v) Refrigeration systems
(vi) Lifts and escalators

This list may be modified or updated from time to time.

Category B

Criteria for Granting Accelerated Depreciation Allowance to Energy Saving Equipment and Devices

The equipment or device must be on the List of Approved Energy Saving Equipment and Devices.

List of Approved Energy Saving Equipment and Devices

(i) Solar heating and cooling systems
(ii) Solar energy collection systems
(iii) Heat recovery system
(iv) Power factor controllers
(v) Energy saving devices of approved types

This list may be modified or updated from time to time.

Summary of new tax concessions in the 1982 Budget

For ease of reference, below is a brief summary of new tax concessions announced in the 1982 Budget:

(A) Individuals

1. Lower PUB bills

Fixed charges in PUB bills, such as sanitary appliance fee, domestic refuse charge, rental for appliances and night soil removal fee, will no longer be included in the computation of the 10% tax.

2. No ceiling on CPF exemption

The S$5,000 tax exemption ceiling on CPF contributions will be removed. With effect from the 1983 year of assessment, all statutory CPF contributions and contributions to designated approved pension and provident funds will be fully tax deductible.

3. More relief for aged

The relief in respect of aged dependants will be raised from S$750 to S$1,000, allowable as long as each dependant has an income of no more than S$1,500 in the year.

4. Estate duty

(a) *Home ownership boost*
To promote home ownership, the estate duty exemption limit for one residential property will be raised from the present S$600,000 to the full value of that property and total estate duty exemption will be given on CPF balances.

(b) *Gold deposits*
Gold deposits with bullion companies held by foreigners, who are neither resident nor domiciled in Singapore, will not be liable to estate duty.

(B) Companies

1. Stamp duty

Stamp duty on ACU offshore loan agreements will be abolished with effect from 1 April 1980.

2. Road tax on buses

Road tax on buses irrespective of the size or engine capacity will be harmonised with effect from 1 April 1982.

3. Capital allowances

The ceiling of capital allowances on company registered cars will be raised from S$25,000 to S$35,000 with effect from 1 April 1982.

4. Liberalising of tax laws for leasing industry

Accelerated depreciation will be grated to the lessor on equipment leased to a lessee.

(C) Pensioners

Allowances to government pensioners now receiving gross pensions of less than S$850 a month will be raised.

(D) Non-industrial users of energy

Non-industrial users of energy will now be given accelerated depreciation allowances over 3 years for approved energy saving equipment. Hotels, restaurants, shopping complexes are among those who will qualify.

Tax Relief for Americans Abroad
~ An Overview ~

by Piroska E. Soos*

I. INTRODUCTION AND BACKGROUND

The general rule that United States citizens, regardless of residence, are subject to U.S. tax on their world-wide income could result in a substantial tax burden on those Americans who work abroad and are subject to foreign taxes. For many years, double taxation of such Americans has been at least partially avoided by providing tax relief in the form of exclusions, deductions or credits. Depending on the legislation in effect for a particular year, an individual could benefit simultaneously from more than one kind of relief, or he had to make an election.

The foreign earned income exclusion was first enacted in 1926 despite the objection that it was unnecessary because of the foreign tax credit available to expatriates, and after initial efforts to change or repeal it, the exclusion remained unmodified and unchallenged for several years.[1] The exclusion was designed to encourage Americans to engage in employment and other business activities abroad, and it was hoped that a greater U.S. presence abroad would increase U.S. exports.[2] As originally enacted, the exclusion was not intended to be a vehicle for reconciling the relative tax burdens of domestic and overseas taxpayers.[3]

At the time of its enactment, the exclusion was unlimited in amount and could be used by any U.S. citizen who had resided in a foreign country for six months or more.[4] The exclusion (based on residence) remained unlimited until 1962, and the changes made between 1926 and 1962 related to the eligibility requirements. In 1942, the six-month requirement was replaced by a bona fide residence test (see Section II), and in 1951, the exclusion was extended to U.S. citizens who did not satisfy the bona fide residence test but who were physically present in the foreign country for 17 out of 18 consecutive months. The reason for this change was to place U.S. citizens working abroad in an equal position with citizens of other countries going abroad who were not taxed by their own countries.[5] However, in 1953, because of abuses, a $20,000 per year limitation was placed on the exclusion for those who claimed it on the basis of the physical presence test.[6]

In 1962, the exclusion for bona fide residents was limited to $20,000 per year and to $35,000 per year for those who had been bona fide residents of a foreign country for at least three uninterrupted years. In 1964, the $35,000 exclusion was reduced to $25,000 per year.[7] At the time that these limits were set, they were high enough so that, for most individuals, all of their income (including allowances) fell within the exclusion.[8]

In addition to the exclusion, Americans abroad benefitted from two other rules. First, they could take the exclusion "from the top" of their gross income (not "exclusion with progression")[9] so that lower marginal rates applied to the income not exempt from U.S. tax. Secondly, foreign taxes paid on the excluded income were creditable against U.S. tax on any foreign income in excess of the exclusion.[10] Both of these rules have undergone changes since the Tax Reform Act of 1976.

Sweeping changes in the rules for the taxation of expatriates were made in 1976 and 1978, and the issue of an exclusion for expatriates was very controversial. The debates were intense, and the arguments for or against the exclusion, or tax relief in gerneral, were not always enlightening. For example, one U.S. Senator characterized U.S. citizens abroad as "mink-swathed Americans" who "spend their waking hours in gambling casinos in Monte Carlo" and as "high-living jetsetters living at the taxpayers' expense".[11]

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Another opponent of tax relief for expatriates wrote that the "fact that expatriates who lobby for reduced taxation are always the best-dressed and only tanned people in the room may prejudice me".[12] It was also suggested that Americans abroad be required to pay the cost of maintaining consulates abroad; one response to this questioned the fairness of expatriates paying for consular officials whose preferred role is that of oppressors of overseas Americans.[13]

The Tax Reform Act of 1976[14] made substantial changes in the foreign earned income exclusion and in other aspects of expatriate taxation. The exclusion was reduced to $15,000 per year, although a $20,000 per year exclusion was permitted for employees of certain qualifying U.S. charitable organizations. In addition, foreign income taxes attributable to the excluded income were no longer eligible as a credit against U.S. tax. Finally, the 1976 Act introduced a rule that required that the exclusion come "off the bottom" ("exclusion with progression") of the taxpayer's gross income so that the top part was taxed at the marginal rate that would apply had there been no exclusion.[15]

As a result of angry protests by U.S. citizens working abroad, the effective date of the 1976 amendments was postponed until 1 January 1977, and later, it was postponed again until 1978 because of the inability of Members of Congress to reach agreement on the changes regarding the exclusion.[16] As a result of these postponements, the amendments made by the 1976 Act never went into general effect, although taxpayers could, for 1978, elect to be taxed under the provisions of either the 1976 Act or the Foreign Earned Income Act of 1978.[17]

This article will discuss the provisions of the Foreign Earned Income Act of 1978 and other provisions applicable to expatriates[18] just before the 1981 changes, which are effective for taxable years beginning after 31 December 1981. This article will also discuss the reasons for the 1981 changes and consider the revenue and other effects anticipated as a result of the new rules.

It should be noted that this discussion is limited to the provisions unilaterally provided by the U.S. and does not consider the numerous double taxation treaties, to which the U.S. is a party, that could affect a taxpayer's liability for either U.S. tax or foreign tax. It should further be noted, however, that U.S. citizens often do not benefit from treaties signed by the U.S. since many treaties contain a "savings clause" in which the U.S. reserves the right to tax its citizens and residents on the basis of all items of income taxable under its own revenue laws as though the treaty did not exist.[19]

II. THE FOREIGN EARNED INCOME EXCLUSION

A. Before the Economic Recovery Tax Act of 1981

The Foreign Earned Income Act of 1978 ("1978 Act")[20] virtually abolished the exclusion for most Americans working abroad and replaced it with a deduction for excess foreign living costs (see Section III). The 1978 Act did, however, retain a $20,000 annual exclusion for a small group of individuals, namely, those who resided in a camp located in a hardship area or who performed qualified charitable services in a lesser developed country.[21] Such individuals could elect the exclusion if they satisfied either the bona fide residence or physical presence test. If they satisfied either test for only part of the tax year, the $20,000 limit had to be prorated based on the number of days that the person satisfied the test relied upon. Individuals who elected the exclusion were not allowed the deduction for excess foreign living costs or the foreign tax credit (or deduction) for the taxes paid or accrued with regard to the excluded amount.[22]

For purposes of the exclusion, "camp" meant substandard housing which was (a) provided by or on behalf of the employer for the convenience of the employer because the place at which the individual rendered services was in a remote area where satisfactory housing was not available on the open market, (b) located, as near as practicable, in the vicinity of the place at which such an individual rendered services, and (c) furnished in a common area, or enclave, which was not available to the public and which normally accommodated 10 or more employees.[23] A hardship area meant any foreign place designated by the U.S. Secretary of State as a hardship post where extraordinarily difficult living conditions, notably unhealthful conditions, or excessive physical hardships existed, and for which a post differential of 15% or more would be provided to U.S. government employees.[24] The 1978 Act also defined "lesser developed countries" and "qualified charitable services".[25]

The hardship area camp exclusion was designed to alleviate some of the problems of American construction companies operating overseas. However, because of the restrictive definition of "camp", the exclusion had a very narrow application.[26] Independent contractors or self-employed persons could not qualify for the exclusion since the "camp" had to be provided by the employer.

An individual satisfied the bona fide residence test if he established to the satisfaction of the tax authorities that he had been a bona fide resident of a foreign country (or countries) for an uninterrupted period which included an entire taxable year.[27] Only a U.S. citizen could claim the exclusion on the basis of the bona fide residence test. Determination of bona fide residence was to be made by applying the principles of I.R.C., Section 871 (tax on non-resident alien individuals) and the regulations thereunder.[28] I.R.C., Regulation 1.871-2(b) defines "residence" as

> An alien actually present in the United States who is not a mere transient or sojourner is a resident of the United States for purposes of the income tax. Whether he is a transient is determined by his intentions with regard to the length and nature of his stay. A mere floating intention, indefinite as to time, to return to another country is not sufficient to constitute him a transient. If he lives in the United States and has no definite intention as to his stay, he is a resident. One who comes to the United States for a definite purpose which in its nature may be promptly accomplished is a transient; but, if his purpose is of such a nature that an extended stay may be necessary for its accomplishment, and to that end the alien makes his home temporarily in the United States, he becomes a resident, though it may be his intention at all times to return to his domicile abroad when the purpose for which he came has been consummated or abandoned. An alien whose stay in the United States is limited to a definite period by the immigration laws is not a resident of the United States within the meaning of this section, in the absence of exceptional circumstances.

The bona fide residence test was not satisfied if the individual gave a statement to the foreign authorities that he was not a resident of that country for purposes of the income tax of that country and he was held not subject, as a resident of that foreign country, to the income tax imposed by that country.[29] In Revenue Ruling 78-254,[30] the U.S. Internal Revenue Service ("I.R.S.") considered whether the taxpayers had made a "disqualifying" statement by filing non-resident tax returns in Belgium. The I.R.S. concluded that they had not, since the taxpayers had not made statements to the Belgian authorities that they were not "residents" of Belgium, as that term is defined for U.S. tax purposes.

The physical presence test could be used by both U.S. citizens and non-U.S. citizens to qualify for the exclusion, and the test required an individual to be present in a foreign country (or countries) for 510 days (approximately 17 months) out of a period of 18 consecutive months.[31] This test was objective and did not consider factors such as the kind of residence established, the nature and purpose of the individual's stay, or his intentions about returning to the foreign country. The test was concerned only with how long an individual was in one or more foreign countries. However, the requirement of 510 days within an 18 month period was unconditional (except as indicated below). An individual fell short of the requirement even if he was forced to leave the foreign country before satisfying the text because of illness or because he was ordered to leave.

As an exception, the 1978 Act permitted waiver of the bona fide residence test or physical presence test if three conditions were satisfied: (1) the individual was actually present in, or a bona fide resident of, a foreign country, (2) he left the country after 31 August 1978 during a period with respect to which the Treasury Department determined that individuals were required to leave the foreign country because of war, civil unrest, or similar adverse conditions in the foreign country which precluded the normal conduct of business by those individuals, and (3) the individual established to the satisfaction of the tax authorities that he reasonably could have expected to meet the time limitation requirements, but for the war, civil unrest, or similar adverse conditions.[32] If these criteria were met, the taxpayer was considered as having satisfied the bona fide residence test or physical presence test for the time that he was resident or present in the foreign country, and the exclusion was computed accordingly.

The exclusion was limited to the individual's "foreign earned income" derived during the time that satisfied either the bona fide residence test or the physical presence test.[33] For purposes of both the exclusion and the deduction for excess foreign living costs (see Section III), "earned income" meant wages, salaries, professional fees and other amounts received for personal services rendered,[34] and was considered received in the year in which the services were rendered.[35]

"Earned income" did not include amounts received as a pension or annuity[36] or that part of an individual's compensation for personal services rendered to a corporation which represented a distribution of profits rather than a reasonable allowance for compensation for the personal services actually rendered.[37] If an individual was engaged in a business (other than in corporate form) in which both personal services and capital were income-producing factors, "earned income" meant a reasonable allowance (not in excess of 30% of the individual's share of net profits) as compensation for the personal services rendered by the individual.[38]

For individuals who elected the exclusion, the hardship area camp was considered to be part of employer's business premises.[39] This meant that the individual could also exclude from gross income the value of employer provided meals and lodging under I.R.C., Section 119 (meals or lodging furnished for the convenience of the

employer) if the other requirements of Section 119 were satisfied.[40]

B. Exclusions under the Economic Recovery Tax Act of 1981

The Economic Recovery Tax Act of 1981 ("1981 Act")[41] dramatically changed the exclusions available to Americans working abroad. The 1981 Act abolished the exclusions under the 1978 Act and established a new exclusion for foreign earned income. The 1981 Act also provided, on top of the foreign earned income exclusion, an exclusion for the "housing cost amount". For 1982, the maximum annual foreign earned income exclusion is $75,000 and this amount is increased by $5,000 per year until 1986, when the maximum annual exclusion will be $95,000.[42] The dollar limit was placed on the exclusion in order to prevent abuse by highly paid entertainers or athletes who might otherwise move abroad to avoid U.S. tax on their income.[43] The earned income exclusion is computed on a daily basis for each day within the period of bona fide residence or physical presence in the foreign country and in case of a married couple, the exclusion is computed separately for each qualifying individual.[44] Significantly, the 1981 Act does not contain an "exclusion with progression" rule, so that the U.S. tax on non-excluded income is computed from the bottom of the U.S. rate scale.[45]

The exclusions are available on an optional basis, and an individual may elect either or both of them. The election may be made by individuals whose "tax home" is in a foreign country and who satisfy either the bona fide residence test or physical presence test.[46] "Tax home" is the individual's regular or principal place of business, employment, or post of duty regardless of where he has his residence; if the individual does not have a regular or principal place of business, his tax home is the place in which he regularly lives.[47] An individual is not considered to have a tax home in a foreign country for any period for which his abode is in the U.S.[48] Thus, an individual who lives in the U.S. but commutes daily to work in Canada has his tax home in the U.S.

The bona fide residence test is the same as it was under prior law and may be used only by U.S. citizens. The requirements for the physical presence test have been relaxed: an individual satisfies the test if he is physically present in one or more foreign countries for at least 330 days in a period of 12 consecutive months.[49] These tests may be waived, and the conditions for waiver are the same as under the 1978 Act.[50]

Other features of the prior law remained unchanged. The definition of "earned income" is the same as before,[51] and the income is taken into account in the taxable year in which the services to which the amounts are attributable are performed.[52] As under prior legislation, "double benefits" are denied: no deduction, exclusion from gross income or credit against tax (including the credit for foreign taxes) is allowed to the extent that the deduction, exclusion or credit is properly allocable to or chargeable against amounts excluded pursuant to the foreign earned income or housing exclusions.[53]

The housing exclusion permits an individual to exclude from gross income his "housing cost amount" which is equal to the excess of his "housing expenses" over the "base housing amount,"[54] and a qualifying individual may elect the housing exclusion whether or not he elects the foreign earned income exclusion. The housing exclusion applies to amounts "paid or incurred on behalf of the individual by the individual's employer which is foreign earned income included in the individual's gross income for the taxable year".[55] Individuals whose housing expenses are not "employer provided amounts" may take a deduction for their "housing cost amount". See Section III.B.

"Housing expenses" have the same definition as under the 1978 Act and include reasonable expenses (not lavish or extravagant under the circumstances) attributable to housing, such as rent, utilities, real and personal property insurance, local telephone charges, furniture rental, and parking fees.[56] "Housing expenses" do not include amounts deductible as interest or taxes, the cost of a home purchase, improvements or furniture purchases, domestic labor, principal mortgage payments or depreciation.[57] The "base housing amount" is 16% of the salary of a U.S. employee whose salary grade is step 1 of GS-14. Since that salary is currently $39,689 per year, the "base housing" amount is $6,350 per year.[58]

If an expatriate maintains more than one foreign household, only the one closest to his tax home is eligible for the housing exclusion. As an exception, the housing expenses of a second foreign household are also excludable if the individual's spouse and dependents live at the second household because of dangerous, unhealthful or otherwise adverse living conditions at the individual's residence.[59]

If an individual elects both the foreign earned income exclusion and the housing exclusion, the total amount of the two exclusions may not exceed the individual's

---

40. The other requirements for exclusion under Section 119 are that (1) the meals and lodging be provided for the employer's convenience, and (2) lodging be accepted by the taxpayer as a condition of his employment.

foreign earned income for the year.[60] For example, if an individual has, for 1982, a salary of $68,000 and the value of the employer provided housing is $10,000 for the year, his total earned income is $78,000 and his housing exclusion is $3,650 ($10,000 less $6,350). The first $75,000 of earned income may be excluded under the earned income exclusion, but only $3,000 of the housing exclusion may be used since the maximum exclusion is $78,000. If the individual's salary in this example were $70,000 per year, his total earned income would be $80,000. He would exclude $78,650 ($75,000 earned income exclusion plus $3,650 housing exclusion).

Once an individual elects the earned income exclusion or the housing exclusion, the election remains in effect for that year and all future years. Either election may be revoked with or without the consent of the I.R.S. However, if the election is revoked without such consent, the individual may not make another election until the sixth taxable year following the taxable year for which the revocation was made.[61]

The 1981 Act retained the rule that, for an individual who is furnished lodging in a camp located in a foreign country by his employer, the camp is considered to be part of the employer's business premises. The definition of "qualifying" camp was relaxed: it is no longer required that the camp be in a hardship area or that it constitute substandard lodging. Although the 1981 Act abolished the hardship area camp exclusion, this provision is important because it may enable individuals to exclude from gross income the value of employer provided meals and lodging under I.R.C., Section 119.

III. DEDUCTIONS FOR FOREIGN EXPENSES

A. Deductions under the 1978 Act

The 1978 Act replaced the exclusion available under prior legislation with a deduction from gross income for excess foreign living costs. The deduction was available to individuals who satisfied either the bona fide residence test or the physical presence test. The tests could be waived under certain circumstances (see Section II).

The maximum allowable deduction was the individual's "net foreign-source earned income", which was defined as the individual's earned income from sources outside the U.S. for that part of the taxable year in which his tax home was in a foreign country, reduced by (1) any foreign-source earned income which was excluded from gross income under I.R.C., Section 119 and (2) deductions (except for the deduction for excess foreign living costs) properly allocable to or chargeable against the foreign-source earned income for the part of the year during which the individual's tax home was in a foreign country.[62] This limitation precluded an individual from using his excess foreign living expenses to reduce taxable income from domestic sources or passive income from foreign sources. For purposes of the excess foreign living cost deduction, "tax home" had the same definition as it has for purposes of the exclusion under the 1981 Act.

For qualifying individuals, the deduction consisted of five separate items: (1) cost of living differential, (2) housing expenses, (3) schooling expenses, (4) home leave travel and (5) hardship area amount.[63] The cost of living differential was generally the amount by which the cost of living in the individual's foreign tax home exceeded the cost of living in the highest cost metropolitan area in the continental U.S., other than Alaska. The I.R.S. prepared tables for individuals to use to compute their cost of living differential, which was to be determined on a daily basis for the period during which the individual's tax home was in a foreign country. If an individual had more than one foreign tax home during the taxable year, he had to compute a separate cost of living differential for each foreign country.[64] An individual could not claim a cost of living differential for any day that the value of his meals and lodging were excluded from gross income under I.R.C., Section 119.[65]

Housing expenses were the excess of the individual's reasonable housing costs (see Section II.B.) over the "base housing amount" which was generally one-sixth of his net earned income.[66] The expenses to be taken into account were only those attributable to housing during periods for which the individual's tax home was in a foreign country and the value of his housing was not excluded under I.R.C., Section 119. Housing expenses also included the expenses for a qualified second household (for an individual's spouse or dependents) if the individual's tax home was in a hardship area camp or if the living conditions at his tax home were adverse. However, special rules applied for the computation of the deduction for excess living costs, including housing expenses, if the individual had a qualified second household.[67]

Schooling expenses consisted of the expenses incurred for the education of the taxpayer's dependents at elementary and secondary levels (equivalent to education from kindergarten through the 12th grade in a U.S.-type school). Expenses included the cost of tuition, books and local transportation; expenses also included the cost of room, board and travel if an adequate U.S.-type school[68] was not available within a reasonable commuting distance of the individual's tax home. Schooling expenses were deductible only if they were attributable to education for a period during which the individual's tax home was in a foreign country.[69]

The home leave travel expense included the cost of one round trip for the individual, his spouse, and dependents from his tax home outside the U.S. to his principal domestic residence. Only one round trip per person for each continuous period of 12 months for which the indi-

65. I.R.C., Section 913(d)(1)(E).
66. *General Explanation*, at 43. The method for calculating the "base housing amount" is set forth in I.R.C., Section 913(d).
67. See I.R.C., Section 913(i) and I.R.C., Regulations 1.913-5(e), 1.913-6(d), 1.913-7(f).
68. I.R.C., Regulation 1.913-7(e) provides that a U.S.-type is a school which offers a curriculum which is taught in English, is comparable to that offered by accredited schools in the U.S., and would qualify the student for graduation if he were to transfer to a U.S. school.
69. I.R.C., Section 913(f).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

vidual's tax home was in a foreign country could be deducted.[70]

The hardship area deduction was $5,000 per year and available to those who lived in a hardship area (see Section II.A.). The amount available as a deduction was to be computed on a daily basis for each day that the individual's tax home was in a hardship area.[71]

An individual who claimed the deduction for excess foreign living costs could also claim the foreign tax credit (see Section IV). However, an individual could not claim the deduction if he elected the exclusion for income earned in a hardship area camp or from qualified charitable services or if his spouse claimed the exclusion, unless the spouse maintained a separate abode which was not within a reasonable commuting distance from the taxpayer's abode.[72]

B. Deductions under the 1981 Act

The 1981 Act repealed the excess foreign living cost deduction, and as a result, there are only two deductions specifically for Americans working abroad. However, Americans abroad may claim any deduction that is generally allowed to resident taxpayers, such as deductions for medical expenses, charitable contributions, and personal exemptions.

An expatriate may elect the housing deduction, introduced by the 1981 Act, which may be used for housing costs which are not attributable to employer provided amounts. The deduction is limited to the excess of the individual's foreign earned income for the taxable year over the amount excluded under the foreign earned income exclusion. There is a one year carryover (to the succeeding tax year) of housing costs not allowed as a deduction because of this limitation.[73]

The second deduction for Americans working abroad is the deduction for foreign taxes paid or accrued. With regard to some kinds of taxes, an individual may elect between a credit or deduction (see Section IV). However, some foreign taxes, such as foreign real property taxes,[74] do not qualify for the credit and may be taken only as a deduction.

IV. CREDIT FOR FOREIGN TAXES

The 1981 Act did not make any changes in the rules applicable to the credit for foreign taxes available to Americans working abroad. Nonetheless, the primary features of the credit will be briefly discussed because the credit is an important tool for reducing the tax burden of expatriates. The credit, which was first enacted in 1918,[75] is available whether or not the individual satisfies the bona fide residence test or physical presence test. In addition, the credit may be used in conjunction with the exclusions or deductions to the extent that the rule against "double benefits" is not violated.

The individual may choose between a credit or deduction for "income, war profits and excess profits" taxes[76] paid or accrued to a foreign country, or taxes paid or accrued in lieu thereof.[77] If the individual elects the credit, he must do so with all "qualifying" taxes; he may not use part of them as a credit and the balance as a deduction.[78] Taxes that do not qualify for the credit may be taken as a deduction. Some taxes, such as the value added tax, qualify for neither the credit nor the deduction.[79]

There is a limit to the amount of the foreign tax credit. It may not exceed the same proportion of the U.S. tax (against which the credit is taken) that the individual's taxable income from foreign sources (but not in excess of the individual's total taxable income) bears to his entire taxable income for the same year. In other words, the credit may not exceed the following fraction:

$$\text{Maximum credit} = \frac{\text{foreign taxable income}}{\text{total taxable income}} \times \text{U.S. tax liability.}$$

For purposes of this computation, "foreign taxable income" means the total foreign-source income reduced by deductions directly attributable to such income, as employee business expenses or (under the 1978 Act) the excess foreign living costs deduction.[80] This amount is further reduced by a portion of other deductions that are not directly attributable to foreign-source income, such as medical expenses and the standard deductrion (now called "zero bracket amount"). The total amount of these "indirect" deductions is multiplied by a fraction, the numerator of which is the total foreign-source income and the denominator of which is gross income from all sources. This amount is subtracted from foreign-source income, and the result is "foreign taxable income".

"Total taxable income" means "taxable income" as determined under U.S. tax laws, with certain adjustments. For U.S. tax purposes, "taxable income" is the individual's "adjusted gross income" less (1) the itemized deductions in excess of the standard deduction ("zero bracket amount") and (2) the amount deductible as personal exemptions.[81] For purposes of the foreign tax credit, "total taxable income" means "taxable income" reduced by the "zero bracket amount" but not by the personal exemptions.[82] Special rules apply for the treatment of capital gains[83] and for recapture of foreign losses.[84]

These rules ensure that U.S. citizens will always be liable for U.S. tax on their U.S. source income, regardless of the amount of foreign taxes paid. If the foreign taxes exceed the maximum allowable, the taxpayer may carry back the excess to the two prior taxable years and then carry forward the unused credit to the following five tax-

able years. However, the excess foreign taxes may be used in other years only to the extent that, in that other year, the taxpayer had an unused foreign tax credit allowance, i.e. the "qualifying" taxes for that year were less than the maximum allowable as a credit. An unused credit may not be taken as a deduction in other years.[85]

A major problem with the foreign tax credit has been the confusion regarding the meaning of "income tax". Although the I.R.S. has issued regulations defining the term,[86] the matter is not resolved, and the complexity and difficulty of this area is indicated, among other things, by the fact that the regulations contain over seventy examples illustrating the various standards for creditability. The U.S. Government's awareness of this problem is indicated by a recent letter to Senator Charles H. Percy, Chairman of the U.S. Foreign Relations Committee, in which Senate Finance Committee Chairman Robert Dole wrote that:

> *The question of what foreign taxes are creditable against U.S. tax has, for several years now, been the subject of substantial controversy. Several versions of the section 901 regulations that have been proposed have been subjected to substantial criticism by affected taxpayers.*
>
> *Some taxpayers maintain that the regulations adopt an overly restrictive interpretation of the statute so that the credit issue may be preserved for treaty negotiations. Taxpayers also complain that requests for IRS rulings receive no action and suspect similar motives to explain the IRS inaction.*
>
> *I am sympathetic with the plight of taxpayers who do not know whether the foreign tax they pay is creditable . . . .*[87]

The foreign tax credit may not be used to offset certain U.S. taxes,[88] and the amount of foreign taxes that qualify for the credit may be decreased if the taxpayer participates in or cooperates with an international boycott.[89]

V. REASONS FOR CHANGE AND ANTICIPATED EFFECTS

The primary reason for the 1981 changes had to do with U.S. economic and trade policy and the concern over continuing deficits by the U.S.[90] Generally, it is more expensive for U.S. companies to utilize Americans rather than nationals in their foreign operations, since the companies commonly have "tax equalization" plans and provide special allowances to their overseas employees. A tax executive of a N.Y. corporation said that the current cost of supporting an American with an annual salary of $30,000 in a foreign country was about $120,000, including salary, housing, education, home leave and taxes.[91]

The extra cost of employing Americans overseas resulted in either (1) higher prices to the customer or (2) replacement of Americans by foreign nationals, or both. To the extent that U.S. businesses charged higher prices, they became less competitive, and this led to non-competitive bids in intensely competitive industries such as construction.[92] One survey indicated that the cost of maintaining American workers overseas added 2 to 10%, depending on the industry, to the cost of U.S. goods and services, and construction firms included in the survey reported that they lost at least 1.2 billion in sales in 1979 because of the increased tax burden on overseas employment.[93]

As to the replacement of Americans by foreign nationals, an executive of a U.S. company estimated that the number of Americans working overseas in such highly skilled professions as construction, architecture, and design declined by about 50% in 1979.[94] The replacement of Americans by foreign nationals was considered to have an adverse effect on U.S. exports. Foreign nationals often ordered parts and equipment from their own countries[95] because they were more familiar with the products and standards of their own country and because they considered the maintenance of business contacts with their home countries as being in their individual interests. It was estimated that U.S. exports in 1980 were 5% below what they could have been because of the decrease in the number of Americans working abroad.[96] A U.S. government study indicated that a 1% decrease in the number of Americans abroad results in a 0.5% decline in the value of U.S. exports.[97]

The 1981 changes are designed to reverse this situation by making it less expensive to employ Americans abroad. U.S. companies generally agree that the lower cost will increase U.S. competitiveness for foreign contracts and indirectly increase U.S. exports.[98]

However, there is disagreement as to the effect of the 1981 Act on the employment of Americans abroad. Some indications are that the lower cost of supporting Americans abroad will be translated into more overseas jobs being filled by Americans.[99] Others disagree. U.S. companies started substituting foreign nationals because of the burdensome tax law changes in 1976 and 1978. But the shift to foreign nationals made sense for other reasons – they know the language, market conditions, and economy better than someone brought in from the outside.[100]

As to the other effects of the 1981 changes, it is expected that the new provisions will eliminate the U.S. tax liability for about 90% of U.S. citizens working abroad.[101] However, since most major U.S. companies pay for the extra tax burden, they will benefit from the new provisions. A Citibank executive noted that the bank had picked up the tax burden and will also pick up the benefit.[102] A U.S. expatriate working for Arabian American Oil Company made the same observation: because of the company's policies, the 1981 Act would have no effect on his net income.[103]

As a result of the 1981 Act, the U.S. Government expects the fiscal year tax receipts to decrease by $299 million in 1982, by $544 million in 1983, by $563 million in 1984, by $618 million in 1985, and by $696 million in 1986.[104]

UNITED STATES:

EXCHANGE OF INFORMATION*

Disclosure to Foreign Countries Pursuant to Tax Treaties

(25)10 (2-12-82)

GENERAL

(1) The United States has entered into tax treaties with foreign countries primarily to alleviate double taxation and to help identify fraud and tax evasion through exchange of information. Although the majority of treaties cover exchange of information concerning income taxes, there are also treaties covering the exchange of information concerning estate and gift taxes.

(2) IRC 6103(k)(4) of the Internal Revenue Code provides for disclosure of information with foreign countries. This subsection provides that: "A return or return information may be disclosed to a competent authority of a foreign government which has an income tax or gift and estate tax convention or other convention relating to the exchange of tax information, with the United States but only to the extent provided in, and subject to the terms and conditions of, such convention."

(3) Tax treaties generally provide for exchange of information between the IRS and foreign tax authorities. Individuals referred to as "Competent Authorities" are designated by each country to make written requests for information and to receive information.

(4) The U.S. "Competent Authority" is the Assistant Commissioner (Compliance). However, under Compliance Order 14, the authority to act as U.S. Competent Authority was redelegated to the:

(a) Director, Examination Division, for administering the Simultaneous Examination Program, Spontaneous Exchanges of Information, and Industrywide Exchanges of Information, under the exchange of information provisions of the Income Tax Treaties to which the United States is a partner; and
(b) Director of International Operations, for administering the Programs for Routine and Specific Exchanges of Information and the Program for Mutual Assistance in Collection, under the Income Tax Treaties and Estate/Gift Tax Treaties to which the United States is a partner.

(5) Although the purpose of the redelegation is to allow routine competent authority correspondence to be signed at the Division level, the Assistance Commissioner (Compliance) will sign all correspondence involving sensitive or substantive policy matters.

(6) Copies of competent authority correspondence generated by the Examination function with respect to programs it is responsible for will be furnished to the Director of International Operations.

(25)20 (2-12-82)

INFORMATION RECEIVED FROM FOREIGN TAX AUTHORITIES

(1) If the IRS[1] needs information from a country with which the United States has a tax treaty, a request is submitted through channels for necessary action. Generally, OIO[2] reviews the request and, as appropriate, prepares a letter of request for the signature of the Director, OIO to be sent to the foreign tax authority.

(2) For U.S. requests pertaining to the Simultaneous Examination Program or an Industrywide Exchange of Information, the Director, Examination Division, will forward the request to the treaty partner competent authority upon receipt from the field.

(3) For Spontaneous Exchanges of Information, the Director, Examination Division, will forward foreign-initiated exchanges to the Assistant Regional Commissioner (Examination) for transmittal to the applicable District Director.

(4) Information which is received by the IRS from a foreign tax authority is subject to secrecy clauses contained in the specific tax treaty. In general, these secrecy clauses provide that information received by the IRS cannot be disclosed to any persons other than those (including courts and administrative bodies) concerned with the assessment, collection, enforcement or prosecution with respect to the taxes, which are the subject of the respective tax treaties. Additionally, to the extent the information relates to the liability or possible liability for tax of a United States taxpayer or otherwise falls within the definition of return information in IRC 6103(b)(2), it is return information subject to the restrictions on disclosure imposed by IRC 6103 as well as the restrictions contained in the treaty clauses.

(5) Because of the secrecy clauses, tax treaty information may not be disclosed to State tax agencies under IRC 6103(d), the Department of Justice or other Federal agencies under IRC 6103(i), or under any other provision of IRC 6103 permitting disclosure for non-Federal tax administration purposes.

(6) Disclosure Officers should ensure that information disclosed for non-Federal tax administration purposes is reviewed and tax treaty information is removed prior to

---

disclosure. Information obtained under a tax treaty is often stamped to indicate that it is tax treaty information.

(7) Generally, tax treaty information obtained from a foreign tax authority may be disclosed to the United States taxpayer to whom it relates in accordance with IRC 6103(e). In this situation, the taxpayer is considered to be concerned with assessment, collection, enforcement or prosecution with respect to the taxes which are the subject of the tax treaty. However, disclosure will not be made to the taxpayer if the IRS or the foreign tax authority providing the information objects to disclosure or if disclosure would seriously impair Federal tax administration. (See IRC 6103(e)(7).)

(8) If a Freedom of Information Act request for tax treaty information is received, the procedure in text (13)46 of this Handbook should be followed.

(25)30 (2-12-82)

DISCLOSURE OF INFORMATION TO FOREIGN TAX AUTHORITIES

(1) If information is needed by a foreign country with which the United States has a tax treaty, a request is submitted by the Competent Authority to the U.S. Competent Authority. Exchanges of information by the IRS with foreign tax authorities are authorized in the National Office by the Director, OIO or Director, Examination Division, or the Assistant Commissioner (Compliance) for sensitive cases. Certain automatic or "routine" exchanges (such as transmission of reports of taxes withheld from income paid to non-resident aliens) are accomplished at the Philadelphia Service Center.

(2) The Director, OIO generally forwards requests for information to the appropriate IRS offices. When the requested information is received from the IRS offices, OIO prepares a response for the signature of the Director, OIO transmitting the information to the foreign Competent Authority.

(3) For treaty partner requests pertaining to the Simultaneous Examination Program or Industrywide Exchange of Information, the Director, Examination Division, or the Assistant Commissioner (Compliance) in sensitive cases, will:

(a) forward the request to the District Director for action; and
(b) when the information is received, transmit it to the treaty partner competent authority.

(4) For Spontaneous Exchanges of Information, the Director, Examination Division, or the Assistant Commissioner (Compliance) in sensitive cases, will forward a U.S.-initiated exchange to the treaty partner competent authority.

(5) Generally, returns are not furnished to foreign tax authorities pursuant to tax treaties.

(6) If it should become necessary to issue a summons to obtain the requested information, the summons should be prepared and forwarded to District Counsel, OIO for review prior to issuance.

(7) Return information which could identify or tend to identify a confidential informant, or seriously impair an IRS tax investigation is generally not disclosed to foreign tax authorities.

(8) Information which would reveal business or trade secrets is excepted from the exchange of information provisions of the treaties.

(9) Disclosures to foreign tax authorities made pursuant to tax treaties must be accounted for in accordance with IRC 6103(p)(3) and the Privacy Act of 1974. See Chapter (38)00 of this Handbook for further information.

(25)40 (2-12-82)

NONTREATY DISCLOSURES TO FOREIGN COUNTRIES

(1) Although IRC 6103(k)(4) is generally the authority for disclosure of return information to foreign tax authorities, other provisions of IRC 6103 permit limited disclosures to foreign countries or individuals of foreign countries in certain situations. These disclosures can be made regardless of whether the United States has a tax treaty with the country. However, when a tax treaty is in effect, we exchange information under the treaty to the extent possible.

(2) Return information may be disclosed by IRS employees to individuals of foreign countries in accordance with IRC 6103(k)(6). See chapter (21)00 of this Handbook.

(3) Returns and return information may also be disclosed to individuals of foreign countries designated in writing by a United States taxpayer to receive such information in accordance with IRC 6103(c) and (e). For example, pursuant to a written taxpayer request and consent for disclosure, IRS may certify to a tax treaty country that taxes were paid in the United States to enable the taxpayer to receive credit for the taxes on a foreign return.

TAXATION OF FOREIGN BUSINESS ACTIVITIES IN AUSTRIA

by Prof. Dr. Wolfgang Gassner*
and Geoffrey C. Pink**

INTRODUCTION

Geographical convenience has resulted in Austria's importance as one of the foremost financial centres for East-West trade, and commercial transactions with Eastern bloc countries frequently begin and end in Austria. Accordingly, many firms have established branches or subsidiary companies there in order to do business with the Comecon, Yugoslavia and Albania; the activities would typically include marketing and maintenance of products sold in those countries, or perhaps a simple representative office. In either case the implications of Austrian tax are important when contemplating commercial contracts, and the following brief survey discusses aspects of the Austrian tax system which are relevant for foreign companies embarking on business relations with Austria.

I. THE AUSTRIAN TAXATION SYSTEM

1. Corporation tax on income of foreign companies from permanent establishments

Although the corporation tax is chargeable on income of all companies, those which are incorporated abroad and have their effective management outside Austria are only subject to limited taxation on certain income derived from Austrian sources. This limited tax liability applies above all to income from business for which a "permanent establishment" exists in Austria; this concept is defined in the Federal Tax Code (Bundesabgabenordnung) and resembles the OECD model treaty definition. A permanent establishment is any fixed place of business, and in particular a branch or a factory. The extent of liability may be reduced if the foreign company is resident in a country which has concluded a double taxation convention with Austria.

Corporation tax is charged on the income attributed to a permanent establishment for each calendar year. In arriving at this income, normal overheads are deductible, together with a number of investment incentives; for example, the accelerated depreciation can be made use of at annually varying rates from the costs of depreciable fixed assets. An accelerated depreciation is possible in the year of purchase in addition to the normal depreciation. Alternatively, an investment allowance of 10 to 20% of the cost of depreciable assets may be given in which case the total allowances are increased to 110 - 120% of the cost. A reasonable proportion of head office expenses may be charged to the permanent establishment and transactions between head office and the Austrian branch are generally to be treated on an arm's length basis.

Income from the permanent establishment is subject to corporation tax at the following tax rates:

Income (AS)	*Rate*
to 200,000	30%
200,100 - 250,000	30% + 50% on excess over 200,100
250,100 - 400,000	40%
400,100 - 500,000	40% + 50% on excess over 400,000
500,100 - 1,000,000	50%
1,000,100 - 1,142,800	50% + 40% on excess over 1,000,000
over 1,142,800	55%

Note: These rates are applied not to individual income brackets, but to total income.

2. Corporation tax of foreign companies on other source income

Apart from the income derived from an Austrian permanent establishment, other Austrian source income of foreign companies is subject to limited corporation tax. This tax as a rule is levied in the form of a 20% withholding tax, which may be reduced or omitted under the respective tax treaty. The following source income has to fall within this category:

(a) dividends of Austrian companies;
(b) compensation received by the company for the services of writers, speakers, artists, architects, athletes or entertainers of all kinds becoming active in Austria;
(c) royalty payments;
(d) compensation for consulting activities performed in Austria in the field of business administration or technology and for the supply of gangs for work in Austria.

3. Corporation tax of Austrian companies

If, however, a foreign company is doing business in Austria through a company incorporated in Austria, or having its management there, the latter is subject to unlimited corporation tax liability on its world-wide income. Business transactions with the parent company should be carried out on an arm's length basis in order to avoid hidden distributions of profit, which may entail considerable tax burdens. The taxable income of Austrian subsidiaries is assessed according to the same principles as that of permanent establishments set out above. However, the rates of tax on distributed profits are reduced by half by virtue of the "split corporation tax rate" that is in force in Austria. A 20% withholding tax is levied on dividends and royalty payments to the non-resident parent company, although this may be reduced under the respective tax treaty.

* Binder Dijker Otto & Co., BDO, Vienna.
** Binder Dijker Otto & Co., BDO, London.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

4. Net wealth taxes, business taxes

Both Austrian branches and subsidiaries of non-resident companies are furthermore subject to net wealth tax. The tax of 1% is levied on the value of the Austrian assets of a branch or on the world-wide assets of an Austrian subsidiary, although the relevant tax treaty may mitigate this. In addition, there is a surtax of 0.5% (inheritance tax equivalent). If and insofar as individuals participate in the company this surtax may be eliminated under double tax treaties.

A business tax is also payable by Austrian permanent establishments of domestic or foreign companies. This is a three-part tax based on business profits, business capital and payroll. The business profit tax is levied together with the business capital tax, and amounts to approximately 14.5% of the business profit prior to deduction of the business profit tax as a business expense. The computation of the business profit is based on the profit determined for corporation tax purposes subject to certain additions and deductions. The most important addition is interest on long-term loans, while the most important deductions include 3% of the value of real estate, and profits from participations. The business capital tax amounts to approximately 0.35% of the business capital value adjusted by additions and deductions. The business tax on the payroll amounts to approximately 2% of the salaries and wages.

5. VAT

VAT is levied on goods and other services, as well as the self-consumption by companies, and the import of goods. The tax rates are 18% (standard rate), 8% (reduced rate), 13% (rate for energy) and 30% (rate for luxuries). The reduced rate of 8% is in particular applied to turnovers of basic foodstuffs, to the leasing of real estate, and to services from certain professional activities (medical doctors, lawyers, accountants, architects, etc.). The 13% tax rate relates to coal, fuel oil, gas, electricity and heat. A 30% VAT is, above all, levied on motor vehicles and on other luxury articles. In a series of businesses the turnover tax is of a purely transitory nature since input VAT can be claimed as a credit. Such a deduction of previously paid VAT is, however, not permissible in the case of private motor vehicles.

Foreign enterprises with neither their domicile or usual place of abode, nor seat or a permanent establishment in Austria, may claim tax exemption for their turnover and not apply VAT as long as they do not make use of the tax credit. In the case of delivery and installation of goods by a foreign enterprise, the material components may be accounted for separately. With regard to the VAT on imports, the credit for VAT may be claimed by the recipient of goods or services, but in all other cases of sales by foreign companies the VAT is withheld by the recipient of goods or services and paid to the tax office, where refunds of VAT may also be claimed by foreign enterprises under certain conditions.

6. Fees

A special peculiarity of the Austrian tax legislation are the fees according to the Fees Law (Gebührengesetz). Under the Fees Law certain documents and legal transactions and, in particular, requests to authorities are subject to fees payable in the form of inland tax stamps. Furthermore, a tax is payable on various legal transactions, such as lease or loan contracts, mortgage or credit contracts and cessions, if they are attested by a written document. As a rule the fee ranges between 0.8% and 2% of the value. The fee on legal transactions is usually exempted whenever a foreign company with no permanent establishment in Austria takes part in the transaction and, moreover, the contract is drawn up abroad and also remains there. The Fees Law is quite formalistic in nature and particularly complicated if foreigners are involved.

II. MAJOR CONTRACTS

Following this brief survey of the Austrian tax system, let us discuss the tax aspects of certain contracts that are important for foreign companies.

1. Supplier contracts

With respect to supplier contracts of foreign companies questions of taxation rarely arise. The foreign supplier is not liable to taxation in Austria as long as he does not maintain a permanent establishment there.

If he delivers the goods from local warehouses, these are not considered as permanent establishments according to the tax treaties. Under such circumstances, however, the foreign supplier becomes liable to pay VAT. VAT must be charged on sales and paid to the tax office and offset by previously paid VAT, in particular, for imports. In the sales contract it should be laid down that the VAT, which is to be shown separately in the invoices, increases the price. Without such specific mention any price agreed upon is understood as the gross price including VAT according to court rulings, so that the supplier receives an amount less VAT.

If an agent is used, care has to be taken that he does not constitute a permanent establishment of the foreign company in Austria. According to the tax treaties a dependent agent generally gives rise to a permanent establishment only if he is given power to conclude contracts. An independent agent may also bring into existence a permanent establishment of the foreign company, if his activities exceed the usual scope. The avoidance of a permanent establishment is important since it entails tax liabilities of the foreign company for the activities of the agent in Austria. The remuneration of an agent for the foreign company is not subject to the Austrian VAT.

2. Supplier, production and service contracts of branches

Supplier contracts carried out via an Austrian branch of the foreign company will normally give rise to a perma-

nent establishment. The same applies to production and services undertaken by Austrian branches. As mentioned earlier, the creation of a permanent establishment entails limited tax liability for taxes on income and net wealth, as well as business tax liability. The profits of the permanent establishment from its business activities in Austria are therefore subject to corporation tax at the full rate and to business tax on the business profit. Where profits exceed 1,142,800 AS the tax burden amounts to approximately 62%. In addition, the assets of the branch are subjected to net wealth tax, the inheritance tax equivalent and the business capital tax amounting to a total of approximately up to 1.9%, and the salaries and wages are subjected to the payroll tax of 2%.

Contracts between the branch and third parties are under the unlimited jurisdiction of the Fees Law. Thus, in particular, loan contracts with banks or lease contracts for buildings or equipment and machinery are subject to fees. However, contracts between the branch and parent company are not liable to fees, since the branch is not itself a legal entity.

3. Formation of subsidiaries, partnerships and acquisition of participations

The formation of subsidiaries attracts a 2% company tax on the paid-in capital. In addition, court and notarial fees become payable. The company is subject to unlimited corporation and property taxes as well as to inheritance tax equivalent and business tax liability. For distributed profits the corporation tax is reduced by one half as already mentioned. The 20% withholding tax on the dividends is, as a rule, considerably reduced under the tax treaties and is credited against the foreign taxes of the parent company. For this reason, a tax advantage may sometimes be achieved by the organisation of subsidiaries instead of branches. The conversion of branches into subsidiaries is tax exempt by virtue of the Business Structure Improvement Law. With respect to fees, however, it should be noted that contracts between the parent company and the subsidiary (in contrast to those between headquarters and branch) may result in fees for legal transactions. This holds true, in particular, for loans by the parent company.

The formation of partnerships, with an Austrian partner, leads to a 2% legal transaction fee on the capital. A foreign company with a share in the partnership is subject to limited taxation like a permanent establishment according to the Corporation Tax Law, the Net Wealth Law and the Inheritance Tax Equivalent Law, and the profit shares are subject to business tax as in the case of a permanent establishment. As regards fees, the same regulations as for a subsidiary apply.

The acquisition of participations in limited liability companies attracts a 2% legal transaction fee and 0.5% stock exchange tax which may, however, be avoided or considerably reduced by a complicated make-up of the contracts.

For participations in stock companies, opnly a negligible stock exchange tax is payable. Participations in partnerships give rise to a 2% legal transaction fee. A revaluation of the tax depreciation basis in Austria is only undertaken in the event of acquisition of a participation in a partnership or the acquisition of a business, but not on the acquisition of participations in a company.

4. Building and construction contracts

Building and construction activities carried out in Austria by a foreign company lead to a permanent establishment only after a certain period of time; as a rule this period amounts to 12 months according to the tax treaties. In the case of shorter periods, generally only VAT becomes payable for which, however, exemption may be claimed, unless considerable VAT has accumulated, making the payment of the VAT and claim of the credit advisable. If the 12-month period is exceeded and a permanent establishment is brought into being, liability for corporation tax, net wealth tax, inheritance tax equivalent and business tax results, as in the case of a branch.

These principles also apply to the employment of subcontractors on the construction site. If the time limit is exceeded, each foreign sub-contractor separately gives rise to a permanent establishment and is individually liable to taxation. The general contractor employing subcontractors becomes liable to taxation as a permanent establishment only if his personal engagement on the construction site goes beyond mere supervisory functions of the sub-contractors. Where the building and construction activities are carried out by a consortium, the latter is treated as a partnership, if the consortium as such enters into contracts. The foreign partner of this consortium is subject to limited taxation in Austria on his share in the profit and the assets. If, however, the consortium only applies to the internal relationship of the partners and the commission is proportionally distributed among the partners, the foreign partner is only liable to limited taxation in respect of the profit and assets of his own permanent establishment.

5. Transfer prices, royalties, cost allocation

In all contracts with Austrian subsidiaries and permanent establishments the principles of dealing at arm's length have to be observed. For this reason the transfer prices for goods and services between the Austrian company or permanent establishment and the parent company or headquarters respectively have to be fixed at an adequate level, as between unrelated parties. This applies, in particular, to goods and services of the Austrian company or permanent establishment, since a hidden distribution of profits may be assumed otherwise.

Royalties are permitted for patents, trade marks and know-how. The amount accepted for tax purposes depends on their value to the Austrian enterprise. In various industries certain rates have in practice evolved from experience; in important cases it is advisable to seek agreement with the tax authorities. From the royalty payments of an Austrian subsidiary or partnership a 20% tax is withheld at source which may, however, be considerably reduced under the tax treaties and for which a foreign tax credit is granted in most cases. In concluding

© 1982 International Bureau of Fiscal Documentation – BULLETIN

a contract it should be recognised that a 1% legal transaction fee may become payable, if the contract is concluded in Austria.

Cost allocations are permissible, if certain prerequisites are met: the costs have to be correctly ascertained at the parent company or the head office; the respective flow of products or services to the Austrian subsidiary or permanent establishment has to be proven; an adequate allocation basis has to be chosen, and an accounting control has to be installed. The opinion of a foreign accountant is accepted as a rule and the cost allocation itself may be negotiated with the tax authority.

6. Cost-plus contracts with East-West trading companies

As mentioned earlier, many foreign-owned subsidiaries have been set up in Austria for the purpose of doing business with East European countries and for serving the maintenance or marketing of products in those countries. Frequently representative offices in the Eastern countries are also maintained by these companies in order to benefit from the treaties of Austria with these countries and at the same time avoid their tax burdens.

Cost-plus contracts, which are basically accepted by the fiscal authorities, have become popular for such companies for reasons of simplification of the tax computation and for eliminating taxation of the full profit margins of the foreign companies in Austria. The Austrian subsidiary performs the representation, maintenance or marketing activities for the foreign parent company in return for remuneration in the amount of its expenses plus a small mark-up. These cost-plus contracts represent a major financial impetus for foreign companies to set up subsidiaries in Austria for doing business with the Eastern European countries.

REPUBLIC OF IRELAND:

Budget 1982

Extracts from the Budget Speech pronounced on 26 March 1982 by the Tanaiste and Minister for Finance Mr. MacSharry

It is unusual, to say the least, for two Budgets to be introduced in Dail Eireann within two months of each other. This fact alone makes it inescapable that this Budget will, in many respects, be similar to that which was presented on January 27th last. In the fortnight available to me, however, I have tried to ensure that while the principal objectives of that Budget – to reduce the current Budget deficit and the overall Exchequer borrowing requirement – will be met, my budget will help those least able to bear hardship and will achieve its aims in a far less disruptive way. Some of my excise taxation proposals have already been implemented and I shall be asking the Dail to confirm these today.

. . .

Tax proposals

I now turn to the question of taxation. I propose to implement the tax proposals put forward in January, subject to certain changes which I will shortly outline. It would not be practicable at this late stage to prepare an alternative tax package for 1982. Before indicating the details of the tax measures, however, I think it necessary to emphasise that our present taxation structure places severe constraints on the freedom of manoeuvre of any Minister for Finance.

Our heavy reliance on indirect taxation for revenue purposes, for example, can cause problems for the industries affected because of its impact on the volume of sales. From the Exchequer's viewpoint, if higher taxes lead to diminishing returns, then they simply defeat the purpose for which they are introduced.

Heavier direct taxes in the future

This reliance on indirect taxation is, however, the result of past policies which have deliberately exempted or relieved whole sectors of the economy – and many individuals – from the rates of taxation normal in other countries, in the interests of economic development. The limits of this policy are now being approached and it must be accepted that in future the tax net will have to be widened significantly and a higher proportion of tax revenue will have to come from direct taxation. It follows that we must also reassess critically the generous reliefs and allowances which are available at present.

The Government are looking forward to the views of the Commission on Taxation on these matters; I understand that a report will be available shortly.

The corollary of widening the tax base is the obligation to develop a more equitable tax system. There is considerable public dissatisfaction with present arrangement and there is general agreement that we need to achieve a fairer distribution of the burden of taxation. A commitment to equity also demands further progress in combating tax avoidance and tax evasion. There is still a considerable loss of revenue because of these practices and the result is that the honest taxpayer has to contribute substantially more than his fair share.

No switch to tax credits

The Government have decided against changing the present structure of income tax in order to apply tax credits. A switch to tax credits for the next income year at this stage would merely give rise to enormous administrative confusion, with little result to show for it.

It is intended, therefore, to continue with the present structure of tax bands and allowances, but changes are being made in order to achieve broadly the same effect for individual taxpayers as under the earlier proposals. As the House is aware the Social Welfare Bill provides for the implementation in full of the improved social welfare children's allowances. The £9.60 weekly payment for spouses who work in the home will not, however, be implemented. The response to this scheme has illustrated clearly that the general public saw no merit in cumbersome and complex scheme which merely transferred money from one spouse, via the Revenue Commissioners, to the other.

That scheme included a family income supplement estimated to cost £4 million this year. This supplement cannot be operated outside a tax credit system and, as I have already mentioned, I am allocating the money instead to social welfare. This, the whole amount set aside in January for income tax improvements is being provided again in this Budget and is being applied to achieve substantially the same re-distributive effects for lower and middle income groups.

While continuing the present income tax structure, I propose to increase the personal allowance from £1,115 to £1,450 for single persons and from £2,230 to £2,900 in the case of married couples. This represents an in-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

crease of 30%. The bands of income taxable at 35% will be reduced to £3,000 in the case of single and widowed persons and to £6,000 in the case of married couples.

With these changes, it is possible to achieve substantially the same effect as the tax credit proposals of January 27th, but without any of the complexity which they would have entailed.

The allowance for widowed persons will be increased to £1,950. An additional allowance for one-parent families was introduced in 1979 and now stands at £650. While this allowance has provided valuable relief to these families, I believe that further assistance is necessary. I am, therefore, providing an increase of £300 in the case of a widowed person and an increase of £800 for other single parents. As a result of these changes, widowed parents and single parents will now be in receipt of allowances equivalent to the married allowance. Widows will continue to qualify for the married allowance in the year of bereavement.

I am also improving the exemption limits for those on low incomes. The limit for single and widowed persons will be increased from £2,000 to £2,200 and from [£4,000 to] £4,400 for married couples. Marginal relief will continue for those whose income does not greatly exceed these amounts. These changes will remove about 24,000 low-income taxpayers from liability.

The elderly are a specially-deserving section of the community and I propose to provide income tax relief for them in several ways. In addition to the increase in the age allowance and the tax allowance for rent on private tenancies proposed on January 27th, I am also improving the age exemption limits by £200 for single and widowed persons and by £400 for married couples.

The changes in allowances, exemption limits and rate bands will cost £39 million in 1982 and £61 million in a full year.

As a consequence of the change in the income tax reliefs for personal loan interest announced on January 27th, some amendments may also be necessary in the provisions relating to tax relief for preferential loan interest. I am looking at this matter in the context of the Finance Bill.

It is intended, therefore, to continue with the present structure of tax bands and allowances, but changes are being made in order to achieve broadly the same effect for individual taxpayers as under the earlier proposals. As the House is aware the Social Welfare Bill provides for the implementation in full of the improved social welfare children's allowances. The £9.60 weekly payment for spouses who work in the home will not, however, be implemented. The response to this scheme has illustrated clearly that the general public saw no merit in cumbersome and complex scheme which merely transferred money from one spouse, via the Revenue Commissioners, to the other.

That scheme included a family income supplement estimated to cost £4 million this year. This supplement cannot be operated outside a tax credit system and, as I have already mentioned, I am allocating the money instead to social welfare. This, the whole amount set aside in January for income tax improvements is being provided again in this Budget and is being applied to achieve substantially the same re-distributive effects for lower and middle income groups.

While continuing the present income tax structure, I propose to increase the personal allowance from £1,115 to £1,450 for single persons and from £2,230 to £2,900 in the case of married couples. This represents an increase of 30%. The bands of income taxable at 35% will be reduced to £3,000 in the case of single and widowed persons and to £6,000 in the case of married couples.

With these changes, it is possible to achieve substantially the same effect as the tax credit proposals of January 27th, but without any of the complexity which they would have entailed.

The allowance for widowed persons will be increased to £1,950. An additional allowance for one-parent families was introduced in 1979 and now stands at £650. While this allowance has provided valuable relief to these families, I believe that further assistance is necessary. I am, therefore, providing an increase of £300 in the case of a widowed person and an increase of £800 for other single parents. As a result of these changes, widowed parents and single parents will now be in receipt of allowances equivalent to the married allowance. Widows will continue to qualify for the married allowance in the year of bereavement.

I am also improving the exemption limits for those on low incomes. The limit for single and widowed persons will be increased from £2,000 to £2,200 and from [£4,000 to] £4,400 for married couples. Marginal relief will continue for those whose income does not greatly exceed these amounts. These changes will remove about 24,000 low-income taxpayers from liability.

The elderly are a specially-deserving section of the community and I propose to provide income tax relief for them in several ways. In addition to the increase in the age allowance and the tax allowance for rent on private tenancies proposed on January 27th, I am also improving the age exemption limits by £200 for single and widowed persons and by £400 for married couples.

The changes in allowances, exemption limits and rate bands will cost £39 million in 1982 and £61 million in a full year.

As a consequence of the change in the income tax reliefs for personal loan interest announced on January 27th, some amendments may also be necessary in the provisions relating to tax relief for preferential loan interest. I am looking at this matter in the context of the Finance Bill.

Social welfare not subject to tax

The Government will not go ahead with the earlier proposal to tax short-term social welfare benefits. Such a tax would impose an unfair burden on many who are unfortunate enough to fall ill [and] are to be made redundant and in any event it would be extremely difficult to administer the tax properly. I have no doubt that there are many cases where the existing provisions encourage absenteeism and reduce the incentive to work, but this does not warrant the general imposition of a tax on those who are in reduced circumstances and have no choice in the matter. The question of reforming the current arrangements will, however, be pursued in other ways.

Blow to private car usage

A number of changes were proposed on January 27th designed to bring about a more rational approach to the taxation and use of motor-cars. One of these concerned the arrangement under which a director or employee has the private use of a company car. At present, this benefit is completely undervalued for income tax so that what is, in effect, substantial additional remuneration escapes taxation.

The exploitation of this tax advantage has become widespread among employees who have little, if any, business travel to do and it is an observable fact that the cars so supplied are bigger and more expensive than the average. Every car, every spare part and every drop of fuel has to be imported and I see no justification for providing unnecessary encouragement to this form of motoring at a time when our balance of payments deficit is giving much cause for concern.

It was proposed in the January Budget, as an interim measure, to increase the annual valuation of the use of a motor-car from 12.5% to 20% of the cost of the car to the employer. I have taken a fresh look at the problem and I am satisfied that a new approach, based on the value of the benefit of the car to the employee, should be taken. In future, the taxable benefit will be based on a sliding scale related directly to the original market value of the car and varying according to whether the costs involved are borne partially or totally by the employer.

I appreciate that it might be unduly disruptive to make this change in a single step. I propose, therefore, to move in two stages to this new basis. For 1982-83, the taxable benefit will be calculated at half the full rates proposed, while the full rates will come into operation in 1983-84. Since most of these cars are replaced at two or three-year intervals this gives ample time to those concerned to decide their own priorities in the matter.

The details of the scales of charge are set out in the "Principal Features". These are designed to ensure that those with a substantial business mileage will be fairly treated. In particular, those with a very high business mileage, such as commercial travellers, will be given further relief, which will in effect exempt them from this charge. The yield from this change is expected to be about £2 million in 1982.

Road tax

I am proposing that the changes in road tax announced in the January Budget will be implemented with effect from May 1st, 1982. The details are set out in the "Principal Fea-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

tures". The extra yield is estimated at £10.5 millions in 1982 and £15.9 millions in a full year.

Insurance levy

It is proposed also to impose a levy on certain insurance transactions with effect from August 1st. The levy will be at a rate equivalent to 1% and will be imposed on premium income from domestic business excluding medical insurance. It is intended that the levy will be collected as a stamp duty on the basis of quarterly returns from the insurance companies. The yield in 1982 will be £2.25 million and the full year yield will be about £9 million.

Bank levy

The levy on the banking sector for 1982 will be £20 million. The details will be published later.

I see these levies as a temporary arrangement and I will be considering in due course proposals for the introduction of a new permanent system of taxation of financial institutions when the recommendations of the Commission on Taxation become available.

Corporation tax: payment dates

The due dates for payment of both first and second instalments of corporation tax will be brought forward by three months. In addition, the grace period before interest is charged on tax overdue will be reduced from two months to one. The combined effect will be that the first instalment will be payable not later than seven months after the end of the accounting period and the second instalment 7 to 16, rather than the present 11 to 20 months after the end of the accounting period.

These changes will bring an additional revenue of £36 million into 1982.

Capital taxes

I have looked at the proposals for capital taxation made on January 27th and I have decided to make some changes.

First, the commencement date for all the capital gains tax proposals will be March 26th instead of January 28th.

Second, the tax treatment of all short-term capital gains will be altered. These gains are akin to income and should be taxed at higher rates than gains made in the longer term. I am proposing, therefore, that gains realised within one year of acquisition will be charged at 60% and gains realised within two or three years of acquisition at 50%.

Third, I am increasing the rate of taxation on gains from disposals of development land. In January, it was proposed that such gains, including gains made by companies, would be liable to a special capital gains tax at a rate of 45%, with certain restrictions on the application of indexation relief, roll-over relief and the right to set off losses. I intend to implement these proposals but I will provide that the normal rate will now be 50% instead of 45%. Gains within one year of acquisition will be liable at the new 60% rate for such short-term gains. There will be no change in the proposed 40% rate for compulsory acquisition cases save where the new proposals for taxing short-term gains apply.

The January 27th Budget also proposed a special capital acquisitions tax on discretionary trusts. I have considered this approach and have concluded that this would be an insensitive and over-simplified approach to the problem. I am, therefore, asking the Commission on Taxation to make a special examination of this area and to recommend measures.

The delay in implementation of the new capital gains tax proposals together with the deferral of the proposed tax on discretionary trusts will reduce the additional yield from capital taxation for this year from £6.5 million to £2.7 million. This new package, however, will bring in over £11 million extra next year.

Excise duties

A number of excise duty changes were introduced from March 13th, 1982, by Government Order under the Imposition of Duties Act, 1957, as amended. This mechanism was used to minimise the revenue lost by the delay in implementing the Budget and its use was entirely consistent with legislation passed without opposition by the Oireachtas. The main duties involved are alcoholic drinks, tobacco and cars over 16 horsepower. The yield from these changes is estimated at £51.4 million in 1982 and £71.3 million in a full year. The House will today have the opportunity to debate a motion noting these changes.

I also propose to implement the other exise duty changes which were put before the House on January 27th, including a duty-based tax increase of 8p per gallon on petrol, road diesel and liquid petroleum gas used in road vehicles, which will have immediate effect. These changes will yield £21.1 million in 1982 and £24.7 million in a full year.

The excise duty increase on petrol, road diesel and LPG will take effect from midnight tonight, but increases in the price of petrol must await a new maximum prices order. This will be made by the Minister for Trade, Commerce and Tourism, who will determine the implementation date. However, if oil prices decline further during this year, it is my intention to look again at the whole question of the appropriate level of taxation on petrol and other hydrocarbon products.

VAT

There will be no VAT imposed on clothing and footwear.

The other VAT changes in the 27th January proposals will be implemented, though the date of implementation of the new 18% and 30% VAT rates will now be May 1st, 1982, and the extension of VAT to certain services which are at present exempt will now take place on September 1st, 1982. Certain professional services provided to farmers and fees on the sale of agricultural land will, however, attract the special low effective VAT rate of 3%. These changes will yield additional revenue of £71.3 million in 1982 and £147.7 million in a full year.

These are, however, two additional changes which I propose. I have been concerned for some time about the application of VAT to books, especially school books. The proposed new rate of 18% would be particularly severe in this area, so I propose to move all books to the zero rate of VAT from May 1st, 1982. This will cost £2.5 million in 1982 and £4.9 million in a full year.

Imports

As was stated in our policy document, VAT is to be imposed on imports at the point of entry. VAT-registered firms may at present, in general, import goods without payment of VAT and account for it subsequently in their normal VAT returns. I propose to change this system to require VAT to be paid at the end of the normal customs duty deferment period, that is on the 15th day of the month following importation. This change will remove the advantage which imports are seen to have over purchases of domestically-produced goods. The change will take effect from September 1, 1982. Details of how it will operate will be included in the Finance Bill.

This change will result in a gain of about £140 million for the Exchequer in 1982, since it will involve earlier payment of VAT. This includes some extra revenue from reducing evasion of VAT on imports and reducing tax losses arising from taxes unpaid in insolvencies. There will also be some gain from a reduction in arrears of VAT. If the change in relation to VAT on imports gives rise to financing difficulties for some firms, then I will look at the possibility of arranging that the Industrial Credit Company could make loan finance available.

Given the desirability of reducing the current budget deficit, the Government had little option but to apply this VAT charge to all imports. Taxation on the "old reliables" has been pushed to the limit and the two main VAT rates are already being increased substantially. The only alternative source of substantial immediate revenue would be income tax increases, which would have borne heavily on the PAYE worker and would be unacceptable to this Government at this time.

No foreign travel tax

The proposal by the previous Government to impose a £20 charge on each person leaving the State on a chartered aircraft will not be implemented. This would have discriminated against one form of foreign travel and, in particular, would have had a significant effect on certain disadvantaged groups.

It is proposed instead to spread the tax over all travellers, by applying a charge, at the rate of £3 per passenger for air and international sea routes, and £2 for cross-Channel sea routes, on all air and sea passengers who pur-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

chase their ticket in Ireland. Accordingly the tax will not apply to most foreign tourists and business persons visiting the State. The tax will apply from September 1, 1982 and is estimated to yield some £1 million in 1982.

Dating of budget changes

A number of the income and capital taxation measures announced on January 27th were to take immediate effect. Where these measures are incorporated in today's Budget, there will now take effect from a current date. It would be inappropriate to backdate their introduction as this would, in effect, correspond to retrospective taxation. The delay in bringing these measures into effect will result in a revenue loss of approximately £2.5 million.

. . .

Deficit and borrowing

The current budget deficit planned in the January 27th Budget was £715 million. I have today added £110 million to the expenditure side of the Budget. On the revenue side of the Budget, the net increase is £146 million, which, taking account of the net increase in expenditure of £110 million, results in a current budget deficit of £679 million or 5.6% of GNP. This compares with an outturn for 1981 of £802 million, or 7.9% of GNP.

The overall Exchequer borrowing requirement emerges at £1,683 million as compared with £1,661 million planned in January. This marginal increase in the borrowing requirement is more than justified by the impact on the economy of the additional expenditure involved. At £1,683 million, or 13.9% of GNP, this requirement compares more than favourably with the 1981 outturn of £1,722 million or 16.9% of GNP.

The planned current Budget deficit and borrowing requirement represent a significant real improvement on the 1981 outturn and are an earnest of this Government's commitment to bring the public finances under control on a phased basis, having regard to the needs of the economy. The improvements in the economy which the Budget will allow should generate a sound basis for further progress in this area in the years ahead. The maintenance of progress will, however, require a sustained, businesslike approach across the broad sweep of public policies and the Government intend to apply this.

I should like to emphasise that the Government will have to take an extremely restrictive line on all requests for additional expenditure or for further taxation reliefs. The scope for any relaxation of financial discipline simply does not exist.

Conclusion

As compared with the proposals of January 27, today's Budget will have a decidedly favourable impact on employment. The removal of VAT from clothing and footwear, the imposition of VAT at the point of import and the maintenance of food subsidies will sustain purchasing power and protect the position of home industries. The increased capital allocations, particularly those for the building industry and local authorities, will give a positive stimulus to employment which will also be helped by the Employment Incentive scheme. Employment will be a central element in the medium – term plan which is being prepared.

The increases in prices as a result of today's Budget will be considerably less than those planned in the January Budget. The CPI effect is estimated at 2.75% compared with the 4.75% increase in prices which would have resulted from the January proposals. This will help to lessen inflation and encourage moderation in pay expectations. The balance of payments will also be improved through better export performance and all – round competitiveness. I estimate that, taking into account the budget changes, GDP growth this year will be higher than last year.

This Budget represents a fair balance between controlling the public finances and giving a stimulus to economic activity and employment. The extra taxation is distributed as equitably as possible, with the greater burden being imposed on those who are best able to pay. The generous social welfare changes provide considerable improvements for those who need help most. The Budget is, therefore, a sensible response to the present difficult situation. It will create more confidence in this country, both at home and abroad, and it will provide a strong imputus for greater and more stable economic progress.

The immediate task facing the Government is to nurse the economy through the present difficult economic period. While we cannot expect dramatic improvements in the short term, we have every reason to feel confident about the future. Our economy is fundamentally sound and it has the capacity to grow steadily. We have assets such as a young, growing and educated labour force which are the envy of many other countries. We must, however, go forward prudently and we must acknowledge that the correction of our public finances has to be a high priority in the immediate future whether we like it or not. This will require acceptance of the fact that we cannot sustain continuing increases in living standards, irrespective of our national output or productivity. It is on this basis, and not either on false hopes or on exaggerated pessimism, that we can advance with justified confidence in our own abilities to secure a better future for all.

Budget Highlights

Indirect taxes

- The 15% basic rate of VAT will be increased to 18% starting from 1 May 1982
- The 25% rate of VAT on "luxuries" will be increased to 30% starting from 1 May 1982
- Certain professional services (solicitors, barristers, accountants, actuaries) will become subject to 18% VAT starting from 1 September 1982
- The 25% rate of VAT on certain furniture and furnishings will be reduced to 18% starting from 1 May 1982
- VAT on books will be abolished
- Imports will become liable to VAT starting from 1 September 1982
- Excise duty on petrol (gasoline) will be increased by 8p per gallon
- Foreign air travel tax will be £ 3 per passenger (£ 2 for cross Channel transportation)
- Road tax on cars, motorcycles and taxis will be increased
- Excise duty on beer, spirits, wine and cigarettes has been increased starting from 12 March 1982

Income tax

- Personal allowances (deductions) will be increased to £ 1,450 for single persons, £ 2,900 for married taxpayers and £ 1,950 for widowed persons
- The child deduction will be *reduced* from £ 195 to £ 100
- The band taxed at the standard rate of 35% will be reduced
- The relief for mortgage interest will be restricted to a maximum of 35% and will only be granted with respect to the borrower's main residence
- The relief for interest on personal loans will be abolished
- The deduction of business expenses for entertainment will be abolished
- The rate of Corporation Tax will be increased from 45% to 50%
- The effective tax payment days will be advanced by four months
- A levy on banks will be introduced as well as a levy of 1% on insurance premiums

Capital gains tax

- Tapering relief will be abolished
- The 30% standard rate will be increased to 40%
- Short term gains in the year of acquisition will subject to a 60% rate instead of 50%
- A special land development tax will be introduced at a normal rate of 50%; in some case the tax may be increased to 60% or reduced to 40%

The Taxation of Petroleum Products

Opinion of the Commission of the European Communities

On 11 September 1981 the Commission of the European Communities submitted the following communication to the Council (COM (81) final)

Contents

1. INTRODUCTION
2. ENERGY AND ECONOMIC POLICY
3. OIL TAXES: FINDINGS AND EFFECTS
4. OIL TAXES: A JOINT EFFORT

Annex

A. Taxation of oil products - Situation
   - excise duties
   - value added tax
   - exemptions and subsidies

B. Taxation of oil products - Effects on:
   - competitiveness
   - tax revenue
   - the demand for oil products

Tables 1-7

1. INTRODUCTION

1.1 At the same time that the impact of the second major increase in oil prices has made structural adjustments in the economy necessary everywhere to meet the changed circumstances regarding energy, the role of prices and taxation as an instrument both of energy policy and of economic policy has been increasingly recognized. In a Council resolution of 9 June 1980 the Ministers said that energy pricing should be based on the following principles:

- "consumer prices should reflect representative conditions on the world market, taking account of long-term trends;
- one of the factors determining consumer prices should be the cost of replacing and developing energy sources;
- energy prices on the market should be characterized by the greatest possible degree of transparency."[1]

1.2 In October 1980 in its communication on energy and economic policy,[2] the Commission:

- stressed the need to keep the trend of petroleum product prices as constantly consistent as possible with the general direction of energy policy;
- hoped that the Member States, insofar as they had an influence on the formation of prices, would try to avoid developments at the level of the final consumer which would discourage energy saving and diversification, that is, energy investment.

It is proposed as an objective:

- attaining a hierarchy of prices which would serve the aims of reducing dependence on external sources of oil and would act both as a deterrent (oil) and as an incentive (other sources of energy), reflecting both these two aspects of energy policy;
- preventing excessive differences in price structures as between Member States - which can be traced back, to a large extent, to the way in which different energy products are taxed - which, given their similarity of situation and the fact that all belong to the same market, cannot be justified.

1.3 It seemed desirable to take taxation, the subject of this paper, as a starting point for analysing the main factors which determine the levels, trends and reasons for differences in the prices of energy resources, the questions of pre-tax price formation for the different forms of energy, transparency and pricing itself being treated in a separate paper to follow.

2. ENERGY AND ECONOMIC POLICY

2.1 The medium-term Community strategy proposed in the Fifth Economic Policy Programme makes the reduction of reliance on external sources, that is to say of consumption of imported energy and especially oil, a major goal, whose attainment is dependent on two variables which ar economic in nature: energy investments and energy prices. This is the reason why the Commission has asked that increases should be passed on immediately and in full to the final consumer and on the other hand that any ensuing secondary inflationist effects should be as far as possible reduced to a minimum. In connection with this, in its communication on the principles of indexation in the Community,[3] the Commission tries to reconcile the economic concern of the moment - reducing the rate of inflation - and the longer-term objective - increasing energy indepence - and recommends exclusion from indexation of: "the impact of any changes in indirect taxes and certain public service prices" and "the rise in prices attributable to a deterioration in the terms of trade due, for example, to a rise in important raw material prices".

2.2 Having regard to the direction to be followed in energy matters, a price policy should be developed which made it possible both to:

- ensure *"true prices"*, which would mean that consumer prices fully reflected the costs of production, transport and distribution, and the investment costs of developing future sources, and to
- give the consumer as clear and stable a picture as possible of *price trends* so that both industry and households would be able to make rational investment decisions which would contribute to restructuring energy supply and demand.

In pursuing these objectives, however, account must also be taken of others, such as those laid down for energy saving, combatting inflation, tax revenue, social policy and the constraints experienced by energy producers (balancing, the budget, commercial policy, etc.).

2.3 Although a single general principle could be used to analyse price formation for the various forms of energy, it is obvious that since for each of them production follows its own individual course each form must be analysed separately (see the paper: Energy Prices: Policy and Transparency, to be transmitted to the Council). In the case of crude oil and refined products their prices are extremely unstable, and the fact that oil products dominate a large part of the energy market means that this instability is passed on to the other forms of energy.

2.4 Nonetheless, in the long term the price of oil will be mainly determined by the price of alternative forms of energy. For some uses, particularly as fuel and in the petro-chemical industry, there are hardly any substitutes for hydrocarbons, and alternatives to conventional oil could only come from oil shale, tar sands or coals. But for other pur-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

poses, in particular heat and electricity production, more economical alternatives already exist and the use of oil should be discouraged here.

2.5 Out of the range of energy products, those whose consumption absolutely must be reduced, petroleum products, are also those whose prices are most subject to control by the Member States in the form of taxation. Oil taxes are generally heaviest on those products for which there are few substitutes (see findings below). If in the medium term the price mechanism should have a role to play, taxation too should be used in such a way as to reinforce its effects. Also, many countries are faced with the need to limit or reduce their public deficits, which leads them to accord particular importance in their economic policies to analysing and controlling the sources of tax revenue.

2.6 The manner in which petroleum products are taxed must contribute to diminishing generally these clashes between objectives, provided the line followed here is consistent with macro-economic and energy policy. Action to achieve this is already both feasible and desirable at Community level.

3. OIL TAXES: FINDINGS AND EFFECTS

3.1 Unlike other forms of energy (coal, gas and electricity) on which there are vitually no taxes other than VAT (which is charged only on final consumption), on petroleum products there are specific charges (excise duty on mineral oils) which can be quite heavy. A detailed analysis of oil taxes, both the origin of and justification for the general arrangements and the exceptions, is given in the Annex, the main conclusions being the following:

- because of their yield in tax revenue, excise duties are heaviest on motor fuel (petrol and diesel) and quite light on furnace fuel;
- the adaptation of the rates of excise duties to general price trends has tended to be very irregular and belated in most countries;
- there are very substantial differences in the rates of excise duty applied in the different countries, particularly in the case of diesel fuel;
- the structure of excise duties varies from one member State to another;
- in all Member States there are different arrangements for exemptions or subsidies the economic justification for which in many cases is not obvious. The Commission proposes that the Council adopts as a principle their progressive elimination on the basis of a joint study with national administrations. Particular attention should be paid to air and inland waterways transport, agriculture and oil consumption within certain industrial sectors (e.g. refineries, petro-chemicals).
- with regard to VAT, the normal rates are usually applied (with the customary differences between countries), but some countries apply reduced or zero rates for certain products.

3.2 From these summary findings certain conclusions should be drawn as regards economic and energy objectives:[4]

- the products that are most heavily taxed are not those that offer the greatest opportunities for saving or the use of substitute products;
- the irregular timing of adjustments in excise duties has not generally contributed to smoothing price changes for oil products, which have been masked by sudden sharp movements in pre-tax prices;
- the delays in adapting excise duties to general price trends over the period 1973-81 has in many cases produced a substantial loss in potential tax revenue;
- the absence at European level of any concerted oil tax policy, both for the direction to be followed and the structure of taxation, has made users less aware of the absolute necessity of reducing oil consumption;
- lastly, certain differences in rates of taxation have provoked distortion of competition and have impeded the proper allocation of resources.

3.3 In practice it may prove difficult to make the changes needed to adapt oil taxation; at all events it will be necessary to spread the changes out over a certain period if economic activity is not to be disrupted, as the present systems of taxation affect both sectoral and regional economic structures. In addition the effect of such changes on the competitivity of firms could be important, at least in the short term, in sectors where oil prices form a major part of production costs. Time will also be needed on the supply side for refining structures to be altered. Furthermore, the complexity of tax structures, the interaction between the rates and the products covered by excise duties, the existence of other forms of taxation (on demand for but also on supply of petroleum products) and the multiplicity of objectives do not lend themselves readily to any single solution.

3.4 If the arrangements decided on led to an increase in public revenue, naturally, inflationist effects would have to be kept under control and deflationist effects averted. To this end, appropriate compensations should be sought in line with the budget situations of the individual Member States, so as to reduce the charges borne by Community undertakings, to increase the budget funds devoted to energy adjustment and to assist low-income categories of society directly affected by the rise in prices for certain petroleum products or the abolition of certain exemptions or reductions in the rate of taxation.

4. OIL TAXES: A JOINT EFFORT

4.1 The considerations set out above enable priorities to be defined for selecting the options that will give a system of oil taxation more in keeping with Community objectives. Ideally, oil taxes should:

- contribute to a more regular adjustment of oil prices, while maintaining a constant and substantial flow of tax revenue;
- encourage the adaptation of the structure of energy prices as a whole and the introduction of a price hierarchy for petroleum products which reflects energy objectives and thus prompts the realization of the major potential for saving and the use of substitute products that exists in the Community;
- reduce the differences in the tax structures and charges within the Community, particularly by keeping special arrangements (exemptions, subsidies) to a strict minium.

4.2 Obviously it would be desirable if oil taxation as a whole, or failing this, the structure of excise duties on mineral oils,[5] could be harmonized, and this would contribute to solving most of the problems, but would take a long time. Without waiting for this work to be terminated, and concurrently with it, objectives should be set that are in line with the general approach and will enable rapid progress to be made. These would include the following five practical goals:

- agreement that sizes for the tax burden to be applied in target areas should be set for each major category of product (i.e. the minimum and maximum incidence in relation to the prices net of tax for all excise duties and VAT), so as to have a direct impact on their price structures and bring them more in line with energy objectives;
- a joint decision of the rate of progression of the overall tax burden (excise duties + VAT) towards the target areas and on the proper balance between excise duties and VAT. Watch must be kept to ensure that changes in the tax burden remain at all times in line with target areas;
- a joint agreement on the need to adapt excise duties regularly, without however revising the level more than once a year;
- adoption of the principle of the gradual abolition, following a timetable jointly agreed, of exemptions, subsidies and reductions of the rate of taxation for particular uses where there is no longer any valid reason for keeping them;
- a decision that the Council should review the trends in energy and particularly oil taxes (both structures and rates) annually, to assess to what extent they contribute to achieving the objectives of economic and energy policy.

---

4. A detailed analysis of the effects of oil taxes on competitiveness, tax revenue and demand for petroleum products (particularly from the point of view of possible substitution effects) is annexed.

5. The Commission has already presented a proposal for a directive on the harmonization of excise duties on mineral oils (OJ No. C 92, 31 October 1973) which could provide a basis for any fresh discussion of the subject.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

ANNEX

A. TAXATION OF OIL PRODUCTS - SITUATION*

A.1 The tax burden on oil products is made up of specific charges (excise duties) and value added tax, which is levied on the sum of the excise duties and the price exclusive of tax. Table 1 gives the different levels of excise duty expressed in EUA and their incidence as a percentage of the price exclusive of tax, the rates of VAT and the total tax burden (excise duties + VAT as a percentage of the price exclusive of tax) as at 1 January 1973 and 15 July 1981.

A.2 However, discussion of the main features, with their effects, of the taxation of oil products must take account of two factors that impinge on the inferences to be drawn from the information set out below:

- in most countries, there are other ancillary tax measures that, to differing degrees, have a direct impact on the size of the overall tax burden on the use of certain oil products (e.g. axle tax in France, road taxes, taxes on the purchase of motor vehicles);
- the share of oil in energy consumption differs very significantly between some countries, particularly in energy-intensive sectors, whether as a result of policy decisions or as a result of the straightforward operation of the law of comparative advantages (see Table 2).

A.3 Excise duties

A.3.1 Since the taxation of mineral oils used as motor fuels was a potentially valuable source of tax revenue, Member States initially imposed high excise duties on them for the purpose of ensuring a steady and substantial flow of tax revenue. The subsequent increases in the duties on motor fuels were justified on several counts, e.g. the need to finance the infrastructure costs of private and commercial road transport, enviromental problems and, of course, energy conservation. As a result, excise duties were also levied on a variety of other oil products the use of which does not generally give rise to transport infrastructure costs.

In many cases, the aim of taxing these other uses of oil products was to protect indigenous energy resources, especially coal. Consequently, oil products are now taxed for purposes that differ not only from country to country but also from one oil product to another and even from one use to another of the same product. Taking the Community as a whole, the Member States' tax systems exhibit marked differences in both the rates and the application of excise duties for the entire range of oil products; and different arrangements governing exemptions and reductions for particular uses have come into being.

A.3.2 The level and trend of excise duties in the Nine as at 1 January of each year from 1973 to 1981 are given in Graphs A1 to A4. It will be seen that:

- as a rule, motor fuels (petrol and diesel oil) are much more heavily taxed than heating fuels (heating oil and heavy fuel oil);
- although all the nine countries have adjusted the levels of their excise duties during the period 1973-81, these still differ appreciably from one country to another; most important, owing to the impact of inflation, they have very seldom held their real value throughout the period: this applies particularly to motor fuels. Even though in many cases recent adjustments have restored the real value of excise duties at 15 July 1981 to levels near or higher than their value at 1 January 1973, they have nonetheless been substantially eroded over the period; this emerges clearly from Tables 4 and 6 and Graphs B1 to B4;
- in the case of motor fuels, excise duties on diesel oil show the greatest disparity between countries. They are identical to the excise duties on heating oil in Denmark and Italy (in the latter they are very low at only 4% of the duty on petrol), while in the United Kingdom they are the same as the duty on petrol (i.e. they are around 20 times higher than in Italy);
- generally speaking, excise duties on heating oil are low but there are quite appreciable differences between countries: expressed as a percentage of the price exclusive of tax, they range from 0 in Belgium to 16.1% in Denmark (where, however, the duty is refunded to persons subject to VAT if VAT on the purchase of oil products is deductible);
- in the case of heavy fuel oils, which for the most part are used in industry, the tax treatment of excise duties differs a great deal and this has an obvious bearing on competition. They are exempt in France and Belgium, but subject to excise duties amounting to 11.5% of the price exclusive of tax in Ireland, 7.1% in the United Kingdom (although there are exemptions for the oil industry) and as much as 24.5% in Denmark (where, however, the duty is refunded in the same way as that on heating oil);
- in the case of lubricants, the rates range from zero in a number of Member States to 211 EUA per tonne in Germany.

A.4 Value added tax

A.4.1 As regards value added tax, it has to be borne in mind that the practical effect of the system of deducting VAT in all Member States (except France, where VAT levied on oils other than heavy fuel oil is not deductible) is to exempt oil products used in industry, with the result that the entire burden of the tax is shifted to private consumption.

A.4.2 Since 1973, VAT rates have been raised in all Member States except Belgium (where the standard rate was cut from 18% to 16% in 1979, while most of the products chargeable at the reduced rate of 14% are now taxed at the standard rate of 16% and certain products are taxed at the increased rate of 25%) and France (where the rates have remained unchanged). Although these adjustments have applied across the board in that more often than not they have taken the form of a change in the standard rate, they have contributed to increases in the prices of oil products at final consumption and, primarily because VAT is an ad valorem tax, they have boosted tax revenue, thereby making up to some extent for the fact that excise duties had lagged behind the trend in the general price level.

A.4.3 Generally speaking, oil products are chargeable at the standard VAT rate, which ranges from 10% in Luxembourg to 22% in Denmark; but some member States apply different rates for different products:

(i) motor fuels are taxed at the reduced rate in Ireland (15%, with effect from 1 September 1981) and Luxembourg (5%), and at the increased rate in Belgium (25%);
(ii) heating fuels (heating oil and heavy fuel oil) are zero rated in Ireland and the United Kingdom, and taxed at the reduced rate of 5% in Luxembourg;
(iii) the reduced rate of 4% that was applied to diesel oil and heating fuels in the Netherlands was replaced in 1979 by the standard rate of 18%.

A.5 The structure of the taxation of oil products in the Community can thus be broadly summarized as follows:
VAT: falls on the final private consumer. Rates on motor fuels for road transport range from 5% to 25%; rates on other oil products range from 0% to 22%.
Excise duties: 90% or more of the excise duties levied affect motor fuels for road transport, which account for about 30% of all oil products consumed (see Table 3).

The range of rates of tax on petrol is fairly narrow, but there are wide differences between the rates applied to petrol and those applied to diesel oil, and the latter vary considerably from one country to another. Other oil products are for the most part taxed at fairly low rates or completely exempt. Differences in rates of tax on heavy fuel oil may be a direct cause of distortion of competition between industries.

A.6 In many cases, the aggregate revenue from the taxation of oil products was declining in real terms over fairly long periods between 1 January 1973 and 15 July 1981. It is clear that, in view of the enormous rise in prices net of tax (a five-fold increase over the period), the total tax burden (excise duties plus VAT as a percentage of prices net of tax) has declined considerably in all countries and, with a few rare execptions, for all products (see Table 2).

A.7 Exemptions and subsidies

A.7.1 As well as this wide variety of arrangements, which makes it difficult to assess the system as a whole, there are a number of exemptions, rebate schemes or reduced rates for specific uses. These special

* Graphs to which the Annex refers have not been reproduced.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

provisions are the subject of a Commission staff working paper entitled "Subsidies and tax exemption for energy consumption"[6] and are listed in tabular form in the document "Excise and VAT exemptions and reductions in favour of certain groups of mineral oil consumers"[7]; this conspectus is reproduced here as Table 7. It shows the special arrangements in force in the Member States for nine types of use:

(i) aviation: in most countries, consumption by commercial traffic is exempt from excise duties and usually from VAT as well (although VAT, when applied, is deductible except in France); consumption by executive aircraft is exempt from excise duties, and in general only consumption by private aircraft is taxed, although sometimes at reduced rates;
(ii) navigation in territorial waters: consumption is largely exempt in all countries for inshore navigation, fisheries and transport, while consumption by pleasure boats is normally subject to the standard rate;
(iii) agriculture and horticulture: consumption is usually exempt from excise duties or taxed at a reduced rate (the reduced rates in force for heating oil are often applied to motor fuels);
(iv) own use of oil products by refineries and the petrochemical sector is exempt everywhere;
(v) public transport: oil products used by the railways are either exempt (Germany and Italy), eligible for tax rebates (Denmark) or taxed at a reduced rate (Belgium, France, the UK, Ireland, Luxembourg and the Netherlands); only Germany refunds excise duties on consumption by public bus services, and it is to discontinue these arrangements by 1983; in the other countries, the standard rate on diesel oil is applied, except in Ireland and Italy;
(vi) consumption by diplomatic missions, international organisations and the armed forces of a foreign state is totally exempt everywhere;
(vii) reclaimed oils are subject to the standard rate of excise duty on lubricants only in Germany and Luxembourg, while Italy applies a reduced rate and other countries grant exemption.

A.7.2 Most countries, then, grant substantial tax reductions for most of these types of consumption. The justification for the reductions is not always obvious, for their origins are diverse: historical reasons such as international agreements, social reasons, technical reasons such as own use, tax reasons or even energy policy reasons. The Commission, in collaboration with national government departments, should carry out a detailed study of the implications and effects of abolishing certain exemptions, rebates or reduced rates, and the arguments for doing so, so that practical proposals may be presented along with a timetable for applying them.

Although each of the special schemes must be investigated in the light of all the reasons for its existence, certain situations should be given special attention. For example, energy considerations may well justify special treatment for consumption for the purposes of inland waterway transport or public transport (particularly by rail), or for own use, which often means the use of by-products with little productive potential that might be replaced by something less suitable if taxed.

B. THE TAXATION OF OIL PRODUCTS: EFFECTS

B.1 From the situation described above, a number of conclusions can be drawn about the effects of the taxation of oil products, or rather the effects of specific taxes in the form of excise duties, the main source of difficulties. We are concerned with the repercussions in three areas: competitiveness, tax revenue and the demand for oil products.

B.2 Competitiveness

Except in a few specific sectors, energy costs usually account only for a small part of aggregate production costs. However, it is clear that the impact of the price trend of oil products on production costs varies widely as a result not only of different structures of energy consumption, but also of differences in tax treatment, and this distorts relative price competitiveness. For example, the share of oil products in the total volume of energy consumed by manufacturing industry in 1979 varied from 22% in the Netherlands and Belgium to about 70% in Ireland and Denmark; the share in Germany was slightly over 30%, and the share in France, Italy and the United Kingdom about 40%. A comparable range of figures is observed in the residential/tertiary sector, although the ranking by countries is different. The Member States' different systems for taxing oil products, described above, frequently do not offset the effects of consumption structures, thereby amplifying differences in the competititve positions of European firms.

If certain excise duties were increased and periodically adjusted, there should be no major repercussions on the international competitiveness of most European exports: in fact, this might act as an additional incentive for investment to rationalize industry, which would improve competitiveness in general in the medium term. However, the sectors that are still heavily dependent on oil, or in which oil products account for a very large share of production costs (steel, man-made fibres, etc.) might find it extremely difficult to remain competitive.

B.3 Tax revenue

B.3.1 In none of the Member States is the policy governing the changes in excise duty rates amenable to logical analysis, in so far as it is based neither on the general movement in prices nor on the requirements of energy policy, whether in the direct measures to discourage consumption of mineral oils or in the indirect measures for manipulating the prices of products that can be substituted for mineral oils.

Many Member States have allowed the specific rates of the excise duties on mineral oils, or at least some of them, to lag behind the general trend in prices. In so doing, they have generally lost sight of the primary objective of excise duties, which is to raise revenue for the State. An illustration is provided by Table 4, which clearly shows that revenue from the excise duties on mineral oils expressed as a precentage of GDP has fallen in many countries, whereas consumption of motor fuels - which account for the major proportion of excise duties - has increased in all countries.

B.3.2 Table 6 gives an estimate of the revenue forgone owing to the failure to adapt excise duty rates in line with the general movement in prices. Thus, if excise duties had been increased each year from 1973 to 1979[8] in step with the overall rise in prices, several countries would have collected appreciably higher revenue each year: aggregated over the period from 1973 to 1979, this "extra" revenue, calculated at current prices, would in some cases have nearly amounted to their total revenue for a single year. The figures also show up differences of approach: some countries have adapted excise duties comparatively frequently; others, some years after the first oil shock, have suddenly increased the rates in an effort to catch up; and in others again, the rates have constantly lagged behind the general movement in prices.

B.3.3 However, this finding must be qualified by the fact that, since VAT is an ad valorem tax and oil prices net of tax have been rising steeply, VAT revenue has increased substantially, thereby offsetting the effects on tax revenue of the slow increase in excise duties.

B.4 Demand for oil products

B.4.1 A distinction must be made between the very different markets for oil products. These markets reflect a clear division between private consumption, that of the tertiary sector and that of the productive sector - with its own economic impact.

B.4.2 *Motor fuels:* in this market, there is practically no substitute for oil in the short or medium term. However, consumption could certainly be made more efficient: recent studies suggest that the price elasticity of demand is generally greater than has hitherto been assumed (ranging form approximately -0.2 to -0.4 in the short term and from -0.4 to -0.9 in the long term).

Even leaving aside additional ways of taxing consumption (e.g. road tax), the present level of taxation of motor fuels is very high compared with that of other products. However, a distinction must be made between petrol and diesel oil. Excise duties on petrol are high, but had their real value been maintained from 1973 to 1980 they would in many cases have been much higher by now and the revenue to the State correspondingly larger, without making an excessive impact on the price inclusive of all taxes (see Table 5). In five countries, the price

7. SEC(81)1314 of 31 August 1981.
8. At this point the calculations cannot be taken beyond the year 1979. The 1980 figures will probably be available in the autumn.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

of petrol would have been approximately 15% higher on average in 1980, which, in view of the price elasticities of demand, might well have led to appreciable savings. In all the countries, diesel oil is taxed at lower levels than petrol, often much lower. Whereas in the past diesel oil was used by and large only in the commercial and productive sectors, the proportion of moter vehicles using it is now increasing rapidly. As the present levels of excise duty on this product in many countries do not encourage energy savings, it would be desirable for taxation on motor fuels to be aligned, i.e. the lowest levels of excise duty on diesel oil should be increased. Steps should also be taken to ensure that the structure of excise duties does not encourage substitution by other forms of energy such as liquified petroleum gas which offer few or no advantage from the viewpoint of energy policy.

B.4.3 *Heating oil:* this product is used mainly in the tertiary and residential sectors for heating. The most attractive substitutes are natural gas, district heating and electricity in the form of electric heat pumps. In all countries, there is considerable potential for conserving energy and for rationalizing consumption through house insulation, inspection and maintenance measures, etc. The current level of taxation (excise duties and VAT) is generally low, although it varies greatly according to country. There are therefore grounds for increasing the level of taxation where it is at present particularly low. Here again, however, one must guard against encouraging a massive switch to the single alternative of natural gas.

B.4.4 *Heavy fuel oil:* the prospects of using substitutes for this product are good, because it is consumed by industry where electricity, coal and gas offer satisfactory alternatives. The level of excise duties is generally low, but there are substantial differences between countries. Besides the problem of competitiveness which arises from this situation, there is little encouragement to conserve energy and adopt alternative processes. For both reasons, the excise duty rates in the Community should be brought up to a common level.

B.4.5 *Non-energy consumption:* in addition to the uses described, oil is also used as a feedstock, particularly in the form of naphtha (chemically similar to petrol). No tax is currently imposed on this use. Since there is as yet no possibility of substitution and since the potential for making savings is limited, there is little reason to introduce significant levels of excise duty.

UNICE and Taxation of Petroleum Products

On 2 February 1982 UNICE gave its opinion on document COM(81) 511 final of 9 September 1981, "Taxation of Petroleum Products" (Commission Communication to the Council)

1. SUMMARY OF THE COMMUNICATION TO THE COUNCIL

The Communication of the Commission is an argument in favour of joint efforts as regards taxes on oil. Although the Commission is concerned with economic policy, energy policy and public finances, the energy aspects are given as the main basis for the proposals made. The Commission sets out its views on various energy problems, especially as regards energy saving and substitution. The present incentives and achievements in the matter of energy saving and substitution are regarded as inadequate. In this connection the Commission argues that the level of prices of oil products should be raised by means of taxes, especially on heating oil and heavy fuel oil so as to accelerate the adjustment processes necessary.

2. ASSESSMENT OF THE COMMISSION'S PROPOSALS

The points made below refer essentially to energy policy, since this is the issue which looms largest in the Commission document. More attention and weight is naturally given here to industrial production and use aspects than to private consumption. Account is also taken of general economic policy considerations.

2.1. View of the Commission's diagnosis of energy problems

UNICE does not at all go along with the Commission thesis that petroleum product prices are not high enough to encourage saving and substitution and should therefore be raised by means of taxes.

The need for investment to cope with energy constraints is fully recognised by business and industry, which act accordingly wherever possible. The price mechanism has clearly played an effective part. A few figures, chosen among many others, illustrate this:

- whereas at the end of the 70s about 80% of the boilers ordered by German Industry were fuel burning, the figure had fallen to 40% (i.e. by half) by 1980. (The new trend being in the direction of (1) fuel/gas boilers using interruptable supplies of gas, and (2) boilers using residual heat or heat from waste);
- in German Industry the yearly consumption of heating oil (light and heavy fuels) dropped from 40 million TCE in 1973 to 25 million TCE in 1980. A further fall of 4 million TCE is expected in 1981, bringing down consumption to 21 million. These figures are a good reflection of Community figures as a whole.

Hence, even before considering the technical details of the Commission's proposals, there is the serious question of deciding whether the proposals are desirable and necessary at all.

2.2. Economic, technical and political problems created by the fiscal measures recommended

Irrespective of the issue whether the public authorities really need to add other general incentives to the price mechanism, one must admit that resort to taxation, at any rate, is not necessarily an effective way of coping with energy constraints.

This can be shown as follows:

a) as mentioned above, there may be serious technical obstacles to investment. For instance, many big firms which would be interested in converting to coal do not always have the extra space necessary for handling this sort of fuel. SMEs, on the other hand, might have financial problems. Account must also be taken of the procedures for obtaining authorisation, which can be long drawn out.

   Increasing fiscal pressure does not help here. All it does is to erode the financial resources of consuming firms. Moreover, in the case of administered prices, tax increases often diminish the flexibility of pretax prices, with adverse effects on the financial situation of enterprises.

b) A deliberate increase in the price of oil products could, in times of supply difficulties, encourage the OPEC to hasten the upward movement in the price of crude oil.

c) The principle of a gradual elimination of fiscal exemptions enjoyed by oil refineries and petro-chemical concerns throughout the Community in respect of oil products used in production can be objected to on three counts:
   - first of all, the oil and petro-chemical sectors are definitely among those which for 10 years have been making consistent efforts to save energy, and have obtained good results. No further incentive is needed here; far from encouraging investment, the use of taxes would hinder it, by diminishing the financial resources which could be devoted to investment in rational use of energy. Furthermore, this would penalize the use of residual petroleum products as a source of process heat, which is precisely a good example of rational use of energy;
   - the elimination of the exemption would only exacerbate the competitive disadvantage suffered by the EEC relative to oil producing countries which are increasingly interested in on-the-spot refining. This would mean creating additional difficulties for a sector which already has serious adjustment problems;
   - the general exemption situation at the moment has the advantage of providing perfect fiscal harmonisation at Community level.

d) In addition to this specific matter, it is obvious that the measures proposed would be detrimental to the competitiveness of European Industry as a whole compared with its international rivals, especially as regards chemicals. Further difficulties would be created on the employment level. The remedies proposed therefore are the carriers of even more serious diseases.

e) Quite apart from these outside considerations it must be said, too, that the views of the Commission on replacing petroleum products are not always very clear.

   As regards heavy fuel, it must be remembered that electricity cannot be regarded as a good substitute if it is produced from oil products or natural gas.

   Replacing heavy fuel by natural gas often is not the best solution either, especially in Member Countries that do not have natural gas deposits. There is a danger that one might replace dependence on oil by an equally harmful dependence on natural gas.

   Furthermore, one cannot see the logic of introducing a hierarchy of energy prices so as to encourage substitution. In paragraph 2.4 it is stated that "more economical alternatives (than oil) already exist, and the use of oil should be discouraged here (production of power and heat)". If oil substitutes are more economical to use, and are offered in sufficient quantities, it is odd that it should be necessary to discourage firms from using oil. If, on the other hand, the oil substitutes are not yet offered in sufficient quantities, it would be dangerous to aim at increasing the price of oil so as to discourage its use as energy, since this would mean pushing up industrial production costs before the more economical factors were available.

   It would be pointless, and dangerous, therefore, to try to reduce dependence on oil and to encourage the use of other energy sources before ensuring the necessary supplies of the substitute.

Among many sectors where the taxation envisaged would only add to production costs, one could quote inland waterway transport, where the possibilities of finding a substitute for diesel engines are practically nil. It is unthinkable that sectors hit by depression, such as the steel industry, should be saddled with extra costs for the transport of raw materials and finished products. This applies, of course, to other industrial sectors too.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

2.3. Taxation as a means of smoothing price changes

The Commission considers that price policy should provide consumers with indications, as clear and as far-sighted as possible, as to future price developments, and that, in this context, taxes on petroleum could help to ensure more regular adjustments in oil product prices.

UNICE does not find this argument very convincing. The regular tax adjustment proposed would imply clear and reliable forecasts as to the quantities of petroleum available, movements in the price of other energies, the shape of demand, political factors and technical progress. A great deal has been written to show the fallibility of energy forecasting and it would be dangerous for the economy to be dependent on guidelines provided by a central forecasting body.

The Commission suggests that tax adjustments should aim at preventing temporary falls in price, possibly through the building up of financial reserves in time of price falls, which could be used to delay the next rise, or spread it over time. Industry does not wish to lose the benefit of any fall in price that might occur. Furthermore, as to the question whether price movements should be carefully evened out, the point could be made that the instability of the petroleum market is a strong argument for dropping this source of energy, wherever this is technically possible.

2.4. Conclusion: Which tax harmonisation strategy?

The general discussion about tax harmonisation in the Community is not new, and UNICE has, on several occasions, expressed support for moves in this direction, so long as the approach was across the board and neutral.

In this conection UNICE would like to make a few suggestions which, necessarily modest, call for more thorough studies with public authorities.

a) Motor fuel taxation should be studied in the context of the overall taxation of vehicles, which includes a series of taxes (VAT on purchase, road taxes, etc.), which must also be taken into account for achieving real harmonisation.

b) If one wishes to make progress in the matter of harmonising taxes on heating fuels (gas-oil and fuel), one must firmly keep in mind the fact that taxes on heating oil constitute only a small proportion of taxes on oil products generally (7.3% of receipts). The tax effect on the selling price of these products is limited too. It might therefore be simplest to limit taxation to motor fuels, leaving industrial fuels exempt througout the Community, which would mean harmonisation.

c) This zero level tax harmonisation as regards industrial fuels would only make sense if all energy products used by industry were looked at from the angle of fiscal harmonisation. The fact is that, in a given country, users may find a favourable tax situation as regards some energy products, and an unfavourable one as regards others. Altering the tax situation of one energy source could upset the prevailing pattern and balance. In general, it must be realised that intra-Community differences as regards taxes on energy can have a compensatory effect by off-setting other intra-Community differences in the matter of productivity, interest rates, wages costs, etc.

Contents

of the June 1982 issue

William W. Chip and Steven S. Snider:

FEDERAL TAXATION OF FOREIGN GOVERNMENTS, INTERNATIONAL ORGANIZATIONS AND THEIR EMPLOYEES IN THE UNITED STATES **243**

A decade ago the Bulletin published an article exploring the historical backgrounds of U.S. taxation of foreign governments, international organizations and their employees. The present article discusses the current situation regarding income taxation and pays also attention to estate and gift taxation.

CONFERENCE DIARY **248**

Milwida M. Guevara:

THE DYNAMICS OF PROPERTY TAX DELINQUENCY IN THE PHILIPPINES: A CASE STUDY **249**

The author discusses the problems connected with the imposition and collection of local property taxes. These problems are not confined to the Philippines but seem to be universal in character.

Parimal M. Parikh:

OVERSEAS INDIANS AND THE FINANCE BILL 1982 ..... **253**

Discussion of new incentives to Indians abroad for investment in India.

Erwin Spiro:

THE 1982 INCOME TAX CHANGES IN THE REPUBLIC OF SOUTH AFRICA **258**

Discussion of the Budget presented by Prof. Owen Horwood, Minister of Finance, on 24 March 1982. The Government aims at restricting public spending and curbing monetary demand. The rate of corporation income tax will be increased.

SOUTH AFRICA: BUDGET 1982-83 ..... **260**

Extracts from the Budget speech pronounced by Professor Owen Horwood, Minister of Finance, on 24 March 1982.

Pedro Massone:

PERU: NEW TAX AMENDMENTS – DEVELOPMENTS IN LATIN AMERICA **264**

This article discusses recent tax amendments which were introduced after the Peruvian tax reform.

IFA NEWS **265**

Piroska E. Soos:

INCOME OF FOREIGN CORPORATIONS SUBJECT TO TAX IN THE U.S. **266**

Revenue Ruling 82-16 holds that a portion of the dividend received by a controlled foreign corporation from its wholly owned foreign subsidiary is excluded from the controlled foreign corporation's "Subpart F income".

G. Thimmaiah:

INDIA: HOW PROGRESSIVE ARE THE DIRECT TAXES? **267**

The author shows that direct taxes in India are not progressive and do not serve to reduce inequalities of income.

HONG KONG: BUDGET 1982-83 ..... **271**

Extracts from the Budget Speech pronounced by the Financial Secretary, Mr. John Bremridge, on 24 February 1982.

CUSTOMS CO-OPERATION COUNCIL **275**

Study of the task and functioning of the Customs Co-operation Council.

INHALTSVERZEICHNIS

William W. Chip und Steven S. Snider:

Die Besteuerung von ausländischen Regierungen, internationalen Organisationen und deren Angestellten durch die U.S.–Bundesbehörden 243
Vor einem Jahrzehnt widmete das *Bulletin* der Besteuerung von ausländischen Regierungen, internationalen Organisationen und deren Angestellten durch die U.S.–Steuerbehörden einen Artikel, der die historischen Hintergründe erläuterte. Dieser Artikel stellt die gegenwärtige Situation dar, wobei neben der Einkommensbesteuerung auch der Nachlass- und der Schenkungsteuer Aufmerksamkeit geschenkt wird.

Veranstaltungskalender 248

Milwida M. Guevara:

Pflichtverletzungen bei der Erhebung der Grundstücksteuer auf den Philippinen: Eine Fallstudie 249
Der Verfasser untersucht die Probleme, die im Zusammenhang mit der Erhebung und Einziehung der lokalen Grundstücksteuer bestehen. Diese Probleme scheinen nicht auf die Philippinen beschränkt zu sein, sondern dürfen weltweit bestehen.

Parimal M. Parikh:

Im Ausland lebende Inder und die Finance Bill 1982 253
Darstellung der neuen steuerlichen Anreize, die im Ausland lebende Inder für Investitionen in Indien beanspruchen können.

Erwin Spiro:

Die Steueränderungen im Haushaltsjahr 1982 in Südafrika 258
Analyse des Haushaltes 1982, der am 24. März vom Finanzminister, Herrn Prof. Owen Horwood, vorgelegt wurde. Die Regierung zielt darauf ab, die öffentlichen Ausgaben zu beschränken und den Geldmengenbedarf zurückzuschrauben. Eine Erhöhung des Körperschaftsteuersatzes ist vorgesehen.

Südafrika: Der Haushalt 1982-83 260
Auszüge aus der Haushaltsrede des Finanzministers, Professor Owen Horwood, gehalten am 24. März 1982.

Pedro Massone:

Neue Steuerrechtsänderungen in Peru – Entwicklungen in Lateinamerika 264
Dieser Artikel behandelt kürzliche Änderungen im Steuerrecht von Peru, die nach der grossen Steuerrechtsreform in Kraft traten.

IFA Mitteilungen 265

Piroska E. Soos:

Die Besteuerung von Einkünften von ausländischen Gesellschaften in den U.S.A. 266
Das Revenue Ruling Nr. 82-16 stellt fest, dass ein Teil der Dividenden, die eine beherrschte ausländische Gesellschaft von ihrer 100%-igen ausländischen Tochtergesellschaft erhält, von der "Subpart F income"-Besteuerung für beherrschte ausländische Gesellschaften ausgenommen ist.

G. Thimmaiah:

I. INTRODUCTION

Citizens and residents of the United States, and certain non-resident aliens as well, are subject to a bewildering variety of U.S. taxes imposed at the federal, state, and local levels. The federal government imposes taxes on income, gifts, transfers by reason of death, and certain other items not considered in this article. All states impose taxes on income or sales or both. Most cities and counties tax the ownership of real and even personal property and some, such as New York City, impose an income tax as well. The many outposts of foreign governments in the United States and the numerous international organizations that are located there, and of course the employees of both, are naturally interested in the extent to which they are subject to this complicated tax regime. Because the federal taxes are usually the highest, and because the state and local rules often follow the federal treatment, the focus of the potential taxpayer's concerns and of this article is on taxation at the federal level.

A decade ago this *Bulletin* published an article that thoroughly explored the historical background of U.S. income taxation of foreign governments, international organizations, and their employees and described the state of the law at the time.[1] Since then, new regulations have been issued concerning the income taxation of official foreign entities, while legislative, judicial, and administrative developments have taken place that will have a significant impact on the income tax status of their employees. An updated review of these topics therefore appeared to be in order. In addition, due to expanding investment by alien individuals in U.S. property, attention to estate and gift taxation of international organization and foreign government employees is also timely.

II. TAXATION OF FOREIGN GOVERNMENTS AND INTERNATIONAL ORGANIZATIONS

Section 892 of the U.S. Internal Revenue Code provides that the investment income of "foreign governments or international organizations" from United States sources shall be exempt from United States income taxation. In contrast, income derived from "commercial activities" within the United States is not exempt.[2] Accordingly, whether a foreign entity is taxable on its income from United States sources will be determined by (1) whether the entity falls within the statutory definition of "foreign government" or "international organization" and (2) whether the income from United States sources is derived from "commercial activities" or from investment.

A. Foreign governments

The term "foreign government" is not defined by the Internal Revenue Code, but is defined in the regulations under section 892. The regulations state that the term "foreign government" applies to all "integral parts or controlled entities of a foreign sovereign".[3] The terms "integral part" and "controlled entity" are then separately defined.

3. Id. § 1.892-1(b)(1).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

An "integral part" of a "foreign sovereign" is defined in the regulations as any body, however designated, that constitutes a governing authority of a foreign country.[4] Prior to issuance of the regulations, the Chilean *Corporación de Fomento de la Producción* had been held by the U.S. Tax Court to be an "integral part" of the Chilean government.[5] In addition, numerous foreign cultural organizations have received rulings from the Internal Revenue Service that they qualify as "integral parts" of a foreign sovereign.[6]

A "controlled entity" of a foreign sovereign is defined as an entity juridically separate from a foreign sovereign that meets all of the following requirements: (1) it is wholly owned and controlled by a foreign sovereign, directly or through other "controlled entities"; (2) it is organized under the laws of the foreign sovereign that owns it; (3) its net earnings are credited to its own account or to other accounts of the foreign sovereign without inuring to the benefit of any private person; and (4) its assets vest in the foreign sovereign upon dissolution.[7] Examples of entities that have been found by the Internal Revenue Service to be "controlled entities" are certain foreign central banks of issue,[8] the Foreign Currency Board of an unnamed country,[9] an export-import loan authority,[10] a government-owned hospital,[11] an orchestra association,[12] and a tourist board.[13] The regulations specifically provide that a pension trust for foreign government employees is a "controlled entity" if the trustees are appointed by the foreign government and the pension plan provides for definitely determinable benefits.[14] Favorable rulings have been issued to several such trusts.[15] Even if they do not fall within the special pension trust provisions of the regulations, government sponsored welfare benefit programs may qualify as "integral parts" or "controlled entities" of a foreign sovereign. An example is the favorable ruling issued in 1979 to a foreign "fund" providing "sickness, injury, bereavement and old age" benefits, not limited to government employees.[16]

Entities owned and controlled by more than one foreign sovereign are not considered "controlled entities",[17] and the East Caribbean Currency Authority and an unnamed "fund" were each ruled not to be a "controlled entity" on this basis.[18] A number of governments may, however, collectively constitute a "foreign government".[19] The test is whether the group as such is empowered to exercise, independently, substantial governmental powers binding the member governments.[20] Under this test the European Economic Community, the European Coal and Steel Community, and the European Atomic Energy Community were held to be "foreign governments".[21]

B. International organizations

The term "international organization", unlike the term "foreign government", is defined in the Internal Revenue Code. Section 7701(a)(18) of the Code defines "international organization" as any "public international organization" afforded the privileges of the International Organizations Immunities Act. The latter Act is codified at sections 288 to 288i of Title 22 of the U.S. Code. Under section 288 the entities afforded the privileges of the Act are "public international organizations" (1) in which the United States participates pursuant to any treaty, or otherwise under the authority of Congress, and (2) which shall have been designated by the President as qualifying for such privileges through an Executive Order. The forty-six organizations that have to date been so designated are listed in the appendix to this article.

C. Commercial activities

As noted above, neither "foreign governments" nor "international organizations" are exempt from tax on their income derived from "commercial activities". Any activity conducted in the United States of the sort ordinarily conducted with a view towards production of income is a "commercial activity" unless the regulations under section 892 specifically provide otherwise.[22] The following activities are listed in the regulations as not constituting "commercial activities": investing in corporate shares, even though they represent a controlling interest; investments in bonds, other securities, loans, net leases, or unproductive land; holding bank deposits; presenting amateur athletic exhibitions; giving cultural performances; purchasing goods for use of the foreign sovereign; engaging in activities not constituting a trade or business in the United States; and engaging in activities not customarily carried on for profit.[23]

III. REMUNERATION FROM A FOREIGN GOVERNMENT OR AN INTERNATIONAL ORGANIZATION

Section 893 of the Internal Revenue Code provides that the wages, fees, or salary of any alien employee of a "foreign government" or "international organization" received as compensation for services to such government or organization is exempt from United States taxation. If the alien is employed by a foreign government, the character of the services performed must be similar to those provided by employees of the U.S. government outside the United States, and the foreign government must grant an equivalent exemption to employees of the U.S. government.[24] Although the law requires that the

State Department shall certify to the Treasury that these two requirements have been met in the case of each foreign government,[25] we are aware of only two cases in which an alien employee of a foreign government was taxed because no such certification was issued with respect to his government.[26]

For purposes of section 893, consular or other officers, as well as non-diplomatic representatives, are treated as foreign government employees.[27] However, former employees of foreign governments and international organizations are not protected by section 893.[28] For example, the Internal Revenue Service has ruled that a former employee of a foreign government was taxable on his pension from that government.[29]

An alien employeee of a foreign government or international organization that wishes to obtain or retain U.S. immigrant status must file a waiver of any exemptions under the law deriving from his occupational status.[30] In most cases, the filing of such a waiver will void the application of section 893 to the alien, and he will become taxable on remuneration from his foreign government or international organization employer.[31] The waiver, however, will not eliminate the exemption if it is based upon a treaty with the foreign government or the articles of agreement of the international organization.[32]

The term "foreign government" is not defined in section 893 or the regulations thereunder, but the regulations under section 892 provide that the term "foreign government" has the same meaning for purposes of section 893 as it does for purposes of section 892.[33] Thus, the principles, discussed in the preceding section, that determine whether an entity itself qualifies for tax exemption as a "foreign government" should also determine whether wages, fees, and salaries paid by the entity to its alien employees are also exempt from taxation. In the case of "international organizations", the regulations again make clear that the same criteria apply for purposes of both sections 892 and 893.[34]

IV. THE DETERMINATION OF RESIDENCY STATUS

The taxation of income which is unrelated to a foreign government or international organization employee's official duties will depend upon whether the employee is a resident or non-resident of the United States. If the employee is a non-resident alien, he will be taxed on fixed and determinable income from U.S. sources, such as rent from U.S. property and dividends and interest from U.S. corporations, at the rate of 30% of the gross amount of such income.[35] In addition, he will be subject to tax at the rate of 30% on net U.S. capital gains, other than gains from the sale of U.S. real estate, if he is present in the U.S. for 183 days or more during the taxable year in which such gains are realized.[36] Capital gains realized from the sale of U.S. real estate (or the sale of stock in a corporation primarily holding U.S. real estate) are subject to tax on essentially the same basis as they are to a U.S. resident, except that a minimum amount of tax, generally equal to 20% of the gain, must be paid.[37]

If the employee is a resident alien, he will be subject to U.S. income tax, according to the progressive schedule of rates applicable to U.S. citizens, on all of his worldwide income (except for wages, fees, and salaries from his foreign government or international organization employer). Foreign income tax paid with respect to foreign source income is usually creditable against the U.S income tax on such income.[38]

Under the income tax regulations, all aliens are presumed to be non-resident aliens for income tax purposes.[39] The regulations also provide, however, that this presumption may be rebutted by acts showing an intention to acquire residence or by a stay of such an extended nature as to constitute the alien a resident.[40] A definite intention to acquire residence is apparently manifested by the absence of any definite intention concerning the length and nature of the alien's stay in the United States,[41] and a stay of one year is of "such an extended nature" to create the presumption of residence.[42] In short, the alien is a resident unless he has a definite intention to leave after accomplishing a purpose that does not require an extended stay. If he stays more than one year the burden of proving his intention shifts from the Internal Revenue Service to the alien.

The determination of the alien's intentions is based solely on objective manifestations of such intentions. No statement made to the immigration authorities, nor any document issued by a foreign government evidencing the establishment of residence abroad, can guarantee that an individual will be accorded non-resident status. Instead, such factors as the length of his stay in the United States; the nature, extent, and reasons for his temporary absence from a foreign home; his visa classification; the size and nature of his physical dwelling in the United States; and the extent of his integration into U.S. society will determine whether an alien is a U.S. resident.

An alien whose stay in the United States is limited to a "definite period" by the immigration laws is considered under the income tax regulations to be a non-resident "in the absence of unusual circumstances".[43] In practical terms, therefore, visa classification should usually be the most significant factor in determining residence, al-

though it is not entirely clear what the regulations mean by a "definite period". D-1 (alien crewman) visas have been held to limit residence to a "definite period" within the meaning of the regulations,[44] but there is otherwise no authoritative guidance. In our view, visas such as B (visitor), J (exchange student or scholar), and L (intracompany transferee) visas, which limit the holders' stay to 12 months or less,[45] are probably "definite period" visas. Visas such as F (student) visas and most G (international organization employee) visas, which limit the holders' stays only to the time they continue pursuing the activities on which their status is based,[46] may not be "definite period" visas.

An alien seeking to retain his non-resident status should also consider the following possibilities: leasing accommodations in the U.S. for short periods of time rather than purchasing them; continuing to own and occupy his home abroad; maintaining an office and substantial business operations abroad; not owning a car in the U.S. and not applying for a U.S. driver's license; not belonging to clubs and churches in the U.S., but continuing affiliations with and contributions to such groups abroad; not maintaining substantial savings or checking accounts in the United States; using traveler's checks and international credit cards rather than local charge accounts for purchases in the U.S.; and continuing to designate a foreign place of residence or domicile in legal documents and in formal correspondence. Although it is not necessary for an alien to comply with all of these recommendations in order to qualify as a non-resident, the more closely they are followed, the stronger will be his case for treatment as a non-resident. Unfortunately, the Internal Revenue Service will not rule in advance on the resident status of an alien if the determination depends on facts that cannot be confirmed prior to the end of the taxable year.[47]

V. ESTATE AND GIFT TAXES

Residents of the United States are taxable on the transfer of property by gift or bequest. However, a $10,000 per-donee, per-annum exclusion from the gift tax,[48] combined with a lifetime gift and estate tax credit of $62,800,[49] means that substantial amounts of property must be transferred before any gift or estate tax is actually payable. Resident aliens are taxable on gifts and bequests of property wherever situated within or without the United States. Non-resident aliens, by comparison, are taxable only on gifts and bequests of property situated within the United States.[50] Generally, for both gift and estate tax purposes, stock in U.S. corporations and the debt obligations of U.S. persons are deemed to be situated within the United States, while stock in foreign corporations and the debt of foreign persons are deemed to be situated without the United States.[51]

The test of residence for estate tax purposes is whether the individual is "domiciled" in the United States at the time of death.[52] In the United States the term "domicile" connotes a more permanent attachment than the term "residence". It is determined, not by length of stay, but by whether one has a "definite present intention" to depart at a later date.[53] Employees of foreign governments and international organizations who wish to avoid U.S. estate and gift tax on their overseas property must take care to preserve their foreign domiciles because the Internal Revenue Service has recently ruled that holding a G-4 or A-1 visa is *not* conclusive evidence that a U.S. domicile has not been established.[54] A number of countries have Estate and Gift Tax Treaties with the United States that may bear on a particular individual's liability for these taxes.[55] Nationals of these countries contemplating large gifts or bequests should examine the pertinent provisions of applicable treaties to ascertain their rights.

VI. SALE OF PERSONAL RESIDENCE

Because of the possibility for substantial appreciation and the very generous deductions allowed homeowners against otherwise taxable income, many U.S.-based employees of foreign governments and international organizations will purchase one or more personal residences during their stay in the United States. In our experience the consequences arising from the sale of their personal residences is the tax question most commonly faced by such employees.

As noted above in Part IV, a non-resident is taxable on essentially the same basis as a resident on gain from the sale of real estate, and this rule also applies to the sale of a personal residence. Gain from the sale of a personal residence is "capital gain" rather than "ordinary income". This is principally significant if the residence has been owned for more than one year, in which case the gain is "long-term capital gain". In computing his taxable income, an individual may deduct 60% of any long-term capital gain.[56]

The tax laws provide relief to an individual who sells his personal residence and purchases a new residence during the 24-month period preceding, or the 24-month period following, the sale of the old residence.[57] If the individual buys a new residence within the prescribed period, he is

taxable on gain from the sale of his old residence only to the extent the "amount realized" from the sale of his old residence exceeds the "cost" of his new residence. For this purpose, the "amount realized" from selling the old residence is reduced by sales commissions, legal fees, and other costs incident to selling the old residence, including certain expenses for work performed on the old residence to assist in its sale.[58] Conversely, the "cost" of the new residence includes fees, commissions, and other expenses incurred in acquiring it, unless they are deducted for U.S. income tax purposes.[59] Mortgage "points", for example, may qualify as interest and, if they do, are deductible in computing taxable income.[60]

This relief from tax on the sale of a personal residence appears to be available even if the individual acquires his new residence outside the United States, provided he was a resident alien at the time he sold his old residence.[61] Indeed, if the alien moves outside the United States, the period during which he must acquire his new residence is extended from two to four years.[62] If, however, the alien was a non-resident at the time he sold his old residence in the United States, relief from taxation is not available unless the new residence is also located in the United States.[63]

Another form of tax relief for homeowners is an exclusion from income of up to $125,000 of gain from the sale of a personal residence if the homeowner is at least 55 years old at the time of sale.[64] A taxpayer may elect this exlusion with respect to only one sale in his lifetime.[65]

VII. U.S. INCOME TAX RETURN FILING REQUIREMENTS

A non-resident alien is required to file a return on Form 104NR if he was engaged in a trade or business in the United States at any time during the taxable year,[66] he has elected to report income from real property on a net basis,[67] or there was underwithholding from U.S. source fixed or determinable annual or periodical income, such as interest or dividends.[68] Employment in the United States with a foreign government or international organization presumably constitutes a U.S. trade or business, and employees of these organizations should therefore file a return unless their gross income, exclusive of exempt wages, is less than $1,000.[69]

A non-resident alien married to a U.S. citizen or resident may elect to be taxed as a resident alien in order to file a joint return with a citizen or resident spouse and thereby qualify for the generally lower rates applicable to individuals filing joint returns.[70] An alien employee of a foreign government or international organization would not subject his remuneration to taxation by electing to be taxed as a resident, because the exemption of such income from tax under section 893 is based on citizenship rather than residence.[71] Under regulations recently proposed by the Internal Revenue Service, a non-resident alien who makes the election in order to file a joint return may not claim to be a non-resident for purposes of any U.S income tax treaty.[72] Although the election may later be revoked, once revoked it may never be made again between the same individuals.[73] The election should not, therefore, be made without careful consideration of the couple's future tax planning needs.

If an alien changes his status from resident to non-resident during the taxable year, he may be taxed "as though his taxable year were comprised of two separate periods", and the tax liability for each period will be computed under its own set of rules.[74] In determining a dual-status taxpayer's tax rate for the year, however, all income must be taken into account, including any part earned during the period of non-residence.[75] A dual-status taxpayer's exemptions for himself, his spouse and dependents may not exceed the taxable income for the period he is a resident alien.[76] If the dual-status taxpayer is a resident alien at the end of the taxable year, he may elect to be taxed as a resident alien for the entire year.

To file as a dual-status taxpayer, the employee should file Form 1040 and write across the top of the return "Dual-Status Return". A separate schedule must be attached to his return to show the income for the part of the year he was a non-resident. Form 1040NR may be used as a separate schedule, but the employee should mark "Statement" across the top thereof.[77]

If the U.S. residency is established after the commencement of a calendar year and the individual does not want to subject to U.S. taxation income from U.S. sources earned during the portion of the year he was a non-resident, he may adopt a fiscal year. If he has not previously filed as a non-resident on a calendar year basis, he may adopt a fiscal year without obtaining the perior approval of the Internal Revenue Service so long as he maintains books and records that "reflect income adequately and clearly on the basis of an annual accounting period".[78] The establishment and maintenance of adequate books and records may not be delayed beyond the end of the first fiscal year.[79]

From a tax standpoint, adoption of a fiscal year appears very desirable. The practical problems of this approach, however, may outweigh the tax benefits. The employee's adoption of a fiscal year may result in greater scrutiny by the Internal Revenue Service than if the employee adopted a calendar taxable year. In addition, the filing of a return on a fiscal basis will require greater efforts by the employee since certain information statements, customarily available at the end of a calendar year, may be unavailable during the year.

The Dynamics of Property Tax Delinquency in the Philippines – A Case Study –

by Milwida M. Guevara *

Evasion is a serious problem in the collection of property tax in the Philippines. From 1974 to 1979, local authorities were only able to collect an average of 51% of the rates due.[1] This situation has precluded the property tax from becoming a buoyant source of revenue for local governments.

In accounting for this problem, local authorities blamed their non-use of legal sanctions in the collection of delinquent taxes on the lack of adequate personnel in the office of the treasurer and the poverty of the taxpayers (NTRC 1974; NTRC 1980).

Another angle was brought up in a study of the same problem by a team from Syracuse University, United States. They noted instances where a land parcel in a local unit in the Philippines was listed as belonging to more than one owner. Apparently this was caused by the failure of assessors to monitor land transfers.

These findings notwithstanding, there is reason to believe that evasion is not a mere product of a weak tax administration. Other studies substantiate the fact that evasion is multi-dimensional in character.

In analyzing delinquency in property tax in Pittsburgh, Pennsylvania (U.S.A.), Sternlieb and Lake (1976) found out that a number of the delinquent taxpayers were old, retired and with incomes below the median income in Pittsburgh 6 years before their study. They also tended to be clustered in the lower-status labourer and service occupation categories.

Vogel (1974), Spicer and Lundstedt (1976) and Lewis (1979), on the other hand, all deal with the importance of attitude in tax compliance.

Vogel (1974) investigated the variables related to attitudes favourable to tax evasion. Education, for example, was found to have an inverse relationship to the predisposition to tax evasion while the awareness of illegal opportunities exerted a positive influence on the said tendency.

In the same vein, Spicer and Lundstedt (1976) found that tax resistance is more likely when a taxpayer perceives that his terms of trade with the government are inequitable and if he personally knows many tax evaders. Their study gave no strong support to the theory of a relationship between tax resistance and the perceived severity of sanctions.

Lewis (1979), in his study of 200 male taxpayers in Bath, England, concluded that income and the amount of tax a person pays have a significant influence on his views of taxation. For example, he found out that people with incomes above £6,000 a year felt that tax avoidance is fair while people with incomes below that level felt otherwise.

Considering the above findings, our intention was to investigate the nature, extent and causes of property tax delinquency in a typical local authority in the Philippines. The study was anchored on the framework that property tax delinquency is affected by several variables as shown in the following model:

$$Y = F(X_1, X_2, X_3, X_4, X_5)$$

where:

Y = property tax delinquency index

X_1 to X_5 = characteristics of the delinquent taxpayer as follows:

- X_1 = income
- X_2 = educational attainment
- X_3 = tax ethics
- X_4 = perception of equity in the property tax system
- X_5 = perception of the probability of detection of delinquency in the property tax payment.

The length of delinquency in terms of the number of years was taken as the index of property tax delinquency. Actual data were used for income and educational attainment while the attitude of the taxpayer towards his tax obligation was measured by his score on a Likert-type attitude scale constructed for the purpose.

Prior to the survey, the researcher went over the 7,652 tax declarations in Obando,[2] Philippines by hand. Some

1,603 taxpayers were identified as delinquent. From these, a 5% tapering sample was chosen through systematic random sampling. Preliminary interviews were conducted with delinquent taxpayers in order to construct the attitude scale which was subjected to an item analysis. The questionnaires were administered using an interview by a team of 6, including the researcher, for 4 days. The data were analyzed using the multiple regression scheme. The variables with very small estimated coefficients were eliminated in the final model which was used. Variables which because of their related nature may exert the same effect on income, such as income and level of education, were tested for auto-correlation. To measure the significance of the independent variables, the t-statistic was computed for each estimated coefficient.

Results of the study

After reorganizing the data from the survey of delinquent taxpayers, the following profile emerged:

Over half (64%) have incomes less than ₱1,000[3] which is below the 1980 national per capita income. Among other reasons, this is because about 40% of the people questioned lack regular employment.

A quarter of the respondents have only finished elementary education. A significant number thus have had only 6 years or less of schooling.

The majority of the respondents (57%) are 50 years and above. A number of them are retired employees and cases of sick and physically handicapped taxpayers were noted.

Most of the delinquent properties are residential in nature and have assessed values from ₱1,000 to less than ₱5,000. Delinquency in commercial lands is concentrated on properties with an assessed value of over ₱5,000 while the core of the delinquency problem in agricultural lands is in properties which have assessed values of less than ₱1,000. The average length of delinquency is 4 years.

A preliminary analysis of the completed questionnaires tended to show great variability in the responses of the different samples. To minimize this, the responses were analyzed by land-use of the property owned by the delinquent taxpayer. The estimated coefficient for income was found to be so small that it was dropped from the final equation that was used. The apparent inference – that income does not exert any significant influence on property tax delinquency – should, however, be made with caution as the study acknowledges a limitation on the income data. Respondents were directly asked the amount of their income, including non-cash income. Considering the reluctance of Filipinos to reveal their true income, it is probable that the data on income were inaccurate.

To check the existence of multi-colinearity among the attitude indices, the coefficient of correlation (r) was computed. The relationship between equity and tax ethics was found significant at the .05 level so that they were not put together in one equation. Two equations were thus used:

$$Y_1 = a + bx_2 + bx_3$$

$$Y_2 = a + bx_2 + bx_4 + bx_5$$

The estimated coefficients of the regression equations are shown below. Some significant coefficients are noted in the estimated relationships for the behaviour of landowners of commercial and industrial properties and employed landowners of residential and agricultural land.

Multiple regression results

Variables/Land-use	*Industrial*	*Agricultural*	*Residential*
Education (b_2)	– .9768 *	–.7340 *	–.3079
Ethics (b_3)	– .2197 *	–.0169	–.0924
Equity (b_4)	–1.193 *	.2128	–.2866 *
Probability of detection (b_5)	.5966 *	–.1489	–.1821
R^2	.8876	.2068	.4262
R	.9421	.4546	.6529
SE	.5512	1.924	1.622

* Significant at the .05 level of confidence.

For delinquent taxpayers owning commercial and industrial properties, an inverse relationship was noted between education and property tax delinquency; tax ethics and delinquency; and the perception of equity and delinquency. This means that delinquency is more likely when taxpayers are less educated and when they are less disposed towards tax compliance. Likewise, delinquency is associated with the perception that the tax system is inequitable. The feeling of inequity was determined by the strong agreement of the taxpayer with the following statements:

1. From what I have heard, there are more property tax evaders among the rich.
2. There is no reason to pay as property tax collections are not properly spent.
3. Taxpayers who have strong political backing can evade payment easily.

A paradoxical observation is the direct relationship between the perception of the probability of detection and property tax delinquency. It appears that among landowners of commercial and industrial lands, delinquency is more probable if they expect to be caught. This finding is contrary to expectations. The attitude of the respondents towards the equity of the tax system can be used to resolve the paradox. Since the taxpayers feel that influential tax evaders enjoy the protection of certain local officials, they are confident that they can enjoy the same protection if and when they are caught. This confidence dispels the fear of penal consequences should they be caught. The fact that Obando (and a large majority of the localities throughout the Philippines) have failed to prosecute tax evaders bolsters this confidence. Among landowners of commercial properties, being caught does not matter as they can get away with it. It is likely that their financial capability to pay the penalties for property tax

3. Rate of exchange US$1 = ₱8.50.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

delinquency lessens their fear of being detected. When they are asked, in fact, of their attitudes towards the fine for delinquency, the majority of them considered it light. Under the law, delinquency is fined at 2% of the tax for every month of delinquency but the maximum penalty that can be imposed is 24% of the delinquent tax. It will thus be advantageous for the taxpayer to cumulate his tax payments instead of paying his delinquency after a year. After all, the penalty is the same whether he is delinquent for one year or for 10 years.

Among employed residential land owners, the variable which is linked with delinquency is the perception of the inequity in the property tax system. However, the t-statistic of the coefficient (–1.7369) did not reach the .05 level which is conventionally acceptable. Using the 10% level of acceptability, it can be inferred that taxpayers are more probable to be delinquent if they have the view that the property tax system is inequitable.

Among the unemployed residential landowners, a pattern of relationship was also evident between the level of education and delinquency and the perception of the probability of detection and delinquency although the t-statistic is too low for any confidence to be placed in this finding.

Variable	Coefficient	t-statistic
Education	.7494	1.158
Perception	.2572	– 1.024

Delinquency moves directly with education and inversely with the probability of detection index. This implies that among unemployed residential landowners, delinquency is associated with those who have had more schooling and who think that evasion is difficult to detect. These inferences cannot be used as generalizations because of the lack of statistical significance of the coefficient of the noted observations.

The variable which tends to influence delinquency among employed owners of agricultural land is education. The level of education of taxpayers was found to be inversely related to delinquency. Like owners of commercial properties, landowners of agricultural lands tend to be delinquent if they have not attained a high level of education.

No variable in the model appears to influence delinquency among the unemployed. To account for the cause of their delinquency one can only fall back on a qualitative analysis of the reasons given by the respondents themselves. As cited earlier, most of them pointed to their poverty as the main reason for delinquency. This is quite credible as most of them realize that payment of taxes is important. When asked to identify the 3 most important reasons why they have to pay taxes, the following were cited:

1. It is the duty of every citizen to pay taxes.
2. Taxes finance the expenditures of the government.
3. It is an honor to pay taxes.

Only the minority (4% of the respondents) related payment of taxes to fear of the government and the lack of alternative except to pay taxes.

From the interviews with respondents, it can also be observed that lack of knowledge on property taxation could be one of the contributory causes of delinquency. Both the employed and unemployed respondents showed little knowledge of the importance of the property tax. When asked, for example, which level of government spends the proceeds from the property tax, 46% admitted they did not know; 33% said that the tax accrued to the national government and only 21% knew that the tax goes to the coffers of local government. Likewise, 36% of the respondents did not know the basis of the property tax. Some said the income of the taxpayer is the tax base (7%); others thought that the tax was based on the location of the land (11%) and others flatly admitted that they did not know the tax base (14%).

Another factor which may predispose taxpayers to evasion is disagreement with the property valuation. Over half the respondents disagreed with the assessor's valuation. Disagreement came mostly from owners of residential buildings (67%) who claimed that they do not know how the buildings they owned were valued. They were puzzled that despite the age of the buildings the valuation had not gone down significantly. This confusion is caused, among other things, by the failure to understand that buildings are valued through the replacement cost approach. This misunderstanding, which is caused by the taxpayers' lack of familiarity with the property tax system, should be an area of concern in Obando and possibly in other municipalities.

The final cause of delinquency in property tax payment is defective tax administration machinery. To date, the municipality of Obando has not actively used the following remedies provided by the law to collect delinquent taxes:

- distraint of personal property, including the crops on the land of the delinquent taxpayers;
- sale of delinquent real property tax at public auction;
- collection of the real property tax through the courts.

The non-use of legal remedies is not peculiar to Obando alone as only 3 out of 10 local units in the Philippines make use of the above powers (NTRC, 1980). When asked to account for the reasons behind the failure to enforce the penal provisions of the tax laws, the treasurers cited their preference for less strong measures, such as sending letters notifying the taxpayers of their delinquent accounts. This reaction is hardly surprising. The treasurer needs not only courage but also the full support of the executive and legislative branches of the local government to enforce collection of taxes on delinquent properties. In many instances, these may be lacking.

Summary and recommendations

The findings of this study suggest that evasion of the property tax is not a simple problem. In analyzing the causes of delinquency of all the sample taxpayers, no variable stood out as clearly significant. It was only when the analysis was carried out by land use that the study was able to relate delinquency to certain independent variables as follows:

© 1982 International Bureau of Fiscal Documentation – BULLETIN

- For owners of commercial and industrial real properties, delinquency is inversely related to education, tax ethics and the perception of equity. On the other hand, delinquency is directly related to the perception of the probability of detection.
- Among employed residential landowners, delinquency is more probable among those who think that the property tax system is inequitable.
- With employed owners of agricultural lands, delinquency is linked to a low level of education.

This changing list of factors influencing delinquency of taxpayers is quite complicated and the solutions suggested below must be qualified in certain instances. However, there are improvements in the tax administration machinery which can be generally prescribed.

Considering legal remedies first, the findings suggest that all delinquent taxes cannot be collected merely by threatening the taxpayers with civil action in court or by distraint of their personal property. A substantial number of delinquent taxpayers (40%) is employed and 64% have incomes less than ₱1,000. Bringing them to court would only create more problems for the local government. It seems clear that the enforcement of legal remedies can only be successfully applied to property with high assessed values (in this particular study, this pertains to those with assessed values above ₱5,000), especially properties which are commercial and industrial in nature. In this connection, increased vigor in the enforcement of legal remedies is called for. There is a general belief among delinquent taxpayers that the property tax system is quite inequitous. Moreover, delinquency among industrial landowners is associated with a certainty of being detected. Yet, because detection and punishment do not go together, the same taxpayers have the courage to evade the tax. They have to be convinced that the government is determined in future to collect all the taxes due. To encourage this spirit, granting a tax amnesty on delinquent property taxes is worth considering to give all property owners the chance to "make amends". As a basis for the proposed tax amnesty scheme, the government can draw the guidelines from the successful tax amnesty program on untaxed wealth and income which was implemented in 1972. After providing taxpayers with the chance to start with a clean slate, the local government can start the prosecution of evaders who have refused to cooperate.

It is also timely for the government to consider the revision of fines for delinquency. As discussed earlier, the limitation on the maximum amount of penalty to 24% of the delinquency encourages taxpayers to cumulate their delinquent accounts instead of pressuring them to pay after one year. This limitation should be lifted by allowing a 2% monthly surcharge on the amount of delinquency.

With respect to the delinquency of landowners owning residential lands, the national government should study the feasibility of granting an exemption to landowners who are incapable of payment. Although the basis of the tax is the assessed value of the property, the government should look into the possibility of using the income of the taxpayers as the basis of the exemption as residential properties on their own do not produce any income. To simplify administration, residential landowners who are exempt from payment of the income tax can also be exempt from payment of rates.

The second area which requires attention after the enforcement of legal remedies is the familiarization of taxpayers with the property tax system and its importance to local governments. Findings here suggest that the taxpayers do not know that the local governments depend heavily on the property tax to finance publicly provided goods and services. This lack of appreciation breeds indifference to payment of the tax. This is further aggravated by the failure to understand the nature of the property tax, its base and the method of its assessment. An information campaign should be launched by the municipality and two of its most effective media are the barangay officials and the teachers in the public schools. Orientation meetings on this tax with the two groups in attendance should be organized.

An increased familiarization of the taxpayers with the functions of their own local government is also favourable to the improvement of their tax ethics or their attitude towards tax compliance. Survey findings indicate a fairly low level of tax ethics. Although taxpayers feel that they have a duty to pay taxes to the national government, they cannot relate the same duty to the local government. This may be due to the lack of awareness of projects which are funded by the local government. It is surprising that residents in a particular locality like Obando are more informed of the activities and problems of the national government than those of their own local government. A publicity program, to improve this lack of communication must be designed by the municipality.

Overseas Indians and the Finance Bill 1982

by Parimal M. Parikh*

Mr. Pranab Mukherjee, the Finance Minister of India, while introducing the Budget in the Parliament on 27 February 1982, anmnounced certain fresh incentives for Indians abroad who invest in India, which will go down as a major policy decision in the economic history of India.

It is therefore possible to strengthen the economic base of the country by augmenting foreign exchange resources and embarking upon industrial ventures where technical skills and the experience of operating in international markets are required.

More than 6 million people of Indian origin have settled abroad and their number is steadily increasing. Indians abroad, with their skill, ability and sheer hard work, have consolidated their economic position. Their cultural and economic links with India are intact. Some economists have estimated the wealth of persons of Indian origin residing abroad to be of the order of Rs. 115,000 crores (1 crore = 10,000,000), i.e. more than three fourths of India's annual gross national product.

In one way or another, they have always passed on part of their prosperity to the motherland. However, it is the feeling of many Indians abroad that the attitude of the government towards them has generally been lukewarm.

Some very important provisions with far-reaching consequences have been introduced in the Finance Bill 1982 in response to a long standing desire of Indians abroad.

An attempt is made hereunder to analyse and understand the proposed provisions and their implications.

I. DEFINITION OF "RESIDENCE"

In India the scope of total income of an assessee is determined on the basis of residential status. For this purpose assessees are divided into the following two categories:

- resident; and
- non-resident.

The individual "resident" in India is further classified as:

- ordinarily resident; and
- not ordinarily resident.

A person who is *ordinarily resident* is liable to tax on all income:

(a) which is received or is deemed to be received in India by or on behalf of such person;
(b) which accrues or arises or is deemed to accrue or arise to him in India; and
(c) which accrues or arises to him outside India.

A person who is *not ordinarily resident* is liable to tax in the same manner as a person who is "ordinarily resident", *except* that the income which accrues or arises to him *outside* India is not includible in his other income unless it is derived from a business controlled in or a profession set up in India.

A person who is a *non-resident* is liable to tax in respect of all income from whatever source derived which is received or deemed to be received in India by or on behalf of such person or which accrues or arises or is deemed to accrue or arise to him in India. He is *not liable* in respect of income accruing or arising *outside India* even if it is remitted to India.

Thus, the liability to pay income tax in India is dependent on the residential status of an assessee.

Under the existing provisions (Section 6 of the Income-tax Act (ITA), 1961) an individual is considered to be "resident" in India in any year if:

(a) he is in India in that year for a period or periods amounting in all to 182 days or more; or
(b) he maintains or causes to be maintained for him a dwelling place in India for a period or periods amounting in all to 182 days or more in that year *and* has been in India for 30 days or more in that year; or
(c) having within the 4 years preceding that year been in India for a period or periods amounting in all to 365 days or more, is in India for a period or periods amounting in all to 60 days or more in that year.

The Finance Act 1978, with effect from 1 April 1979, inserted an Explanation to Section 6(1) to secure that in the case of an Indian citizen rendering services outside India, and who is or has been in India on leave or vacation in the previous year, the 30 and 60-day periods respectively referred to in (b) and (c) above are extended to 90 days. The effect of this provision is that an Indian citizen *employed* outside India is able to stay on leave or vacation in India for 89 days in a previous year without becoming resident in India in that year.

With a view to avoiding hardship in the case of Indian citizens who are employed or engaged in other vocations outside India, the Finance Bill 1982 seeks to make certain modifications in the tests of "residence" in India.

One of the conditions for being treated as a "resident" is dependent upon maintenance of a dwelling place for more than 182 days *and* stay in India in a given year for 30 days or more. This condition was causing hardship to In-

* B. Com., F.C.A. Chartered accountant.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

dians going abroad in the middle of a year to take up employment outside India inasmuch as they were being treated as "residents" in the year of their departure, with the consequence that their income *outside* India also suffered Indian taxation. As we have seen above, under the Income-tax Law, "residents" have to pay tax in India on their total *world* income, while "non-residents" pay tax only on their *Indian* income. This condition of dwelling place is being removed with effect from 1 April 1983, that is, the assessment year 1983-84.

Yet another condition causing hardship was in relation to a person in India for 60 days or more in a year and who was in India for 365 days or more in the preceding 4 years. For such persons also, a stay up to 182 days in a year does not make them "residents" with the resultant taxation in India of their foreign income. No doubt this benefit of 182 days is available only for the first year of their departure for the purpose of taking up *employment* outside India. A further amendment appears to indicate that the benefit of stay up to 182 days is not available to persons not taking up employment but becoming *self-employed* or otherwise. Self-employed persons will be governed by the test of stay of 90 days or more, as provided in the explanation to Section 6(1) of the Income-tax Act, 1961.

II. REMITTANCE OF FUNDS TO INDIA

The next amendment is to be found is Section 10 of the Income-tax Act, 1961, first in respect of Section 10(4A) which exempts from tax income from interest on moneys standing to the credit of a "non-resident" in a non-resident (external) account in any bank in India in accordance with the Foreign Exchange Regulation Act, 1973 (FERA).

According to FERA, Indian nationals and persons of India origin holding foreign passports residing abroad can freely remit funds to India through banking channels and keep them in their accounts with banks authorised to deal in foreign exchange ("authorised dealers"). The following facilities are available for these persons for remittance of funds to India and for making investments in India.

1. Non-resident (external) accounts designated in Indian rupees (NR(E) accounts)

The funds must be transferred to India through banking channels from the country of residence or from any other country in the External Account group other than Bulgaria, Czechoslovakia, German Democratic Republic, Hungary North Korea, Poland, Romania and the U.S.S.R. The facility is also available to government servants posted abroad on duty with Indian Missions and similar agencies set up abroad by the Government of India where the officials draw their salaries out of Central Government resources, Government servants deputed abroad on assignments with foreign government or regional/international agencies like the World Bank, IMF, WHO, ESCAP, and officials of a State Government and public sector undertakings deputed abroad on temporary assignments or posted to branches of their offices abroad.

The advantages of opening the above type of account are:

- The income accruing on the balances in the accounts is free of Indian income tax (Section 10 (4A) of ITA).
- The account holders have the freedom to repatriate the balances, along with the interest accrued thereon, outside India at any time without reference to the Reserve Bank of India.
- Interest accruing on the accounts may be credited to the accounts freely by authorised dealers.
- Debits to the accounts for local disbursements are freely permissible.
- Purchase of units of the Unit Trust of India, Government securities and National Plan Certificates or National Savings Certificates from the balances in these accounts may be made freely.
- Dividends or interest on and sale or maturity proceeds or repurchase price of the units, securities or certificates may be credited to the external accounts, on application to the Reserve Bank of India.

2. Non-resident (external) accounts designated in foreign currencies (FCNR accounts)

In order to provide account holders a cover against the risk of any loss arising from fluctuations in the exchange rate of currencies, a new scheme for opening non-resident (external) accounts designated in special foreign currencies (pounds sterling and U.S. dollars) has been introduced. The accounts are maintained in the currencies in which the remittances are received and the funds are also to be repaid to the account holder, or transferred elsewhere in India under his instructions, in the same currency. The interest is paid in the currency in which the account is maintained. This interest is also free of Indian income tax (Section 10 (4A) of ITA).

Thus, the exchange risk in respect of both the funds remitted to India by the account holders and the interest accruing on the funds is not to be borne by the non-resident depositors. To start with, the accounts are maintained in the form of fixed deposits for periods of 91 days and above, but not exceeding 61 months at a time. This period of 61 months can be further extended.

The present condition for exemption under Section 10 of ITA is that the person should be a "non-resident" under ITA. The tests for being treated as "non-resident" under FERA and under ITA are entirely different. The amendment seeks to exempt such income of "non-residents" under FERA.

To determine the residential status of a person under FERA, the following questions must be answered:

- Is he an Indian citizen or not?
- If he is an Indian citizen, has he been staying in or outside India and for what purpose?
- If he or she is a foreigner staying in India, what is the purpose of his or her stay, whether his or her wife or husband is a person resident in India, and what is the duration of his or her stay here?

Section 2(p) of FERA lays down specific norms for determining the residential status of person as follows:

(a) If an Indian citizen has been staying in India at any

© 1982 International Bureau of Fiscal Documentation – BULLETIN

time after 25 March 1947, he is regarded as a person resident in India.

(b) If an Indian citizen has gone out of India:
  (i) for employment, business, or vocation outside India; or
  (ii) for any other purpose with the intention of staying outside India for an indefinite period,
  he is regarded as a person not resident in India.
  Even though the word "profession" is not mentioned in Section 2(p), if an Indian citizen leaves India to carry on his profession outside India, he will become a person resident outside India.
  If an Indian citizen has gone abroad for his studies, a pleasure trip, medical treatment, a business trip, visiting friends or relatives, and other purposes where the intention is not to stay abroad for an indefinite period, he will be regarded as a person resident in India during his stay abroad.

(c) An Indian citizen who was abroad and was regarded as a person resident outside India under the preceding provisions will be regarded as a person resident in India when he returns to India for employment, business, or vocation in India. Similarly, if he returns to India for any other purpose with an intention to stay in India for an indefinite period, he will be regarded as a person resident in India.

(d) An Indian citizen who has not stayed in India at any time after 25 March 1947 coming to India for employment, business, or vocation, staying with his or her spouse who is resident in India, or for any other purpose, with an intention to stay for an indefinite period, will be regarded as a person resident in India.

(e) A foreign citizen who has come to stay in India for employment, business or vocation in India will be regarded as a person resident in India. Similarly, if a foreign citizen stays in India with his or her wife or husband who is resident in India, the foreigner will be regarded as a person resident in India during his or her stay in India even if the stay of the foreigner is temporary.
  If a foreigner stays in India for any other purpose and his stay is for an indefinite period he will be regarded as a person resident in India. If, however, a foreign citizen has become a person resident in India for the reasons stated in the preceding paragraph, he will become a non-resident during the period he is outside India even though that period is of short duration.
  For example, if an Indian after becoming a British citizen comes to India for employment, business or vocation in India, he will be regarded as a person resident in India. But during his temporary stay abroad, his status will change and he will be treated as a non-resident.

(f) The residential status of a person does not depend upon that of his or her husband, wife or parents. For example, if a married Indian citizen has gone abroad for employment, he will become a non-resident. If his spouse, who is otherwise treated as a person resident in India, goes abroad to stay with him for a temporary period, she will continue to be a person resident in India.

Thus it may be observed that the definitions of "resident" and "non-resident" are totally different under FERA and ITA.

It is possible that a person may be *non-resident* under FERA but *resident* under ITA. Such a person would be denied this exemption.

With a view to removing this anomaly it is proposed to provide that the exemption from income tax in respect of interest on non-resident (external) accounts shall be available in the case of a "person resident outside India" as defined in Section 2(q) of FERA.

Similarly, the balance standing to the credit of such non-resident (external) accounts is exempt under Section 6(ii) of the Wealth Tax Act, 1957.

The Finance Bill 1982 also seeks to exempt gifts made by non-resident Indian citizens and foreign nationals of Indian origin out of the moneys to their credit in non-resident (external) accounts in India.

However, balances held in non-resident (external) accounts are not exempt from Estate Duty (i.e. death duty).

A recent announcement made by the Reserve Bank of India (RBI) permits overseas companies, firms, societies and trusts to invest freely in units of the Unit Trust of India, securities (other than bearer securities) of Central and State Governments and national savings certificates from the funds held in their NR(E) accounts and FCNR accounts or by sending remittances directly from abroad. Such investments enjoy the benefits of repatriation of capital as well as income earned.

Overseas companies, partnership firms, societies and other corporate bodies which are owned to the extent of at least 60% by Indian nationals or persons of Indian origin residing abroad, as well as overseas trusts in which at least 60% of the beneficial interest is irrevocably held by such persons, can now open with any bank authorised to deal in foreign exchange in India NR(E) Rupee Accounts and FCNR Accounts in U.S. dollars or pound sterling out of the funds transferred by them to India. Hitherto, only Indian nationals and persons of Indian origin residing abroad were given this facility. All authorised dealers have been permitted to freely open such accounts out of the funds received from any country in the External Account Group other than Bulgaria, Czechoslovakia, German Democratic Republic, Hungary, North Korea, Poland, Romania and the U.S.S.R.

To open such accounts, the concerned party will, however, have to produce to authorised dealers a certificate from an overseas auditor, chartered accountant, or certified public accountant in a precribed form to the effect that the ownership/beneficial interest in these entities is held to the extent of at least 60% by Indian nationals or persons of Indian origin residing abroad.

III. NATIONAL SAVINGS CERTIFICATES

With a view to encouraging the remittance of foreign exchange into the country, a new sub-section (4B) is proposed to be inserted with effect from 1 April 1983, that is, from assessment year 1983-84, to provide an exemption from income-tax for interest in 12% 6-year National Savings Certificates to be issued hereafter by the Central Government. The exemption will be available to *"non-resident" Indians* or to foreign nationals of *Indian origin* provided that the subscription to the certificates is in

© 1982 International Bureau of Fiscal Documentation – BULLETIN

foreign currency in accordance with the provisions of FERA. Thus, this exemption shall be available only to initial subscribers of these 6% National Savings Certificates.

A corresponding exemption from wealth tax is also provided by Section 5(1) (xvi c) of the Wealth Tax Act, 1957 whereby non-resident Indian citizens and foreign nationals of Indian origin can avail themselves of this exemption provided that the subscription to the certificate is in foreign currency in accordance with the provisions of FERA.

Similarly, Section 5(1) (ii d) of the Gift Tax Act, 1958 seeks to grant exemption from gift tax to gifts of such Savings Certificates by non-residents to their *relatives* who are "residents" in India. For this purpose, "relative" is defined by Section 2(21) of the Income Tax Act, 1961 as including husband, wife, brother, sister or any lineal ascendant or descendant of that individual.

IV. INVESTMENT IN SHARES

The recent announcement made by the RBI liberalises the policy governing investment in Indian companies by Indian nationals or persons of Indian origin residing abroad.

RBI has also simplified the procedural formalities in this regard to facilitate a higher inflow of non-resident investment. According to an RBI notification, the facilities are available to all Indian nationals or persons of Indian origin residing abroad.

The facilities extended include permission to invest in shares without any limit on the quantum or value of the investment, permission to make portfolio investments in shares with full benefits of repatriation of capital invested and income earned, and expeditious sale and transfer of shares by such persons.

Under the liberalised facilities, such persons can invest in shares through stock exchanges in India without any limit on the quantum and value of investment, either by fresh remittances from abroad or out of their NR(E), or FCNR or Non-resident Ordinary accounts. Repatriation of capital invested and income earned thereon will not, however, be allowed.

In order to avoid references, for specific approval of each transaction, the RBI will grant permission to banks in India authorised to deal in foreign exchange for purchasing and selling shares on behalf of their clients.

They can also invest in new issues of public or private companies engaged in any business activity (except real estate business) up to 100% of the issued capital without any obligation to associate resident Indian participation in equity capital at any time.

They can also make portfolio investments in shares in India with full benefit of repatriation of capital invested and income earned thereon, provided:

- the shares are purchased through a stock exchange;
- the purchase of shares in any one company does not exceed 100,000 Rupees in face value or 1% of the paid-up equity capital of the company, whichever is lower; and
- payment for such investment is made either by fresh remittances from abroad or out of the funds held in the NR(E) or FCNR account with a bank in India.

As in the case of investment in shares without repatriation benefits, the RBI will grant permission to banks to purchase shares through stock exchanges on behalf of their non-resident customers, subject to the limit and conditions mentioned above.

They can make investment in the new issues of new or existing companies in India (other than a FERA company) up to 40% of total new capital with full benefits of repatriation of capital invested and income accruing thereon. They can also make investment with full repatriation benefits in the capital raised by any company other than through issue of prospectus up to 40% of total new capital subject to a ceiling of 4 million Rupees. Such investments can be made in any industry including those in the "negative" list of industries (which has been withdrawn), as well as in the hotel industry.

If subscriptions or portions thereof are refunded by companies, banks may allow the amounts to be re-credited to the applicants' accounts from which they had been withdrawn earlier. Similarly, where subscriptions to new issues were remitted from abroad by such persons to companies in India or to bankers to the issues, banks may remit the refunds of excess subscriptions to the concerned beneficiaries.

The facility of equity investment with full repatriation benefit under the 74% scheme continues, with a further relaxation that the investment can now also be made in the hotel industry, apart from the priority industries.

To facilitate the expeditious sale and transfer of shares by such persons through stock exchanges, a consolidated application furnishing full particulars of their holdings in quoted shares may be made to the RBI. The bank will grant permission for the sale of these holdings, initially with a one-year validity period, renewable for further periods subsequently. These shares can then be sold at any time within the validity period.

Such person can freely invest in Six-year National Savings Certificates. Such investments will be free from wealth tax, income-tax and gift tax and they enjoy the same facilities as are available for repatriation of maturity proceeds of other Government securities or credit thereof to non-resident accounts of the beneficiary.

All the facilities of direct and portfolio investments outlined above have been extended to overseas companies partnership firms, societies and other corporate bodies, which are owned to the extent of at least 60% by Indian nationals or persons of Indian origin residing abroad as well as overseas trusts in which at least 60% of the beneficial interest is irrevocably held by such persons.

V. EXEMPT GIFTS

Section 5(1) (ii c) of the Gift Tax Act 1958 seeks to grant exemption from gift tax of gifts to *relatives* of any amount of foreign currency or other foreign exchange remitted from a country outside India by *non-resident Indians* or foreign nationals of *Indian origin*.

From Prentice Hall

An indispensable aid for American businessmen, investors and corporations engaged in or planning foreign operations and for those in foreign countries planning or doing business in the United States —

TAX TREATIES

This definitive guide is indispensable for any businessman or corporation that sells, buys, manufactures, or invests in the United States — as well as for any American businessman or corporation that does business in foreign countries. It tells you:

- How and where to handle your investments while eliminating the chance of double taxation.
- How much of your investment income will be protected by tax treaty exemptions.
- How much business Americans can carry on in a foreign country and vice versa without becoming taxable as a "permanent establishment."
- How to protect your employees who are temporarily at work abroad from a double tax burden.

In Tax Treaties, you'll also find:

1. The full official text of every existing treaty, supplementary treaty, or protocol relating to income taxes and estate and gift taxes between the United States and each of its tax-treaty countries, including model treaties showing the latest trends.
2. Annotated editorial text arranged in a Uniform Paragraph Plan . . . makes for easy direct comparison of provisions of one tax treaty country with another . . . permits a single unified index which works hand in hand with this unique setup. You'll make sure, speedy decisions at the flip of a wrist.
3. Official reports on each treaty giving you the background behind the provisions; why particular treaty articles were included; and what each provision means to you.
4. A Special Finding List at the beginning of the editorial summary for each country . . . speeds you quickly to explanatory and official material that affects you.
5. Monthly REPORT BULLETINS, analyzing the latest treaties, decisions and rulings, keep you right on top of today's fast breaking tax treaty developments . . . (plus Current Matter containing the most recent U.S. court decisions and IRS rulings giving you the latest judicial and official word on tax treaties.)

In today's constantly expanding international commerce, expert tax-managing or tax-counseling of business activities between the United States and each of its treaty countries is a must — so keep up to date with Prentice-Hall's TAX TREATIES.

To order a one-year introductory subscription to this unique publication at the low rate of only $156, address Department S-TT-103.

THE 1982 INCOME TAX CHANGES IN THE REPUBLIC OF SOUTH AFRICA

by Dr. Erwin Spiro

Presenting the 1982 Budget on the 24th March, 1982, the Minister of Finance, Prof. Owen Horwood, confessed to aspiring to comply with three minimum requirements: first, to restrict the increase in government spending as much as possible without disrupting the provision of essential services; second, in order to assist in curbing monetary demand and to prevent undue upward pressure on interest rates, to reduce the 'deficit before borrowing' as a percentage of gross domestic product to well below its average of 3.4% over the past 22 years and, third, to finance this deficit in such a manner that not only the Exchequer, but also the government sector as a whole, including the extra-budgetary funds, were able to avoid a net recourse to bank credit. It is against this background that the following income tax changes must be understood.

I. STRUCTURAL INCOME TAX REFORMS

Fringe benefits

The recommendations of the Parliamentary Commission in respect of fringe benefits arising from employment or from the holding of an office will, upon receipt, be considered by the government without delay and, if found to be acceptable, be notified to employer and employee organizations in good time so that any legislation which may be required can be introduced early in the next year in order to ensure that the recommendations take effect as from 1 March 1983 (that is for the 1983/1984 tax year).

Final PAYE deduction system

As announced in the 1981 Budget speech, persons whose taxable incomes (that is net salary (wage) after deduction of medical expenses, pension and retirement annuity fund contributions and the allowance of the earnings of a spouse), do not exceed R7,000, will, with effect from 1 March 1982, no longer be required to submit annual returns of income. In the present budget the Minister of Finance made it quite clear that the new measure would not be applicable to persons who received substantial investment income not taxed at source or to those whose income was received in a form other than fixed salaries, wages or pensions.

II. ONGOING TAX REFORMS

Exemptions

The first R100 of the aggregate income derived from interest and dividends will be exempt from tax, such exemption being granted to all taxpayers irrespective of their income.

Rebates

The primary rebates have been increased by R120.

Deductions

Married women. It has still not been possible to formulate a preferable alternative to the present system whereby the incomes of married persons are aggregated for taxation urposes. However, the deduction allowed from the earnings of a married woman is increased from the R1,200 applicable in the 1980/1981 tax year to R1,400 in the 1981/1982 tax year and to R1,600 in the 1982/1983 tax year.

Housing. Investors who plan to erect housing accommodation for rent will be granted the annual depreciation allowance of 2% at present applicable to new industrial buildings. This will apply to all new housing projects which offer not less than five family housing units for rent, provided the erection commences on or after 1 April 1982:

In addition an initial allowance of 10% of the cost of the project will be allowed as a deduction from income in the year in which the project is completed and the accommodation is first let to tenants.

If the developer of the housing project should dispose of such property either by means of an outright sale of the whole project or through sectional little selling of individual units, or in any other way, the allowances previously granted will be recouped and included in his taxable income.

Taxable income of long-term insurance companies

In view of the enormous growth of the long-term insurance industry, the percentage of gross investment income used as a yardstick for measuring taxable income is to be increased from 30 to 40%.

Loan levy on individuals

A 5% loan levy will be imposed on income tax payable by individuals, the following taxpayers being exempted therefrom:

(a) persons of all age groups whose incomes are R7,000 or less. Falling as they do, at least most of them, under the Final PAYE Deduction System (supra), they will be taxed at a fixed rate, and it would not be fair to impose upon them the further loan levy.

(b) other persons, whose basic normal income tax before the addition of loan levy amounts to R150 or less;

(c) persons who are 70 years of age and older and whose taxable incomes exceed R7,000, but do not exceed R15,000 per annum (they, of course remain liable for normal tax).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The levy is a compulsory loan, repayable within a maximum period of 7 years at simple tax-free interest, its rate being raised from 5 to 8%.

Company tax

Ordinary companies. The present 5% surcharge is to be incorporated in the basic rate, thus becoming 42%, and a further surcharge of 10% is to be levied on such new basic rate.

This applies to all companies excluding gold and diamond mining companies.

Gold and diamond mining companies. The basic rate is not increased. But the present surcharge of 5% is increased to 15%. That change serves the purpose, inter alia, to meet the increased demands which will be made on the Exchequer in the form of assistance to the marginal gold mines.

III. RATES OF (NORMAL) INCOME TAX

Persons other than companies

Persons other than companies are, in respect of the taxable income derived in the year of assessment ending 28 February 1983 or 30 June 1983, whichever is applicable, subject to (normal) income tax at the rates contained in the TABLE attached, with a maximum basic marginal rate of 50% and with the addition, in the case of unmarried persons, of a 20% surcharge on the tax. The maximum rate is reached where the taxable income exceeds R40,000 in the case of married persons and R28,000 in the case of unmarried persons.

If the taxable income is greater than R7,000 and the tax is not less than R150, the loan levy of 5%, mentioned above, must be added to such tax.

Companies

Companies are, in respect of taxable income derived in respect of every year of assessment ending during the period of twelve months ending on 31 March 1983, subject to the following rates of (normal) income tax:

(i) on each R of the taxable income (excluding taxable income derived from mining operation and taxable income referred to in (ii)(c)) 42 cents plus a surcharge equal to 10% of the tax;

(ii) in respect of taxable income derived from gold mining:

(a) in the case of any mine other than a post-1966 gold mine an amount determined in accordance

INCOME TAX TABLE REFERRED TO IN III. ABOVE
for persons other than companies

Taxable income	Rates of tax
Where the taxable income –	
does not exceed R7,000	10% of each R1 of the taxable income;
exceeds R 7,000 but does not exceed R 8,000	R 700 plus 12% of the amount by which the taxable income exceeds R 7,000
exceeds R 8,000 but does not exceed R 9,000	R 820 plus 14% of the amount by which the taxable income exceeds R 8,000;
exceeds R 9,000 but does not exceed R10,000	R 960 plus 16% of the amount by which the taxable income exceeds R 9,000;
exceeds R10,000 but does not exceed R11,000	R 1,120 plus 18% of the amount by which the taxable income exceeds R10,000;
exceeds R11,000 but does not exceed R12,000	R 1,300 plus 20% of the amount by which the taxable income exceeds R11,000;
exceeds R12,000 but does not exceed R13,000	R 1,500 plus 22% of the amount by which the taxable income exceeds R12,000;
exceeds R13,000 but does not exceed R14,000	R 1,720 plus 24% of the amount by which the taxable income exceeds R13,000;
exceeds R14,000 but does not exceed R15,000	R 1,960 plus 26% of the amount by which the taxable income exceeds R14,000;
exceeds R15,000 but does not exceed R16,000	R 2,220 plus 28% of the amount by which the taxable income exceeds R15,000;
exceeds R16,000 but does not exceed R18,000	R 2,500 plus 30% of the amount by which the taxable income exceeds R16,000;
exceeds R18,000 but does not exceed R20,000	R 3,100 plus 32% of the amount by which the taxable income exceeds R18,000;
exceeds R20,000 but does not exceed R22,000	R 3,740 plus 34% of the amount by which the taxable income exceeds R20,000;
exceeds R22,000 but does not exceed R24,000	R 4,420 plus 36% of the amount by which the taxable income exceeds R22,000;
exceeds R24,000 but does not exceed R26,000	R 5,140 plus 38% of the amount by which the taxable income exceeds R24,000;
exceeds R26,000 but does not exceed R28,000	R 5,900 plus 40% of the amount by which the taxable income exceeds R26,000;
exceeds R28,000 but does not exceed R30,000	R 6,700 plus 42% of the amount by which the taxable income exceeds R28,000;
exceeds R30,000 but does not exceed R32,000	R 7,540 plus 44% of the amount by which the taxable income exceeds R30,000;
exceeds R32,000 but does not exceed R34,000	R 8,420 plus 46% of the amount by which the taxable income exceeds R32,000;
exceeds R34,000 but does not exceed R36,000	R 9,340 plus 47% of the amount by which the taxable income exceeds R34,000;
exceeds R36,000 but does not exceed R38,000	R10,280 plus 48% of the amount by which the taxable income exceeds R36,000;
exceeds R38,000 but does not exceed R40,000	R11,240 plus 49% of the amount by which the taxable income exceeds R38,000;
exceeds R40,000	R12,220 plus 50% of the amount by which the taxable income exceeds R40,000.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

with one of the formulae laid down plus a surcharge which is not payable in respect of certain assisted gold mines equal to 15% of the said amount;

(b) in the case of post-1966 gold mines an amount determined in accordance with one of the formulae laid down plus a surcharge of 15% of the said amount;

(c) in the form of excess recoupments over capital expenditure accruing to companies which are or have been gold mining companies the average rate of tax as determined in accordance with the Act or 35 cents per R1, whichever is higher;

(iii) in the case of companies mining for diamonds 45 cents per R1 of the taxable income plus a surcharge of 15% of such amount;

(iv) in the case of companies mining, but not for gold or diamonds, the position is the same as in the case of a non-mining company (see (i) above).

Taxpayers carrying on long-term insurance business

The taxable income derived from the carrying on of long-term insurance business by any taxpayer who carries on such business in the Republic (whether on mutual principles or otherwise) is deemed to be an amount equivalent to 40% of the gross income derived from investments.

IV. RATES OF OTHER TAXES CONTAINED IN THE INCOME TAX ACT

Non-resident shareholders' tax

The non-resident shareholders' tax is 15% of the amount of the dividend or interim dividend in question.

Undistributed profits tax

The undistributed profits tax is 33⅓ cents on every R1 by which the 'distributable income' as defined exceeds the amount of dividends distributed during the 'specified period' as defined.

Non-residents' tax on interest

The non-residents' tax on interest is 10% on the amount of the interest in question.

Donations tax

The donations tax is at progressive block rates, the block exceeding R90,000 being taxable at the rate of 25%.

SOUTH AFRICA:

Budget 1982

Extracts from the Budget Speech pronounced by Professor Owen Horwood, Minister of Finance, on 24 March 1982.

World economic recession

This year's Budget is being presented against the background of a serious and long-lasting world recession. In the United States the rate of real economic growth was actually negative in 1980, less than 2% in 1981 and, according to the latest forecasts of the Organization for Economic Co-operation and Development, will be negative again in 1982. In the United Kingdom, the real economic growth rate was minus 1.7% in 1980, minus 2% in 1981 and is now expected to recover to a small positive figure in 1982. In West Germany a growth rate of minus 1% in 1981 is expected to be transformed into a positive rate of just over 1% in 1982. In addition, the countries behind the Iron Curtain and a number of important oil-producing states have been experiencing serious economic difficulties, which have forced some of them to sell large quantities of gold on world markets. At the same time, the economic plight of most Third World countries has reached critical proportions.

Revenue 1982-'83

Estimated total revenue on the current basis of taxation amounts to R15 417 million, which is 7.9% higher than the revised 1981-'82 estimate of R14 290 million. Receipts both from Inland Revenue and from Customs and Excise are expected to increase – Inland Revenue by R912 milion and Customs and Excise by R215 million. These estimates already include the increased proceeds to be collected from the one percentage point increase in general sales tax and the 10% import surcharge announced last month.

The additional revenue from these two sources, now estimated to amount to about R1 235 million, will in itself only partly offset the decrease in the collections from income tax on gold mines and gold mining leases. Estimated receipts from the gold mining industry during 1982-'83 most probably will amount to no more than R900 million, compared with R2 171 million in 1981-'82 – a reduction of nearly R1 300 million in one year. This huge loss in revenue is the direct result of the adverse effect that the drop in the gold price and cost escalations are expected to have on the operating results of the gold mines.

Uncertainty regarding the future behaviour of the gold price makes it extremely difficult, if not virtually impossible, to predict with any degree of accuracy Exchequer revenues from this source. While I am certainly not pessimistic on the longer term outlook for gold – anything but – it would only be prudent to assume that the average gold price for the year 1982-'83 will be significantly below the average realized during the current financial year, and I have framed my estimates accordingly.

To sum up, on the current basis of taxation, total tax revenues of R15 417 million are available to finance total expenditures of R18 238 million. The deficit before borrowing at his stage thus amounts to R2 821 million.

Despite the financing problems we are faced with now, I wish to announce the following concessions.

Final PAYE deduction system

In my Budget speech last year I announced that, with effect from the tax year which commenced at the beginning of this month, persons in the lower income categories who derive their income entirely, or almost entirely, from salaries, wages or pensions, will no longer be required to submit annual returns of income. In the majority of such cases the PAYE, which will be deducted in terms of the new deduction tables which came into operation on the first of this month, will represent a final settlement of their tax liability. A substantive amendment was included in last year's Income Tax Act to make this possible.

Persons affected by this measure are those whose taxable incomes, that is, net salary after deduction of medical expenses, pension and retirement annuity fund contributions, and the allowance in respect of the earnings of a spouse, do not exceed R7 000.

The new measure cannot, of course, be applied to persons who receive substantial investment income not taxed at source, or to

© 1982 International Bureau of Fiscal Documentation – BULLETIN

...illion in 1975 to R0.9 million in 1980, ...doubt mainly due to the advent of television.

The Standing Commission has recommended that the tax be abolished. I am in agreement with this recommendation and, in the interest of more efficient administration, accordingly propose that the tax be abolished with effect from 1 April 1982. The loss of revenue will amount to some R1 million.

The total of the concessions I have just outlined amount to R34 million and will reduce receipts from Inland Revenue from the printed figure of R13 198 million to R13 164 million.

Before turning to certain proposals for relief from excise duties, there are two further inland revenue matters to which I should like to refer.

Fringe benefits

The taxation of fringe benefits arising from employment or from the holding of an office, which has been part of our income tax law ever since its inception, has in principle been reaffirmed by the Government. The question in regard to the uniform valuation of such benefits is, however, one which should be approached very circumspectly.

Certain proposals were first put forward by the Franzsen Commission in 1970. The matter was subsequently investigated by Inland Revenue and the Standing Commission on Taxation Policy. After protracted and wide-ranging discussions, it was decided that the Standing Commission's valuation proposals should form the basis of an in-depth inquiry by a Parliamentary Commission.

Although reports have appeared in the Press to the effect that the proposals for the taxation of fringe benefits have been shelved, I wish to give the assurance that this is not the case. The recommendation of the Parliamentary Commission, will, upon receipt, be considered by Government without delay and, if found to be acceptable, will be notified to employer and employee organizations in good time so that any legislation which may be required can be introduced early in the next year in order to ensure that the recommendations take affect as from 1 March 1983, that is for the 1983-'84 tax year.

Fiscal incentive measures

In my Budget Speech on 26 March 1980 I indicated that I had directed the Standing Commission on Taxation Policy to investigate the initial and investment allowances accruing to manufacturers and to make recommendations to me in this regard. The matter is one of extreme complexity and, as I previously said, caution is needed before any change is made to the *status quo*. I am informed that the Standing Commission has made good progress in its task and am hopeful that it will be possible for the Commission to submit its recommendations to me within the next few months. It appears unlikely, however, that any consequential legislation will be introduced during the current session of Parliament.

I wish now to propose two concessions in regard to excise duties.

Excise duty concessions

Natural wines

The agricultural industry in the Western Cape is one of the main supports of the regional economy and provides an important impetus to development and growth. It is also true that agriculture in this region is much dependent upon the weal and woe of the products of the vine.

At the same time wine provides the State with not inconsiderable excise revenues and in this way assists in financing necessary expenditures. Yet it is also true that in the case of natural wines, notwithstanding a slight, albeit consistent upturn in demand, consumption *per capita* today is still below the 1975 level and this despite an annual average producers' price rise of less than 9% during this period.

I wish to propose, therefore, that the full excise duty of 3 cents per litre on natural wines be abolished. Though the incidence of this duty may be small, I am told the concession will bring South Africa into line with other wine-producing countries such as West Germany, Italy, Austria, Switzerland and Australia.

The loss of revenue is calculated to amount to R6 million in 1982-'83.

In the case of natural fermented apple, pear and orange beverages I propose that the excise duty be similarly withdrawn. The loss of revenue in this case will be minimal.

Natural fruit juices are, of course, not subject to any excise duty.

Non-alcoholic beverages

This industry has had to cope in recent times with substantial increases in input costs, one of the latest examples being an increase in the price of sugar of some 13%. Any tax concessions will grant a measure of relief not only to the producer and the consumer but will also, I understand, tend to be helpful to the small businessman in the rural areas. I wish to propose, therefore, that the excise duty on non-alcoholic beverages be reduced by 1 cent per litre. This will mean an estimated loss of revenue in 1982-'83 of some R10 million.

Government notices to give effect to these proposals will appear tomorrow.

The total cost of these two concessions will amount to R16 million and will reduce the income from customs and excise duties in the printed Estimates of Revenue to R2 203 million.

Financing of deficit

The estimate of total revenue is now R15 637 million, which leaves me with a deficit before borrowing of R2 871 million at this stage.

After adding to the deficit an amount of R1 246 million to provide for loan redemptions and other loan expenditures – the latter figure is very substantially lower than total redemptions for the 1981-'82 financial year – the total financing requirement will amount to R4 117 million.

I propose that this amount be financed as follows:

	R million
Public Debt Commissioners	1 290
Reinvestment of maturing stock	614
New stock issues	800
Non-marketable securities	550
Foreign loans	250
Surplus carried forward from 1981-'82	16
	R3 520

This still leaves me with a shortfall of R597 million.

National Defence Bonds and Defence Bonus Bonds

I should explain that the non-marketable securities I have just mentioned comprise tax-free Treasury Bonds, tax-free Defence Bonus Bonds and taxable National Defence Bonds.

Recently in my Part Appropriation speech I announced an increase in the interest rate on Treasury Bonds and indicated that I would also deal with improvements in the terms of issue of National Defence Bonds and Defence Bonus Bonds in due course.

It has now been decided that the interest rate payable on fully taxable National Defence Bonds – which have a minimum currency of twelve months – be raised from 11% to 14% with effect from 1 April 1982 to make them more attractive in the market.

From the same date the method of calculating interest on the tax-free Defence Bonus Bonds will also be changed from the current 5% simple interest basis to a 5% monthly compounded basis, which will yield an effective 5.66% per annum over a five-year term. This compound rate of interest will also apply to all existing unredeemed investments made since the inception of the scheme provided that the Bonds are not redeemed before 1 April 1983. Interest on redemptions made before that date will continue to be calculated at the existing simple interest rate. These adjustments should at least ensure a positive flow of investment funds into these two investment media.

The loan programme set out above presupposes that funds be obtained in the domestic market in a non-inflationary manner at realistic market-related rates and care will therefore be taken to limit the individual stock issues to smaller amounts obtainable without undue difficulty and without placing undue pressures on the money and capital markets and thus on interest rates. Smaller stock issues will also ensure a more even distribution of cash flows to the Treasury throughout the year.

I also believe that the Exchequer should approach the markets for its loan requirements on a more regular basis than hitherto. The success of the Treasury's first tender issue has been most heartening considering the difficult conditions pertaining in the market at the time, and this method will again be used

© 1982 International Bureau of Fiscal Documentation – BULLETIN

those whose income is received in a form other than fixed salaries, wages or pensions.

It is gratifying to note that even at the relatively low income levels, many persons are still able and willing to save, and in order to encourage savings and not to deprive them of the benefits of the new system, I furthermore propose that the first R100 of their aggregate income derived from interest and dividends be exempt from tax. This exemption will, in fairness, be granted to all taxpayers irrespective of their income, and I estimate the concomitant loss of revenue to the Fiscus for the 1982-'83 financial year at R13 million.

Although taxpayers in the category I have mentioned will not in future be required, as a matter of course, to submit returns of income for assessment purposes, I realize that factors, such as the birth of a child or abnormally high medical expenses may result in over-deductions of PAYE. In such cases, taxpayers will still be entitled to ask for an assessment and a refund of tax overpaid.

There is a point which I would like to stress in regard to the new system, and that is it does not affect the year of assessment which ended on 28 February this year. Income tax returns in respect of that year were recently mailed and must still be completed by all taxpayers. The Commissioner for Inland Revenue will in due course advise all those taxpayers who will not in future be required to complete returns of income.

The adjustments and simplifications which I have referred to will make the tax collection system that much more cost-effective and is a further positive step in our overall tax reform programme.

Primary rebate

It is apparent from the new normal tax rate table which will be tabled today, that the rate of tax applicable to the first R7 000 of an individual's taxable income is 10%. Previously the rate of tax for the first R6 000 was 8% and from R6 001 to R7 000 it was 10%. The proposed new rate results in an additional R120 gross tax payable, before the deduction of rebates. The increase in the rate is not intended to be an additional impost on taxpayers but has been decided upon as part of the scheme for the elimination of unnecessary income tax assessments in the case of salary earners whose taxable incomes do not exceed R7 000, as explained. To neutralize the increase in the gross rates, an additional rebate of R120 was provided for in last year's Income Tax Act as part of the scheme to put into operation the PAYE final deduction system as from 1 March 1982.

The sacrifice of revenue, which is confined to the R0 - R7 000 income sector, is estimated at R40 million and has also already been taken into account in the printed Estimates of Revenue.

The increase in the primary rebate, taken together with the standard deductions for medical and certain other expenses and the standard insurance rebate provided for in last year's Income Tax Act, will have the effect of raising the tax thresholds of individuals without children or dependants as follows:

	Present threshold	Proposed threshold
Married person		
– under 60	R2 500	3 800
– 60 but under 70	R4 000	R5 000
– 70 and over	R5 000	R5 800
Unmarried person		
– under 60	R1 500	R2 850
– 60 but under 70	R3 000	R4 050
– 70 and over	R4 000	R4 850

Married women

Honoré de Balzac once said that "women are always afraid of thing which have to be divided". This does not seem to be the case with the vexed question of the taxation of the income of married women, a matter which continues to enjoy the attention of the Department and the Standing Commission on Taxation Policy.

It has still not been possible to formulate a preferable alternative to the present system whereby the incomes of married persons are aggregated for taxation purposes. However, as I announced during my 1981-'82 Budget Speech, one of the consequential adjustments which would be necessary to facilitate the introduction of the Final PAYE Deduction System referred to, is that the deduction allowed from the earnings of a married woman would need to be increased in two stages, from the R1 200 applicable in the 1980-'81 tax year, to R1 400 in 1981-'82, and to R1 600 in 1982-'83.

I trust that this concession will further reduce the real tax burden of women engaged in gainful employment or in a trade or profession. The loss of revenue for the 1982-'83 financial year is estimated to amount to R19 million.

I may add that the total loss of revenue as a result of the introduction of the Final PAYE Deduction System, including amounts already accounted for in the printed Estimates of Revenue, will aggregate no less than R109 million in a full year.

The effect of the final deduction system with its inbuilt standard deductions and rebates and increased deduction from a married woman's earned income, can best be illustrated by an example. Take the case of a married couple under the age of 60 years with no children, where the husband earns R4 000 and the wife R2 500 per year, a total of R6 500. In the tax year which ended on 28 February 1982, tax amounting to some R210 had been deducted in their case. In the present tax year ending 28 February 1983, total tax deductible will only amount to R109, and no further tax returns or adjusting assessments will be issued. I regard this to be a very meaningful concession to the lower income groups in South Africa.

Housing

As indicated earlier, the provision of adequate and sufficient housing remains a problem which enjoys a very high priority with the Government. Not only have substantial public funds been allocated over the years for the provision of housing, but employers have also been encouraged by means of tax concessions to assist employees in either acquiring their own homes or in obtaining rented accommodation.

The provision of adequate financial resources, particularly for housing for the lower income groups, is at present being studied in depth by an expert committee representing the private and public sectors under the chairmanship of the Deputy Minister of Finance.

The private sector will be called upon to make a much more substantial contribution towards solving this problem, but in the meantime I feel it appropriate for the Government to offer further tax concessions specifically to encourage the construction of new accommodation for rent, at present at a premium throughout the country.

Various schemes and suggestions have been researched, but most were found to be either impracticable, too open to abuse, or even in conflict with sound taxation principles.

I am prepared, nevertheless, to offer the following concessions to investors who plan on erecting accommodation for rent: The annual depreciation allowance of 2% at present applicable to new industrial buildings will be extended to include all new housing projects which offer not less than 5 family housing units for rent. This will apply to all qualifying housing projects the erection of which commences on or after 1 April 1982.

In addition I wish to propose that an initial allowance of 10% of the cost of the project be allowed as a deduction from income in the year in which the project is completed and the accommodation is first let to tenants.

If the developer of the housing project should dispose ofsuch property either by means of an outright sale of the whole project or through sectional title selling of individual units, or in any other way, the allowances previously granted will be recouped and included in his taxable income. Details of the allowances will be contained in the Income Tax Bill which will be presented to Parliament later in the session.

I am confident that these concessions will stimulate the provision of accommodation for rent for the benefit of those dependent on such accommodation, and will assist investors materially with their cash flow prolems and return on investment.

It is estimated that the loss of revenue which this concession will entail in 1982-'83 will not exceed R1 million, but it could amount to approximately R500 000 for each R10 million invested in such projects in a full year.

Cinematograph films tax

The cinematograph films tax has been in operation in its present form since 1960. It is imposed at the rate of 3 cents on admission tickets of more than 35 cents, and has remained unchanged over the years. The tax has never been a substantial contributor to the State coffers and, in fact, the yield has declined dramatically over the last five years; from

© 1982 International Bureau of Fiscal Documentation – BULLETIN

for the April issue and probably for further issues during the year.

It is imperative that the shortfall of R597 million be financed in a non-inflationary manner, most suitably by way of taxation. Various options are open to me in this respect, but considering all the positive and negative effects of the various taxes, a choice had to be made as to the most desirable package under present-day and expected conditions.

I wish to turn, then, to the additional taxation proposals. As Henry Ward Beecher so aptly states it: "In this world it is not what we take up, but what we give up, that makes us rich". Let us not give up grudgingly for the rewards will be plentiful.

Ad valorem excise duties

In 1978 certain *ad valorem* duties were imposed on less essential goods such as jewellery, photographic equipment, furs and the like. I feel it essential for these items to make a further contribution to the State coffers and wish to propose that the present *ad valorem* duties on certain locally produced gods as well as their imported equivalents be raised from 20% and 25% to 25% and 30%, respectively.

This proposal is expected to yield additional revenue of some R28 million in the 1982-'83 financial year and should also assist in curbing consumer demand. The increased duties will become effective as from 25 March 1982 and will be applicable to all imported goods concerned which have not been cleared for home consumption before that date and to all similar locally manufactured goods which by tomorrow have not been removed from the premises of manufactures and owners of warehouses licensed by the Commissioner for Customs and Excise.

Advertising

General sales tax

General sales tax is levied on a wide variety of commercial and industrial services, for example repair services, the services of tailors, hairdressers, launderers, photographers, signwriters and printers, to mention only a few. The omission from this list of advertising services is somewhat anomalous and I feel that the taxation of such services for the purpose of producing revenue is fully justified and will not prove to be unduly burdensome.

It is, therefore, proposed to amend the Sales Tax Act to bring advertising services within the ambit of the Act as from 1 August 1982. There may be certain practical problems in this regard and I have, therefore, instructed the Commissioner for Inland Revenue to liaise with the advertising industry and media in order to iron out these problems before the legislation is drafted.

The additional revenue from this source is estimated at R31 million for a full year and at R20 million for the current financial year.

Company tax

During 11 of the last 14 years a surcharge ranging from 2.5% to 10% was imposed on the income tax payable by companies. In addition, in most of these years a loan levy was also applied. The present surcharge on the basic rate of 40% amounts to 5%, which makes the effective rate of tax on all companies excluding gold and diamond mining companies – 42%.

This is a low rate by world standards. In view of the fact that basic company tax rates have remained unchanged since 1970, I propose that the present 5% surcharge be incorporated in the basic rate. I propose, further, that a surcharge of 10% be levied on the new basic rate for all companies excluding gold and diamond mining companies.

The additional tax that will be collected by the increase in the effective rate from 40 to 42% and the 10% surcharge is estimated at R400 million for a full year and at R300 million for the 1982-'83 financial year.

I do not propose to increase the basic rate of tax applicable to gold or diamond mining companies. Gold mining companies pay tax according to a formula which varies with profitability, and to which is added a 5% surcharge, while the tax on diamond mines is 45% plus a 5% surcharge, an effective rate of 47.25%.

In the circumstances prevailing, however, I consider it is not inappropriate to increase the surcharge in the case of the gold mining as well as the diamond mining companies by 10%, that is, from 5% to 15%, to provide in this way much needed additional revenue from which to meet, *inter alia*, the increased demands which will be made on the Exchequer in the form of assistance to the marginal gold mines. In this way the more profitable mines will contribute partly to the strengthening of the total mining industry.

The yield from the additional surcharge on gold and diamond mining companies is estimated to amount to R115 million in a full year and R105 million in the 1982-'83 fiscal year.

Long-term insurance companies

The taxable income of companies carrying on long-term insurance business cannot, because of the nature of their business, be determined according to normal accounting principles and it has always been neccessary to provide special rules for this purpose. Since 1959 the basic measure for the determination of taxable income from life insurers has been 30% of gross income derived from investments.

Over the years the long-term insurance industry has grown enormously and I feel it is only fair that it should make a greater contribution to the Exchequer. I propose, therefore, that the percentage of gross investment income used as a yardstick for measuring taxable income be increased from 30 to 40%.

The taxation position of the long-term life insurance industry is a matter which requires further investigation and I have instructed the Standing Commission on Taxation Policy and the Commissioner for Inland Revenue to consider the matter in depth during the recess in consultation with the whole industry and to report as soon as practicable.

The additional revenue to be collected during the current financial year as a result of this proposal is estimated to amount to R38 million.

Loan levy on individuals

The additional tax that can be collected based on the proposals I have just made amounts to R491 milion which still leaves me with a deficit of R106 million.

Few will differ from Thomas Jefferson when he remarked: "The purse of the people is the real seat of sensibility. Let it be drawn upon largely, and they will listen to truths which could not excite them through any other organ."

I wish thus to propose, finally, the imposition of a 5% loan levy on income tax payable by individuals, but subject to exempting the following taxpayers:

(a) Persons of all age groups whose incomes are R7 000 or less. These taxpayers, the majority of whom will fall under the Final PAYE Deduction System to which I referred earlier on, will be taxed at a fixed rate. I do feel that no further loan levy should be added to their tax;
(b) Persons, other than those I have just mentioned, whose basic normal income tax before the addition of loan levy amounts to R150 or less; and
(c) in the Year of the Aged, persons who are 70 years of age and older and whose taxable incomes exceed R7 000 but do not exceed R15 000 per annum, though remaining liable for normal income tax, will not be liable for loan levy.

Not only will the levy yield the revenue required to leave me with a small surplus for the 1982-'83 financial year, but it should also contribute, albeit moderately, to curb consumer demand by reducing personal disposable incomes and thus help in the fight against inflation. Additionally, it has the advantage that it does not presuppose an increase in the marginal rates of tax which I have striven so hard to bring down to, and keep at, lower and more realistic levels.

The levy is a compulsory loan to be repaid within a maximum period of 7 years, at simple, tax-free interest. Up to now the rate of interest has been 5% per annum, but I now propose that this rate be raised to 8%.

The yield expected from the loan levy in the 1982-'83 financial year will amount to around R115 million and R157 million for a full financial year.

After all these revenue proposals have been taken into account, there will remain a small surplus of R9 million.

Developments in Latin America

PERU: NEW TAX AMENDMENTS

By Pedro Massone *

TABLE OF CONTENTS

1. General description
2. Income tax jurisdiction
3. Deduction of losses
4. Mining taxation
5. Taxation of capital gains
6. Taxtion of income derived by non-domiciliaries
7. Property taxation
8. Sales taxation
9. Customs duties
10. Adjustment for inflation
11. Tax incentive measures

1. IN GENERAL

Law No. 23,337 of 14 December 1981, published in the Official Journal *El Peruano* on 15 December 1981, introduced tax amendments affecting the recent tax reform discussed in my recent article, "The Peruvian Tax Reform (1981)", in this *Bulletin*.[1]

The changes refer to the tax code, income tax, property tax, general tax on sales, excise tax, mining taxation, customs duties and some other subjects. The principal changes are discussed in the following sections.

2. INCOME TAX JURISDICTION

Persons (individuals or legal entities) that under the provisions of the income tax law are domiciled in Peru are taxed on their world-wide income. The nationality of individuals, the place where entities are organized and the income-producing source are in this respect irrelevant. Persons not domiciled in Peru and their branches, agencies or permanent establishments in Peru are taxed on their Peruvian-source income only.

The foreign income tax paid abroad on foreign-source income is creditable against the liability to Peruvian income tax. The credit is limited to: (a) the tax actually paid abroad; and (b) the Peruvian tax which would result if the average (effective) rate applicable to world-wide income were applied to foreign-source income only.

For income tax purposes, legal entities include branches, agencies and *any other permanent establishment* in Peru belonging to sole proprietorships, companies or entities of any kind established outside Peru.

3. DEDUCTION OF LOSSES

Taxpayers domiciled in Peru can set off Peruvian-source losses against Peruvian-source income. They can also set off foreign-source losses against foreign-source income. They cannot, however, set off their foreign-source loss against Peruvian-source income. Only Peruvian-source losses can be set off against income arising in subsequent periods (carry over).

4. MINING TAXATION

The Mining Law is amended in order to specify that concessionaires are subject to the following taxes and duties:

- surface and registration duties;
- the income tax;[2]
- the tax on goods and services for the period during which it was in force (i.e. up to 31 October 1981);
- the general tax on sales as far as transactions subject to this tax are performed;[3]
- the "special tax" levied on exports of traditional products in place of the tax on goods and services;
- the tax on considerations for the rendering of personal services;
- the additional tax on sales levied on exports of minerals listed by the law, which was established in Legislative Decree No. 33 of 21 February 1981;
- the 2% surtax on behalf of the *Fondo de Compensación Nutricional* except where the taxpayer has concluded a contract with the government by means of which a guarantee has been granted that taxation rules will remain unchanged for a certain period of time;
- the taxes levied on behalf of the National Fund for Housing;
- social security contributions; and
- the tax on the distribution of electric power and running water, which was established in Legislative Decree No. 163 of 12 June 1981.

Concessionaires are exempt from taxes other than those listed above.

5. TAXATION OF CAPITAL GAINS

Taxable capital gains include gains arising from the transfer of property belonging to legal entities organized in Peru or to permanent establishments of enterprises organized abroad that perform in Peru activities that produce third category income. Other rules on the taxation of capital gains continue in force.

6. TAXATION OF INCOME DERIVED BY NON-DOMICILIARIES

Dividends paid to beneficiaries not domiciled in Peru are

---

* Professor of Tax Law at the University of Valparaíso.

1. 36 *Bulletin* No. 4 (1982) at 148.
2. The income tax is levied, as regards mining activities, under ordinary rules of the Income Tax Law, with several deviations therefrom, as explained in "The Peruvian Tax Reform (1981)", Section III. B.
3. Most minerals are specifically exempt from the general tax on sales.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

subject to a 40% withholding tax which is a final tax (was 30%).

For income taxation purposes, it is presumed that loans expressed in foreign currency produce an interest of not less than the average "Libor" rate for 6-month deposits, for the second semester of the preceding year. This rule does not apply in those cases already excluded from the presumption of interest under the income tax law enacted in June 1981.[4]

Royalties paid to beneficiaries not domiciled in Peru are subject to a 55% withholding tax which is final (was 25%).

7. PROPERTY TAXATION

The property tax on non-business real estate due for the year 1982 shall be calculated on the basis of the amount due for the year 1981, increased by 40%. This rule does not apply to dwellings the rent of which is frozen.

8. SALES TAXATION

The coverage of the general tax on sales is extended to include production services.

For purposes of the excise tax *(Impuesto Selectivo al Consumo)*, enterprises are deemed to be economically connected, in addition to instances specified in previous legislation, if more than 30% of the capital of two or more enterprises belong to persons who are common partners of said enterprises.

9. CUSTOMS DUTIES

The Executive Branch is vested with the power to revise the customs tariff. Moreover, imports of goods carried out during 1982 are subject to a surcharge representing 15% of the old customs tariff. Imports made by the government are exempt from the surcharge.

10. ADJUSTMENT FOR INFLATION

The capitalization of the net appreciation resulting from the revaluation of fixed assets carried out under the law (partial adjustment for inflation) is subject to a tax of 5% of the capitalized sum. This tax is paid by the company concerned. The capitalization shall be carried out during the first semester of every year as regards the revaluation made at the end ot the preceding year.

The capitalization to be carried out in 1982 shall include any appreciation resulting from prior revaluations, which has not been capitalized yet.

11. TAX INCENTIVE MEASURES

The Executive Branch shall prepare a bill containing a revised statute for tax incentives which shall preserve the system of tax credits currently in force.

While the approval of the new statute for incentives is pending, some of the current benefits are reduced, i.e.;

- indexes of selectivity included in Decree Law No. 22,401 are reduced;
- the capitalization of reinvested profits shall be subject to income tax at a 5% rate unless a higher tax is due under previous legislation;
- exemptions from the tax on business net worth granted by old laws are reduced to 50%. This reduction does not affect benefits granted in Decree Law No. 2 of 17 November 1980 to agriculture and activities that are allowed to conclude contracts with the government by means of which a guarantee is granted that taxation rules will remain unchanged for a certain period.

4. E.g. the presumption does not apply to loans granted by non-domiciliaries from abroad.

IFA NEWS

FINNISH BRANCH

The Board of the Finnish Branch of IFA met on 5 March 1982. The Board discussed, among other things, applications for membership and resignations. On 1 January 1982 the Finnish Branch had 52 individual members, which number did not change during the first two months of 1982. The Board decided to send the Resolutions of the Berlin Congress[1] to the Ministry of Finance and the National Board of Taxes for their information. It was also decided that a report of this Congress, to be prepared by the Secretary, would be submitted for publication in the Taxation magazine.

The Annual Meeting was held on 20 April 1982. Professor Andersson and Mr. Pallonen who were appointed as national reporters for the Montreal Congress discussed their reports.

The Finnish Branch of IFA will attempt to organize a group trip to Montreal in September.

1. See for the text of these resolutions 35 *Bulletin for International Fiscal Documentation* No. 12 (1982) at 544-546.

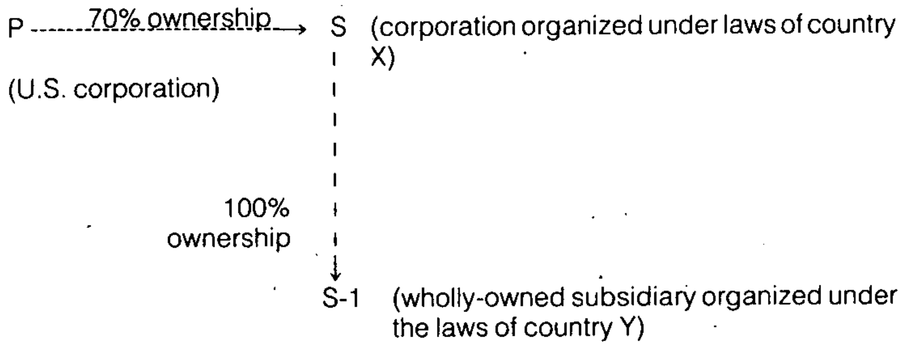
UNITED STATES:



Income of Foreign Corporations Subject to Tax in the U.S.

by Piroska E. Soos*

In Revenue Ruling 82-16,[1] the United States Internal Revenue Service ("I.R.S.") applied the provisions of Subpart F (Sections 951-964) of the U.S. Internal Revenue Code ("I.R.C.") which is designed to prevent tax avoidance by U.S. persons (individuals and entities) that seek to reduce their U.S. tax liability by conducting part or all of their business operations through foreign subsidiaries. I.R.C., Section 951(a) provides, inter alia, that if a person is a U.S. shareholder of a "controlled foreign corporation" and owns stock in the corporation on the last day (in a taxable year during which a foreign corporation is a controlled foreign corporation for an uninterrupted period of 30 days or more) on which the corporation is a controlled foreign corporation, such person must include in his gross income his pro rata share of the corporation's "Subpart F income".

I.R.C., Section 957(a) defines a "controlled foreign corporation" as any foreign corporation of which more than 50% of the total combined voting power of all the classes of stock entitled to vote is owned directly or indirectly by U.S. shareholders on any day during the taxable year of such foreign corporation. "Subpart F income" is defined in I.R.C., Section 952 and includes, among other things, certain sales income and certain dividends, interest and royalty income.

Revenue Ruling 82-16 involved a U.S. corporation, P, and two foreign corporations, S and S-1. Under the rules of direct and indirect ownership in I.R.C., Section 958(a), P was deemed to own 70% of S and 70% of S-1. The following diagram illustrates the relationship among the corporations.

During its tax year ending on 30 September 1980, S-1 had "Subpart F income" of 100x dollars and other income of 50x dollars. S-1 also had accumulated earnings and profits in excess of 250x dollars, none of which was attributable to amounts previously included in P's gross income under I.R.C., Section 951(a). On 30 September 1980, S-1 distributed 200x dollars in cash to S, all of which was "Subpart F income" in the hands of S.

Under I.R.C., Section 951(a), P must include in its gross income for U.S. tax purposes its pro rata share of the "Subpart F income" of both S and S-1. However, in the absence of a specific provision stating otherwise, P would be taxed twice on its pro rata share of 100x dollars since the same 100x dollars was "Subpart F income" for both S and S-1. I.R.C., Section 959(b) prevents this result by providing that, for purposes of Section 951(a) the earnings and profits of a controlled foreign corporation attributable to amounts that are, or have been, included in the gross income of a U.S. shareholder under Section 951(a) shall not, when distributed through a chain of ownership described under Section 958(a), also be included in the gross income of another foreign corporation in the chain for purposes of applying Section 951(a) to the other controlled foreign corporation with respect to the U.S. shareholder.

The issue in the Revenue Ruling related to the words "amounts that are, or have been, included in the gross income of a U.S. shareholder" in I.R.C., Section 959. Does the phrase apply to exclude 70x dollars (P's pro rata share of S-1's income included in P's income) from S's gross income? Or, does the phrase exclude the entire 100x dollars of S-1's earnings and profits that are attributable to the 70x dollars included in P's gross income?

The I.R.S. held that, under the facts in this case, 100x dollars of the dividends received by S from S-1 are excluded from S's "Subpart F income" for purposes of applying I.R.C., Section 951(a) to P, its U.S. shareholder. The I.R.S. said that the exclusionary language of I.R.C., Section 959(b) looks at the total amount of earnings and profits of the controlled foreign corporation that caused the U.S. shareholder to be in receipt of gross income under I.R.C., Section 951(a). In this case, it was 100x dollars of S-1's earnings and profits that caused P to be in receipt of 70x dollars of gross income.

The I.R.S. found that if the exclusion of I.R.C., Section 959(b) were limited to 70x dollars, P would in fact have to include more than its pro rata share of S-1's income. If only 70x dollars were excluded, the remaining 30x dollars would be included in S's "Subpart F income", and P would have to include in its gross income its pro rata share of 30x dollars, i.e. 21x dollars (70% × 30x dollars). Thus, the total amount includible in P's gross income as a result of the 100x dollars would be 91x dollars (70x + 21x dollars).

The I.R.S. noted that I.R.C., Section 959(b) was enacted for the specific purpose of preventing the income of a controlled foreign corporation, which income had once been included in the gross income of a U.S. shareholder, from being included in the gross income of the U.S. shareholder a second time when the income is distributed to another controlled foreign corporation. This purpose could be achieved only by excluding 100x dollars from S's "Subpart F income".

INDIA:

How Progressive are the Direct Taxes?

by G. Thimmaiah*

1. INTRODUCTION

In India taxation has been used to promote multiple objectives: increase the rate of domestic savings, reduce inequalities of income and wealth and maintain price stability. The first objective was attempted through "widening and deepening of the Indian tax system" so as to mobilise additional revenue for the purpose of investment in the public sector. Additional taxation measures were mainly intended to increase public sector saving by diverting increased income in the private sector (from conspicuous consumption) to public sector saving and investment. But in the 1970s empirical studies have shown that this has not actually happened in India.[1] In fact, both direct and circumstantial evidence go to prove that additional taxation has encouraged the government to increase its consumption expenditure much more than government savings.

In the case of price stability, taxation was justified on the basis of Keynesian macro-economic logic, namely, that taxation would reduce disposable income and hence effective demand and thus bring down prices. But here again, some empirical studies have shown that taxation, particularly indirect taxation,[2] instead of reducing demand, has simply added to the tax-pushed price rise; consequently the additional tax measures in the past 10 years or so have only added to price instability in the country.

In regard to the equity objective, the role of taxation in reducing inequalities of income and wealth has been rather overemphasised. During the Second Five Year Plan period, the big-push strategy of industrialisation emphasised the objectives of growth and equity. Growth was attempted through rapid industrial development, particularly by starting capital goods industries, and equity was supposed to be achieved through fiscal policy tools, particularly by levying steeply progressive rates of tax on income and wealth. Accordingly, for the first time a group of direct taxes was introduced based on the recommendations of Nicholas Kaldor which came to be known as the "integrated direct tax system". In addition to the then existing income tax and capital gains tax, wealth tax, estate duty, gift tax and expenditure tax were introduced during the Second Five Year Plan period. Since then, these taxes have continued to operate with various modifications and only expenditure tax has been removed.

Nicholas Kaldor provided a very appealing rationale for the equity objective of taxation in the following way:

> An effective system of progressive direct taxation is vital to the survival of democratic institutions in India. The need for this arises not merely on financial grounds – to raise adequate resources for purposes of accelerated economic development – but in order to bring about the degree of social cohesion and co-operation that is essential for the successful functioning of a democratic system. In a community where there is such a wide gap between the position of a privileged minority of well-to-do and the vast majority who live in dire poverty, social cohesion can only be achieved if economic inequality is effectively lessened and the tendency towards increasing concentration of wealth is effectively counteracted. This can only be done through the instrument of taxation. It is in any case inevitable that heavy burdens should be laid on the broad masses of the population if India is to attain a satisfactory rate of development in the coming decades. it will not be possible to carry through the programme successfully with the consent and co-operation of the people if the privileged minority of the well-to-do are not made to bear a fair share of this burden. Moreover, in matters of taxation, like in the administration of the law, it is not enough that justice should be done – it must also be seen to be done. If owing to defects in the tax laws, or in their administration, highly progressive taxes of wealth and income have no visible effect on the prevailing economic inequality, or in the standards of living of the rich, the mere enactment of advanced tax legislation will prove fruitless.[3]

The Government of India took this advice very seriously and relied too much on direct taxes to reduce inequalities of income and wealth in the country. What is more, by introducing many direct taxes together, the Government of India tried to convince the majority of the vast masses that the richer people were bearing a very high burden of taxation and therefore the masses should also contribute, to whatever extent possible, through indirect taxation for the development effort of the country. This led to an enormous increase in the rates and coverage of indirect taxation. Such an unprecedented increase in indirect taxation also gave a lever to the private sector, which has been protected from foreign competition, to increase the profit through pushing up prices. While the Government was lulled to complacency on the assumption that increased taxation would reduce consumption and bring down the price level and also that the system of integrated direct taxes would prevent evasion of direct taxation and reduce inequalities of income and wealth, in actual practice prices went on rising as and when taxes were increased and the really rich self-employed income earners went on evading direct taxes. This is the story of postwar tax policy in India. After a period of two decades it has come to be realised that inequalities of income have increased and mass poverty has only spread. Several explanations are given for these not so unexpected economic

consequences. Recognising this fact, the Fourth Five Year Plan emphasised restructuring the plan priorities and also the composition of the goods produced in the country with a view to achieving growth with equity. The Fourth Plan also started some anti-poverty programmes which have been continued even in the Fifth and Sixth plans.

While the effect of indirect taxes and the overall additional tax measures on public sector saving and the price level have been examined elsewhere, an attempt is made here to assess the effect of direct taxes on the inequalities of income and wealth in India. This is done by measuring the progressivity of direct taxes in India.

2. MEASUREMENT OF PROGRESSIVITY

For the purpose of judging the progressivity of tax, the average rate and marginal rates are traditionally used. Thus, over a given range of ascending income levels, if the average rate and marginal rates are equal, the tax is considered proportional; if the marginal rate is greater than the average rate, it is progressive; and if the average legal rate is greater than the marginal rate, it is regressive. However these refer only to legal rates which exist in law, but which in actual operation may not satisfy these conditions. In other words, what is important from the point of view of judging the progressivity of direct taxes is the comparison of average effective and marginal effective rates. These rates are obtained on the basis of actual amount of revenue collected from the taxpayers at different income levels. Though the progressivity of taxation is measured in terms of average progressivity, marginal rate progressivity, and tax liability progressivity, in order to know the effect of direct taxes on the inequality of income and wealth, we need to have some summary measure which has some relation to the popularly used measure of inequality, namely, the Lorenz curve. R.A. Musgrave[4] has suggested a measure in which the inequalities of pre-tax and post-tax incomes are compared and the effect of a tax system on the inequality of income is measured. Recently, D.B. Suits[5] and N.C. Kakwani[6] have also developed similar summary measures to know the impact of the tax structure on inequality of income. In this paper we have used Musgrave's measure as it will not only give us the impact of direct taxes on the degree of inequality, but also takes into account the impact of the statutory rate structure, the level of tax yield and the distribution of income.

Progressivity of direct taxes is measured with reference to their distributional effect. Following R.A. Musgrave, the incidence of taxation has come to be defined in terms of its distributional consequences. Accordingly, progressivity is supposed to reduce the inequality of post-tax income distribution. No doubt, for the purpose of knowing the progressivity and the impact of distribution of income, not merely the incidence of the overall tax structure but also the incidence of public expenditure should be considered. Only such a complete budget incidence will give the true picture of the distributional consequences of a government budget. However, it is also necessary to examine the impact of specific direct taxes on the distribution of income from the point of view of tax reform. The taxes which are traditionally considered as direct taxes – such as income tax, estate duty, capital gains tax, gift tax, wealth tax, etc. – are supposed to fall on those people on whom legal liability is indicated and established. It may be noted that the effectiveness of these taxes in reducing the inequality of income depends upon the nature of the progressive structure of the tax rates. In the case of Musgrave's measure, first the gini-coefficient of income distribution before tax, (G), is estimated. Then the gini-coefficient of post-tax income distribution, (G*), is estimated and the ratio of the latter to the former, (G*/G), will give the overall progressivity of the tax. The ratio (G-G*/G), which may be called the coefficient of equalisation, will give us the effect of direct taxation on the distribution of income. If the ratio of the Gini coefficient of post-tax income distribution, (G*), to the Gini coefficient of pre-tax income distribution, (G), is greater than 1, the overall effect of a tax is progressive. If it is equal to 1 it is proportional, and if it is less than 1 it is regressive. Further, the higher the value of the coefficient of equalisation, (G-G*/G), the higher the redistributive effect of taxation.

3. PROGRESSIVITY OF DIRECT TAXES IN INDIA

Table 1 shows the changing composition of direct taxes in India. It may be observed that the income tax, which contributed almost 75% of the revenue from direct taxes, gradually declined in its importance to 18%. Correspondingly, the revenue importance of corporation tax has increased from 23% in 1950-51 to 71% in 1981-82. Of the remaining direct taxes, the revenue from wealth tax has been increasing in both absolute and relative terms. Even so, the revenue importance of direct taxes on individuals has been declining. This would suggest that direct taxes on individual income and wealth are declining as compared to direct tax on corporate income, thereby making them ineffective in achieving the equity objective.

Table 2 presents the summary measure of progressivity and the redistributive effect of direct taxes in India. The summary measure of progressivity is the one suggested by R.A. Musgrave which indicates that all direct taxes have been regressive as the values are less than 1. Perhaps wealth tax, estate duty, gift tax and capital gains tax can be considered to be proportional in view of the values of their progressivity measures being nearer unity. But in the case of individual income tax, it is definitely regressive as it is less than 1. What is more, the coefficient of equalisation which is presented in Table 2 shows that the income tax, though it had a more equalising effect than other direct taxes, is still greatly inadequate to reduce the inequality of income distribution among direct tax assessees. In the case of wealth tax, the equalising effect is almost absent. And in the case of other direct taxes it is negligible. This suggests that direct taxes did not have a significant equalising effect to reduce inequalities of income distribution among the assessees to direct taxes in India.

We have also examined average rate – marginal rate progressivity. (However the results are not presented here as they run into several pages.) There also we find evidence of regressivity. In other words, though the summary measure of progressivity indicates the overall progressivity over the entire range of income levels, even the marginal rate progressivity does not clearly indicate progressivity at different ranges of income levels. It is quite possible that a tax may be progressive at different levels of income but may not be progressive over the entire range of income levels. However, both the summary measure of progressivity and the average – marginal rate progressivity indicate that all the direct taxes in India have not been progressive so as to reduce inequalities of income and wealth.

It should, however, be noted that these direct taxes have been operating in a situation of rising prices. Rising prices themselves operate as some sort of regressive tax, and in order to know the true nature of the progressivity we have to eliminate the impact of inflation on the progressivity of these taxes. However, we have not been able to separate the regressivity of inflation from the regressivity of direct taxes. Even so, one would expect from the tax rate structure that some sort of progressivity would prevail. But the average effective rates and the marginal effective rates indicate that the effective rate progressivity has been regressive in India.

4. EXPLANATIONS FOR THE ABSENCE OF PROGRESSIVITY

After establishing he negligible equalising effect of direct taxes in India, it is necessary to search for the reasons for such absence of progressivity. Three reasons may be given to explain this phenomenon:

(1) Though the legal rates have been steeply progressive, the effective rates have been made regressive owing to various exemptions, allowances, deductions and so on. In other words, "tax expenditure measures" which are built into the direct tax system have distorted the legal rate structure and made them regressive.

(2) Tax evasion seems to be evident as the marginal and average effective rates become lower at the higher levels of income and wealth.

(3) The extent of tax avoidance under legal protection and the ever increasing arrears of assessment and of collection (as is evident from Tables 3 and 4) do indicate that, at the higher levels of income and wealth, people resort to legal remedies because of defective assessment and, as a result, the actual tax liability becomes far less than the expected legal liability. Consequently, the originally designed tax loses its progressivity element over time, apart from the government losing the revenue.

Thus a combination of these factors have been operative in the country to make the direct taxes ineffective in their equalising effect. The policy implication of the foregoing findings is simple, namely, to recognise the reality of the situation. It is better to admit the fact that the direct taxes in the country cannot be used to reduce inequalities of income and wealth, rather than to proclaim repeatedly that they are intended for that. This is mainly because the coverage of these taxes is so small that it is meaningless to think of using such taxes – which cover a small proportion of the active population in the country – to reduce the inequalities of income in the country as a whole. The actual operation of the tax laws has shown that the average and marginal effective rates have been quite different from the legal rates and as a result the expected equity even among those whose income and wealth are assessed for direct taxes is not achieved. It would be better to recognise the fact that these direct taxes cannot reduce inequalities of income and wealth in this country, and, therefore, to justify these taxes only from the point of view of raising revenue. Otherwise, great hopes will be raised, and in fact such hopes have been raised in the past, in the minds of the people in the name of achieving equity through steeply progressive taxation, which in fact has not been achieved. Hence, instead of raising expectations and dashing them to the ground without achieving the intended objective, it would be better to admit the fact that direct taxes in the Indian situation cannot achieve the objective of reducing inequalities of income in the country.

Alternatively, one might argue that we should reform the direct tax structure in such a way as to cover more people, to plug legal loopholes not only to prevent evasion of tax payment but also to reduce tax avoidance through tax planning. We would consider such arguments as merely academic in the Indian politico-economic institutional setting.

Table 3 (Number of assessments)

HONG KONG:

Budget 1982-83

Extracts from the Budget Speech pronounced by the Financial Secretary, Mr. John Bremridge, on 24 February 1982

A detailed discussion of Hong Kong's tax system appears in the International Bureau of Fiscal Documentation's publication: TAXES AND INVESTMENT IN ASIA AND THE PACIFIC

1. I begin my first budget speech by acknowledging my debt to my predecessor who has left me a clean slate on which to draw. I am also grateful to my new colleagues in Government who have worked so hard on the budget, and have loyally pointed me in approximately the right direction, though the choice of paths is mine – even in a budget which naturally reflects governmental not personal policy. I cannot name them all, but they particularly include officers in Finance, Economic Services, Monetary Affairs, and Inland Revenue.

2. My speech deals with three main issues – where Hong Kong has been and why; the current state of the Government's accounts and my proposed estimates and tax concessions; and where Hong Kong then seems likely to go in 1982. It is supported by the accompanying cross referenced 1981 Economic Background and 1982 Economic Prospects, plus footnotes and appendices bound with the printed version.[1]

. . .

TAX PROPOSALS

74. I come now to my proposals on taxation. The estimated surplus for 1982-83 is $6.3 billion as against the revised estimate of $7.7 billion for 1981-82. Our reserves are now larger at $23 billion.

75. While there are several sources of increased or additional revenue fairly open, with tobacco and alcohol only among the more obvious, I do not believe that it is ordinarily appropriate for the Government to raise taxation when it clearly does not need the money either for its immediate expenditure requirements or in order further to strengthen prudent reserves. While for years it has been argued in Hong Kong that in normal circumstances taxation should be fiscal in nature there may have to be exceptions. Higher taxes on motor vehicles and duties on petrol are possible examples. There are others. Common sense in such cases may indicate that the Government should consider not only its fiscal requirements but also the potential of taxation as a supplementary means of achieving other policy ends.

76. I believe that the new Capital Works Reserve Fund is a businesslike way of spreading unpredictable and often lumpy capital revenue from year to year against a current Public Works Programme four-year overhang of some $23 billion. In fact annuality (except as an important control concept) does not really play a part in major capital programmes, for we are not likely to stop large capital schemes in mid-stream unless in extraordinary circumstances.

77. With the C.W.R.F. established and initially funded, the surplus is estimated to drop to $3.7 billion in 1982-83. This presupposes that members will accept my recommendation that $11 billion should be appropriated in 1982-83 for the fund. While the creation of the C.W.R.F. has seemingly diminished the overall surplus on General Revenue Account, we should not allow ourselves to be seduced by this budgetary innovation into inconsistent fiscal behaviour.

78. I make no apology for referring frequently in this speech to the need for consistency in Government policies – and particularly taxation policies. While simultaneously observing our accepted guidelines it is reasonably consistent that I should propose to abate taxation in 1982-83 by some $1.37 billion, which compares with the figure of $1.25 billion a year ago. You will note that I do not use the irritating phrase 'give back', which presuppose that private monies are all at Government's beck and call.

79. My major concerns for 1982-83 include the need for appropriate monetary and fiscal counter-inflationary policies, the problems of industry, the continued development of Hong Kong as a major financial centre, and the less privileged. I also acknowledge the burdens of Mr Lobo's sandwiched society – the middle class who in Hong Kong as elsewhere tend to be a mainstay of the community. Finally I am well aware that capital revenue yield from future land sales is as enigmatic as it ever has been.

80. I thus propose ten tax concessions in four areas, which I believe reflect these concerns. They otherwise are mainly neutral in effect, and will promote our general economic well-being. In that state of well-being I include a sense of fair play, for good budgets must surely have some satisfying emotional content.

BUSINESS TAXATION

81. My first two concessions offer incentives for investment to the business sector of our economy and in particular to our manufacturers, who I believe should be further encouraged to expand their investment in new capital equipment. This is essential if our industry is to remain flexible and competitive. I am anyway well aware of the difficulties currently being experienced for example by many in the spinning, weaving, dyeing and finishing sectors. Members will recall that in order to encourage manufacturers to re-equip and upgrade their plant and equipment, Government last year introduced both improved annual depreciation rates and an increased initial allowance, which was raised from 25% to 35% in respect of expenditure incurred on the provision of plant and machinery.[2] Some have said that we did not go far enough and that we should permit a full 100% write-off in the year of acquisition as indeed is the practice in some other places. This would, however, be an expensive concession, which could not be contemplated in one single bound. Furthermore, bearing in mind Hong Kong's unusually low rates of tax fiscal relief alone will probably never be a conclusive incentive to incur expenditure on plant and equipment; other considerations such as a desire for improved production capacity, increased productivity, and particularly enhanced profitability are more likely to be the deciding factors. Nonetheless I accept that tax considerations play their part in the decision-making process; and our manufacturers still represent the backbone of our economy. Accordingly my first proposal is that the initial allowance should be further increased from 35% to 55% for expenditure incurred on the provision of qualifying plant and equipment.[3] The new initial allowance will apply to both final profits tax assessments for 1981-82 and provisional profits tax for 1982-83. The cost to the revenue of this increased allowance will be $354 million in 1982-83 and $180 million in a "full" year.

82. My second concession, which concerns the industrial buildings allowance, will benefit both manufacturers and those who invest in industrial property for rental income purposes. For just as it is important that our manufacturers should be encouraged to re-equip and upgrade their plant and equipment, so it is desirable that new plant and equipment, and particularly the workers who operate the machines, should be accommodated in modern and efficient factory premises.

83. The present legislation provides for the grant of industrial buildings allowances by reference to the cost of construction only: no account is taken of the profit element included in the price which the property developer charges to the purchaser for his new building. I propose therefore, that where a person carrying on a trade, which consists wholly or partly of the construction of buildings or structures with a view to their sale, sells a qualifying building in the course of that trade, before it is used, then the initial and annual allowances will be computed by reference to the net price paid by the purchaser and not by reference to the actual cost of construction.[4] The cost to the revenue of this concession will be $66 million in 1982-83 and $34 million in a "full" year; and the concession

---

1. Not reproduced here.
2. B.S. 1981, paragraph 243.
3. Thus, for example, an item of weaving or spinning machinery already ranking for the annual rate of allowance of 30% will qualify for a write-off for profits tax purposes (initial and annual allowances taken together) of 68.5% in the year of acquisition.
4. Thus, assuming a factory building is constructed by a property developer at a cost of $8 million and sold to a corporate manufacturer for, say, $10 million (which could be a comparatively modest mark-up), then the tax saving to the manufacturer in the year of acquisition as a result of this concession would be $79,200 (i.e. tax at 16.5% on initial and annual allowances granted on the developer's profit of $2 million).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

will again apply to both final profits tax assessments for 1981-82 and provisional profits tax for 1982-83.

INTEREST TAX

84. I turn now to the controversial issue of interest tax. When presenting his 1981-82 Budget Sir Philip made reference to the taxation treatment of foreign currency deposits and told this Council that an examination was in hand.[5]

85. In the course of our subsequent deliberations we once again concluded that for a variety of reasons there was no present case for the total abolition of interest tax; and that the case for the exemption of foreign currency deposits taken in Hong Kong was not clearcut, because it could lead to switching of funds from Hong Kong dollar deposits to foreign currencies with consequential pressure on the exchange value of the Hong Kong dollar. I have since received two reports prepared by the Hong Kong Association of Banks. The second of these gave information obtained from a survey of member banks, the general consensus of which was (hardly surprisingly) strongly in favour of a tax exemption for foreign currency deposits. These submissions acknowledged the probable fiscal consequences of repeal, but took the view that in the context of our total budgetary situation we could afford the loss in yields from interest tax. They also argued that the monetary and economic advantages, in particular the enhancement of Hong Kong's position as an international financial centre, could well outweigh the fiscal losses; and that such losses would in part at least be offset by increased profits tax yields from financial institutions. After long internal debate and much heartsearching we have come to the conclusion that the arguments for a partial repeal of the interest tax on pragmatic and economic grounds outweigh the fiscal arguments for its retention. The Government considers that the continuing growth of Hong Kong as an international financial centre is worthy of encouragement.

86. I therefore propose to exempt foreign currency deposits placed with licensed banks and registered and licensed deposit-taking companies from interest tax; and it follows that those institutions will no longer be under any withholding obligations in respect of such deposits. The original terms of reference for the examination envisaged that exemption would only be available for deposits of a minimum size, and would apply only to deposits placed with licensed banks and licensed deposit-taking companies. We have now come to the view, however, that it would best serve Hong Kong's interests if the exemption were extended to registered deposit-taking companies as well, thus giving to international investors who wish to use our services a wider range of choices. By the same token I have decided not to impose a minimum level of deposit. Any such limitation would necessarily have had to be arbitrary: if set too high it would have vitiated the objectives of the exemption; and if set too low could have been readily circumvented, for instance by groups of depositors joining together to meet the stipulated minimum. Furthermore a minimum level of deposit which was pitched high would be open to criticism on grounds of equity – helping only the rich investor at the expense of the man in the street. Consequently the exemption will apply to all foreign currency deposits placed with licensed banks and licensed or registered deposit-taking companies. And, I should add, not only is the charge to interest tax removed but also it is intended to provide a corresponding exemption from profits tax in respect of interest accruing on foreign currency deposits placed with these institutions by persons, whether corporate or non-corporate, carrying on a trade, profession or business in Hong Kong (other than the business of 'financial institution' as defined in the Inland Revenue Ordinance).[6] I must stress that the profits tax exemption will not apply to 'financial institutions' – for obvious reasons. The borrowing and lending of money at interest with a view to profit is the very essence of their business activities, and there is clearly no case for excluding those profits from charge.

87. Having thus decided to exempt interest on foreign currency deposits, there remained the problem to which I have already referred; that is the evident dangers for the Hong Kong dollar if depositors began significantly to move across the exchanges out of Hong Kong dollar deposits ino foreign currency deposits. It is also now a relatively simple matter for an investor to minimise his exchange risks at small cost by entering into what is known in the trade as a "swap" transaction – that is the coincidental purchase and resale of the foreign currency deposit. This practice moreover is clearly mushrooming.

88. Bearing in mind, however, that there is a cost element in minimising exchange risk exposure, we believe that it is possible to discourage widespread switching from Hong Kong dollar to foreign currency deposits; and this I propose to do by reducing the rate of interest tax on Hong Kong dollar deposits with licensed banks and registered and licensed deposit-taking companies from 15% to 10%. At this level the tax advantages of moving into foreign currency deposits will usually be small; indeed a switch could well be disadvantageous when measured against the costs of covering exchange risks. Much will depend, however, upon the relative movements of Hong Kong dollar and other interest rates. I do not incidentally propose to introduce a differential rate for profits tax on Hong Kong dollar deposit interest accruing to business depositors. The practical complications would be considerable and, in my view, not justified. Again it will be appreciated that the concessions now proposed apply only to deposits with banks and deposit-taking companies. Interest on other forms of indebtedness such as mortgages and private loans will continue to attract liability to tax at the standard rate of 15%, or 16.5% in the case of the profits of corporations who receive such interest as part of their trading profits.

89. The cost to revenue of exempting foreign currency deposits and of reducing the interest tax rate on Hong Kong dollar deposits to 10% is estimated to be $400 million in 1982-83, subject always to the influences which variations in interest rates from time to time and in the volumes of deposit business transacted might have on revenue yields.

90. It would be appropriate administratively to introduce these interest tax proposals with effect from 1st April 1982, that is at the commencement of the next fiscal year. As however there could be something of a hiccup in the financial sector in the intervening weeks, I have decided that it will be more intelligent to introduce the new exemption for foreign currency deposits and the reduced rate of 10% forthwith. To this end Your Excellency this morning signed an Order under the Public Revenue Protection Ordinance which will bring these proposals into force so as to apply to interest paid or credited on or after tomorrow, Thursday, 25th February 1982. It is my hope that the clamourings of the interest tax abolitionist lobby will now subside. But whether they do or not, we shall watch carefully the effects of the reliefs now to be introduced. Whatever the monetary and economic advantages may be, we realise that these reliefs introduce a new, untried and somewhat untidy dimension to the well tested fiscal balance of our tax system. If the imbalance which these new reliefs impart to the system is unduly exploited – for example by way of sophisticated gearing devices designed to eliminate or reduce substantially the profits tax liabilities of ordinary trading concerns – we shall have to consider whether the loss to revenue is still justified, or whether we have begun to pay too high a price for the economic advantages gained. It will also be a matter of experience whether 10% is an appropriate level.

PERSONAL TAXATION

91. Last year substantial increases were introduced in the level of allowances granted to those liable to salaries tax and to those who elect for personal assessment. I propose this year to introduce further concessions in the field of personal taxation because, as Sir Philip aptly put it last year, we have an ongoing commitment 'to review the system of personal taxation periodically, having regard to our current budgetary situation and to the need to maintain equity as between different income groups at a time when the growth of money incomes is leading to fiscal drag'.[7] If at some future time our revenue needs dictate an increase in the levels of taxation, I shall not hesitate so to address this Council. For the moment, however, I am satisfied that we can afford this year to review again the levels of our personal taxation allowances and to revise upwards the tax thresholds, that is the

---

5. B.S. 1981-82, paras. 295-296 . . . . . to consider the implications of the proposition 'that interest payable on deposits denominated in foreign currencies above a certain minimum size, accepted by institutions of a certain status (say, licensed banks and the proposed new category of merchant banks), be made exempt from tax and consequently, that the institutions concerned be made exempt from any withholding obligations'.

6. This profits tax exemption is a logical consequence of the decision to exempt foreign currency deposits from interest tax, and also recognises that business proprietors could with comparative ease remove surplus funds temporarily from their businesses thus legitimately avoiding the charge to profits tax whilst at the same time enjoying the interest tax exemption.

7. B.S. 1981, paragraph 223.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

levels of the entry points into the tax net. Such concessions will ensure that those who would otherwise be brought into the tax net because of the effects of inflation on money incomes are kept out: they will pass on to some of those already in the tax net some of the benefits of our satisfactory budgetary situation: they will also mean that some are no longer liable to tax at all.

92. Firstly, I propose an increase in the level of personal allowances from $15,000 to $20,500 for single persons and from $30,000 to $41,000 for married persons. The present supplementary personal allowances of $7,500 for a single person and $15,000 for a married person will remain unchanged, and the available claw-back mechanism will continue to be zero rated. Thus taken together the basic personal allowance plus supplementary allowance will total $28,000 for a single person and $56,000 for a married couple; below these income levels there will be no liability to tax. The new allowances will be, therefore, very nearly 25% higher than the present levels fixed a year ago, and thus considerably in excess of the rate of inflation.

93. Secondly, I propose an increase in the child allowances from $7,000 to $8,000 (or by 14.3%) for the first child and from $5,000 to $5,500 (or by 10%) for the second child. I do not propose increases in the present allowances for the third to ninth children, which I consider remain appropriate.

94. Thirdly, I propose an increase in the dependent parent allowance from $7,000 to $8,000 (or by 14.3%), as before pitching this allowance at the same level as that for the first child. I do not propose to vary the criteria for the granting of this allowance.[8] I shall give further thought to the important social question of persuading children to support their ageing parents, of whom I am one.

95. If approved, my proposals for personal taxation allowances will be applicable to final salaries tax assessments (and for personal assessments also) for 1981-82 and to provisional salaries tax for 1982-83. The cost to the revenue in 1982-83, after allowing for the two-instalment system for the payment of provisional salaries tax, will be $509 million, equivalent to a substantial proportion (22%) of the estimated revenue from personal taxation. The cost in a "full" year is estimated to be $316 million at present levels of chargeable income.[9] I do not propose to dwell on the figures, but I suggest that close examination will demonstrate again that our system of personal taxation is extraordinarily modest in its impact. Indeed there can be few other places in the world which have both tax thresholds so high that the majority of the economically active are excluded from charge to tax, and a system which is so efficiently revenue productive (and, I might add, at an extremely low cost by world standards).

ESTATE DUTY

96. Finally I have three concessions relating to Estate Duty. But first I intend to use this opportunity to comment on certain criticisms of Estate Duty at large, which will also enable me to range more widely. It has been suggested that the Estate Duty legislation ought to be repealed because it is cumbersome and complex, its impact is easily avoided, it produces little revenue, and is difficult and expensive to administer.

97. The facts however are that the legislation is well understood by those who have to deal with it professionally, and by the officers of the department who administer it. As regards avoidance, all our direct taxes are susceptible to avoidance, based as they are on our limited territorial source criterion. On the whole because of our modest rates the majority of our entrepreneurs and others who use Hong Kong's excellent infrastructure of services, communications facilities and so on do not conduct their tax affairs as cynically as their counterparts in other places where high levels of taxation prevail. But I am bound to say that, if ever our taxation system ceases to be as revenue productive as it is now, we shall have to think seriously about plugging the leaks even if that means paddling into the muddy waters of highly complex fiscal legislation, which we have always avoided in favour of our simpler system.

98. In the year ended 31st March 1982 estimated estate duty collections are expected to be $294 million, which though not a significant sum measured against our total revenue yields, is a useful contribution to our total budgetary needs. Nor must we ever commit the cardinal error of being mesmerized by billions: it is an accumulation of small sums that matters, as every man and woman in the street knows. The cost of collection is under 1%, which is hardly an expensive operation. Finally, so the Commissioner informs me, the Estate Duty Office provides an excellent source of information on those who during their lifetime made little or no contribution to the Exchequer – because they evaded or cheated on taxes they ought to have paid. This final opportunity to seek and obtain some restitution from the estates of such people would in itself be justification for the retention of the estate duty, even if the yield from the duty itself were insignificant – which it is not.

99. But to return to my three concessions. Members will recall that last year we raised the estate duty exemption limit to $1 million in recognition of rising asset values. This year I propose firstly further to raise the exemption limit to $2 million: that is to say no duty will be payable on the estates of deceased persons who die possessed of net assets of a value below that figure. This increase may at first sight seem somewhat generous, but it recognises that asset values have continued to rise and is consistent with our low tax philosophy.

100. Secondly, one of the effects of successive increases in the exemption limit in recent years has been to make the initial impact of the estate duty rather more significant than it should be, and therefore inconsistent with our low tax philosophy. If my proposal to increase the exemption limit to $2 million is approved, the rate of duty applicable to estates between $2 million and $3 million under the present schedule (and subject, of course, to marginal relief) would be 17%. Therefore in order to reinstate the concept of graduality I propose to replace the present schedule of rates with a new schedule scaled from 10% on estates between $2 and $2.5 million to 18% above $4 million.[10]

101. Thirdly, I propose to exempt from duty altogether the principal matrimonial home of the deceased, where the deceased leaves a surviving spouse. This relief acknowledges the claim that sometimes there can be hardship for the surviving spouse because the home is subject to duty. While I know of no case where a widow has been obliged to sell the home in order to pay the duty, it seems logical in the context of our low tax philosophy to exclude it from charge.[11]

102. The cost to the revenue of these three proposals will be approximately $42 million in 1982-83 and an estimated $52 million in the following year.

OTHER MATTERS

103. Before I leave the subject of taxation I wish to comment on other matters on which I have received representations. (My office is of course always open to criticism or to new ideas.)

---

8. At certain income levels those who contribute only the minimum qualifying annual contribution of $1,200 to a dependent parent can gain a tax advantage in excess of that sum; the majority of claimants probably make a rather larger contribution to the maintenance of their dependent parents.

9. These increased allowances will benefit an estimated 92,000 persons; 52,000 taxpayers who were previously liable and who will now be exempt, and a further 40,000 who would have become liable in 1982-83 but who will now be kept out of the tax net. This means that in 1982-83 there will be an estimated 218,000 salaried taxpayers, compared with some 310,000 who would have been liable without these new concessions. Furthermore, of those remaining in the tax net some 205,000 will benefit by way of reduced liability. About 13,000, or 6% of the total number in the tax net, will receive to benefit from these concessions and will continue to bear tax on their chargeable incomes at the standard rate of 15%. *This high income group continues to contribute well over half of the total yield from salaries tax.* Additionally an estimated further 55,000 persons who elect for the advantages of personal assessment will also benefit through reduced liability. Examples of the effects of these new allowances for persons at various income levels and in various personal circumstances are contained in Appendix E to the printed version of this speech; and at Appendix F there appears a table showing examples of the present and future effective rates of tax at different income levels for persons in various personal circumstances. Appendix G shows the income levels at which persons in various personal circumstances will become liable at the standard rate in future.

10. On estates between –

$2,000,001 and $2,500,000	10%
$2,500,001 and $3,000,000	12%
$3,000,001 and $3,500,000	14%
$3,500,001 and $4,000,000	16%
$4,000,001 and above	18%

11. The exemption will be administered by reference to rules which broadly follow the Property Tax owner-occupier exemption; and where there is more than one matrimonial home the estate's legal personal representative will be permitted to designate which property is to be the principal matrimonial home. But for the purposes of determining the appropriate rate of duty to be applied to the remainder of the estate, the matrimonial home will first be aggregated with the other dutiable assets and only thereafter excluded from charge.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

104. They include allegations that our profits tax legislation enables the Commissioner to charge capital gains to tax. I am advised that this is not so; and the Commissioner assures me that he has never done so and has not the slightest intention of trying to do so. He does concede that there are occasions when he seeks to tax as income what the taxpayer prefers to think of as a capital profit. But there are remedies through the appeal process, if the Commissioner's view in such a case seems incorrect. It has also been represented that executors of deceaseds' estates are in some jeopardy in that the Commissioner could successfully recover from the personal assets of the executor taxes owed by the deceased. Again I am advised that this is not a correct interpretation of the law, and the department does not seek to recover taxes in default in this way. I have also been told that in certain circumstances dividends could be chargeable to profits tax. Once more, that is not a view to which the Commissioner subscribes. These, and other miscellaneous matters which have been placed before me, are not in any respect what could be described as burning issues. However, I have taken due note of them; if at some convenient time in the future it is thought that any of them has merit, or that there is indeed some legal doubt as to the proper interpretation of the existing legislation, steps will be takenm to put matters right.

105. The one proposition which has caused me sleepless nights is the contentious issue of separate taxation for married women. I have of course noted Sir Philip's concluding comments in the last year's debate.[12]

106. I am fortified by two other considerations. Firstly, the cost to revenue of separate taxation for married women would be about $200 million per annum. It would not be prudent to add this considerable sum to this year's total tax cuts, and it would therefore be necessary to sacrifice others of my proposals to make room for benefits for married women. I do not think it sensible that my overall reliefs should thus be distorted.

107. Secondly and fortuitously, the Commissioner for Inland Revenue has told me that because of the considerable changes proposed this year and the computer software problems inherent in a system of separate assessment his department simply could not cope with such a change. On pragmatic grounds, therefore, further tax changes this year are not possible.

108. Perhaps I protest too much. I will admit under pressure that as history moves on the arguments for and against separate taxation for women seem more evenly balanced, while deeply felt emotion rightly or wrongly can be as persuasive as logic. In fact the argument is not simple, for there are great practical problems involved. Nevertheless a dispassionate and pragmatic man should be able now to see which way the tide is running both in Hong Kong and elsewhere. Whether it should so run is another matter; but Canute proved the fallacy of relying on this sort of argument.

109. If, therefore, women members of this Council and some 50% of the population will bear with me this year, without of course making any promises or commitments and absolutely dependent on the situation as it then exists I hope to be able to have another look at this proposition next year with a view to some movement. I do trust that this olive branch will be accepted, and that I am not forced in subsequent debate to erect defensive battlements. This can be done, but I would like to avoid the necessity, which indeed I think could be counterproductive.

110. The cost to the revenue of my tax concessions is $1.37 billion, and the estimate of total revenue thus becomes $37.8 billion. The difference between this and the estimate of total expenditure of $35.5 billion is $2.3 billion, which is the surplus we are budgetting for on General Revenue Account in 1982-83.[13]

111. These concessions produce satisfactory results as far as the balance of the fiscal system[14] and the budgetary guidelines are concerned.[15]

112. But I must again draw attention particularly to the growth and relative size of the public sector in 1982-83. On Consolidated Account total expenditure will be no less than $37.7 billion. This is an increase in money terms of $6.8 billion, or 22% over the revised estimate for 1981-82. In real terms it represents an increase of 10.7%. The growth rate of 10.7% envisaged for 1982-83 though large thus represents a significant slowing down in the growth rate of the public sector, but it will still be higher than the forecast growth rate of G.D.P. of 8%.

113. As a result, the relative size of the public sector will again increase from 22.9% in 1981-82 to about 24% in 1982-83. We clearly must not relax in our efforts to ensure that the growth rate of expenditure on Consolidated Account has due regard to the growth rate of the economy.

---

12. "Is there really any valid reason why one family with an income of, say, $100,000 should pay less tax than another family with a similar income, simply because in the first case the $100,000 is produced by the husband and wife, whereas in the second case the husband (or wife) alone contributes to the support of the family."

13.

Revenue:	*$mn*	*$mn*
Recurrent	25,308	
Capital	12,518	37,826
Expenditure:		
Recurrent	19,466	
Capital	16,034	35,500
Surplus on recurrent account		5,842
Deficit on capital account		3,516
Overall surplus		2,326

(Including the surplus in the C.W.R.F. the total overall surplus is $4,954 million).

14. Ratio between direct and indirect taxes – 67 : 33.
Ratio between direct and indirect taxes taken together and all other recurrent revenue – 66 : 34.

15.

Guideline	*Ratio*	*1982-83*
Recurrent revenue / Total expenditure	At least 77%	77%
Recurrent expenditure / Recurrent revenue	No more than 85%	77%
Surplus on recurrent account / Capital expenditure	At least 33%	44%
Recurrent expenditure / Total expenditure	No more than 65%	59%
Capital revenue / Capital expenditure	At least 20%	93%

(The percentages for 1982-83 are calculated to include the Capital Works Reserve Fund.)

IFA NEWS

[continued from page 265]

JAPANESE BRANCH

The Japanese Branch held its 1982 annual conference in Tokyo on 1 May 1982.

At the conference, the following subjects were reported on:

(1) Recent Trends of Japanese Tax Treaties, by Mr. Yasuyuki Kawahara, Director of the International Tax Affairs Division, Tax Bureau, Ministry of Finance.
(2) Aussensteuergesetz of West Germany, by Professor Tadashi Murai, Professor of Law, Kansai University.
(3) Unitary Tax in the United States of America, by Mr. Toshio Miyatake, attorney-at-law.

SWISS BRANCH

The Swiss Branch of IFA will meet on 25 June 1982 in Zurich. The agenda shows the following important topics of discussion:

1. The presenting of the 1981 annual report and the 1981 financial statements;
2. The resignation of a number of members of the Board and the Board's proposal for the (re)appointing of (new) Board members;
3. Dr. Vögeli will speak on the tax aspects of international competition with respect to Swiss banks.

The next meeting of the Swiss Branch will be held on 5 November 1982 in Bern.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Customs Co-operation Council *

Since the beginning of the century, attempts have been made to simplify and standardize Customs formalities in international trade. The first substantial proposals for simplification were sponsored by International Congresses of European Trades and brought forward by the International Chamber of Commerce for consideration by the League of Nations. Inter-governmental actions taken under the aegis of the League resulted in the drafting of the international Convention for the simplification of Customs and other formalties. This Convention, dated 3 November 1923, was the first concrete result obtained.

Several subsequent international conferences also studied this question but achieved no appreciable results.

After the end of the second World War the United Nations Conference on Trade and Labour resumed the examination of the problem at international level. Several provisions relating to Customs questions were included in the draft for the establishment of an International Trade Organization (Havana Charter) and in the "General Agreement on Tariffs and Trade" (GATT).

Nevertheless, there was still no international organization specializing in the comparative study of Customs technique, which was regarded merely as an aspect of economic policy and had been given close consideration only at national level and in very few countries.

THE EUROPEAN CUSTOMS UNION STUDY GROUP:

In a joint declaration made in Paris on 12 September, 1947, thirteen Governments represented on the Committee for European Economic Co-operation agreed to give consideration to the possibility of establishing one or more European Customs Unions. With this end in view, it was decided to set up in Brussels a Study Group to examine the problems incidental to the project and the steps necessary for its materialization.

In 1948, this Study Group set up an Economic Committee and a Customs Committee, the latter being assisted by a Permanent Tariff Bureau.

The Study Group subsequently suspended the activities of the Economic Committee, the work of which was tending to overlap with that of the Organization for European Economic Co-operation (OEEC) after the creation of that organization.

It was decided, however, that the Customs Committee, which had been charged with the task of making a comparative study of Customs techniques in the various countries concerned, with a view to their standardization, should pursue this work. This Committee devoted particular attention to the establishment of a common tariff nomenclature and the adoption of a common definition of value for Customs purposes. It also studied other aspects of Customs procedures.

THE CONVENTIONS OF 15TH DECEMBER 1950:

In 1949, the Study Group decided that, irrespective of the progress which might be made with the Customs Union project, the achievements already attained in the fields of Nomenclature and Valuation should be turned to advantage and that similar endeavours should be made in other fields of Customs technique.

This decision was the origin of the three Conventions signed in Brussels on 15th December 1950. Two of these Conventions are concerned with Nomenclature and with Valuation; they represent the culmination of the extensive work undertaken by the Study Group's Customs Committee on these two important subjects. The purpose of the participating countries in setting up – under the third Convention – the Customs Co-operation Council was not only to assemble the executive machinery required for the interpretation and application of the two specialized Conventions in a single international organization but also to entrust that organization with a more general responsibility: "to secure the highest degree of harmony and uniformity in Customs systems and especially to study the problems inherent in the development and improvement of Customs technique and Customs legislation in connection therewith."

ESTABLISHMENT OF THE CUSTOMS CO-OPERATION COUNCIL:

The Convention establishing a Customs Co-operation Council came into force on 4 November 1952, and the Council met for the first time on 26 January 1953. Under the provisions of this Convention, the Customs Co-operation Council is required to:

- make recommendations to ensure the uniform interpretation and application of the two other Conventions (on Nomenclature and Valuation);
- perform such functions as may be expressly assigned to it in those Conventions; and
- act in a conciliatory capacity in any disputes which may arise in this respect.

Apart from these particular functions, the Council has the more general task of:

- studying all questions relating to co-operation in Customs matters which the Contracting Parties agree to promote;
- examining the technical aspects of Customs systems with a view to proposing practical means of attaining the highest possible degree of harmony and uniformity;
- preparing for this purpose draft Conventions and Recommendations;
- circulating information regarding Customs procedures;
- furnishing information or advice to Member States; and
- co-operating with other international organizations.

In order to enable the Council to accomplish this extensive task, Articles V and VI of the Convention provide that it shall establish the two specialized Committees envisaged by the Nomenclature and Valuation Conventions and shall be assisted by a Permanent Technical Committee, in respect of other Customs matters, and by a General Secretariat.

The functions of the Council are thus clearly defined. They in no way duplicate the activities of other international organizations particularly of those essentially concerned with economic policy.

The Council is a technical body and its studies and attempts to resolve Customs problems are based on a purely technical approach. Its purpose is to improve and harmonize Customs operations and thus facilitate the development of international trade, without obliging Member countries to adopt provisions incompatible with their individual economic policies.

Accession to the Council Convention dopes not entail accession to either or both of the two other Conventions on Nomenclature and Valuation, but accession to the Council Convention is obligatory for any country wishing to accede to either of those Conventions.

THE COUNCIL AT WORK:

The Council normally meets once a year. The delegates to the Council are representatives of the Contracting Parties to the Council Convention and those representatives are usually the heads of national Customs administrations.

---

* Prepared by Douanes (Pakistan) Custom House, Karachi.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The first part of each Session is devoted to technical matters. The Council receives reports from the Nomenclature Committee, from the Valuation Committee, from the Permanent Technical Committee, the Harmonized System Committee and, on intersessional developments, from the Secretary General. After discussion of these reports, the Council takes such executive decisions as may be appropriate, for example, by initiating Conventions or Protocols of amendment to Conventions, by making Recommendations to Contracting Parties, and by giving directives to the Committees or to the Secretary General regarding the work in progress or future work to be undertaken.

One or two days at the end of each Session are reserved for current administrative and internal questions which are usually presented in the form of proposals worked out in advance either by the Finance Committee – which meets before each Council Session – or by the Secretary General.

The adoption of these methods enables the work of each Session to be conducted expeditiously.

The official languages of the council are English and French and all documents and publications are issued in these two languages.

THE NOMENCLATURE COMMITTEE:

Under the authority of the Customs Co-operation Council, the Nomenclature Committee supervises the operation of the Convention on Nomenclature for the Classification of Goods in Customs Tariffs.

This Convention, which entered into force on 11 September 1959, has been ratified by several countries. In addition, many countries or territories have based their national tariffs on the Customs Co-operation Council Nomenclature (CCCN), without becoming Contracting Parties to the Convention.

The CCCN is also used by many regional organizations, including the European Communities, the European Free Trade Association (EFTA), the Latin American Free Trade Association (LAFTA), the Common Afro-Mauritian Organization (OCAM), the West African Economic Community (CEAO) and the Central African Customs and Economc Union (UDEAC).

AIMS OF THE NOMENCLATURE CONVENTION:

The essential aims of the Nomenclature Convention are:

(a) to establish a common basis for the classification of goods in national Customs tariffs;
(b) to facilitate comparison of the Customs duties applicable in various countries to all goods entering into international commerce;
(c) to simplify international Customs tariff negotiations;
(d) to facilitate comparison of international trade statistics;
(e) to provide Government and traders alike with a firm guarantee of the maximum uniformity in the classification of goods in national Customs tariffs; and
(f) to facilitate international trade and thus to contribute to its expansion.

CHARACTERISTIC FEATURES OF THE CCC NOMENCLATURE:

The CCCN is systematic. It provides a framework for the classification of goods in Customs tariffs but, since it includes Interpretative Rules and legal Notes, it also constitutes a comprehensive classification system which has been designed to ensure:

(a) maximum simplicity, so that it can be readily understood by the public as well as by experts;
(b) precision, so that the most appropriate heading for a given commodity can be readily identified; and
(c) exactness in application, so that the same commodity will be classified in the same way in the tariffs of the countries using the Nomenclature.

STRUCTURE OF THE CCC NOMENCLATURE:

The CCCN comprises:

(a) the Rules for the interpretation of the Nomenclature which prescribe the general principles governing the classification system;
(b) Section and Chapter Notes, which define the scope and limits of Sections, Chapters and of certain headings. These legal Notes permit the headings to be drafted in concise form without any loss of precision or of exactitude in their interpretation; and
(c) a list of headings, arranged in systematic order, covering all the times in international commerce.

The headings in the Nomenclature are arranged in 99 Chapters which are themselves grouped in 21 Sections. In general, goods are grouped according to the material of which they are made; further, most Chapters are developed "progressively" – that is, starting from raw materials and progressing to finished articles.

ADAPTATION OF THE CCC NOMENCLATURE TO THE ECONOMIC REQUIREMENTS OF INDIVIDUAL STATES:

The Nomenclature Convention leaves the Contracting Parties free, within the framework of the Nomenclature, to make such provisions as they may consider necessary in order to safeguard their own special national interests.

In particular, countries may set up, within the CCCN headings, subheadings covering those products or categories of products to which they propose to apply special treatment. They also remain perfectly free to fix their rates of duty at the levels they consider appropriate, subject to due regard to any bilateral or multilateral commitments they may have entered into with other countries.

SUPPORTING PUBLICATIONS:

The CCCN is supported by several publications designed to facilitate its use and interpretation.

The Explanatory Notes do not form an integral part of the Nomenclature Convention itself, but they do constitute the official interpretation of the Nomenclature as approved by the Council and they are, therefore, an indispensable complementary publication thereto.

In addition to technical information, the four volumes of the Explanatory Notes provide a full commentary on the meaning and scope of the Section and Chapter Notes and on the scope of each heading.

The Alphabetical Index to the Nomenclature and the Explanatory Notes lists all the goods specified in the Nomenclature, with references to the relevant headings or Section or Chapter Notes, and in the Explanatory Notes, with reference to the pages on which the goods are mentioned and, in some cases, described.

The Compendium of Classification Opinions lists, in Nomenclature heading order, all Classification Opinions adopted by the Nomenclature Committee and the Customs Co-operation Council as a result of the study of practical cases submitted to the Council by the administrations.

The English and French versions of the Nomenclature and its complementary publications are equally authentic. They are kept constantly up-to-date, in particular in the light of current technological developments.

THE NOMENCLATURE COMMITTEE AT WORK:

The Nomenclature Committee met for the first time on 23 May 1960, after the entry into force of the Convention, but the Council had set up an Interim Committee from early 1953 and in effect the Committee has been at work since then.

The Committee normally meets twice a year for a fortnight at a time. It is composed of delegates representing Contracting Parties to the Convention. Its Sessions are attended by Observers from many non-Member States and from International Organizations. The Committee is assisted by a Committee of Chemists which also meets, in principle, twice a year.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The Nomenclature Committee's main tasks are to give decisions on the more declicate classification questions raised by administrations or by International Organizations, to resolve differences of opinion between Customs administrations and, in general, to take all appropriate steps to ensure international uniformity in the interpretation and application of the Nomenclature.

To this end, the Committee:

(a) collates and circulates information concerning the application of the Nomenclature;
(b) studies the procedures and practices of the Contracting Parties in relation to the Classification of goods for Customs purposes;
(c) makes appropriate recommendations to the Contracting Parties to secure uniformity in the interpretation and application of the Nomenclature;
(d) prepares draft amendments to the Nomenclature Convention;
(e) drafts and amends the Explanatory Notes;
(f) issues Classification Opinions; and
(g) takes such other steps as may be necessary to achieve the aims set by the Convention establishing the Customs Co-operation Council and the Convention on Nomenclature.

AMENDMENTS TO THE NOMENCLATURE:

Since 1959 the CCC Nomenclature has undergone three series of amendments, in 1965, 1972 and 1978, in order to keep it abreast of developments in the fields of production and international trade.

The third series of amendments, published in the Recommendation of 18 June 1976, entered into force on 1 January 1978. It includes more than 260 amendments to the 1972 Nomenclature, the main changes being the deletion of some 90 headings which no longer represented a significant volume of international trade and the amendment or creation of other headings.

THE CCN AND INTERNATIONAL TRADE STATISTICS:

It has already been mentioned that one of the aims of the CCCN is also to facilitate comparison of international trade statistics, insofar as these are compiled from data collected on the basis of the national Customs nomenclatures.

In 1950, the United Nation Statistics Office established a Standard International Trade Classification (SITC), to facilitate the systematic study of world trade statistics.

Since the aims in a single area of activity were very much akin, it was necessary to establish a close correlation between the two basic systems of classification.

The first correlation between the CCC Nomenclature and the revised SITC was completed in 1960. A new correlation was concluded in 1974, when the SITC was revised for a second time (SITC/Rev. 2).

The SITC/Rev. 2 was published on 1 January 1975. On the same date, the Council issued a Recommendation proposing that Member States incorporate in their Customs tariffs the 1,087 subheadings which make it possible to collect statistical data on the basis of the CCC Nomenclature and to achieve complete correlation with the SITC/Rev. 2. The complete system (SITC/ Rev. 2 and the new correlation) entered into application in a number of countries on 1 January 1976.

THE FUTURE OF THE CCC NOMENCLATURE:

The future of the Nomenclature is bound up with the work on the Harmonized Commodity Description and Coding System.

THE HARMONIZED SYSTEM COMMITTEE:

In September 1970 the Council set up a Commodity Coding Study Group to explore the feasibility of developing a harmonized commodity description and coding system which could simultaneously meet the needs of Customs, external trade statistics and carriers.

This Study Group reported to the Council in May 1973 that the development of a harmonized commodity description and coding system was not only feasible but was essential in the longer term interests of facilitation on international trade and recommendaded that the Council undertake to carry the project to completion. The Council approved the Study Group's Report, and decided that such a system should be developed.

In preparing the system, the Harmonized System Committee, which was created by the Council to succeed the Study Group, is taking account of some 15 classification systems, chosen as being representative of the requirements of Customs administrations, external trade statistics and carriers.

The system is based on the CCCN and on the SITC/Rev. 2 which will be revised where necessary to achieve the system's general aims.

In some respects, therefore, the Harmonized System will be a development of the revised CCCN elaborated by the introduction of subheadings (structured nomenclature), which will include those already drawn up for the correlation between the CCCN and the SITC/ Rev. 2.

The system also includes "descriptors" for the more important commodities in international trade. These descriptors will provide cross-references to the subdivisions of the structured nomenclature and the SITC/Rev. 2 and will also serve for the compilation of an alphabetical index.

Implementation of the system will be facilitated by Explanatory Notes which will supplement those of the CCCN by providing a guide to classification in the subheadings, and it is hoped that the system will eventually be employed by most, if not all, participants in international trade.

The concern for the harmonization and simplification of the various national and international instruments used in international trade, which brought about the development of the Harmonized System, is felt by many agencies. In particular, the United Nations Statistical Commission, at its 19th Session (November 1976), agreed that the Harmonized System should also play a prominent part in the harmonization of the various statistical classifications concerning transportable goods.

This will be possible if the CCCN and its extension, the Harmonized System, are compatible with the concept of the industrial origin of commodities, and this principle has been approved by the Council.

THE VALUATION COMMITTEE:

Under the authority and in accordance with the directives of the Council, the Valuation Committee supervises the operation of the Convention on the Valuation of Goods for Customs purposes. This Convention entered into force on 28th July 1953. Since then the Brussels Definition of Value which is annexed to the Convention has found a steadily widening field of application. Apart from the Contracting Parties to the Convention many countries have already based their valuation systems for Custom purposes on the Definition.

AIMS OF THE VALUATION CONVENTION:

The essential aims of the Valuation Convention are:

(a) to achieve the maximum uniformity, internationally, in the valuation of goods for Customs purposes;
(b) to simplify international Customs tariff negotiations and the comparison of foreign trade statistics by providing a uniform basis for the valuation of goods; and
(c) in general, to facilitate international trade.

CHARACTERISTIC FEATURES OF THE BRUSSELS DEFINITION OF VALUE:

The Brussels Definition of Value is designed to:

(a) provide for the establishment of Customs values by reference to a single formula to be uniformly applied to all clas-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

ses of importations, thus ensuring equitable treatment as between all imported goods;
(b) conform as closely as possible to commercial practice in open market conditions;
(c) ensure that administrations are safeguarded against evasion;
(d) ensure that honest traders are protected against unfair competition and arbitrary administration; and
(e) meet the needs for commercial simplicity and administrative convenience.

These requirements are met by:
(a) selecting the standard of the price made under a contract of sale concluded:
  (i) in respect of imported goods, and
  (ii) in the open market between a buyer and a seller independent of each other;
(b) giving precision to this standard by specifying the contract of sale to be a contract concluded at a price:
  (i) appropriate to the time when the duty becomes payable, and
  (ii) giving delivery to the buyer at the port.
(c) setting up this standard in the Definition as a notional concept expressed in terms of the price which the goods "would fetch" on a sale conforming, inter alia, to the conditions envisaged at (a)(i), (a)(ii), (b)(i) and (b)(ii) above.

THE VALUATION COMMITTEE AT WORK:

The Valuation Committee normally meets twice a year. It is composed of delegates representing Contracting Parties to the Convention. Its Sessions are attended by Observers from many non-Member States and from International Organizations.

Its task, in general, is to ensure the uniform interpretation and application of the Definition.

To this end the Committee's duties are:
(a) to collate and circulate information concerning the valuation of goods by the Contracting Parties;
(b) to study the domestic laws, procedures and practices of Contracting Parties in relation to the Definition and its Interpretative Notes and to make recommendations to the Council or the Contracting Parties to secure uniformity in the interpretation and application of the Definition and Notes and the adoption of standard procedures and practices;
(c) on its own initiative or on request, to furnish to Contracting Parties information or advice on any maters concerning the valuation of goods;
(d) to submit to the Council proposals for any amendment of the Convention which it may consider desirable; and
(e) to exercise such other powers and functions of the Council in relation to the valuation of goods for Customs purposes as the Council may delegate to it.

RECOMMENDATIONS:

The Valuation Committee has established the following Recommendations:
- Recommendation concerning the treatment of inadvertent errors in the declared value of goods;
- Recommendation concerning the treatment, in the valuation of goods, of the right of reproduction in the country of importation;
- Recommendation concerning the application of the Brussels Definition of Value;
- Recommendation concerning the application of the provisions of Article III of the Definition of Value and of its Interpretative Note 2;
- Recommendation concerning the application of the Definition of Value in regard to trade marks; and Recommendation concerning the interpretation of Article I of the Definition of Value.

EXPLANATORY NOTES:

One of the important tasks completed by the Committee has been the preparation of the Explanatory Notes to the Definition, which were first published in 1960. Further experience gained since 1960 having shown that some revision of, and additions to, the Explanatory Notes were desirable, a new edition was issued in 1971 in three separate volumes (one English, one French and one bilingual).

These Explanatory Notes, which are available to the public as well as to the Customs, expound the theory and practice of valuation under the Brussels Definition both in general terms and with regard to problems of a general nature and, within these generalities, also with regard to particular problems of common occurrence. They give reasons for each conclusion and demonstrate the underlying equality of treatment as between the different methods advocated. As it has been put shortly, they provide the "Why" as well as the "How" of valuation.

Although these Notes do not form part of the Valuation Convention, they constitute the official Commentary on the Brussels Definition of Value.

EXAMPLES TO ILLUSTRATE SELECTED PASSAGES IN THE EXPLANATORY NOTES:

In order to facilitate the practical application of the Explanatory Notes referred to above, the Committee decided to supplement them by suitable Examples indicating how the text they illustrate should be applied to factual cases.

Two loose-leaf volumes, one in English and one in French, containing 34 such Examples were published in 1975, and further Examples are being added as they are prepared and adopted by the Committee.

VALUATION OPINIONS:

In pursuing the general aim of ensuring uniformity in interpretation and application of the Definition, the Committee has issued several Valuation Opinions based on actual cases of doubt submitted by Members.

VALUATION NOTES:

The foregong aim is also achieved by means of a number of Valuation Notes which serve the purpose of clarifying the meaning of certain terms of the Definition which present difficulties in interpretation.

VALUATION STUDIES:

The Committee has made studies on a number of important aspects of valuation, such as Members' domestic legislation; administrative procedures; valuation disputes; the combating of fraud; the treatment of royalties; expenses incurred on advertising and trade marks; the dutiable value of computers and programme media; and the application of the Recommendation concerning the right of reproduction.

Certain of these studies have been published.

COMPENDIUM OF TEXTS CONCERNING VALUATION:

The Valuation Convention, Recommendations, Opinions, Notes and Studies are published together in a Compendium.

THE PERMANENT TECHNICAL COMMITTEE:

As mentioned previously, the Council's functions include not only ensuring the uniform interpretation and application of the Conventions on Nomenclature and Valuation but also the study of all aspects of Customs technique in order to find practical means of attaining the highest possible degree of harmony and uniformity in Customs systems. It is assisted in this latter work by the Permanent Technical Committee.

This Committee, which was established in 1953, is composed of representatives of all Council Members. It meets twice a year and its sessions are attended by both representatives of Member countries and by observers from many non-Member countries and international organizations.

The achievement of a high degree of harmony and uniformity is a long-term project. In this connection a wide-embracing international instrument, the Convention on the simplifica-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

tion and harmonization of Customs procedures is now in force. A number of other Conventions and Recommendations have been prepared on specific subject matters of Customs technique.

Another matter which has occupied the Committee's attention is that of mutual administrative assistance between Customs administrations for the prevention, investigation and repression of Customs offences. The Committee prepared a Recommendation on this topic as early as 1953 and followed up with additional Recommendations in 1971 and 1975. In 1977 the Council adopted a major instrument n this field, the International Convention on mutual administrative assistance for the prevention of Customs offences. Particular emphasis has always been placed on the combating of illicit traffic in narcotic drugs and psychotropic substances.

In addition to technical Conventions and Recommendations, the Permanent Technical Committee has carried out a systematic study of procedures in Member countries on the basis of which International Customs Norms have been drawn up laying down fundamental principles to guide Customs administrations considering amendment or review of Customs legislations or regulations. The Committee has also prepared a Glossary at present containing some 60 terms with definitions in English and French, and which, when complete, will result in a uniform international Customs terminology. The Glossary will be brought up-to-date as required.

In parallel with these activities, the Committee devotes part of each session to the consideration of such maters as the simplification of documentation, postal traffic, and also to questions submitted by Members or by international organizations. These latter, according to circumstances, are either discussed by the Committee or are circulated to Members as requests for information or for written observations.

A Working Party has been established to deal with the practical applications of computers in the Customs field.

CUSTOMS CONVENTIONS:

The Committee has produced eleven Conventions which are open to all Council Members and in most cases to all Members of the United Nations or its specialized agencies.

1. International Convention on the simplification and harmonization of Customs procedures

This Convention, adopted by the Council on 18 May 1973, deals systematically with all the principal Customs rules and procedures. It consists of a central body and separate Annexes, each of which lays down the basic principles applicable to a distinct area of Customs activity. It is anticipated that ultimately the Convention will have some 30 Annexes. The 20 Annexes adopted so far deal with subjects such as Customs warehouses, drawback, temporary admission subject to re-exportation in the same state, clearance for home use, Customs transit, rules of origin, repayment of import duties and taxes, free zones, Customs facilities applicable to travellers, outright exportation and postal traffic.

2. Conventions concerning temporary duty-free importation

(a) The Customs Convention of 6 October 1960 on the Temporary Importation of Packings (entered into force on 15 March 1962).

This Convention meets a wish frequently expressed by representatives of international trade for the extension of temporary duty-free importation procedures to packings. The Contracting Parties undertake to grant temporary admission to packings, subject to the conditions specified in the Convention, and to accept an undertaking to re-export the packings in lieu of security whever the Customs authorities deem this possible.

(b) The Customs Convention of 8 June 1961 on the Temporary Importation of Professional Equipment (entered into force on 1st July 1962).

This Convention is designed to facilitate the international exchange of specialised skills and techniques by the introduction of general rules on the temporary duty-free importation of professional equipment.

It has three Annexes, one relating to equipment for the press or for sound or television broadcasting, one to cinematographic equipment and the third to other professional equipment.

(c) The Customs Convention of 8 June 1961 concerning Customs facilities for the Importation of Goods for display or use at Exhibitions, Fairs, Meetings or Similar Events (entered into force on 13 July 1962).

The purpose of this Convention is to facilitate the display of goods at exhibitions, fairs, meetings or similar events of a commercial, technical, religious, educational, scientific, cultural or charitable nature.

It deals, in particular, with:
- the temporary admission of goods and equipment for display or use at an event;
- the waiving of import duties in respect of certain goods (small samples, printed matter, catalogues, etc.); and
- the simplification of formalities on importation and re-exportation.

(d) The Customs Convention of 1st December 1964 concerning Welfare Material for Seafarers (entered into force on 11 December 1965).

This Convention was drawn up by the Council on the initiative of and in consultation with the International Labour Organization. Its aim is to promote the welfare of seafarers on ships engaged in international maritime traffic.

Contracting Parties undertake to grant facilities in respect of welfare material for use on board foreign ships and, unless a reservation is entered in this respect, to welfare material for use in welfare establishment ashore.

(e) The Customs Convention of 11 June 1968 on the Temporary Importation of Scientific Equipment (entered into force on 5 September 1969).

This Convention helps to materialize the principle of the "free flow of ideas" which has been advocated and promoted by UNESCO for more than twenty years. It removes certain difficulties encountered in the implementation of the 1950 Florence Agreement and supplements, with regard to scientific equipment, the Professional Equipment Convention and the Fairs and Exhibitions Convention which were also drawn up by the Council in co-operation with UNESCO.

The Contracting Parties undertake to grant temporary admission, free of duties and taxes, to instruments, apparatus, mahines or accessories therefor which are to be used for purposes of scientific research or education by "approved institutions" and to reduce the attendant Customs formalities.

(f) The Customs Convention of 8 July 1970 on the Temporary Importation of Pedagogic Material (entered into force on 10 September 1971).

This Convention is designed primarily to supplement, in the field of educational materials, the Scientific Equipment Convention. It rounds off the work done by the Council, in co-operation with UNESCO, in connection with the temporary importation of educational, scientific and cultural materials.

Under the Convention the Contracting Parties undertake to grant and facilitate the temporary admission, free of import duties and taxes, of pedagogic material which complies with the prescribed conditions (and with certain optional conditions which may be imposed by each Contracting Party). A non-limitative list of pedagogic material is annexed to and forms an integral part of the Convention.

3. Conventions introducing international Customs documents:

(a) The Customs Convention of 1st March 1956, regarding ECS Carnets for Commercial Samples (entered into force on 3rd October 1957).

The aim of the Convention was to facilitate the temporary duty-free importation of commercial samples.

(b) In view of the success of the ECS carnet, in 1961, the Permanent Technical Committee established the Customs Convention on the ATA carnet for the Temporary Admission of Goods. This carnet can be used not only for

© 1982 International Bureau of Fiscal Documentation – BULLETIN

commercial samples but also for goods temporarily imported under:

- international conventions concerning temporary admission to which a State is party (e.g. Conventions on Professional Equipment, on Exhibitions, Fairs, etc.);
- national regulations on temporary admission.

The principle of the ATA Convention is the same as for the ECS scheme: it seeks to eliminate the two main difficulties encountered when importing goods temporarily into a country, namely the need to make out a Customs declaration on the national form each time the goods are taken into a country and the necesity of furnishing security for the payment of the Customs duties and other taxes chargeable in case of failure to re-export them.

This double aim is achieved by the ATA carnet which is an international Customs document issued and guaranteed by associations approved by the Customs and affiliated to an international chain.

Some years ago it was decided that the ATA carnet should replace the ECS carnet, in view of the latter's limited scope. This replacement has continued progressively and the point has now been reached when ECS carnets have practically disappeared. In the near future, therefore, there will be only one international document in use for temporary duty-free admission operations. In fact the Council has recommended to Contracting Parties to denounce the ECS Convention and a number of States have already done so.

4. Customs Convention on the international transit of goods (ITI Convention)

This Convention, adopted by the Council on 7 June 1971, was prepared to deal with emerging patterns in international traffic, particularly the widespread use of intermodal freight containers. The basic aim of the Convention is, whilst taking full account of the latest transport techniques, to provide the Customs with the possibility of carrying out their essential controls without creating transport delays, thus permitting transport operators to enjoy fully the advantages of the through-transport concept.

5. International Convention on mutual administrative assistance for the prevention, investigation and repression of Customs offices

The Convention applies to all Customs offences insofar as they involve matters falling within the competence of Customs administrations.

It is dividend into Annexes which can be accepted independently of each other. As is usual in mutual assistance instruments, the Convention is based on the principle of reciprocity, according to which a Contracting Party is required to give assistance to another Contracting Party only if both have accepted the Annexes concerned.

Annexes I to IX cover different aspects of mutual administrative assistance and apply to every kind of goods except those specified in Annexes X and XI, that is to say, narcotic drugs and phychotropic substances (Annex X) and works of art, antiques and other cultural property (Annex XI). It was felt advisable to prepare separate Annexes for these categories of goods because, for many countries, they represent a major problem which often cannot be handled within the usual framework and has aspects not normally associated with the more strictly fiscal or Customs type of offence.

RECOMMENDATIONS:

The Permanent Technical Committee has drawn up some thirty Recommendations, which can be grouped in the following categories:

(a) Recommendations designed to promote co-operation between Customs administrations.
For example:
- Pooling of information concerning Customs fraud.
- Spontaneous exchange of information concerning illicit traffic in narcotic drugs and psychotropic substances.

(b) Recommendations designed to secure uniformity in practice as regards duty-free admission or the repayment or remission of duties.
For example:
- Refund of import duties and taxes on shortages.
- Free admission of removable articles imported on transfer of residence.

(c) Recommentations to facilitate the international transport of goods, and travel and tourism.
For example:
- Simplified Customs control, based on the dual channel system, of passengers arriving by air, and by sea.
- Customs sealing systems in connection with the international transport of goods.

(d) Recommendations relating to the application of certain Conventions.
For example:
- Use of ATA carnets for commercial samples.
- Measures to facilitate the application of the ITI Convention.

(e) Recommendations to simplify and harmonize Customs documents.
For example:
- Lay-out key for Goods declaration (outwards).
- Adoption of a standard form of certificate of origin.

(f) Recommendation to ensure that adequate legal remedies are available to the tax-payer.
For example:
- Right of appeal in Customs matters.

PUBLICATIONS CONCERNING CUSTOMS TECHNIQUE:

A compendium containing the texts of the Recommendations, Resolutions and International Customs Norms relating to Customs technique has been published. It is intended to incorporate the Glossary of international Customs terms in this Compendium in due course.

A Handbook containing the complete texts of the international Convention on the simplification and harmonization of Customs procedures and its Annexes, with a Commentary printed after the relevant provisions, has also been published. The detailed information furnished by Contracting Parties with regard to the implementation of Annexes and other matters (reservations, terms of application, etc.) is also included.

RELATIONS WITH OTHER INTERNATIONAL ORGANIZATIONS:

Under the terms of the Convention by which it was established, one of the Council's functions is to co-operate with other inter-governmental organizations and maintain with them such relations as may facilitate the achievement of its aims. It also co-operates with certain non-governmental organizations dealing with questions within its competence.

Over the years the Council has established close relations with a large number of organizations, either directly or through its Committees or the Secretariat, exchanging observers or co-operating even more directly in the study of questions mutually of concern to those organizations and the Council.

TECHNICAL CO-OPERATION:

The Council has rendered technical assistance in various spheres of Customs work to a large number of Member and non-Member developing countries.

Many countries have been given assistance in transposing their tariffs into the form of the CCC Nomenclature, such being a prime necessity for any country wishing to modernize and rationalize its Customs procedures. Also of great importance is the adoption by countries of the Brussels Definition of Value and a number of countries have been helped in this respect. Further, countries have been advised on means of implementing the wide range of other instruments which have been devised by the Council to improve Customs

© 1982 International Bureau of Fiscal Documentation – BULLETIN

efficiency and to facilitate international trade. In many instances it has been possible to arrange for "on-the-spot" assistance by experts, the selection of the experts being made in co-operation with Member countries of the Council and other international organizations, particularly the United Nations, the United Nations Conference on Trade and Development, the United Nations Development Programme, the International Monetary Fund, the Organization of American States, the United Nations Sttistical Office and the United Nations Regional Economic Commissions.

Considering the importance of training with a view to the establishment of an efficient Customs administration, the Council has published a brochure entitled "Training Facilities for Customs Officials of Developing Countries" which contains full particulars of the training facilities available in Member countries. The facilities described in the brochure consist of participation in the normal training courses designed to meet the needs of some developing countries. Many trainees benefit from the facilities.

The Council also actively participates in the training programmes of other international organizations. It has provided lecturers from the staff of the Secretariat for training programmes of United Nations Regional Commissions and has organized courses in collaboration with the UNDP, UNCTAD and the OAS, some of the lecturers being Secretariat staff members and other being officials supplied by Council Members.

The Council's efforts in technical assistance, especially Customs training, are directed to complement the work being done bilaterally by its Member countries and to co-operate with other international and regional organizations.

Bibliography

Books

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

PRENTICE-HALL, INC.
Englewood Cliffs,
New Jersey 07632
U.S.A.

Prentice Hall Announces:

The most strikingly different new tax guide ever published for taxpayers with income from foreign sources.

U.S. TAXATION OF INTERNATIONAL OPERATIONS

Continuously Supplemented. . . . . Always Up - to - Date

This outstanding new Service is created specifically to help save money for:

U.S. INDIVIDUALS
with investments and/or earned income from a foreign source

U.S. CORPORATIONS
with income from foreign sources

FOREIGN CORPORATIONS
with income earned or taxable in the U.S.

NONRESIDENT ALIENS
receiving income from, or taxable in the U.S.

If you fit any of these categories — or if you counsel, advise, or in any way service any of these categories — U.S. TAXATION OF INTERNATIONAL OPERATIONS will be an invaluable new tool for you.

It will deliver management benefits — operations benefits — tax benefits.

In clear, direct language, backed up by practical, tested practices of acknowledged experts in international business operations, the new work spells out how the taxpayer can best take full advantage of every popular, every sophisticated, and every little-known tax-saving device.

Authoritative, specific guidance from one source devoted exclusively to this kind of vital help has been non-existent — until now.
With the first 1972 publication of the innovative U.S. TAXATION OF INTERNATIONAL OPERATIONS this important need is now fulfilled. And bi-weekly "Report Bulletins" will keep the guide as new and up to the minute as the day you receive it.

Personal response to this new publication has been even more enthusiastic than our most optimistic projections. Subscriptions are now being accepted by mail for $ 231 a year.

Address your request to Dept. S-RR-103, Prentice-Hall Inc., Englewood Cliffs, N.J. 07632 and specify U.S. TAXATION OF INTERNATIONAL OPERATIONS, 1-year introductory charter subscription.

Annual payment is not due until 20 days after receipt of the new, ready-for-reference volume.

Tax Treaty Shopping

Art. 16 of the Draft U.S. Model Income Tax Treaty

By Michael J. Cooper and Thomas J. Rasmussen *

The purpose of this article is to comment on Article 16 of the draft U.S. Model Income Tax Treaty of 16 June 1981 (Model Treaty) and alternative versions of Article 16 in the Treasury News Release of 23 December 1981. [1]

I. COMMENTS ON U.S. TREATY POLICY

Treasury appears to have made a policy decision to include some form of Article 16 in all new U.S. income tax treaties in an attempt to prevent treaty shopping.[2] We recognize that there is a valid concern underlying such a policy. However, we believe that this policy would also discourage foreign investment in the United States and thus would not be helpful to the American economy. In the past, fostering such investment has been considered more important to the U.S. economy than trying to end all treaty shopping.[3]

Nevertheless, at a public meeting held at Treasury on 14 January 1982 to discuss Article 16, it was suggested that Treasury's policy decision on this matter would not be changed.

We are unaware of any economic studies that have been done by the Treasury which would justify this decision to overturn 42 years of U.S. treaty policy and administrative practice.[4] Therefor, we urge Treasury to re-consider this decision because we believe:

1. Article 16 could significantly reduce new foreign investment in the U.S.

2. Article 16 could cause a flight of already-invested foreign capital from the United States.

3. The effect could be to reduce the capital pool available to U.S. owned business for investment in new plant and equipment.

4. Concern about a possible flight of capital from the U.S. compelled Congress to make permanent in 1976 the temporary exemption from U.S. withholding tax on interest paid to non-resident aliens and foreign corporations on their U.S. bank deposits.[5] If a serious outflow of foreign investment capital would have resulted from ending this exemption for interest, there can be no doubt that declining investment and a similar outflow will result from Article 16's elimination of reduced withholding tax rates on dividend and interest paid with respect to foreign portfolio investments in U.S. businesses.

5. Article 16 will discourage foreign investors from locating manufacturing plants, real estate projects, or other job-producing businesses in the United States. It is counter-productive for the U.S. to use Article 16 to try to collect more tax on dividends or interest when paid by such businesses to its foreign investors if Article 16 deters the business from being located in the U.S. in the first place.[6]

6. By discouraging foreign portfolio and foreign direct investment in the U.S., Article 16 may actually reduce U.S. income tax revenues from such investment in the U.S.

7. Article 16 could have a negative impact on U.S. tax revenues by preventing U.S. corporations from using the favorable treaty network of a U.S. treaty partner to lower the foreign income tax such corporations would otherwise have to pay to a third country. As a result, U.S. corporations (or their foreign subsidiaries) could pay more foreign income tax, which would produce higher foreign tax credits, and thus could further reduce U.S. income tax revenues.

---

* Deloitte Haskins & Sells.

1. The U.S. Model Income Tax Treaty serves as the starting point for U.S. negotiators in negotiating an income tax treaty with a foreign country.

2. Treaty shopping involves residents of countries that do not have an income tax treaty with the U.S. (third countries) or that have less favorable income tax treaties with the U.S. These third-country residents organize a corporation in a country that has a favorable treaty. They then use the treaty-country corporation to invest in the U.S. Because of the treaty, the treaty-country corporation receives reduced rates of withholding on any U.S. dividends, interest, rentals and royalties derived from that investment.

3. See, e.g.: Rev. Rul. 75-23, 1975-1 C.B. 290.

4. The only possible exception to this policy is the U.S.–Netherlands Income Tax Treaty, as it applies to the Netherlands Antilles. See: Statement of Treasury Department With Respect to the Protocol of 23 October 1963, in II P-H Tax Treaties: Netherlands 66,169 (1982).

5. See: section 861(a)(1)(A) and (c). The General Explanation of the TRA of 1976, prepared by Staff of Jt. Comm. on Tax., 94th Cong., 2d Sess. 256 (1976), states that

> Congress has concluded that the elimination of the exemption would result in a *significant decline* in the substantial deposits by non-resident aliens and foreign corporations in banks in the United States. Since *a possible shortage of investment capital* presently exists in the United States, Congress concluded further that *it would not be advisable at this time to permit the exemption to expire at the end of 1976 with the resultant outflow in investment capital.*
>
> Moreover, it was decided to retain the exemption on a permanent basis. . . . [Emphasis added.]

6. The location of such businesses in the U.S. in recent years has been increasing. An important economic factor in locating these businesses in the U.S. instead of some competing location is the availability of a favorable bilateral U.S. income tax treaty. A favorable treaty is one that reduces the U.S. rate of withholding tax on U.S.-source dividends, interest, rents, and royalties. Typically, the foreign investor will organize a corporation in a country having a favorable treaty with the U.S. That corporation will then organize a U.S. corporation to which it contributes or loans large amounts of foreign capital to be used to run the U.S. business and hire American workers. The U.S. corporation will pay U.S. income tax on its profits. Because of the favorable income tax treaty, the U.S. will then pay dividends (from those previously taxed profits) and interest to its foreign parent corporation at reduced rates of U.S. withholding tax.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

8. If included in revised U.S. tax treaties, Article 16 will render many existing foreign investments in the U.S. and U.S. investments in treaty countries economically unsound by denying the investors reduced rates of withholding tax. Many of these investments were made on the understanding that such reduced rates of withholding tax would be available.

9. The foreign portfolio investors that will be affected by Article 16 are, for the most part, not consuming U.S. social and governmental services. Consequently, the treaty benefits received by such third-country foreign investors are not unjustified in view of the capital they bring into the U.S.

10. We know of no authoritative economic studies done by Treasury on whether Article 16 will cause a revenue loss to the U.S., a loss in new foreign portfolio investment in the U.S., an outflow of already-invested foreign capital from the U.S., a reduction in the capital pool available to U.S.-owned business, or a reduction in the number of job-producing, foreign-owned businesses located in the U.S.
Therefore, we respectfully recommend that before any Article 16 policy is implemented, such studies be conducted to ensure that such a policy does not produce the investment and other losses discussed above.

II. TECHNICAL COMMENTS ON ARTICLE 16

These comments refer to the two basic versions of Article 16: the "June Draft", published as part of the proposed Model Treaty of 16 June 1981, and the "Discussion Draft", published in a Treasury News Release of 23 December 1981. These drafts currently exist as possible alternative formulations of Article 16 as it might appear in future U.S. income tax treaties.

75% Test (June Draft)

Article 16(1)(a) of the June Draft denies treaty benefits to a corporation of a contracting state unless "more than 75% of the beneficial interest" in the corporation is owned directly or indirectly by persons who are residents of that contracting state (hereinafter "75% test").[7]

This provision causes numerous problems:

Problem No. 1: The June Draft will discriminate against U.S. corporations that are foreign-owned, by denying them treaty benefits available to other U.S. corporations.

For example, suppose that a U.S. corporation, manufacturing automobiles in the U.S. and owned by Japanese residents, makes a loan to a Dutch affiliate. Suppose the 75% ownership test is included in the U.S.–Netherlands Income Tax Treaty. The U.S. corporation will lose its treaty exemption from Dutch withholding tax on interest received from the Dutch borrower, merely because the U.S. corporation is owned by non-residents of the U.S.

Article 16(1)(c) and (2)(e)(ii) of the Discussion Draft might cure this problem, but only if the income subject to treaty benefits is incidental to, or derived in connection with, the above corporation's U.S. business operations.[8] However, even if these tests are met, Article 16(2)(e)(ii) creates only a presumption that a foreign-owned U.S. corporation qualifies for the Treaty benefits. Because this presumption could be challenged by the subjective judgments of the revenue authorities of the other contracting state, it would be difficult to obtain certainty as to the application of this presumption. Moreover, the lack of a definition for the term "incidental" makes it difficult to judge when the presumption would operate in the case of income "incidental to" U.S. business operations.

We recommend that a definition of "incidental" be provided and that the presumption be made a conclusive one.

Article 16(1)(b), as supplemented by Article 16(2)(d) of the Discussion Draft, also might cure the problem in the June Draft, but only if more than 75% of the U.S. corporation is owned directly by resident individuals of a third-country having a U.S. income tax treaty (with relief not less favorable than, for example, the U.S.–Netherlands Treaty discussed above).[9] However, many U.S. corporations are directly owned by foreign corporations, not by foreign individuals. Thus, Article 16(2)(d) is not helpful in those cases.

Moreover, in the case of the Japanese-owned U.S. corporation discussed above, the U.S.–Japan Income Tax Treaty does not provide relief on interest payments as favorable as the U.S.–Netherlands Treaty. Even if it did, Article 16(2)(d) creates only a presumption, not a certainty, that the U.S. corporation qualifies for treaty benefits. We therefore recommend that the "presumption" language be deleted.

The "principal purpose test" in Article 16(2) of the June Draft might also resolve this problem, but again, this Article is too subjective.[10]

Problem No. 2: U.S. corporations are taxed on their world-wide income and thus can claim tax benefits

7. The term "contracting state" refers either to the U.S. or the foreign country with which the U.S. has concluded an income tax treaty.
8. Article 16(1)(c) of the Discussion Draft essentially provides that a corporation will be entitled to treaty benefits if it is established that the principal purpose of the corporation or of the conduct of its business was not to obtain such benefits (hereinafter "principal purpose test").
Article 16(2)(e)(ii) establishes the presumption that the principal purpose test is met if the income subject to treaty benefits is incidental to, or derived in connection with, the corporation's business operations in the contracting state of which it is a resident.
9. Article 16(1)(b) provides essentially that a corporation of a contracting state will be entitled to treaty benefits if it is controlled by residents of that state or U.S. citizens.
Article 16(2)(c) states that a person or persons shall be treated as having control of the corporation claiming treaty benefits if, under the income tax laws of the contracting state where income arises, they could be treated as having direct or indirect control of the corporation for any purpose.
Article 16(2)(d) presumes that the corporation meets this control test if (i) U.S. citizens, (ii) individual residents of the contracting state in which the above corporation is a resident, or (iii) individual residents of a third country having a U.S. income tax treaty (offering relief as favorable as the treaty in question) own directly more than 75% of such corporation. See Discussion below, pp. 294-295.
10. Article 16(2) of the June Draft allows treaty benefits to a corporation if it is determined that the acquisition or maintenance of the corporation and the conduct of its operations did not have as a "principal purpose" obtaining benefits under the treaty. See Discussion below, pp. xxx-xxx, for a more complete treatment of this Article.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

granted by the Code without regard to whether any shares are owned by U.S. residents.[11]

Since the U.S. taxes on the basis of world-wide income without regard to the identity of the shareholders, access to our treaty system should be allowed on an equal basis, regardless of ownership.

Problem No. 3: The 75% ownership test is too high.

If a corporation resident in a contracting state is not a sham and has a good business purpose, apart from the U.S. treaty benefit, for residing there, the fact that less than 75% of its shareholders are non-residents should be irrelevant to its access to treaty benefits.[12]

As just noted, a U.S. corporation is considered to be sufficiently connected to the U.S. for all purposes of the Code, even if none of its shares are owned by U.S. residents and none of its income is derived from the U.S.[13]

In adopting Subpart F and the foreign personal holding company (FPHC) provisions. Congress thought that if U.S. persons owned more than 50% of a foreign corporation, that corporation was sufficiently connected to the U.S. for its income, on a pro rata basis, to be subject to the U.S. taxing jurisdiction.

If more than 50% U.S. ownership is needed for Subpart F and FPHC purposes, and no U.S. ownership is necessary to tax a foreign-owned U.S corporation, a requirement that more than 75% U.S. ownership is necessary to claim treaty benefits is too high.

Problem No. 4: An international finance subsidiary (IFS) is an important vehicle for raising foreign capital for U.S. businesses. The 75% ownership test in the June Draft undercuts the economic viability of an IFS created by a U.S. corporation in, for example, the Netherlands Antilles by denying treaty benefits to that IFS. The reason is that, typically, more than 75% of the beneficial interest in such an IFS is owned by U.S. corporations that are not residents of the Netherlands Antilles.

This problem in the June Draft appears to be cured by Article 16(2)(e)(ii) of the Discussion Draft if the U.S.-source interest income received by the IFS for which the Antilles treaty benefit is claimed can be regarded as derived in connection with, or incidental to, the conduct of business operations by the IFS in the Netherlands Antilles.[14] Thus, we recommend that such income be regarded as derived in, or incidental to, the conduct of such business operations so that this presumption would clearly apply.

If not cured by Article 16(2)(e)(ii), this problem is also not cured by the control test in Article 16(1)(b) or (2)(d)(i) of the Discussion Draft, unless "citizens of the United States" can be interpreted to be the U.S. corporate owners of the IFS, an unlikely interpretation.[15]

Problem No. 5: For the same reasons, the 75% test in the June Draft denies treaty benefits to, and thus undercuts the economic viability of, an IFS created, for example, in the Netherlands by a Canadian corporation to raise funds to loan to its U.S. operating companies.

Interest paid by those U.S. companies to the IFS (because the IFS is Canadian-owned) would lose the exemption from U.S. withholding tax afforded by Article 8 of the U.S.–Netherlands Treaty if the 75% test were included in that treaty.

Article 16(2)(d)(iii) of the Discussion Draft may prevent this problem but only in cases where the shareholders of the IFS are individual residents of countries having income tax treaties with the U.S. and those treaties grant relief as favorable as the relief claimed under the Netherlands Treaty.[16]

The present U.S.–Canada Treaty does not grant relief as favorable as the the Netherlands Treaty.[17] Also, shareholders of an IFS are ordinarily not individuals

Stock Trading and the 75% Test (June Draft)

For purposes of satisfying the 75% ownership test, Article 16(1) of the June Draft also establishes a presumption that a corporation with "substantial trading" in its stock on a recognized exchange in its state of residence is owned by individual residents of such state.

Problem: This provision is of little use since it merely creates a presumption of satisfying the 75% test.

The IRS can overcome the presumption merely by requiring the taxpayer to supply proof that the 75% ownership test is actually met. Because the term "substantial trading " is undefined, the IRS could also contend that certain levels of trading are not substantial.

We believe the stock trading provision in Article 16(1)(a) of the Discussion Draft is preferable to the provision in the June Draft. The former eliminates the presumption and permits a corporation to qualify for treaty benefits if, for example, its stock is listed on an approved stock exchange in its country of residence.

Control Test (Discussion Draft)

Article 16(1)(b) of the Discussion Draft denies treaty benefits on income arising in a contracting state (assume

11. See: sections 11 and 7701(a)(3) and (4).
12. See, e.g.: *Moline Properties, Inc. v. Commissioner,* 319 U.S. 436, 438-439, 30 AFTR 1291, 1293-94 (1943), and *Rothschild v. U.S.*, 407 F. 2d 404, 409-10, 415, 23 AFTR 2d 69-637, 642-43, 648 (Ct. Cl. 1969), which synthesizes the judicial standards for shamming a corporation and shamming a transaction, respectively.
13. See: Treas. Reg. 1.11-1(a).
14. As previously stated, under Article 16(2)(e)(ii) a corporation is presumed to meet the principal purpose test and thus be entitled to treaty benefits if the income in question is incidental to, or derived in connection with, the corporation's business operations in the contracting state of which it is a resident. See note 8.
15. As previously stated, under Article 16(1)(b) a corporation of a contracting state is entitled to treaty benefits if controlled by residents of that state or U.S. citizens. Under Article 16(2)(d)(i) a corporation is presumed to meet the above control test and thus get treaty benefits if more than 75% of the corporation is owned directly by U.S. citizens. See note 9.
16. As previously stated, under Article 16(2)(d)(iii) a corporation is presumed to meet the control test and thus get treaty benefits if individual residents of a third country having a U.S. income tax treaty (offering relief as favorable as the treaty in question) own directly more than 75% of each corporation. See note 9.
17. See Article XI(1) of the Canadian Treaty which imposes a 15% withholding tax on U.S.-source interest.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

U.S.) to a corporation of the other contracting state (assume Netherlands), controlled by persons who are not residents of that other contracting state, unless such persons are U.S. citizens.

Under Article 16(2)(c) a person (or persons) is treated as having control of such corporation for Article 16(1)(b) purposes if under the income tax laws of the contracting state in which income arises (assume U.S.), "the person or persons could be treated as having direct or indirect control of the corporation for any purpose".

Problem No. 1: The definition of "control" in Article 16(2) of the Discussion Draft refers to control "for any purpose" under the tax laws of the contracting state in which the income arises. Suppose a Dutch corporation wants to claim treaty benefits on U.S.-source income. The Dutch corporation could never be sure that it qualified for those benefits unless shareholders residing in the Netherlands owned enough of its shares to meet the maximum ownership test under any provision of the Internal Revenue Code.

This article provides no guidance as to which ownership rules the IRS or Treasury will use. Thus, the IRS or Treasury would be free to choose among the various ownership tests in ways that could not be anticipated by any investors.

Problem No. 2: Another problem with the definition of "control" is that other states might not have constructive ownership rules or might have control provisions that differ significantly from those of the U.S.

For example, suppose that in country X a corporation is considered to be controlled by country X residents if 40% of a corporation's shares are owned by such residents. It is unlikely that country X will agree to a provision that requires country X residents to own, for example, 80% of any country X corporation receiving dividends or interest from the U.S. before that corporation gets treaty benefits, when U.S. investors in country X have to own only 40% of a U.S. corporation for that corporation to get treaty benefits on income from country X.[18]

Problem No. 3: In many cases, Article 16(1)(b) of the Discussion Draft will cause the U.S. Treasury to collect less U.S. income tax than if treaty benefits had not been disallowed by this Article.

For example, suppose that T, a resident of a country (Y) not having an income tax treaty with the U.S., owns a U.S. corporation. The U.S. corporation does not conduct business operations in the U.S. but receives $100,000 of dividends from sources in country X. The U.S. has an income tax treaty with country X which reduces X's withholding tax rate on dividends from 35% to 10%. If Article 16(1)(b) of the Discussion Draft is not included in the country X treaty, the U.S. corporation would only have to pay $10,000 of country X withholding tax (10% of $100,000) on such dividends. However, if Article 16(1)(b) is included, the U.S. corporation will not meet the control test of that Article since it is owned by a resident of country Y.

The loss of the reduced rate means that the U.S. corporation must pay $35,000 of country X withholding tax instead of $10,000. Because of Article 16(1)(b) the U.S. corporation will claim a greater U.S. foreign tax credit and thus pay less U.S. income tax than if the treaty benefits had been available.

This problem is not cured by Article 16(1)(a) of the June Draft (the 75% test) which requires that more than 75% of the U.S. corporation be owned by residents of the U.S.[19]

Exception to Control Test (Discussion Draft)

Under Article 16(2)(d) of the Discussion Draft, a corporation is presumed to meet the "control test" if:

(i) U.S. citizens,

(ii) individual residents of the contracting state (treaty country) where the corporation claiming treaty benefits resides (assume Netherlands), or

(iii) individual residents of third countries having income tax conventions with the contracting state from which relief from taxation is claimed (assume U.S.) providing relief not less favorable than under the convention with the treaty country (assume U.S.–Netherlands Treaty),

own directly more than 75% of the total combined voting power of all classes of voting stock and more than 75% of the shares of each other class of stock of the corporation claiming the treaty benefits.

Problem No. 1: Article 16(2)(d) of the Discussion Draft is unclear on whether a combination of U.S. citizens, Dutch individual residents, or individual residents of states (having an income tax convention with the contracting state from which relief from taxation is claimed), who own together more than 75% of all classes of the corporation's stock, can meet the 75% test. Article 16(2)(d) should be amended to make it clear that such a combination does meet the 75% test.

Problem No. 2: If the section 385 regulations or similar rules are eventually applied to international transactions, they could accidentally cause a corporation to lose treaty benefits guaranteed to it by the 75% test of Article 16(2)(d) of the Discussion Draft.

For example, suppose that a U.S. corporation is owned by a Dutch corporation. Suppose also that 76% of all classes of stock of the Dutch corporation is owned by an individual resident of a third country having a U.S. income tax treaty providing benefits not less favorable than the U.S.–Netherlands Treaty. The other 24% of the Dutch corporation is owned by a Liberian corporation.

On 1 August 1982, the Dutch corporation becomes indebted to its shareholders in the form of interest-bearing, demand loans with a fixed maturity date. At the time of issuance it was felt that the debt-to-equity ratio on these loans was not excessive, even though the 3:1 safe-harbor ratio was not met. Of this debt, 30% is owned by the third-country individual and 70% by the Liberian corporation. The terms of the debt to each shareholder are identical.

In December 1985, the U.S. corporation pays a dividend to the Dutch corporation.

18. The 80% control test in section 368(c) is used here as an example.
19. See Discussion above, pp. 292-293.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The Dutch corporation claims the reduced rate of withholding granted by Article VII of the U.S.–Netherlands Treaty. In 1986, a determination is made that the shareholder debt-to-equity ratio of the Dutch corporation was excessive. Under Treas. Reg. 1.385-4(c)(1)(i) and 6(a)(2) and (g)(1), the foregoing shareholder debt of the Dutch corporation is reclassified as non-voting preferred stock during 1986, retroactive to its date of issuance.

Until the reclassification, the Dutch corporation appeared to meet the control test of the above Article because 76% of all classes of its stock was owned by an individual resident of a third country having an income treaty as favorable as the U.S.–Netherlands Treaty. However, because of the reclassification of debt to preferred stock, the Liberian corporation owns 70% of one class of the U.S. corporation's non-voting preferred stock. Thus, the Dutch corporation retroactively will not meet the control test of the above Article because the third-country individual does not own more than 75% of the shares of each class of the Dutch corporation's non-voting stock.

Problem No. 3: Other problems with this exception to the "Control Test" are discussed on pages 292 and 293.

Pass-through test (June Draft)

Article 16(1)(b) denies treaty benefits to a corporation of a contracting state (assume Netherlands) whose income is used "in substantial part, directly or indirectly", to pay liabilities, e.g. interest expenses, to persons who are not residents of that state and who are not citizens of the United States. Treaty benefits are lost even if 75% of the beneficial interest in the Dutch corporation is owned by Dutch residents.

Problem No. 1: The pass-through test of Article 16(1)(b) is too severe since it will deny treaty benefits even when no third-country resident is taking advantage of a U.S. income tax treaty.

For example, suppose a Dutch company engaged in business in the Netherlands has a subsidiary in the U.S. The Dutch company is wholly owned by individual residents of the Netherlands. The Dutch company borrows money at low rates in Europe from a Swiss bank, and then loans the money to its U.S. subsidiary in return for an arm's length interest rate. The Dutch company under this Article will lose the benefit of the reduced rate of U.S. withholding tax afforded by the U.S.–Netherlands Treaty, even though more than 75% of the beneficial interest in the Dutch company was owned by individual residents of the Netherlands. The loss occurs because the Dutch company pays interest to a Swiss bank. As presently drafted, Article 16(1)(b) interferes with legitimate business transactions and thus should be deleted. Existing case law is sufficient to deal with any real treaty abuse occasioned by pass-through payments. See *Aiken Industries, Inc. v. Commissioner*, 56 T.C. 925, 933-34 (1971).

Problem No. 2: This provision will deny treaty benefits to, and thus undermine the economic viability of, an international finance subsidiary (IFS) organized by a U.S. corporation in, for example, the Netherlands Antilles to raise capital by selling bonds to European investors.

If an IFS loans the sales proceeds from its bond sales to its U.S. parent, the interest received by the IFS from the parent would be paid to the European investors to meet the interest obligations of the IFS to those investors. Because of this pass-through of interest, the IFS would not be entitled to the reduced rate of U.S. withholding tax on interest received from its parent under Article 16(1)(b). This is a burden for an American business community in need of large amounts of investment capital.

Problem No. 3: Also, Article 16(1)(b) of the June Draft presents various interpretative problems. What is the precise meaning of such phrases as "in substantial part", "to meet liabilities", and "directly or indirectly"?

Because Article 16 of the Discussion Draft does not contain a pass-through provision, we believe it is preferable to the June Draft on this issue.

Principal Purpose Test (June Draft)

Article 16(2) of the June Draft allows treaty benefits to a corporation if it is determined that the acquisition or maintenance of the corporation and the conduct of its operations did not have as "a principal purpose" obtaining benefits under the treaty.

Problem No. 1: Article 16(2) can easily be read to deny treaty benefits to a corporation, even if it meets both the 75% test and the pass-through test of Article 16(1) of the June Draft. If so, treaty benefits will be lost in many cases where there is no imaginable treaty abuse.

At the Treasury meeting of 14 January 1982, however, Treasury personnel responded to this concern by saying that Article 16(2) was intended to grant treaty benefits to a corporation that otherwise failed the pass-through test or the 75% test. In order to conform the language of Article 16(2) to that intent, we recommend that the following words be inserted after the word "apply":

to cause a loss of benefits . . . under the convention

In summary, we believe that the principal purpose test should be used only to permit a corporation to qualify for treaty benefits when it would not otherwise qualify for such benefits under the other tests.

Problem No. 2: The principal purpose test in Article 16(2) makes it easier for the IRS to deny treaty benefits than would otherwise be permitted by existing case law.

Suppose that a resident of a third country has an appreciable business purpose, such as minimizing non-U.S. taxes, for making an investment in the U.S. through a treaty-country corporation, apart from any U.S. treaty benefit. Despite the presence of such a purpose, Article 16(2) allows the IRS to sham the transaction.

If the transaction is shammed, the investment will be treated as having been made directly by the non-resident person, causing a loss of treaty benefits. This results because the IRS only has to show that obtaining treaty benefits was "a principal purpose" for making the investment through the treaty country corporation. It can then

© 1982 International Bureau of Fiscal Documentation – BULLETIN

ignore any appreciable business purpose, apart from the treaty benefit, for the investment.

Existing case law, however, will not permit the IRS to sham the above investment transaction if the third-country resident can show that some appreciable economic advantage or disadvantage (business purpose) flows or was reasonably expected to flow from the transaction.[20] If such a business purpose is present for making the investment through the treaty-country corporation, it is irrelevant that the above resident also knew that U.S. treaty benefits would be available to the treaty-country corporation.[21]

We, therefore, recommend that the principal purpose test in Article 16(2) of the June Draft be amended to conform to the standard of existing case law.

Problem No. 3: If Article 16(2) is administered like similar language in existing treaties, it will be useless to taxpayers in many situations.

Article 16(2) gives the IRS and the Treasury unlimited discretion to determine the intent of taxpayers who enter into investments in the U.S. Such discretion makes it impossible for taxpayers to have any certainty of qualifying for treaty benefits, if the principal purpose test is involved. It is unreasonable to expect prudent businessmen to invest significant amounts of capital in the U.S. without some certainty that treaty benefits will not be withdrawn because of purely subjective determinations by the IRS or the Treasury.

We understand that in the past well-intentioned IRS and Treasury personnel have frequently disagreed over the meaning of language similar to Article 16(2).[22]

Often, the positions of each department have fluctuated with personnel changes. Because of these disagreements, the issuance of rulings has often been delayed. Only a handful of favorable rulings has been issued under Article VII(1) since 1978, mostly under familiar fact patterns. We see no good purpose in continuing such an uncertain situation that is not conducive to investment in the U.S.

We think this is another good reason for adopting the recommendation above. We also recommend that Treasury in Article 16(2) provide a non-exclusive list of business purposes for making an investment in the U.S. through a treaty-country corporation that will prevent the investment transaction from being shammed.

Principal Purpose Test (Discussion Draft)

The principal purpose test in Article 16(1)(c) of the Discussion Draft is essentially the same as the test in the June Draft, except that the Discussion Draft clearly sets forth the test as an alternative to claiming treaty benefits. Thus, the Discussion Draft is preferable on this point, but the other problems we have discussed remain.

Equality of Tax (June Draft)

Article 16(3) of the June Draft denies treaty benefits to a resident of the other contracting state on, for example, U.S.-source dividends and interest, when such income bears a significantly lower tax in that other contracting state than dividends and interest arising in that other contracting state.

Problem No. 1: Many contracting states levy income tax only on income arising within their borders and not on foreign-source (including U.S.-source) income. Thus, Article 16(3) would always disallow treaty benefits to residents of such states because the income they derive from the U.S. would always bear a significantly lower tax than similar income arising within their state of residence.

Clearly, it cannot be the treaty policy of the United States to penalize residents of states with territorial tax systems. We therefore recommend that this Article be deleted.

Problem No. 2: Article 16(3) of the June Draft can easily be read to deny treaty benefits to a corporation, even if it meets the 75% test, the pass-through test, and the principal purpose test of Article 16(1) and (2) of the June Draft.

Equality of Tax (Discussion Draft)

Under Article 16(2)(e)(i) of the Discussion Draft, a treaty country corporation (assume Netherlands) is presumed to meet the principal purpose test if "the reduction in [assume U.S.] tax claimed is not greater than the tax actually imposed by the Contracting State. . ." (assume Netherlands) where such corporation is a resident.

Problem No. 1: It is unclear whether (a) the "reduction" in tax refers to an absolute dollar amount or a percentage rate reduction, or (b) whether "the tax *actually* imposed" refers to the tax rate or the actual tax collected in, for example, the Netherlands. If the reference is to the actual tax collected in the Netherlands, a Dutch corporation may never be able to meet this standard if Netherlands-source net operating losses or other deductions significantly reduce the amount of Dutch tax collected on the U.S.-source income in question.

Problem No. 2: Even if this test is met, Article 16(2)(e)(i) of the Discussion Draft creates only a presumption that the above corporation qualifies for Treaty benefits. If this article is retained, the "presumption language" should be deleted.

Problem No. 3: Article 16(2)(e)(i) relief also may be unavailable to corporations resident in states with territorial tax systems.

20. See *Rothschild v. U.S.*, 407 F. 2d 404, 409, 415, 23 AFTR 2d 69-637, 642, 648 (Ct. Cl. 1969), (and cases cited therein); *Gilbert v. Commissioner*, 248 F. 2d 399, 411, 52 AFTR 634, 646-47 (2d Cir. 1957) (Hand, J., dissenting), *cited approvingly in Knetsch v. Commissioner*, 364 U.S. 361, 366, 6 AFTR 2d 5851, 5853 (1960); *Aiken Industries, Inc. v. Commissioner*, 56 T.C. 925, 934 (1971).

21. See *Fabreeka Products Co. v. Commissioner*, 294 F. 2d 876, 878, 8 AFTR 2d 5554, 5555-56 (1st Cir. 1961); *Bass v. Commissioner*, 50 T.C. 595, 601 (1968); *Gilbert* at 646 stating "when a taxpayer supposes that *the transaction*, in addition to its effect on his tax, *will promote his beneficial interest in the venture*, he will of course secure the desired reduction [in his tax] for it *would be absurd to hold that he must deny himself an economic advantage* unless he pays the tax based on facts that have ceased to exist." (Emphasis added.)

22. See Article VII(1) of the U.S.–Netherlands Treaty, as extended to the Netherlands Antilles.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Existing Investments

Problem: Article 16 will render many existing foreign investments in the U.S. and U.S. investments in treaty countries economically unsound by denying their investors the reduced rates of withholding tax. This result is unfair because such investments were made on the understanding that such rates would be available. To avoid this inequity, we recommend that the U.S. Model Treaty and all renegotiated U.S. treaties include a provision that existing investors continue to receive the reduced rates of withholding, even if their investment does not meet the requirements of Article 16.

III. RECOMMENDATIONS

It is our view that Article 16, as proposed, should not be included in U.S. tax treaties. Even if, as a matter of policy, it were desirable to include Article 16 in tax treaties, we think the interpretative problems and the impediments to the conduct of international business presented by Article 16 outweigh any arguments in favor of the adoption of such an Article.

JUNE DRAFT

Article 16
Limitation on benefits

1. A person (other than an individual) which is a resident of a Contracting State shall not be entitled under this Convention to relief from taxation in the other Contracting State unless
a) more than 75% of the beneficial interest in such person is owned, directly or indirectly, by one or more individual residents of the first-mentioned Contracting State; and
b) the income of such person is not used in substantial part, directly or indirectly, to meet liabilities (including liabilities for interest or royalties) to persons who are residents of a State other than a Contracting State and who are not citizens of the United States.

For the purposes of subparagraph a), a company that has substantial trading in its stock on a recognized exchange in a Contracting State is presumed to be owned by individual residents of that Contracting State.

2. Paragraph 1 shall not apply if it is determined that the acquisition or maintenance of such person and the conduct of its operations did not have as a principal purpose obtaining benefits under the convention.

3. Any relief from tax provided by a Contracting State to a resident of the other Contracting State under the Convention shall be inapplicable to the extent that, under the law in force in that other State, the income to which the relief relates bears significantly lower tax than similar income arising within that other State derived by residents of that other State.

DECEMBER DRAFT - (Discussion Draft)

Article 16
Investment or holding companies

1. A corporation which is a resident of a Contracting State shall not be entitled under this Convention to relief from taxation in the other Contracting State with respect to an item of income, gains or profits unless the corporation establishes that:
a) its stock of any class is listed on an approved stock exchange in a Contracting State, or that it is wholly owned, directly or through one or more corporations each of which is a resident of a Contracting State, by a corporation the stock of which of any class is so listed; or
b) it is not controlled by a person or persons who are not residents of a Contracting State, other than citizens of the United States; or
c) it was not a principal purpose of the corporation or of the conduct of its business or of the acquisition or maintenance by it of the shareholding or other property from which the income in question is derived to obtain any of such benefits.

2. For the purposes of this Article:
a) an approved stock exchange in _____ means _____;
b) an approved stock exchange in the United States means the NASDAQ System owned by the National Association of Securities Dealers, Inc. and any stock exchange registered with the Securities and Exchange Commission as a national securities exchange for the purposes of the Securities Exchange Act of 1934;
c) a person or persons shall be treated as having control of a corporation if under the income tax laws of the Contracting State in which the income arises the person or persons could be treated as having direct or indirect control of the corporation for any purpose;
d) notwithstanding subparagraph c) of this paragraph, a corporation is presumed to meet the requirements of subparagraph b) of paragraph 1 of this Article if the corporation establishes that individuals who are:
i) citizens of the United States; or
ii) residents of a Contracting State; or
iii) residents of States that have income tax conventions in force with the Contracting State from which relief from taxation is claimed and such conventions provide relief from taxation not less than the relief from taxation claimed under this Convention;

own directly more than 75% of the total combined voting power of all classes of the corporation's stock entitled to vote and more than 75% of the number of shares of each other class of the corporation's stock;

e) a corporation is presumed to meet the requirements of subparagraph c) of paragraph 1 of this Article, in particular, where:
i) the reduction in tax claimed is not greater than the tax actually imposed by the Contracting State of which the corporation is resident;
ii) the corporation is engaged in business operations in the Contracting State of which it is a resident and the relief from taxation claimed from the other Contracting State is with respect to income which is incidental to or derived in connection with such business.

BELGIUM:

Cutting Taxes on Business and Investment Income

by Frans Vanistendael*

I. GENERAL OUTLINE OF NEW TAX MEASURES

During the spring of 1982 a new set of tax measures was introduced in Belgium in what looks like a determined effort to relieve the country of its bad international reputation for high taxes. The measures are aimed at achieving two goals:

a. a general and permanent improvement in the tax environment by a substantial cut in the tax rate on business and investment income;
b. a boost in investment in physical and financial assets by temporary but substantial tax incentives, that will have an effect over a relatively long period of time.

The legal basis for most of the new measures is the Special Powers Act of 2 February 1982. This act enables the government to take sweeping reform measures by Royal Decree, thereby effectively excluding the vote necessary for a formal Act of Parliament. The special powers are granted on a temporary basis and expire 31 December 1982.

Art. 2 of the act enables the government to amend by simple Royal Decree, any existing tax statute, decree or ruling with respect to specifically listed items. However any amendment so effected by Royal Decree is to be confirmed by a formal Act of Parliament before 1 January 1984. Any amendment by Royal Decree that has not been confirmed before that date will lapse thereafter.

The chance of non-confirmation of the measures seems at present very remote, if only because non-confirmation would bring down instantly a whole tax structure that has been built up very carefully.

Under the Special Powers Act, the following tax decrees have already been issued:

(a) 15 February 1982
- Royal Decree No. 1: Reduction of the V.A.T. rate on new construction from 17% to 6%;
- Royal Decree No. 2: Abolition of the capital gains tax on unimproved land situated in areas earmarked for residential construction;
- Royal Decree No. 6: Tax incentives for taxpayers under 35 who start a new unincorporated business or a new profession;
- Royal Decree No. 7: Deduction of a special reserve for severance pay;
- Royal Decree No. 8: Change (reduction) of the tax base for the application of V.A.T. to sales of works of art, antiques, gold and bullion;
- Royal Decree No. 9: Reduction of V.A.T. rate to 1% on gold bullion;
- Royal Decree No. 10: New system of advance payment for taxpayers filing a joint return.

(b) 19 March 1982
- Royal Decree No. 15: Tax incentives for the subscription of shares in Belgian companies;
- Royal Decree No. 16: Reduction of the corporate income tax rate.

(c) 30 March 1982:
- Royal Decree No. 29: Replacement of the tax deduction by a tax credit for income from social security schemes (retirement pensions, sick- and disability pay, unemployment compensation, etc.).

(d) 2 April 1982
- Royal Decree No. 40: Amendments with respect to interest charged for late payment of taxes;
- Royal Decree No. 41: Amendments with respect to criminal sanctions for tax avoidance.

(e) 5 May 1982
- Royal Decree No. 44: Changing the provisions for aggregating the income of husband and wife.

(f) 22 June 1982:
- Royal Decree No. 48: Replacement of existing tax incentives by an investment deduction and tax exemption for capital gains realized on certain business assets.

Comments will be limited to those Royal Decrees that directly affect business activities, i.e. No. 7 on the special provision for severance pay, No. 15 on the tax incentives for the subscription of Belgian shares, No. 16 on the reduction of corporate income tax, and No. 48 on the investment deduction and the exemption for capital gains on business assets.

Finally it should be added that the temporary solidarity surcharges will not be renewed and that negotiations are under way to create a new legal basis for the privileged tax status of foreign executives and research employees.

Discussion of the above measures will be divided into two parts: those of a permanent nature and those which are temporary.

II. PERMANENT MEASURES

1. Reduction of the corporate tax rate

The maximum corporate tax rate will be reduced from a maximum of 56.8% for fiscal 1982 to a single top rate of 45% for fiscal 1983 (income earned in 1982). This reduction is effectuated in two steps.

The first step is the non-renewal of both temporary solidarity surcharges of 4.8% respectively 4% on so called exceptional profits that were introduced by Art. 43 of the Economic Recovery Act of 30 March 1976, and by Art. 48 of the Budgetary Proposals Act 79 - 80 of 8 August 1980. In order to remain in effect, these surcharges had to be confirmed each year by Act of Parliament. There is a political agreement within the government, not to ask for confirmation of the surcharges, so that they will be repealed automatically as of 1 January 1983.

The second step is a reduction of the general top corpo-

* Professor at law, Louvain, Belgium.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

rate tax rate from 48% to 45%. As of fiscal 1983 the structure of the tax rate is the following:

Income (US$)[1]	*Tax rate*
income ≤ 20,000	31 %
20,000 - 72,000	40 %
72,000 - 288,000	47.5%
income ≥ 288,000	45 %

It follows that for taxable income below US$288,000 the effective tax rate is lower than 45% and may vary from 31% to maximum 45%.

The tax credit for dividends and directors' compensation has been adopted to reflect the changes in the corporate tax rate. The tax credit on net-dividends (after 20% withholding tax) has been reduced from 57.5% to 51% of the net amount received.

The credit on non-deductible directors' compensation has been lowered from 46% to 41%. The relative importance of the tax credit, aimed at reducing the burden of double economic taxation (combination of corporate and personal income tax), remains unchanged. About half the amount of the corporate income tax (22.44 for dividends and 22.55 for directors' compensation) is creditable against personal income tax.

2. Exemption for capital gains on business assets

The exemption for capital gains on business assets has its historical origins in Art. 9 bis and 9 ter of the Royal Decree implementing the Income Tax Code (I.T.C.). These articles provided for exemption of capital gains realized on certain business assets.
The exemption had to be renewed on an annual basis. This annual renewal rule, combined with the fact that renewals were sometimes very late, rendered the exemption ineffective as a tax incentive.

Therefore the exemption was incorporated in Art. 36 I.T.C. as a permanent measure not subject to annual renewal, by Art. 53 of the so called Program Act of 2 July 1981, Art. 2 e.s. of Royal Decree No. 48 of 22 June 1982 confirms this permanent exemption and determines its application.

As a general rule exemption is granted with respect to capital gains realized on business assets, used during more than five years in business or other professional activity, when the total sales price of such assets is reinvested in new assets in Belgium within a period of three years. The exemption is automatic and not subject to preliminary rulings or approval by the Department of the Treasury or the Department of Economic Affairs.

The three years reinvestment period is calculated as of the first day of the calendar year or the financial year during which the capital gain has been realized, until the last day of the second calendar year (31 December), or financial year, following the (calendar or financial) year in which the capital gain has been realized.

If business activities are ceased at an earlier date, the reinvestment period ends simultaneously with the cessation of business activities.

Example I

Company keeps its financial year from 1 July - 30 June. A business asset is sold in October 1982. Start of the three years reinvestment period: 1 July 1982, end of the reinvestment period: 30 June 1985.

The reinvestment has to be made in new business assets to be used in Belgium. However, the following are not considered as reinvestment: the purchase of goods in trade or inventory, bonds or simular securities, time deposits, loans or claims, buildings or land held for resale as well as the repayment of a debt. However, bonds issued or guaranteed by the Belgian State for a period of more than five years, do qualify as a reinvestment, if purchased by fiancial or similar enterprises. The purchase of company shares or stock, title to patents, copyrights or other non-physical assets are considered as qualifying investments.

The exemption for capital gains is not applicable to assets that have benefited from the investment reserve provided for in Art. 58 of the Program Act of 2 July 1981 or the investment deduction introduced by the same Royal Decree No. 48 (see below). The basic idea is to prevent the taxpayer from combining the benefits of two incentives. This means that the taxpayer has to make a choice between an immediate tax benefit in the form of an investment reserve or deduction in the year of investment or a deferred tax benefit on the capital gain in the year in which the assets will be sold. Taxpayers that have already chosen for the investment reserve in 1981, or will choose for the investment deduction, will not be entitled to claim the exemption for capital gains at the time the asset is sold.

New business assets purchased as a reinvestment to obtain the exemption from capital gains tax do qualify however for the investment deduction described below.

Example II

Purchase of research equipment in 1982. Application of the investment deduction of 20%. Equipment sold in 1988, and sales price reinvested in similar but more modern equipment. Capital gain realized in 1988 is taxable (at lower rate of 22.5%), because of investment deduction of 20% claimed in 1982. New equipment purchased in 1988 does qualify however for the investment deduction.

New assets purchased as a reinvestment can be depreciated in accordance with ordinary rules. Although the capital gain, which in theory originated the cash for the new investment is completely tax exempt, the newly acquired assets are subject to full depreciation like any other business asset.

Example III

Equipment with salvage value of US$10,000 is sold for US$50,000 in 1982 and proceeds are reinvested in 1983, in new equipment with a purchase price of US$200,000. Capital gain of US$40,000 is tax exempt. Amount of up to US$200,000 of new assets can be depreciated.

1. Exchange rate at 50 Bfrs. = US$1.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The exemption applies to all taxpayers engaged in business or professional activities in Belgium: resident individuals and corporations, and Belgian establishments of non-resident taxpayers (individuals and corporations).

3. Investment deduction

The same Royal Decree No. 48 introduces a new investment deduction. The intention of the government was to simplify the complicated structure and the scattered pattern of existing tax incentives, by replacing several existing incentives with one single and simple measure. Removed from the statute books are both of the investment reserves introduced in 1982 (the 5% reserve enacted on 10 February 1981, and the 28 or 30% investment reserve enacted on 2 July 1981), depreciation of research equipment at 110% of acquisition cost and depreciation at will ("ad libitum") of energy saving equipment.

Art. 6 of the Royal Decree provides for a so called "investment deduction" of:
- 25% on energy saving equipment
- 20% on research equipment and new technology
- 5% on furniture and office equipment
- 13% on any other business equipment qualifying under the Royal Decree; i.e. the standard rate of the investment deduction is 13%.

The investment deduction is applied to the acquisition cost of the qualifying assets in addition to ordinary depreciation. It does not decrease the tax base of the assets for the purpose of calculating subsequent capital gains or -losses in case the assets are sold. It follows that the investment deduction is in fact an additional depreciation deduction in excess of the 100% cost base. The investment deduction does not apply to some additional acquisition costs such as taxes, fees, installation- and transportation charges, on which the taxpayer has the option either to deduct such costs as ordinary expenses, or to capitalize such costs and to depreciate them together with the purchase price. If the additional costs are deducted as an expense, the investment deduction does not apply. If however the additional costs are capitalized and depreciated the deduction is applicable.

Example IV

Purchase of equipment at a price of	US$200,000
Packing and transport charges	US$ 10,000
Installation charges	US$ 10,000
Value added tax (V.A.T.)	US$ 37,700

(purchaser is no V.A.T. payer).
If V.A.T. and charges are deducted as an expense, the basis for the investment deduction is US$200,000; if V.A.T. and charges are capitalized and depreciated together with purchase price, the basis for the investment deduction is US$257,700.

In applying the investment deduction the taxpayer has the option either (a) to apply a one time lump sum deduction calculated as a percentage of the acquisition cost of the qualifying asset, or (b) to spread the amount of the deduction over the normal depreciation period of the qualifying asset. In the latter case the amount of the annual investment deduction bears a compounded interest at a rate of 10% per annum to reflect the deferral of the tax saving. It is clear however that in most cases the biggest tax saving (and also the simplest) will be realized by taking the one time deduction for the full amount in the year of investment.

Example V

Purchase of equipment for US$100,000 to be depreciated with the declining balance method over a period of ten years. Depreciation allowance during the first year (at 20%) US$20,000. One time investment deduction: US$13,000. Total deduction during the year of investment: US$33,000, or 33% of acquisition cost.

Example VI

Purchase of vehicle for US$10,000 to be depreciated with declining balance method over five years. Depreciation allowance during the first year (at 40%): US$4,000. One time investment deduction: US$1,300. Total deduction during the year of investment US$5,300, or 53% of acquisition cost.

The investment deduction applies to all taxpayers engaged in business activities (resident individuals and companies), as well as to Belgian establishments of non-resident individuals and companies, including financial and real estate activities that in the past have very often been excluded from the benefit of such tax incentives. Understandably it does not apply to taxpayers that are not assessed on real but on estimated income. For the time being it is not applicable to taxpayers engaged in the professions, but the Decree provides for the possibility to extend the deduction to this category of taxpayers.

The deduction applies to all *new* investment assets used in business activities with the exception of the following categories of assets:
- assets used for mixed purposes (partially business – partially personal);
- assets subject to a depreciation period of less than three years;
- all automobiles and stationwagons used for transport of individuals, except when used solely for taxi- or leasing services (with driver);
- real estate held for sale by taxpayers professionally engaged in real estate activities.

It also applies to assets acquired as a reinvestment within three years of capital gains that are exempt under Art. 36 I.T.C. (see above).

In order to qualify, the assets must be *new*. It follows that land and old buildings (not new construction) do not qualify as well as some intangible assets (such as goodwill) that are generated in the course of business activities, or that already have been partially depreciated. Also excluded are some other assets, because they already benefit from existing tax incentives:
- workmen's housing and other facilities for personnel that benefit from a 50% exemption provided for in Art. 42 I.T.C.
- assets that benefit from the special depreciation at will (Act of 29 November 1977);

© 1982 International Bureau of Fiscal Documentation – BULLETIN

- assets that benefit from the repealed investment reserves introduced in 1981 and 1982 (Acts of 10 February 1981 and 2 July 1981).

Finally the investment deduction does not apply to some acquisitions that are not subject to depreciation and can be deducted as ordinary business expenses (or depreciated at 100%) in the year during which the expenses are incurred (see below).

Example VII

Purchase of a business vehicle for US$20,000, to be depreciated with declining balance method. V.A.T. amounts to US$5,000. Total acquisition cost US$25,000. Deductions in year of investment:
- US$5,000 V.A.T. as business expense if purchaser is no V.A.T. payer
- US$8,000 depreciation allowance for 1st. year
- US$2,600 investment deduction.

Total deduction: US$15,600 or 62.4% of total acquisition cost.

When the amount of the investment deduction exceeds the amount of taxable profits, or when the company realizes a loss, any unused amount of the investment deduction can be carried forward indefinitely. In case of a tax free reorganization the investment deduction is carried over to the surviving company.

4. Depreciation of acquisition cost

In order to determine which items are subject to depreciation and to determine the basis of depreciation, the tax legislation is now harmonized with existing statutes on annual financial statements (Act of 8 October 1976); so that there is no longer any discrepancy between depreciation rules for tax purposes and for accounting purposes. This identity between tax and accounting rules with respect to depreciation has its most important consequence in the field of leasing: henceforth the lessee will be entitled to take depreciation on the leased asset instead of the lessor.

The new Art. 48 § 2 I.T.C. confirms existing administrative practice with respect to expending or capitalizing certain items of acquisition cost. Additional costs of acquisition, or costs of establishment or incorporation of a business can be (a) either capitalized and depreciated together with other assets, (b) or be capitalized and depreciated in accordance with a separate depreciation schedule, (c) or be expended and deducted at once as an ordinary business expense. This rule applies to such additional cost as indirect taxes, local taxes, charges for transportation, packing, installation, fees for experts etc.

5. Provision for severance pay for small business

As is well known in the international business community severance pay in case of firing or lay-off is quite substantial in Belgium, particularly for non-manual employees. Until now, taxpayers were generally not allowed to take any deduction for provisions established for such contingencies as firing or laying-off employees.

Royal Decree No. 7 provides for a tax deductible provision for firing or laying-off employees for small business employing less than 100 employees at the beginning of the calendar year, or financial year (if not identical to the calendar year). The deductible provision amounts to maximum US$800 per additional employee for manual workers and to maximum US$2,400 per additional employee for non-manual workers. The number of additional employees, that have been hired, is calculated by comparison with the average number of employees employed during the preceding (calendar- or financial) year. When the number of employees decreases (because of firing, lay-off, retirement or resignation), previously deducted provisions become taxable in accordance with the category of employees (manual, or non-manual) that has decreased.

6. Tax status of executive and research personnel

The tax status of executive and research personnel of multinational companies has up to 1982 been regulated by administrative circular. This circular in principle expires on 31 December 1982, for employees residing in Belgium before 1 January 1975. Moreover a recent decision of the Supreme Court has cast some doubt on the legal status of these tax privileges. (Cass. 19-11-1981, F.J.F. 1982, 22).

However, the Belgian government has the firm intention of maintaining a special tax status for non-Belgian executive and research personnel, that are hired abroad and transferred to Belgium. Negotiations are under way to find a more solid and more permanent legal basis for this special tax status. At the same time tax benefits would be improved; the main benefits at present being (a) a 30% flat deduction on the first US$100,000 of taxable income for employees of international headquarters and research personnel and of US$30,000 for other employees and (b) the limitation of the tax liability to income from employment earned in Belgium.

III. TEMPORARY TAX INCENTIVES

Royal Decree No. 15 of 9 March 1982 introduced two new tax incentives for the subscription to newly issued or the purchase of existing shares in Belgian companies. The first incentive consists of an exemption from corporate income tax coupled with an exemption from personal income tax for dividends on newly subscribed shares; the second incentive consists of a deduction from personal income of the price of shares purchased in the market. By virtue of its exemption from corporate income tax the first incentives affects Belgian subsidiaries of non-resident parent companies, and non-resident individuals holding shares in Belgian companies. The second incentive affects solely Belgian residents subject to personal income tax.

The new tax incentives replace the old 5% dividend exemption introduced by the law of 29 November 1977 and amended by the laws of 10 February 1981 and 2 July

© 1982 International Bureau of Fiscal Documentation – BULLETIN

1981. The 5% exemption indeed proved to be ineffective as a tax incentive.

1. Exemption from corporate income tax

Art. 2 of Royal Decree No. 15 provides for an exemption from corporate income tax during a five-year period for dividends that have been distributed on shares in Belgian companies and other legal entities that were newly issued during the calendar years 1982 or 1983.

The exemption applies only to shares in companies or other legal entities that are subject to Belgian corporate income tax. Shares in non-resident companies having a permanent establishment in Belgium are excluded. The new shares must be issued at the time of incorporation or increase of statutory capital. The shares must be paid in cash. Payment in kind whether made directly or indirectly by having the company first receive the cash and then purchase the assets from its shareholders, does not qualify. The exemption applies to public as well as to limited issues of shares.

Incorporation or capital increases resulting from splitting, merger or other forms of corporate reorganizations do not qualify. Any decrease of statutory capital during the period 1982 – 1983 is deducted from the amount of capital increase qualifying for the exemption, except when the decrease has been necessary to consolidate accumulated losses. Shares acquired in exchange for convertible bonds issued before the starting date of the exemption period do not qualify either.

The exemption is further subject to the condition that at a minimum 60% of the proceeds of the capital increase is invested either in tangible or intangible fixed assets used for business activities in Belgium, or in shares of companies subject to Belgian corporate income tax. The business investment requirement must be met by the end of the first financial year in which the corporate income tax exemption applies. The Secretary of the Treasury has the power to decrease the 60% investment requirement for companies using the proceeds of the capital increase to repay specific debts, to consolidate accumulated losses or to acquire participations in non-resident companies in order to secure supplies of raw materials or fuel, or to secure foreign outlets for the sale of domestic products. In case the acquired assets are sold or otherwise transferred, the proceeds must be reinvested in qualifying assets within a period of three months.

The exemption applies to dividends distributed on the newly issued shares, not of the newly subscribed capital that has actually been paid in. Any capital surplus paid in excess of the face-value of the shares is also taken into account to determine the basis for the exemption. The exemption is increased to 13% of newly paid in capital if and when the company undertakes the obligation to distribute any supplementary income resulting from the tax saving caused by the corporate income tax exemption, to the newly subscribed shares.

Such obligation can in practice only be undertaken in case of the incorporation of a new business, or in case of a capital increase when all newly subscribed shares can be duly identified.

Example VIII

Capital increase of US$1,000,000 in 1982 with obligation to pass on tax savings.
Dividends distributed of up to US$130,000 per annum are tax exempt from 1983 through 1992 (see below).

The exemption is granted for a period of five financial years following the year in which the capital increase has been effectively paid in. However for companies newly incorporated in 1982 or in 1983, or companies effectuating a capital increase within three years of incorporation the exemption is granted from the third through the seventh financial year following the year of incorporation.

Example IX

Company incorporated in 1960, with financial year coinciding with the calendar year. Capital increase in May 1983. Exemption for dividends distributed from 1 January 1984, through 31 December 1988.

Example X

Company incorporated on 15 May 1983 with financial year coinciding with the calendar year. Exemption for dividends distributed from 1 January 1986 through 31 December 1990.

The exemption period is extended however, when the company undertakes the obligation to distribute the tax benefit to the newly issued shares and the exemption is raised to 13%. The exemption period is raised to ten or nine years depending on whether the capital increase takes place in 1982 or 1983.

The ten or nine-year period takes effect, the first financial year after the year of the capital increase, or the third financial year after the year of a new incorporation, or of a capital increase within three years of incorporation.

Example XI

Incorporation of company on 1 July 1980, financial year coinciding with the calendar year.
Capital increase on 10 October 1982, thus within three years, with obligation to distribute tax savings to newly issued shares.
Exemption for dividends distributed from 1 January 1985 through 31 December 1994.

Companies holding shares in other companies can also benefit from the tax exemption of 13% on dividends distributed to them on newly issued and qualifying shares, to which the holding has subscribed, provided the holding company undertakes the obligation to pass through to its newly issued shares any tax saving from which it may itself benefit on dividends distributed by its subsidiary.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Example XII

Company A effectuates a capital increase with shares, qualifying for the 13% exemption, to which company B subscribes.
Company B will also benefit from the 13% exemption on dividends distributed on qualifying shares by company A, provided it (company B) undertakes the obligation to pass through to its shareholders any tax saving it may receive on dividends distributed by company A.

The 8% or 13% exemption remains in effect so long as the company meets the investment conditions, and the obligation to pass through any tax savings to the newly issued shares (only 13% exemption).

Together with the annual tax return a company claiming the exemption must submit a list of the qualifying investments still in use in the company. In case of tax free splitting, mergers or other forms of reorganisation the exemption is carried over to the surviving company.

2. Exemption from personal income tax

In addition to the exemption from corporate income tax described above Art. 3 of the Royal Decree No. 15 provides for a total exemption from personal income tax of dividends of shares that were newly subscribed during 1982 or 1983. Whereas the amount of the corporate income tax exemption is limited to the first 8 or 13% of dividends distributed on paid in capital, the exemption for dividends from personal income tax to the shareholders has no limit.

Example XIII

A dividend of 20% on paid in capital will benefit from the corporate income tax exemption up to 8 or 13% while the balance (12 or 7%) will be subject to corporate income tax. However, the total amount of the dividend distribution (20%) will be exempt from personal income tax.

The total dividend exemption is subject to the condition that the shares on which the dividends are distributed do qualify either for the 8% or for the 13% exemption from corporate income tax.

The period of the dividend exemption is also linked to the period of the corporate income tax exemption (e.g. depending on the corporate income tax exemption the personal income tax exemption is granted for a period of 5, 9 or 10 years (see above)).

It is not required that the shareholder claiming the personal income tax exemption be the original subscriber of the shares i.e. the exemption from personal income tax on qualifying shares is carried over to any resident individual purchasing the shares during the period of exemption from corporate income tax (5, 9 or 10 years).

If the company does not meet the 60% investment requirement set for the corporate income tax exemption (see above) this does not entail the loss of the personal income tax exemption to the individual shareholder, except when the shareholder would act in bad faith.

Whereas a capital decrease for another reason than the consolidation of accumulated losses entails only a proportional reduction of the tax benefit in the corporate income tax, it entails a complete loss of such benefit in the personal income tax, even if only part of the face-value is repaid on each share.

The exemption from personal income tax does not entail an exemption from the withholding tax due at the time of the payment of dividends. The withholding tax of 20% is the sole remaining tax on dividend income, i.e. the total income tax burden on dividends distributed on qualifying shares is limited to 20% and the shareholder receives 80% of total corporate profits after tax.

Dividends on qualifying shares do not have to be reported in the shareholder's tax return. Payment of the withholding tax absolves him from any further tax liability.

However for shareholders in low income brackets (average rate below 43.14%), the existing system of crediting withholding tax and the tax credit on dividends (51% of dividend after withholding tax) remains in effect. Such shareholders have the option to report their dividend income from qualifying shares. The credits from withholding tax (20%) and the tax credit on dividends (51% on net dividend) will then result in an even lower tax burden than the single withholding tax at 20%.

Finally, shares qualifying for the personal income tax exemption, do also qualify the holder of such shares to an exemption from inheritance and gift taxes during a period of up to ten years after the subscription if payment takes place in the same calendar year.

3. Deduction of purchase price of shares

Art. 4 of the Royal Decree No. 15 provides that subject to certain conditions, the purchase of shares, or certificates in Belgian investment funds made between 1 January 1982 and 31 December 1985 entitles the purchaser to a deduction from taxable income of the total acquisition price (within certain limits). In order to qualify, shares must have been issued by a corporation subject to the Belgian corporate income tax. When such shares were issued before 1 January 1982 then quotation on a Belgian stock-exchange is necessary. When issued after 31 December 1981, the company must have undertaken the obligation to invest 60% of the actually paid-in capital in fixed assets upon issuing the shares. Certificates in Belgian investments funds qualify only when the fund has been accredited by the Department of the Treasury, approval which is dependent upon the fund investing at least 60% of its assets in Belgian shares.

The deduction is limited to 40,000 Bfrs. for a single individual and to 50,000 Bfrs. for a married couple. It is increased with 10,000 Bfrs. per dependent. Of course, the amount of the deduction may not exceed the purchase price really paid for qualifying shares or certificates during the calendar year.

The deduction is total, i.e. up to the maximum amount mentioned above, in the year of purchase. However, upon transfer of the shares within a period of 5 years, a fraction of the acquisition price is added to the tax base,

© 1982 International Bureau of Fiscal Documentation – BULLETIN

the numerator being the number of months between the transfer and the end of such period and the denominator being 60.

Complete reinvestment of the "resale" price within three months or transfer by reason of death or gift to lineal ascendants or descendants does not entail such partial and deferred taxation.

It is clear that the taxpayers wanting to benefit from the deduction will have to report the dividends from the shares on which they claimed the deduction. The deduction of the purchase price of the shares does not entitle the dividends distributed on such shares to an exemption from personal income tax. The normal rules (withholding tax and tax credit) apply. As stated above there is no additional income tax, because of these credits, if the average tax rate of the shareholder does not exceed 43.14%.

As to shares that qualify both for the deduction as well as the exemption, the shareholder has an option. He is presumed to prefer the exemption unless he expressly and irrevocably opts for the deduction in the personal income tax return related to the taxable year wherein the shares were purchased.

CONCLUSION

This brief review of the latest tax measure makes it clear that the tax climate is definitely changing for the better in Belgium. The measures in the field of taxation are coupled with a whole series of Royal Decrees in the field of social security also aimed at reducing the labor cost to business. The Belgian economy is certainly not back in the golden Sixties, but the new tax measures have been rolling back the tax burden on business enterprise at least to the level of the early Seventies.

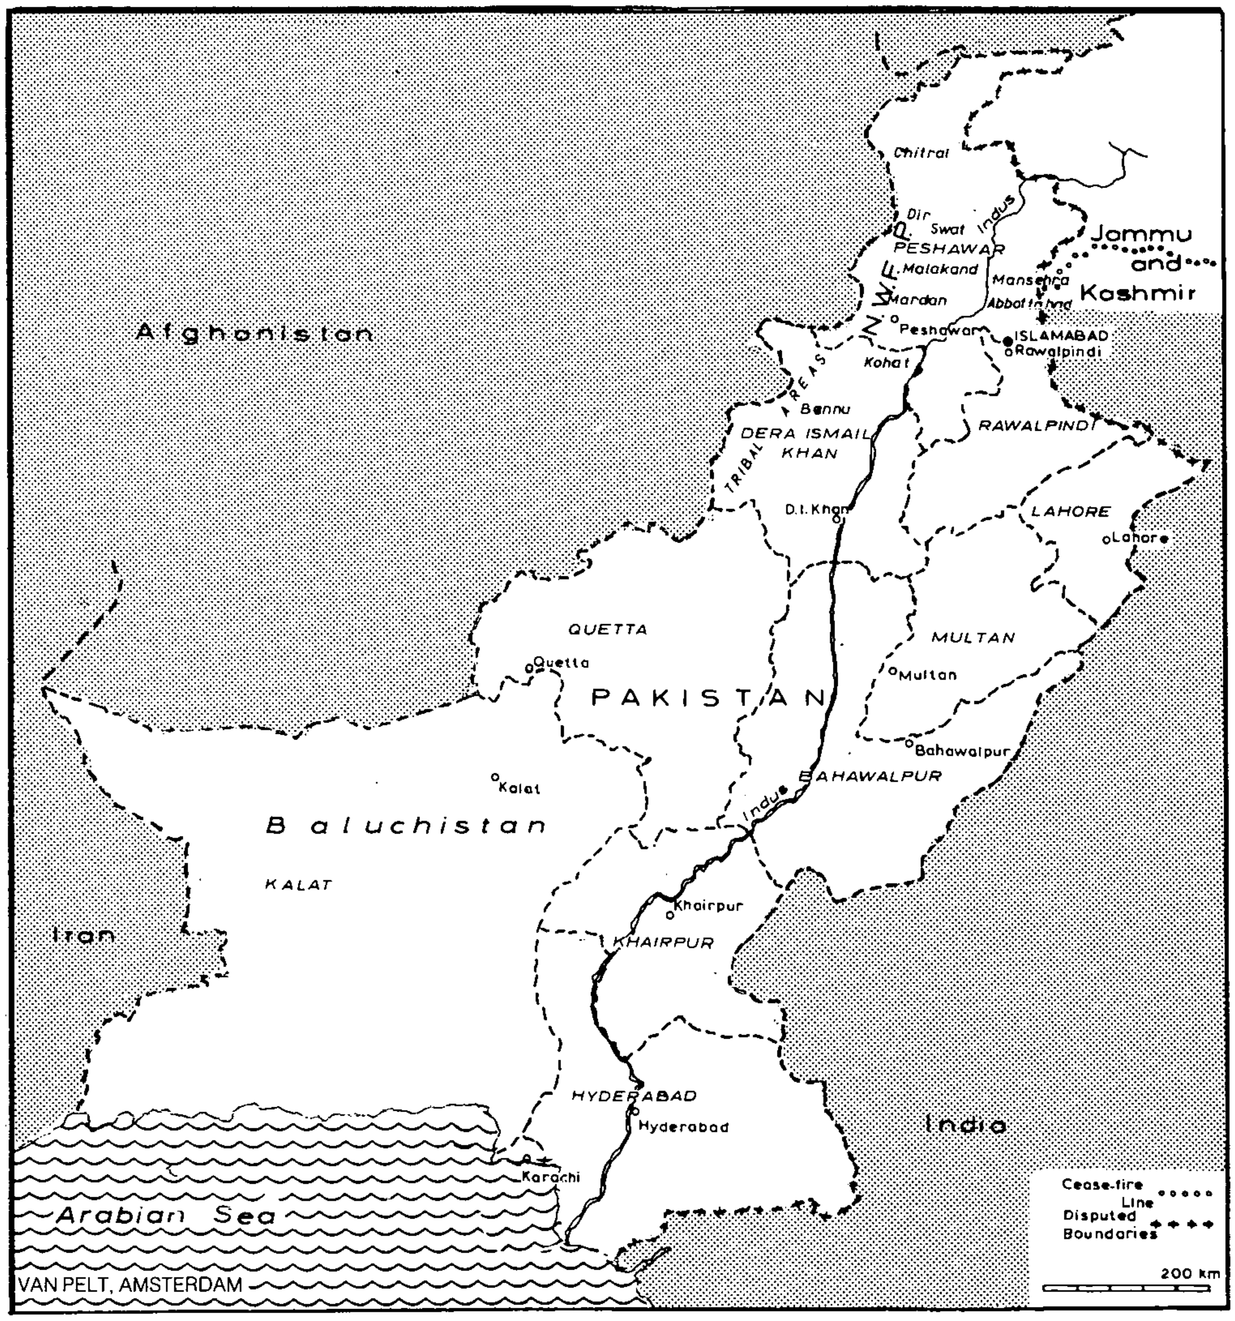
Role of Income Tax Incentives in Industrialization in Pakistan During the Seventies – A Critique

by Ahmad Khan*

A. PHILOSOPHY OF TAX INCENTIVE PROGRAMS



Tax incentive legislation is generally designed to promote certain socio-economic goals. These goals may include the development of manufacturing or industrial sectors in the economy, dispersal of the industries to less-developed (or pre-industrial) geographical areas or places (which are or may be the source of raw materials), developing import substitution and export oriented industries, attracting foreign capital and technology and, in the process, helping to create a socio-economic order which provides ample opportunities for employment, development of technical skills and adequate supply of goods and services for public consumption. The net result of the complementary fiscal measures (in the present context, income tax incentives) should be to encourage savings, stabilize the economy (and, of course, industrial growth), strengthen the balance of payment position, narrow down the gap in industrialization of various geographical regions of the country concerned, and utilize fully available technical skills and manpower. With these ends in view, appropriate tax incentive programs are envisaged and supplement the various non-fiscal and monetary measures intended for the same purpose.

The present study describes the role of fiscal incentives in the industrial development of Pakistan in the context of the overall economic strategy during the decade 1970-80. It identifies the economic priorities and the fiscal measures adopted during this period in historical sequence. In conclusion, an attempt has been made to evaluate the impact of income tax concessions in achieving the economic goals for which such measures were designed.

B. HISTORY OF TAX INCENTIVES IN PAKISTAN

The present study of the tax incentive legislation relates to the post-1970 period. It is, therefore, imperative to glance briefly through the economic scenario prevailing in 1970, the economic plan strategy announced through the Fourth-Five-Year Plan 1970/75[1] and the ensuing political and economic considerations requiring changes in the Plan Strategy accompanied by the changes in the fiscal policies. This will serve as a background to the legislative intentions behind the various tax measures adopted with a view to accelerating the pace of industrial (and, of course, the overall economic) development in Pakistan.

At the time of its independence in August 1947, Pakistan inherited an almost negligible industrial base, and also other infrastructural facilities were non-existent. In FY 1949/50, the industrial sector contributed 7.7% towards GDP of which 5.5% was accounted for by small-scale manufacturing. The value added in large-scale manufacturing increased to 8.8% in FY 1968/69, reflecting a growth rate of 14% over the two decades. During the 1950s, the aggregate growth rate recorded by large-scale manufacturing was as high as 16.3% and during the Second Five-Year Plan 1960/65, it was 13.0%.[2] Industry during this period passed from an initial concentration on cotton and jute textile to sugar, vegetable ghee and cement, and later on to more sophisticated chemical and engineering industries.[3] The considerable increase in industrial capacity was largely caused by the governmental effort in developing infrastructural facilities. A major stimulus was the creation of public corporations to play a pioneering role in establishing such industries, which the private sector was unable to undertake either because these industries were technologically complex or needed large investments. The Government further established specialised credit institutions and, to fill up the technological gap, set up engineering universities, colleges and industrial advisory institutes. These promotional activities were strengthened by providing fiscal concessions and a sizeable allocation of foreign exchange resources at subsidised prices to the industrial sector. As a result of the combined efforts of the public and private sectors, the manufacturing sector showed an impressive performance. Nevertheless, excessive protection and extra liberal concessions also led to the establishment of many inefficient industries and the neglect of productivity in general. While import substitution occurred regarding consumer goods, there was relatively little headway towards the production of capital goods. The net result was that whereas a great deal was accomplished in building an industrial sector from scratch, the more complex and challenging task of creating a balanced, efficient and modern industrial sector was not tackled satisfactorily.[4]

The Fourth Five-Year Plan 1970-75

With the prevailing economic scenario in mind, the Fourth Five-Year Plan 1970/75 stated that its policy was to provide for an adequate measure of flexibility in respect of unresolved issues. At the same time it would constitute a definitive and positive start in areas where no doubts existed about future trends and driving forces. The Plan suggested concrete proposals through which income inequalities could be reduced and equal opportunities assured for all people. It was also expected to serve as a vital instrument of accelerating development of less-developed areas.[5]

While referring to its strategy for private investment, the Fourth Plan stated that "Pakistan has a mixed economy with large part of the production activities in the private sector", and "it may appear surprising that the main emphasis in planning in Pakistan has been in the public sector". Nevertheless, "during the second Plan, the private sector strategy involved the setting up of an incentive mechanism sufficiently attractive to obtain a high investment response and evolution of an institutional framework for channelling real resources to the private sector to translate investment demand into physical investments. The absence of detailed and restrictive planning for the private sector combined with very powerful incentives and sizeable credit availability had the advantage of turning the private sector into a dynamic force. However, there was very little attention paid to the quality of investment, efficiency in the use of resources and consistency of private sector development with social goals."

During the Third Plan 1965-70, the conflict between the pursuit of social objectives and the maintenance of powerful incentives for private investment became obvious, and "many policy shifts were made". Therefore, for the Fourth Plan, it was considered "imperative to look deeper into the behaviour of the private sector and to start the process of integrating the private sector more adequately into overall national planning". Prior to the Fourth Plan, the strategy for the private sector "was based essentially on the premise that capital is shy and that enterprises need to be brought up with the help of special incentives in the form of subsidies, protection and tax concessions. Thus, a powerful and effective system of incentives was evolved over the years and, within the given framework, private enterprise was left free to exercise its option with a view to maximising its rate of return. The system produced results and has been responsible for a very high rate of industrialization." This strategy for the private sector resulted in a continuous rise in the cost of development. "Essentially the protection of infant industries, which are at times quite inefficient, implied that consumers have to pay high prices. The concessions to industry mean that others have to bear a large burden of taxation".[6]

---

1. The Pakistan Government appointed a Planning Board in July 1953 to review the development that has taken place since independence and to prepare a national plan of development based on the fullest possible utilization of available resources. The First Five-Year Plan 1955-60 was published in May 1956 and it was subsequently revised in 1957 on the basis of public comments. Since the formulation of the First Plan, the Pakistan Government has formulated the Second (1960-65), Third (1965-70), Fourth (1970-75) and Fifth (1975-80) Plans. The Sixth Five-Year Plan is in the process of formulation.

The Fourth Plan further stated that "the first element of new strategy is the recognition that over the years we have now developed an aggressive and dynamic private sector, quick to respond to profit incentives and capable of setting up and running large industrial business and service enterprises. Apart from the establishment and experience, there is a sizeable class of potential new entrants who are being attracted by the demonstrated success of the others. *The incentive mechanism is no more needed on a general basis, but more selectively for correcting regional imbalances and reducing the handicaps from which new entrants suffer.*" As to the old and more established industries they "have to acquire the level of efficiency where they would need a minimum of special incentives and protection."

Objectives: Increase of industrial production and closing the foreign exchange gap

As to the overall Fourth Plan Strategy on industrialisation, it had two inter-related objectives, viz., output of the industrial sector must grow at 10% per annum, and the foreign exchange gap should be kept within manageable limits, by maintaining the momentum of manufactured exports and replacing a larger proportion of imports, particularly of engineeering goods and imported raw material. The Fourth Plan envisaged a long-term view of export possibilities in the industrial sector and "shifting the structure of production towards other lines in which [we] possess, or may be reasonably expected to develop, a comparative advantage". The Fourth Plan indicated that for the purposes of industrialisation, criteria such as those relating to increased production for export and for import substitution, relatively higher value added, appropriate employment opportunities, encouragement of indigenous capital goods industry, etc. would be kept in view. Simultaneously, "reliance will continue to be placed on private investment for the bulk of industrial investment during the Fourth Plan in West Pakistan other than the less developed areas . . . . Public investment in manufacturing will be undertaken only in those cases where private investment is not forthcoming, where a joint venture cannot be organized or where considerations of national interest dictate public investment." As to the less-developed areas, "effective steps will be taken by way of fiscal and other measures to improve the investment climate . . . ".

The Fourth Plan Strategy, however, could not be implemented in the wake of the 1971 war with India and the shift in the overall socio-economic policies of the new government. A large portion of the industrial sector was taken over by the government and reserved for the public sector. The private sector was left with only a very small sector of capital intensive industries and as such the fiscal measures were oriented more towards developing public sector industries. In the process, generous tax exemptions and subsidies were granted to public sector industries, especially in the form of concessions to the foreign component of the capital outlays and the sophisticated technology needed for these projects.

Change in industrial development strategy

The poor performance of the manufacturing sector in the mid-1970s prompted the Government to initiate important changes in Pakistan's industrial development strategy in 1977/78. The new industrial development policy aimed at encouraging private sector participation while reducing the scope of the public industrial sector and improving the latter's operational and organizational efficiency. In 1977/78 agro-processing units were denationalized, and a re-demarcation policy was announced permitting private sector involvement in many fields previously reserved for the public sector. The measures taken in 1978/79 included the exemption from import duties for textile machinery required for balancing* , modernization, and replacement (BMR) and for the manufacture of garments and made-up textile goods; the introduction of export subsidies for cotton textile products ranging from 7.5% to 12.5%; and the abolition of excise duties on the manufacture of cotton yarn and fabrics. In addition, import procedures were streamlined for machinery valued up to 2.5 million Rs. In 1979/80 export rebates were extended to engineering goods, canvas footwear, and acetate yarn. In 1980/81 the authorities continued the policy of encouraging private sector investment by simplifying government investment approval procedures.

First, the ceiling below which private sector projects are exempt from approval procedures was doubled to 20 million Rs.

Second, machinery up to 10 million Rs. is now allowed to be imported under the Non-Repatriable Investment (NRI) Scheme or against cash licenses without government approval, provided that the projects do not fall within the "negative list" of industries which the Government does not want to encourage; previously the cutoff limit was 5 million Rs.

Third, establishment of new import-based industries (defined as those depending on imports for 50% or more of their input requirements) no longer needs the approval of the Economic Coordination Committee of the Cabinet, provided their annual import requirements are less than 5 million Rs; previously, all import based projects needed approval irrespective of their imported inputs.

Fourth, the role of the Central Investment Promotion and Coordination Committee, the agency which approves projects proposed by IPB, PICIC, and IDBP, was curtailed; only projects of 20 million Rs. or more

* *Editor's note:* The term "balancing" (of machinery) means installation of additional machines in an industrial unit for the purposes of achieving optimum efficiency of the various inter-related components of that unit. For instance, in the textile industry, if an industrial undertaking has both yarn-producing and weaving facilities, 25,000 spindles "balance" with 500 looms. Therefore, if such an undertaking does not have the spindles and looms in the appropriate proportion, either the spindles or the looms would be working below capacity resulting in less than optimum efficiency. Installation of additional looms or spindles, as the case may be, to bring about the right proportion between the two would mean "balancing" of the existing machinery. Similar standards can be found for the ideal capacity of machines involved in intermediate stages of production from raw material to the end product.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

sanctioned by IPB are now subject to review by the Committee, which has been reduced in size and renamed the Central Investment Promotion Council.[7]

On the income tax side, selective tax concessions for industrial undertakings established in less-developed geographical regions, viz., Baluchistan, N.W.F.P. (North-West Frontier Province), parts of the Punjab and Sind Province were granted during the fiscal year 1974/75. The process of granting income tax concessions to the manufacturing industry and export oriented trade accelerated during the subsequent years and tax incentives in the form of tax-holidays, investment credits, tax rebates, etc. were introduced to revitalize the process of industrialization in the country.

C. TYPES OF TAX INCENTIVES INTRODUCED IN PAKISTAN

Pakistan has adopted a variety of income tax incentives, which generally include:
(1) tax holidays, (2) tax rebates, (3) tax credits, (4) investment credits or rebates, (5) accelerated depreciations, (6) other investment-related tax incentives.

The types and extent of the tax incentives introduced since 1970 have varied depending upon overall economic priorities, as reflected in the Fourth and Fifth Five-Year Plans and the Finance Minister's budget speeches. The valid economic reasons, at times, gave way to the introduction of some ad hoc tax concessions, which, if looked at in the overall scheme of economic strategy, may not appear as a part of the overall package, and overlap some of the existing tax incentives. The net result, as we may see in the latter parts of this study, has been or still is the grant of too liberal concessions.

The position of various tax incentive programs during the period under study, i.e. July 1970 to June 1981, is as described below:[8]

1. Tax holidays

These include total or partial tax concessions to new industries set up in selected geographical regions, certain sectors of industries and to certain types of income.

a. Area-wise tax holidays

(i) The tax holidays scheme introduced in 1959 envisaged complete tax exemption for new industrial undertakings for a prescribed period of 4, 6 or 8 years depending upon the geographical location of such industries. It was further liberalized in 1966 by relaxing the condition for reinvestment of tax-exempt profits from 60% to 40%. The condition of reinvestment was altogether removed in 1968. In 1970, i.e. the end of the tax holiday period, it was decided to extend for an additional two years partial tax exemption to industries set up before 1 July 1970 is an industrial estate established by the Government or an authority thereof.[9] The tax holiday scheme was suspended by the 1971-72 assessment year, and it was decided that the tax realized for this year from companies eligible for the tax holiday would be allowed as a credit against the tax liability for the period following the expiry of the tax holiday. In 1972-73, the tax holiday scheme was abolished with retrospective effect from the assessment year 1971-72.[10]

(ii) The fiscal concessions in terms of a tax holiday on the basis of geographical location of new industries were not extended during the fiscal year 1974-75.

(iii) During the fiscal year 1975-76, a partial tax exemption was granted with respect to the income of companies registered under the Companies Act, 1913, earned between 1 July 1975 and 30 June 1981 from industrial undertakings commencing commercial production during this period to the extent of:
  (a) 10% of capital if the undertaking is located in Baluchistan, Tribal Areas, and Azad Kashmir.
  (b) 5% of capital if it is located in other areas (excluding the Talukas of Karachi and Hyderabad and Tehsils of Lyallpur and Lahore and such adjoining areas as may be notified by the Federal Government).[11]
  (Section 15B of the Repealed Income tax Act, 1922).

(iv) During the fiscal year 1976-77, the partial exemption granted under (iii) was restricted only to those industrial undertakings which are formed other than by splitting up or by reconstruction or by transfer to a new business of any plant or machinery used in a business being carried out in Pakistan prior to 1 July 1975.

(v) The existing relief provisions under which an investment deduction of 10% of capital was granted to industrial undertakings registered under the Companies Act, 1913 between 1 July 1975 and 30 June 1981 and commencing commercial production during the same period were, during the fiscal year 1978-79, turned into a full exemption for 5 years (from the month in which the industrial undertaking was set up or commenced industrial production, whichever is later) for undertakings established in Baluchistan, the Tribal Areas, the Northern Areas and Azad Kashmir. This exemption was further extended to similar industries established in the Districts of Mansehra, Kohistan, Northern Areas, and Tribal Areas

7. IMF Study on Economic Situation in Pakistan.
8. The summarised position of the various tax incentives as prevailing in Pakistan at present is given in Appendix I.
9. The Finance Minister in his Budget Speech for the year 1970-71 stated that the tax holiday played an important role in bringing about the rapid industrialization of the country. Due to the lack of infrastructure and other facilities, entrepreneurs found it difficult to start industries in the 6-year tax holiday zone and, of necessity, converged on the Government-established industrial starts located in the four-year tax holiday area, further extension of industries set up during Fourth Five-Year Plan period was of vital necessity.
10. The Finance Minister in his Budget Speech for 1972-73 stated that the "notorious" tax holiday scheme was being abolished as it did not achieve its purposes of industrial disposal but, instead, contributed to the concentration of economic power and wealth and encouraged the establishment of uneconomic units. The Government, instead, considered it a sufficient incentive to give full exemption from import duties in case of capital equipment to be installed in less-developed areas, and also to revive the Equity Participation Fund for giving support to private entrepreneurs who propose to set up industries in less developed areas.
11. The Finance Minister in his Budget Speech for the year 1975-76 stated that since 1969 there had been stagnation in private investment in large scale industries. Some improvement occurred in the recent past and the stock exchange showed some buoyancy. With a view to further strengthening this trend, new fiscal incentives (including the tax holiday) were being introduced. No adjoining areas were announced as referred to in the Fiscal measures.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

established during the period between 1 July 1979 and 30 June 1983.

(vi) During the fiscal year 1979-80, income of companies registered under the Companies Act, 1913 from an industrial undertaking established in under-developed areas, whose income is equal to 5% of paid-up capital and which were hitherto exempt from tax were made to qualify for such tax exemption on income equal to 10% of paid-up capital.

(vii) During the fiscal year 1978-79, an exemption was allowed with respect to the income of companies registered under the Companies Act, 1913 from an industrial undertaking set up between 1 April 1978 and 30 June 1983 for a period of 5 years beginning with the month in which the commercial production commences (whichever is later) if such an undertaking is set up in the Divisions of D.I. Khan Malakand in N.W.F.P. province.[12]

(viii) During the fiscal year 1978, a similar tax exemption was allowed with respect to the income of companies registered under the Companies Act, 1913 from an industrial undertaking set up between 1 March 1978 and 30 June 1983 in the province of Baluchistan.[13]

(ix) During the year 1980-81, income of companies registered under the Companies Act, 1913 from industrial undertakings set up in industrial estates in the whole of N.W.F.P., district of D.C. Khan, Mianwali and Tehsil Khushab in Punjab, and districts of Dadu (excluding Kotri), Jacobabad and Shikar-pur in Sind were exempted for a period of 5 years from the date of setting up of the undertaking or commencement of commercial production (whichever is later).[14]

b. Income-wise tax holidays

(1) *Dividends*

(i) During the fiscal year 1970-71, dividends paid out of capital gains on which tax had already been paid by the company or firm of which such person was a shareholder or a partner were exempted from income tax (S.14(4)) of the Repealed Income tax Act, 1922). This exemption was withdrawn during the year 1971-72 to the extent that the dividends paid out of the taxed capital gains were made liable to tax in a manner similar to dividends paid out of any other taxed income.[15]

(ii) During the fiscal year 1972-73, dividends received by a private company were made liable to taxation at normal rates. Intercorporate dividends in the hands of a public company continued to be taxed at the concessional rate of 15%.

(iii) During the fiscal year 1978-79, the existing preferential tax treatment accorded to dividends from NIT and ICP mutual funds was discontinued. From then onwards, dividends received from any company listed at stock exchange or from NIT or ICP mutual funds was exempted to the extent of 15,000 Rs. per annum.

(2) *Capital gains*

Capital gains from the disposal of movable assets (capital stocks of joint stock companies, etc.) have been exempt from income tax during the period beginning 1 July 1975 onwards. The exemption is available up to 30 June 1983. Capital losses during these years have been allowed to be carried forward for setting of against the future capital gains.[16]

c. Sector-wise tax holidays

(i) *Income from the manufacture of agricultural machinery:* Income derived from sales during the period 1 July 1968 – 30 June 1983 from the manufacture (not assembly of specified agriculture machinery and component parts thereof, provided the latter can be easily fitted into their places in these implements and cannot ordinarily be used for purposes other than agriculture, is totally exempt from levy of income tax.[17]

(ii) *Income from renting out of agricultural machinery, etc.:* Income derived from the business of renting out of machinery for agricultural operations, or providing pest control services to agriculturists, is exempt from income tax for a period of 2 years from the date such business is set up provided that the business has been or is set up during the period 1 July 1976 and 30 June 1983.[18]

(iii) *Income from storage and preservation of food grains, etc.:* Income derived from a business of providing services for the storage and preservation of food grains through scientific drying, fumigating and storing is exempt from income tax for a period of 5 years from the date of setting up of such business during the period 30 October 1969 – 30 June 1980.[19]

(iv) *Income from poultry farming, etc.:*

(a) Income derived during the period between 1 July 1971 and 30 June 1983 from poultry farming, fish catching and cattle or sheep breeding is exempt from income tax.[20]

---

12. See SRO. 317(I)/78 dated 25 March 1978.
13. See SRO. 234(I)/78 dated 2 March 1978.
14. See Clause 82A of Second Schedule of the Income Tax Ordinance, 1979.
15. The Finance Minister in his Budget Speech for 1971 felt that there was no justification for giving preferential treatment to dividends out of taxed capital gains as compared with dividends from other types of taxed income. The measure was introduced as a step towards achieving neutrality in all types of income.
16. The tax concession was for the first time introduced in 1977 for a period of 2 years through an amendment in S.17(5) of the repealed Income Tax Act, 1922. It was further extended for a period of 2 years through the Finance Ordinance Acts of 1976, 1978 and 1980.
17. The tax exemption was for the first time allowed for a period of 5 years during FY 1968-69 through SRO 25(K)/68, dated 20 November 1968. The exemption period was subsequently extended through a series of amendments in this notification, viz., SRO.371(I)/71, dated 17 June 1972, SRO.960(I)/71, dated 28 June 1973, SRO.1535(I)/74, dated 19 December 1974, SRO.648(I)/76, dated 1 July 1976, and the Finance Ordinance, 1980. The tax exemption is now contained in Clause 98 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
18. The tax exemption was first introduced during FY 1976-77 through SRO.649(I)/76, dated 1 July 1976. The exemption period expiring on 30 June 1980 was subsequently extended to 30 June 1983 through the Finance Ordinance, 1980. The tax exemption is now contained in Clause 96 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
19. This tax exemption was first introduced through SRO.225(I)/69, dated 21 October 1969. The exemption, as expiring on 30 June 1975, was subsequently extended to 30 June 1980 through SRO.647(I)/76, dated 1 July 1976.
20. See SRO.142(I)/70, dated 1 July 1970. The exemption, expiring on 30 June 1976, was extended first through the Finance Ordinance, 1975 (by amending S.4(3)(xx) of the repealed Income Tax Act, 1922 and then through Finance Ordinance, 1980 by introducing Clauses 64-A and 64-B in Second Schedule of the Income Tax Ordinance, 1979. Presently, the provision appears at Clause 99 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(b) Income derived during the period between 1 July 1980 and 30 June 1983 from the business of poultry processing is exempt from income tax.[21]
(c) Income derived during the period between 1 July 1971 and 30 June 1983 from the business of dairy farming is exempt from income tax.[22]
(d) Income derived from an industrial undertaking manufacturing cattle or poultry feed as set up prior to 1 July 1971 for the period 1 July 1971 – 30 June 1975 was exempt from income tax.[23]
(e) Income derived during the period 30 June 1977 – 1 July 1982 from fish farming established after 1 July 1977 is exempt from income tax.[24]

(v) *Miscellaneous income:* Income of cooperative societies as derived from dealings with their members from the business of granting agricultural or rural credits; cottage industry; marketing of agricultural produce of their members; purchase of agricultural implements, seeds, livestock or other agricultural articles for supply to their members; ordinary processing of agricultural produce of their members to render the produce fit for marketing; letting of godowns or warehouses for storage, processing, etc. for their members is totally exempt from income tax.[25]

d. Exemption for the garment industry

During the year 1978-79, income of a company registered under the Companies Act, 1913 as derived from an industrial undertaking set up between 1 July 1978 and 30 June 1983, was exempt from tax for a period of 5 years beginning with the month in which the industrial undertaking is set up or commercial production is commenced (whichever is later) engaged in the manufacture of garments from cloth manufactured in Pakistan.[26]

e. Exemption for industries engaged in processing of dates, manufacture of chipboard or straw board or refining of edible oil

During the year 1978-79, income of a company registered under the Companies Act, 1913, from an industrial undertakings set up between 1 May 1978 and 30 June 1983, in the District of Sukkur in Sind Province and engaged in processing of dates, manufacture of chipboard or straw board or refining of edible oil, was exempted for a period of 5 years beginning with the month in which the undertaking was set up or it commenced commercial production (whichever is later).[27]

f. Exemption to mineral industries

During the year 1981-82 income of Pakistani companies engaged in the exploration and extraction of a selected number of minerals (other than petroleum) derived from industrial undertakings set up between 1 July 1981 and 30 June 1985 were exempt from income tax for a period of 5 years from the date of commercial production; and after expiry of the 5 years, tax on such income was levied at 50% of the normal rate for the next 5 years.[28]

2. Tax rebates[29]

Tax rebates allowed to the various industries during the period 1970 – 1981 include:

(i) Refundable surcharge (discontinued by virtue of the Finance Ordinance, 1970).
(ii) Tax at 10% on excess free reserves of companies (abolished by virtue of the Finance Ordinance, 1971).
(iii) Surcharge levied through the Finance Ordinance, 1970 (abolished from the assessment year 1972-73).
(iv) Flood relief surcharge on income tax (abolished by virtue of the Finance Ordinance, 1974).
(v) Super tax rebate at 5% was allowed to companies setting up industrial undertakings between 1 July 1975 and 30 June 1980 if their fixed assets did not cost more than 3 million Rs. (excluding cost of land) by virtue of the Finance Ordinance, 1975. During the year 1980-81, this concession was extended up to 30 June 1983. The relief was also extended in scope, viz., to companies owning assets of value of 5 million Rs. as against 3 million Rs. previously.
(vi) Export rebate at 25% of the tax attributable to income derived from approved items after 1 July 1975 allowed to manufacturers exporting such goods (Finance Ordinance, 1975). The tax rebate was increased from 25% to 50% in fiscal year 1976-1977. The scope of this concession was also extended to commercial exporters. During the fiscal year 1979-80, the tax rebate was further increased to 55%.
(vii) During the fiscal year 1977-78, the rate for inter-corporate dividends in case of private companies was reduced from 50% to 30%.
(viii) During the fiscal year 1980-81, the rebate on the surcharge on retained earnings was enhanced so that the rebate would bear the same ratio to the surcharge as the retained income bears to after-tax profits. The concession was restricted to those companies whose free reserves did not exceed 150% of the paid up capital.
(ix) Rebate of surcharge on companies was reduced from 10% to 5% during the fiscal year 1981-82. For the purpose of surcharge in case of financial institutions, the limit of reserves was raised to 300%.

3. Tax credits

The concept of tax credits was first introduced during 1974. The various measures adopted to date include:

---

21. Exemption granted through the Finance Ordinance, 1980. See Clause 100 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
22. See footnote 9 above. It appears at Clause 101 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
23. See SRO.41(I)/70 dated 1 July 1970.
24. Tax exemption introduced through the Finance Ordinance 1977, by incorporating Clause (xxi).to S.4(3) of repealed Income Tax Act, 1922.
25. See Clause 103 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
26. See SRO 973(I)/78, dated 1 July 1978. The exemption now appears at Clause 125 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
27. See SRO 574(I)/78, dated 18 May 1978. The provision now appears at Clause 124 of Part I of the Second Schedule to the Income Tax Ordinance, 1979.
28. See Clause 123 of Part I and Clause 1 of Part II of the Second Schedule to the Income Tax Ordinance, 1979.
29. A number of new industries were set up during the years 1974-75 onwards. In order to maintain this trend and also to encourage private savings and investment, government took suitable measures to follow a relatively liberal scheme of reduction in taxes. In this context, see the Finance Minister's Budget Speech for the year 1974.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(i) Finance Ordinance, 1974 provided tax credits to companies making an initial investment in shares of new industrial undertakings as approved by CBR at:
   (a) 30% of such investment if the industrial undertaking is set up in Baluchistan, Tribal Areas, Northern Areas and Azad Kashmir;
   (b) 15% of investment if it is set up elsewhere in Pakistan; except Talukas of Hyderabad, Karachi, Tehsil Lyallpur and Lahore and such adjoining areas of Tehsil Lahore as may be notified by the Federal Government (no such areas have actually been notified to date).[30]

(ii) During the fiscal year 1975-76, the above tax concession was also made admissible in respect of identifiable expansions carried out after 1 July 1975.

(iii) Pakistan companies investing any amount in the purchase of plant and machinery for installation between 1 July 1976 and 30 June 1983 in an industrial undertaking for the purposes of replacement, balancing or modernization of already installed plant and machinery are allowed a tax credit of 15% of the amount so invested. The unabsorbed tax credit can be carried forward for adjustment against the future tax liability.[31]

(iv) Pakistani companies making an initial investment in shares or debentures issued by the Equity Participation Fund established under the Equity Participation Fund Ordinance, 1970 as approved by CBR, were allowed a tax credit equal to 50% of the amount so invested. Provisions were also made to carry forward any unabsorbed tax credit (which is redeemable in the year in which such shares or debentures are sold, transferred or disposed of).[32]

(v) During the fiscal year 1980-81, a tax credit for investment in debentures or negotiable bonds issued by the Government or a government owned corporation (approved by CBR for this purpose) was allowed to the extent of 5% of the nominal value of such bond or debenture. The unabsorbed tax credit was allowed to be adjusted during the subsequent years.[33]

4. Investment credits

Under this method, a specified percentage of new investment is allowed as a reduction while computing taxable profits. The various measures taken during the period from 1970 onwards include:
Income of a Pakistani company derived from approved industrial undertakings set up in the territories of Pakistan (excluding Talukas of Karachi and Hyderabad and Tehsils of Faisalabad and Lahore and such adjoining areas of Lahore Tehsil as notified in this behalf by the Federal Government) not exceeding 10% of the capital employed is exempt from income tax, provided it has commenced its commercial production during the period from 1 July 1975 to 30 June 1983 and that it has not been formed by splitting up or reconstruction or reconstitution of an existing business or by transfer to a new business of any plant or machinery already used in an existing business. This concession applies in respect of assessment years ending on 30 June 1985.[34]

5. Accelerated depreciation

In addition to the normal depreciation allowance on plant and machinery installed by an industrial undertaking, certain special measures have been adopted during the period from 1970 onwards to depreciate the capital assets over a relatively short period of time. These measures were intended to ease the cash flow position of the companies engaged in industrial undertakings. These measures include:
(i) Initial depreciation allowance of 25% on plant and machinery installed between July 1976 and June 1983.[35]
(ii) Rate of initial depreciation in case of industrial undertakings commencing commercial production on or after 1 July 1981 admissible at 40% as against the earlier rate of 25%.
(iii) Depreciation allowance of 10% in respect of residential buildings for industrial labour. Initial depreciation allowance of 25% admissible on buildings constructed up to 30 June 1983 for industrial labour earning up to 1,000 Rs. per month.

6. Other investment related incentives

Apart from the specific income tax incentives discussed above, various other investment related incentive programs have also been introduced during the period from 1970-71 onwards. These include:
(i) The amount required to be distributed as dividends by tax holiday companies (under S. 15BB of the repealed Income Tax Act, 1922) was lowered from

---

30. See Section 15FF of the repealed Income Tax Act, 1922 and Section 106 of Income Tax Ordinance, 1979.
The BMR concession was for the first time introduced through the Finance Ordinance, 1976 (by introducing S.15GG in the repealed Income Tax Act, 1922) at 10% of the amount invested in the purchase of plant and machinery and it was applicable up to 30 June 1979. The rate of tax credit was raised to 15% through the supplementary Finance Ordinance 1977, and the period of admissibility was extended to 30 June 1980 by virtue of the Finance Ordinance, 1978.
31. During FY 1978-79, the BMR concession was supplemented by exempting dividends paid by public companies incorporated between 1 July 1978 and 30 June 1982 and engaged in an industrial undertaking set up during this period for a period of 5 years from the year in which commercial production commenced (S.4(3)(xv)(4) of the repealed Income Tax Act, 1922).
32. See Section 105-A of the Income Tax Ordinance, 1979.
33. See Section 48 of the Income Tax Ordinance, 1979. The Finance Ordinance 1975 provided that this tax concession would be available for 5 years, i.e. 1 July 1975 to 30 June 1980 at the rate of 10% of capital, if the undertaking was set up in Baluchistan, Tribal Areas, Northern Areas and Azad Kashmir, and at 5% if it were located elsewhere (excluding Talukas of Karachi and Hyderabad and Tehsil Lyallpur and Lahore and adjoining areas of Tehsil Lahore as notified by the Federal Government through amendment in S.15B of the repealed Income Tax Act, 1922. The exemption was restricted to companies other than those formed by splitting up, reconstitution or reconstruction by virtue of the Finance Ordinance, 1976. The rate of the investment credit for areas other than Baluchistan, Tribal Areas, etc. was raised from 5% to 10% by virtue of the Finance Ordinance, 1979. The tax exemption which expired on 30 June 1981 was also extended to 30 June 1983 through the same Finance Ordinance.
34. This measure was adopted through the Finance Ordinance 1975 by amending Section 10(2) (V a) – Explanation 2.
35. In addition to the type of depreciation allowance described above, a special depreciation of 15% was also admissible to industries set up by 30 June 1980. The condition of two consecutive months use of plant and machinery for claiming depreciation has also been removed through the Finance Ordinance 1980.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

60% to 50% (and consequently the extent of reserves to be compulsorily retained raised from 40% to 50%) (during fiscal year 1970-71).

(ii) Tax on undistributed profits of companies was withdrawn (during fiscal year 1972-73).

(iii) To reduce the adverse effects of fluctuation in exchange rates, the Government allowed an adjustment in the rate of the written-down value of plant and machinery acquired through foreign loans with effect from 1975 (during the fiscal year 1978-79).

(iv) Listed holding companies were allowed to set off current losses of a wholly owned subsidiary company against current year's income for a period of 3 years with effect from assessment year 1981-82 provided that the holding company gives a scheme of revival of the sick mill* duly approved by a financial institution, namely, PICIC, IDBP, NDFC or Banker's Equity Ltd.[36]

(v) While computing taxable profits, Pakistani companies exporting carpets and engineering goods have been allowed a deduction of expenditure on account of publicity and free samples abroad at the rate of 3½ times of the actual expenditure by virtue of the Finance Ordinance, 1981.

(vi) In order to reduce the cost of technical expertise from abroad, as required for industrial projects, the income of expatriate technicians has historically been exempted from income tax for the initial period of 3 years, and exempt from payment of tax-on-tax during the subsequent 3 years if the employing enterprise pays the tax on behalf of such a person.

(vii) With a view to attracting foreign investment, a liberal tax exemption has been granted to approved foreign loans.

(viii) A tax holiday has been granted to industries set up in the Export Processing Zone to the extent that:

(a) income of the enterprise and of foreign employees is exempt from income tax for a period of 5 years, extendable by the Federal Government in the light of performance of the enterprise;

(b) a concessional rate of tax will be applicable at ¼ the prevalent tax rate for a period of 5 years after the expiry of the full tax holiday period;

(c) capital gains out of sale proceeds and shares of such enterprises are exempt from income tax.

In the light of the preceding paragraphs it can be safely stated that the government made a conscious attempt to provide liberal income tax incentives for accelerating the process of industrial development both in the already developed and "pre-industrial" regions of Pakistan. As to the adequacy or otherwise of these incentive programs, and their actual impact in accelerating the process of industrialization in the country, the following sections indicate actual performance.

D. Evaluation of the impact of income tax incentives on the pace of industrial development in Pakistan

The plan strategy for industrial development in Pakistan necessitated the introduction of various fiscal concessions. These were supplemented by non-fiscal and monetary measures such as providing infrastructural facilities, skilled manpower, advisory services, credit facilities, etc. The fiscal measures included exemptions (partial as well as total) from income tax, sales tax and customs duties. In the absence of economic data, it is not possible to identify the impact of individual measures through carrying out a regression analysis. As such, the following analysis regarding the impact of the income tax concessions with respect to the pace of industrial development during the decade of 1970-80 can merely serve as an indicator and any conclusions may be treated as the best approximation. This is especially true as factors like marketability or market share of industrial products, profit margins, etc. have not been accounted for.

Before actually embarking upon the evaluation of income tax concessions it seems appropriate to refer briefly to the customs duty concessions, as prevailing during the period under reference, due to the fact that they partially fit in the package of fiscal measures for developing the "pre-industrial" geographical regions of Pakistan. Further, considering the huge capital outlays for the industrial projects, partial or total exemption from customs duties on import of plant and machinery plays a vital role in making investment decisions. As to the customs duties, under-developed areas were extended total exemption on import of plant and machinery.[37] Relatively less developed areas were granted a 50% concession on duty on import of plant and machinery.[38] Similarly, plant and machinery for industrial units located in industrial estates in areas outside the geographical regions covered by the 50% concession attracted only a 10% rate of duty. Nevertheless, total exemption from customs duties was granted on import of plant and machinery for installation in the industrial estates in specified under-developed areas.[39] Selective concessions in duties were also granted on the basis of category of industry.[40]

It is, thus, obvious that whereas total exemption from customs duty is available on the import of plant and machinery for industrial establishment enjoying income tax concessions under Clauses 119, 120, 121 and 122 of Part I of the Second Schedule to the Income Tax Ordinance, 1979, the entire tax holiday area covered under Section 15B of the repealed Income Tax Act 1922[41] was

---

* *Editors note:* sick industry.

36. See Section 34 A of the repealed Income Tax Act, 1922. This measure was adopted during FY 1980-81 so as to revive sick mills.

37. Total exemption from customs duty was granted through S.R.O.695(I)/77, dated 4 August 1977 as amended through S.R.O.22(I)/78, dated 1 January 1978 to the Province of Baluchistan, D.I. Khan & Malakand Division, Mansehra & Kohistan District, Tribal Areas, Northern Areas, and Azad Kashmir.

38. A concession to Government-financed industrial estates at Karachi and whole of Pakistan, excepting certain industrially developed districts, was granted through S.R.O.1481(I)/74 dated 4 December 1974.

39. The geographical regions attracting no duty include N.W.F.P. Districts D.G. Khan, Mianwali, and Tehsil of Khushab, Districts Shikarpur, Jacobabad and Dadu excluding Kotri.

40. This includes machinery for balancing, modernization and replacement of textile, tanning, cutlery, surgical goods, sports goods, leather garment and gloves, and garment manufacturing industries. Shoe manufacturing and hosiery industries, poultry and dairy farming and establishment of fertilizer units were later included in the list of such industries through S.R.O.829(I)/78 dated 20 June 1978, SRO.830(I)/78 dated 29 June 1978, and SRO.393(I)/74 dated 21 March 1978 respectively.

41. Section 15B of the repealed Income Tax Act, 1922 provided an investment credit to the new industrial undertaking.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

not extended the 50% concession in customs duties. Similarly, the concession in duty on import of plant and machinery for balancing, modernization and replacement (which enjoys a general income tax credit under Section 107 of the Income Tax Ordinance 1979) has been restricted only to a small group of industries. Further, the distinction in the rate of duty on plant and machinery imported under the "Repatriable and Non-repatriable Investment Scheme (NRI)" does not squarely fit in the overall package of income tax concessions granted to new industrial establishments. The sum total of the above discussion is that we can safely presume that due to the almost simultaneous existence of both income tax and customs duty concessions designed for dispersal of industries to the "pre-industrial" or less-developed geographical regions, the final conclusions reached through evaluating the role of the income tax incentives is not tangibly affected by not specifically taking into consideration the effect of customs duty concessions.

Against the above background, it is now easier to see through the overall industrial performance during the decade 1970-80 and spell out the effect of the income tax incentives on the pace of industrial development. The performance of the industrial sector in the Third Plan, though substantial, was not entirely up to expectations. The Plan has had a chequered career. It got off to a difficult start in FY 1965/66 and the pace of investment and production was again upset by the disturbances of FY 1968/69. The investments sanctioned for large, medium and small scale industries in the private sector between July 1965 and December 1969, both under CIIS and PLI amounted to 5,877 million Rs. (as against the Plan target of 9,287 million Rs.).

Phenomenal growth of public sector investment

Private sector industrial investments (in current prices) during FY 1969-70, 1970/71 and 1971/72, respectively, stand at 1,395.9 million Rs., 1,425.7 million Rs. and 1,235.4 million Rs. as against public sector investment of 179.2 million Rs., 69.2 million Rs. and 98.5 million Rs. during the same period. There was a fall in the private industrial investment during FY 1972/73 and 1973/74, i.e. 1,019 million Rs. and 1,022.8 million Rs. respectively. Subsequently, it reached 2,111 million Rs. during FY 1976/77 and 3,808 million Rs. in FY 1980/81. The growth in public sector investment during FY 1973/74 onwards was, however, phenomenal. It started from a very low level of 110.6 million Rs. during FY 1972/73 and touched 6,315.5 million Rs. during FY 1980/81. The average public sector investment during this period has varied between 10 and 60 times the investment during FY 1972-73.[42] Nevertheless, in spite of the entire emphasis on the public sector up to the year 1974/75, the growth in private sector investment has been on the increase (in current prices) which is to be attributed to the overall economic strategy including a package of fiscal incentives.

Impact of tax incentives on industrialization

While compiling the necessary statistical data to form the basis of evaluation, it has been observed that no consolidated data on a uniform pattern are available for the purposes of the present study.[43] Therefore, the consolidated data from the Annual Report of the State Bank of Pakistan and the Industrial Profile of the N.W.F.P., along with some other scattered information, form the basis of the present analysis. For the purposes of convenience, the N.W.F.P., which is relatively a less-developed geographical region, forms the focus of the present evaluation. Consequently, the analysis suffers from quite a few inadequacies and may be treated as the best approximation.

Appendix II shows the comprehensive picture of all Pakistan-based industrial investment, in both the private and public sectors. It appears that during the period FY 1972/73 to FY 1980/81, total industrial investment stands at 227,179 million Rs. out of which the share of private investment works out at 71,935 million Rs. The investment made in large scale and small scale manufacturing is reported at 18,678 million Rs. The N.W.F.P. attracted private investment to the tune of 1,267.33 million Rs. The all Pakistan investment pattern over FY 1972/73 – FY 1980/81 indicates a gradual increase in the private sector investment over the years. Nevertheless, during FY 1979/80 and 1980/81, there has been a greater buoyancy in favour of investment which respectively touched the figure of 2,995 million Rs. and 3,808 million Rs. The N.W.F.P. recorded the lowest investment of 1.194 million Rs. during the start of the period under reference, i.e. FY 1972/73 (Appendix III). It increased to 118.273 million Rs. during FY 1973-74. FY 1976-77 observed the record high investment of 402.086 million Rs. which again showed a decline during the subsequent period.[44] As to the number of industrial units established from 1972/73 onwards, the number gradually increased from 3 in FY 1972/73 to 28 in FY 1976/77 (the year indicating the highest investment). There is a gradual decline thence onward and only 18 industrial units were established during FY 1980/81.

As to public sector investment during the same period in N.W.F.P., it has been observed that out of the total public sector investment of 155,244 million Rs. N.W.F.P. got a share of 51,125 million Rs. for industries and mineral sectors. As to the total number of units, a total of 58 industrial units were established by various agencies including Sarhad Development Authority, Small Industries Development Board, and FATA Development Corporation during FY 1972/73 onwards. The total investment in these units stands at 855.552 million Rs. (in-

42. Source: Ministry of Finance and Economic Affairs.
43. The economic data on the industrial sector is reflected through the various Government publications which include Census of Manufacturing Industries (CMI), Economic Survey, Pakistan – Basic Facts, Pakistan Statistical yearbook, monthly publications of the Industries Developments, Annual Report of the State Bank of Pakistan, etc. The CMI is available only up to the period 1970-75. It is not possible to derive a uniform data pattern out of these publications on the required lines.
44. Industrial Profile of The N.W.F.P., Industries, Commerce, Labour, Mineral Development and Transport Development, p. 63.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

cluding 4.642 million Rs. spent in establishing 7 industrial estates during this period). The Federal Government (through various corporations) established 16 capital-intensive industrial units (cost of these projects is not available). The district-wise position of various projects established from FY 1972/73 to FY 1980/81 is reflected in the table below:

District	*Number of units established*	*Cost incurred Rs.*
Peshawar	12	339.118 million
Mardan	8	200.239 million
Kohat	5	4.782 million
D.I. Khan	6	32.930 million
Abbottabad	15	155.665 million
Mansehra	4	1.143 million
Bannu	4	16.444 million
Swat	7	45.010 million
Dir	1	0.146 million
Chitral	2	0.315 million

The employment generated by the 16 projects of Sarhad Development Authority and 9 FATA Development Corporation projects shows an average of 145.52 persons per project.[45]

The statistics indicate the total number of operating units in N.W.F.P. at 335 at the end of FY 1980/81. The majority of these units are located at Peshawar, Mardan, Swat and Abbottabad (i.e the already industrially developed districts). The districts of Kohat, Bannu, D.I. Khan, Malakand Agency and Mansehra respectively have 8, 8, 7, 7 and 6 units.[46]. The relatively detailed analysis indicates that as against a total number of 828 NOCs (No Objection Certificates) for establishing industrial units between FY 1970/71 and FY 1980/81, a total of 82 units were actually established. Whereas the number of units established from FY 1974/75 to FY 1978/79 stands at an average of 11 units, the highest number of units, i.e. 19, was established during FY 1979/80. Most of these units were established in the districts of Peshawar, Mardan, Hazara, and Swat, i.e. 38, 11, 11 and 15 respectively. The number of units established in the districts of Bannu, Kohat and D.I. Khan stands at 2, 8 and 3 respectively.[47]

As to the district-wise investment approved by the financial institution from FY 1969/70 to FY 1980/81, statistics indicate that out of the total approved investment of 801.3055 million Rs., the highest investment was observed during FY 1979/80, i.e. 132.0815 million Rs. for 24 cases. Except for FY 1970/71 which recorded the lowest investment approvals, i.e. 12.6 milion Rs. for 8 cases, the trend of investments approved showed a gradual increase from FY 1971/72 to FY 1975/76. There was a decline in the investments during FY 1976/77 after which a gradual increase was registered, reaching the highest during FY 1979/80. The investments approved during FY 1980/81 stand at 110.844 million Rs.[48]

Regarding the district-wise investment approvals during the same period, the Peshawar district received the highest amount of approved investment, i.e. 229.9285 Rs. The districts of Abbottabad and Mardan stand almost equal, i.e. 169.517 million Rs. and 165.884 million Rs. respectively, the districts of Kohat, Bannu, D.I. Khan and Mansehra received investment approvals varying from 40 million Rs. to 69 million Rs. The lowest investment was recorded in the Malakand Agency and Swat Division, i.e. at 26.00 and 25.195 million Rs. There was no investment at all in the districts of Kohistan, Dir and Chitral.

The analysis in regard to the private sector industrial units established in the Small Industrial Estates at Peshawar, D.I. Khan, Abbottabad, Swat, Mardan, Kohat and Bannu districts indicates that since the inspection of these industrial estates (mostly during early and mid-1970), the maximum number of plots was allotted at Peshawar, i.e. 1962. The next highest number of plots was allotted in the district of Mardan. The number of plots allotted in the industrial estates in D.I. Khan, Abbottabad, and Bannu district up to FY 1980/81 is relatively low, i.e. varying from 14 to 29. No plots were allotted in the Industrial Estates in Swat and Kohat district despite the availability of 131 plots in the latter district.[49]

The above analysis is summed up as follows:

(i) As against all Pakistan private investment of 18,678 million Rs. from FY 1972/73 to FY 1980/81, N.W.F.P.'s share is at 1267.33 million Rs. The N.W.F.P. public sector allocation for industries and mineral sector during the same period is reported at 5,1125 million Rs.

(ii) As against the total picture of 335 industrial units employing 49,452 persons as at the end of FY 1980/81, private sector industrial units starting operations between FYs 1970/71 and 1980/81 stands at 182 units (with a total capital investment of 1,691.611 million Rs. and employing 14,883 persons). During the same period 58 industrial units, with an investment of 855.22 million Rs. were established in the public sector. The position of loans approved in respect of the private sector from the FY 1969-70 to FY 1980-81 stands at 801.3055 million Rs. The district-wise position indicates that out of these units, the highest number of units was established in the Peshawar district, i.e. 82 units (with an investment of 504.299 million Rs.).The Mardan and Swat districts followed with 36 units (investment of 485.969 million Rs.) and 21 units investment of 62.126 million Rs. The Abbottabad district which attracted 16 industrial units from FY 1970/71 to FY 1980/81 had a total investment of 80.3347 million Rs.

(iii) Private industrial investment was lowest in FY 1972, i.e. 1.194 million Rs. as against the highest recorded investment at 402.086 million Rs. during FY 1976/77. There was a gradual decline in the subsequent years (except 1979/80 which showed an investment higher than the preceding as well as succeeding years).

(iv) The majority of the 335 industrial units operating at the end of FY 1980/81, were established at the Peshawar, Mardan, Swat and Abbottabad districts (i.e. 181, 46, 51 and 28 respectively).

The analysis indicates that despite very liberal tax incentives, the investment, both in terms of financial investment and number of units, converged on the already developed districts, i.e. Peshawar, Mardan, and Abbot-

tabad. Nevertheless, the trend of industrial development in the other districts, i.e. Kohat, Bannu, D.I. Khan and Swat, indicates that investment started flowing to these areas only during the tax holiday period. The Kohat district recorded the lowest investment from FY 1973/74 to FY 1975/76, and FY 1980/81. No investment was made at all from FY 1976/77 to 1978/79 (which can probably be attributed to the relatively adverse political situation in the area). The investment in the Bannu district since FY 1971/72 has been more or less constant. The districts of Kohistan, Dir and Chitral (the areas with practically no infrastructural facilities) did not attract any investment at all.

Conclusions

The above analysis leads to the following conclusions:

(i) The overall level of industrial investment between FY 1970/71 and FY 1980/81 has been encouraging. However, the major investment appears to have been made in the public sector rather than the private sector.

(ii) Private sector investment was relatively lower between FY 1970/71 and FY 1974/75 (a period having few income tax concessions). It gradually started increasing with the introduction of income tax incentive programs during FY 1975/76, and during FY 1980/81 it touched a level four times higher than that during FY 1970/71. Thus, increased investment, apart from a variety of other factors such as economic stability, Government's changed emphasis on private investment, etc., can be attributed to tax concessions.

(iii) Whereas public sector investment has gone to all kinds of geographical regions, both pre-industrial and fully developed, private sector investment has been selective. It has essentially converged on these geographical areas with the necessary infrastructural facilities, market share, etc. Wherever such facilities were not available (which includes Dir, Chitral and Kohistan districts in the N.W.F.P.), either a too low investment or no investment at all was made. The pre-tax or post-tax profits (due to the availability or otherwise of the tax concessions) seem to have had no impact while making the investment decisions in the various geographical regions.

(iv) The overall Government policy regarding the role of private investment, the uncertainty in its economic policies and the political situation prevailing during a particular period of time governed the level of industrial investment. Thus, although tax incentive legislation was introduced from FY 1974/75 onwards, the level of investment remained almost constant from FY 1975/76 to FY 1978/79, essentially due to uncertain Government policies towards private investment. The moment that the credibility gap was to some extent bridged, there was a phenomenal increase in industrial investment from a figure of 2,293 million Rs. in FY 1978/79 to 2,995 million Rs. and 3,808 million Rs. in FY 1979/80 and FY 1980/81 respectively.

(v) Income tax incentive legislation played a vital role in inducing private sector investment in the areas where infrastructural facilities were in existence. This is indicated by the high level of investment in the districts of Peshawar, Mardan and Abbottabad in the N.W.F.P. between FY 1970/71 and FY 1980/81. The same is true in respect of the other tax holiday areas adjoining the developed regions of the other provinces.

(vi) As a result of the industrial investment motivated by the liberal tax concession, additional employment to the tune of 14,883 was created from FY 1970/71 to FY 1980/81 in the N.W.F.P. alone. The total number of industrial employment places stood at 49,452 at the end of FY 1980/81. The indicators show that whereas the capital intensive public sector projects generated relatively less job opportunities, private sector investment was essentially labour-oriented.

(vii) Regarding the improvement in industrial production, the overall country-wise manufacturing sector indices (Appendix IV) (in constant 1969/70 prices) stand at 104, 104, 101, 112, 115 and 127 respectively for FY 1974/75 through FY 1979/80.[50] The major portion of the value of production during FY 1975/76, i.e. approximately 47%, relates to textile and food manufacture. The trend continued during subsequent years. These industries, along with other manufacturing industries of the private sector, have been the major contributors to the overall value of production. The manufacturing sector indices indicate the level of increase in production over the period FY 1974/75 through FY 1979/80. The fiscal incentives had their role in increased production through encouraging new investment and balancing, modernization and replacement of existing industrial units.

(viii) The export oriented tax concessions can be referred to as having played an important role in the overall economic strategy for establishing industries aiming at the exports of manufactured products. The quantum of exports of manufactured goods increased from 1,998.4 millions Rs. in FY 1970/71 to 10,286.3 million Rs. in FY 1974/75, touching the figure of 21,393.9 million Rs. in FY 1980/81, showing an increase of 100% (in current prices) during the decade of 1970/71 – 1980/81. The ratio of exports of semi-manufactured and manufactured goods to exports of primary commodities during the period from 1975/76 to 1980/81 (the period of liberal tax concessions) has generally been around 3:2.[51] (Appendices V and VI).

(ix) As to the role of tax incentives in developing import substitution industries, nothing can be said with certainty, especially in view of the fact that importation of all kinds of goods including consumer goods, raw material for consumer goods, capital goods and raw material for capital goods has been constantly on the increase from FY 1975/76 through 1980/81. The quantum of imports (in current prices) increased from 20,672 million Rs. in FY 1975/76 to 49,809 million Rs. in FY 1980/81. The intervening period shows

50. Ministry of Finance & Economic Affairs.
51. Statistics Division, Ministry of Planning and Development.
52. Ibid.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

a gradual increase except FY 1979/80 which reflected a decline of 4,869 million Rs. as compared with the immediately preceding year. The ratio of imports of consumer goods to capital goods during the period under reference has generally been around 3:2.[52]

To sum up the discussion, the available information about the N.W.F.P. (without pro-rating it to the rest of the country) indicates a favourable impact of tax incentive legislation over the industrial investment, provided infrastructural facilities existed in the tax holiday area. The overall level of private investment in Pakistan in the manufacturing sector showed a favourable increase over the years 1970/71 – 1980/81. The extent to which it was influenced by the fiscal measures is a question of value judgement and cannot be stated with certainty. However, keeping in view the constant public demand for all kinds of tax concessions as a means of inducing investors, it can be safely stated that investment would not have been attracted to the given level without providing the necessary income tax concessions. The positive role of tax incentives is, thus, implicitly established.

APPENDIX I

Statement of industrial tax incentives

S.No.	*Type of tax concession*		*Brief description*	*Duration of tax concession*	*Expiring on*
1.	*2.*		*3.*	*4.*	*5.*
	Tax holidays				
1.	Area-wise tax holidays	(i)	Total tax exemption for industries set up in Baluchistan during the period from 1 July 1978 to 30 June 1983 (Clause 80 of Part I of the Second Schedule).	5 years	30.6.83
		(ii)	Total tax exemption for industries set up in D.I. Khan and Malakand division from 1 April 1978 to 30 June 1983 (Clause 81 of Part I of the Second Schedule).	5 years	30.6.83
		(iii)	Total tax exemption for industries set up in Tribal Areas, districts of Mansehra and Kohistan from 1 July 1979 to 30 June 1983 (Clause 82 of Part I of the Second Schedule).	5 years	30.6.83
		(iv)	Total tax exemption for industries set up in approved industries estates in N.W.F.P., D.G. Khan, Mianwali, Tehsil Khushab, Dadu (excluding Kotri), Jacobabad and Shikarpur (Clause 82A of Part 2 of the Second Schedule).	5 years from date of setting up	–
	Income-wise tax holidays	(i)	Total exemption of the dividends received from public companies from 1 July 1978 to 30 June 1982 (Clause 80 of Part I of the Second Schedule)	5 years	30.6.82
		(ii)	Dividends paid by a company wholly owned by a foreign Government (Clause 82 of Part I of the Second Schedule)		
		(iii)	Dividend income of an approved private company engaged in planning, promoting, developing, organizing and implementing schemes for establishing industrial, commercial mining, etc. (Clause 81 of Part I of the Second Schedule).	10 years	
		(iv)	Bonus shares issued by a company or body corporate between 1 September 1977 and 30 July 1982 (Clause 108 of Part I of the Second Schedule).	5 years	30.6.82
		(v)	Capital gains on disposal of shares of public companies, etc.		
	Sector-wise tax holidays	(i)	Total exemption of manufacture of agricultural implements to industries set up to 30 June 1983 (Clause 98 of Part I of the Second Schedule).		30.6.83
		(ii)	Total exemption of income from sale and renting of agricultural machinery or provision of pet control as set up from 1 July 1976 to 30 June 1983 (Clause 96 of Part I of the Second Schedule).	2 years	30.6.83
		(iii)	Income from poultry farming, fish catching, cattle sheep breeding tax exempt during the period up to 30 June 1983 (Clause 99 of Part I of the Second Schedule).	–	30.6.83
		(iv)	Income from poultry processing tax exempt between 1 July 1980 and 30 June 1983 (Clause 100 of Part I of the Second Schedule).	3 years	30.6.83
		(v)	Income from dairy farming up to 30 June 1983 (Clause 101 of Part I of the Second Schedule).		
		(vi)	Income of cooperatives (Clause 103 of Part I of the Second Schedule).	–	–
		(vii)	Income from garment industry exempt as set up during 1 July 1978 to 30 June 1983 (Clause 125 of Part I of the Second Schedule).	5 years	30.6.83
		(viii)	Income from date processing, manufacture of chipboard/ strawboard and refining of edible oil of industries set up from 1 May 1978 to 30 June 1983 in Sukkur district for 5 years (Clause 124 of Part I of the Second Schedule).	5 years	30.6.83

PAKISTAN:

INCENTIVES FOR INVESTMENT IN INDUSTRIAL PROJECTS *

Incentives/concessions provided to the investors

A. Custom duty exemption:

(1) Complete exemption from custom duty if project is located in:
The Province of Baluchistan,
Territory of Azad Kashmir,
Northern Areas and Tribal Areas,
Dera Ismail Khan and Malakand Divisions, Mansehra and Kohistan Districts and approved Industrial Estates of N.W.F.P.,
Approved Industrial Estates in the Districts of Shikarpur, Jacobabad and Dadu excluding Kotri in the Province of Sind, and
Approved Industrial Estates in Districts of Dera Ghazi Khan and Mianwali and Tehsil Khushab in the Province of Punjab.

(2) Complete exemption from custom duty on such items of machinery as are not manufactured in the country for the industries relating to:
Fertilizer, readymade garments, poultry industry, and dairy industry.

(3) Complete exemption from custom duty on such items of imported machinery as are not manufactured in the country for balancing, modernisation and replacement in industries relating to:
Textile, tanning, cutlery, surgical goods, sports goods, and leather garments and gloves.

(4) 50% exemption in custom duty for specified under-developed areas as detailed below:

i) All Government financed industrial estates except those located at Karachi.
ii) The whole of Pakistan excluding the areas specified below:
   1) Tehsil of Rahimyar Khan
   2) Tehsil of Multan
   3) Tehsil of Faisalabad
   4) Tehsil of Shahdra
   5) Tehsil of Lahore
   6) Tehsil of Gujranwala
   7) Tehsil of Sialkot
   8) Tehsil of Rawalpindi
   9) Islamabad Capital Territory
   10) Karachi
   11) Taluka of Hyderabad
   12) Taluka of Kotri
   13) Taluka of Sukkur
   14) Such areas adjoining Karachi and Lahore as may be specifed by the Central Board of Revenue.

(5) Machinery and raw material for manufacture of goods meant primarily and exclusively for export can be imported free of custom duty under bonded ware-house scheme.

(6) Import of following machinery and raw material are allowed free of custom duty against a bank guarantee subject to the condition that goods are exported within six months:

(a) Material for processing, further manufacturing or repair.
(b) Material for embellishing or decorating goods produced in Pakistan for export.
(c) Packing material used or required to be used as external or internal covering of goods, or as holders on which goods are rolled, wound or attached provided that they do not change their original shape or form (packing material such as straw, paper, glass and like materials excluded).
(d) Machinery and equipment for repair.
(e) Professional equipment imported by visiting technicians, doctors, etc.
(f) Equipment and material imported by visiting television and broadcasting units, press photographers and film companies.
(g) Scientific and educational instruments, apparatus and appliances including simultaneous broadcasting equipment imported for scientific, educational or cultural seminars to be held in Pakistan.
(h) Goods imported by Government or semi-Government institutions for demonstration purposes in their display centres.
(i) Goods imported for display at international or single country exhibition for foreign Missions.
(j) Machinery imported by the representatives of foreign commercial firms for demonstration purposes.

B. Tax holiday:

Complete tax holiday is available as per details given below:
(i) Tax holiday for five years from the date of commencement of commercial production to industrial undertakings set up by the Companies between July, 1978 to June, 1983, in the Province of Baluchistan.
(ii) Tax holiday for five years from the date of commencement of commercial production to industrial undertakings set up by the Companies between April, 1978 to June 1983, in the Divisions of D.I. Khan and Malakand in the N.W.F.P.
(iii) Tax holiday for five years from the date of commencement of commercial production to industrial undertakings set up by the Companies between July, 1979 to June, 1983, in Azad Kashmir, Northern Areas, Tribal Areas and districts of Mansehra and Kohistan of N.W.F.P.
(iv) Tax holiday for five years from the date of commencement of commercial production to industries set up in the District of D.G. Khan in the Province of the Punjab and in the approved industrial Estates in the whole of N.W.F.P., District of Mianwali and Tehsil Khushab in the Province of Punjab, and Districts of Shikarpur, Jacobabad and Dadu in the Province of Sind.
(v) Tax holiday for five years from the date of commencement of commercial production to industrial undertakings set up by the Companies between May, 1978 to June, 1983, anywhere in Pakistan for the manufacturing of garments from cloth made in Pakistan.
(vi) Tax holiday for five years from the date of commencement of commercial production to industrial undertakings set up by a company between May, 1978 to June, 1983 in the district of Sukkur in the Sind Province and engaged in the processing of dates, manufacture of chipboard or refining of edible oils.
(vii) Income from poultry farming and dairy farming, fish catching and cattle and sheep breeding is exempt from income tax for the period July, 1975 to June, 1983. A similar exemption is available to fish farming for the period July, 1977 to June, 1982 where such business is established after 1.7.1977.
(viii) Income from poultry processing derived from 1st July, 1980 to 30th June, 1983 is exempt from income tax.
(ix) Income from manufactures of agricultural implements is exempt from income tax till 30th June, 1983.

C. Tax credit for modernization, balancing, replacement and extension of machinery to company in respect of existing units:

Tax credit equal to 15% of the cost of machinery installed for modernization, balancing, replacement, and extension of existing of existing industrial units, is allowed to a company where such machinery is installed between July, 1976 and June, 1983.

D. Income of industrial companies which is partially exempt:

Profits of industrial companies set up between 1975 and 1983 are exempt to the extent of 10% of the capital employed in the undertakings set up in the areas excluding Talukas of Karachi and Hyderabad, Tehsils of Faisalabad and Lahore for a minimum period of 5 years from the year of commoncement of commercial production.

---

* Government of Pakistan, Finance Division (Investment & Capital Issues Wing).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

E. Tax credit for investment by companies in industrial undertakings:

Tax credit is admissible to a company in respect of the amount invested in the acquisition of share-capital of a company which set up an industrial undertaking to the extent indicated below:

(a) 30% of the amount invested if the industrial undertaking is located in Baluchistan, Tribal areas, Northern Areas or Azad kashmir.
(b) 15% of the amount invested where industrial undertaking is located at any other place, excluding the Talukas of Karachi and Hyderabad and Tehsils of Faisalabad and Lahore.

F. Setting off losses of wholly owned subsidiary companies:

Listed holding companies have been allowed to set off current losses of a wholly owned subsidiary company against current year's income. The concession is available for three assessment years, and is subject to the condition that the holding company gives a scheme of revival of the sick mill duly approved by a financial institution namely PICIC, IDBP, NDFC or Bankers Equity and submits a yeraly progress report to the said financial institution, showing that progress is in accordance with the scheme of rehabiliation.

G. Tax exemption on capital gains:

Capital gains including gains arising on sales of shares for the assessment year upto 30-6-1984 have been exempted.

H. Tax holiday for non-residents:

No tax is charged on income, profits or gains which accrue or arise outside Pakistan to a person:
(i) Who has not been resident in Pakistan in nine out of ten years preceding the income year; or if
(ii) He has not during the seven years preceding that year been in Pakistan for a period of for periods aggregating to, more than two years.

This tax exemption is however, not available in case such income gains and profits are derived from a business controlled in a profession or vocation set up in Pakistan or are brought into or received in Pakistan during the income year.

I. Tax rebate on repatriation of income from consultancy services rendered abroad:

Non company resident professionals earning income from consultancy services abroad shall on repatriation of such income be entitled to a rebate equal to 30% of the tax payable on such income.

J. Investment allowances to persons other than companies:

An allowance of 33⅓% of the total income subject to a maximum of Rs. 40,000/– is admissible to any person, except a company, in NIT Units, specified certificates and debentures, in the acquisition and debentures, in the acquisition of the share-capital of industrial companies other than purchase from a previuos owner.

K. Exemption of dividend from income tax:

Following income from dividends is exempt from tax:

(a) From the National Investment (UNIT) Trust or any mutual fund established by the Investment Corporation of Pakistan or from a company listed on stock exchange in Pakistan, other than that specified in sub-clauses (b) or (c):
(i) Where such dividend income does not exceed fifteen thousand rupees. (The whole of such income)
(ii) Where such dividend income exceeds fifteen thousand rupees. (Fifteen thousand rupees)
(b) dividends declared and paid by any public company registered at any time between the first day of July, 1977 and the thirtieth day of June, 1982 (both dates inclusive) under the Companies Act, 1913 (VII of 1913), and having its registered office in Pakistan, out of its profits for any income year ending in or before the thirtieth day of June, 1982. (The whole of such income)
(c) dividend income received from any public company registered under the Companies Act, 1913 (VII of 1913), at any time between the first day of July, 1978 and the thirtieth day of June, 1982 (hereinafter referred to as the said period), having its registered office in Pakistan and engaged in an industrial undertaking set up in Pakistan at any time within the aforesaid period out of the profits of the undertaking, for a period of five years beginning from the year in which commercial production is commenced. (The whole of such income)
(d) There is no deduction of 30% standard rate of Income tax on dividends paid to overseas Pakistanis Certificate holders of State Enterprises Mutual Fund of ICP. In other words the income to the certificate holders residing abroad is tax free.

L. Bonus shares:

Face value of any bonus shares or the amount of any bonus declared, issued or paid by a company to its shares holders is exempt in the hands of shareholders.

M. Exemption to foreign technicians:

Salary received by any person who is not a citizen of Pakistan is exempt for a period of three years from the date of his arrival in Pakistan for services rendered by him during such period as a technician under a contract of service approved by the Commissioner of Income Tax before the commencement of his service or within one year of such commencement.

N. Tax rebate on income from exports:

Rebate is allowed to all commercial and industrial exporters at the rate of 55% of the tax attributable to income from export of goods manufactured in Pakistan.

O. Tax relief to cooperative societies:

Cooperative Societies are allowed earned income relief, personal allowance and investment allowance as admissible to individuals.

P. Super tax rebate:

Super tax rebate of 5% is allowed to industrial undertakings set up between July, 1975 and June, 1983 provided the cost of fixed assets exclusive of cost of land does not exceed Rs. 5.0 million.

In the case of domestic Public Companies, rates of super tax have been reduced on intercorporate dividends from 15% to 10%. In respect of Private Limited Companies the rate of super tax on intercorporate dividends received by such Companies has been reduced to 30%.

A Pakistani construction company earning income from constuction contracts abroad, shall on repatriation of profits to Pakistan be entitled to a rebate equal to the amount of super tax payable on such income.

Q. Tax credit on investment by companies in shares and debentures:

Companies investing in shares or debentures of the Equity Participation Fund are allowed tax credit of 50% of the amount invested in such shares or debentures.

R. Interest on approved loans exemption from income tax:

Interest payable on loans made by approved foreign institutions or on approved loans taken by industrial undertakings in Pakistan for purchase of plant and machinery complete

© 1982 International Bureau of Fiscal Documentation – BULLETIN

exemption from Pakistan tax if the country from which the loan has emanated grants exemption from its own tax to the income in question or agrees to give credit in the home assessment of lender for tax payable on his income in Pakistan but exempted by Government.

S. Sales tax exemption on machinery:

Machinery and components thereof for industrial use are exempt from payment of sales tax both at the import stage as well as when locally manufactured.

T. sales tax exemption on export of manufactured goods:

In order to promote the export of manufactured goods, a general exemption from sales tax is given to all goods exported from Pakistan. In addition, the raw material used in their manufacture is also exempted from sales tax.

U. Depreciation allowance:

Depreciation allowance is calculated on the cost of assets at the time of their acquisition in the first year and on the written down value in subsequent years.

An initial depreciation allowance at the rate of 30% is allowed on ships and at a rate of 25% on other plant and machinery installed between July, 1976 and June, 1983. Rate of depreciation allowance on residential buildings for industrial labour is 10%. Buildings constructed upto 30th June, 1983 for industrial labour drawing salary upto Rs. 1000 per month are allowed an initial depreciation at the rate of 25%.

In respect of assets most commonly in use of rates of normal depreciation allowance are as follows:

(1)	Building (not other-wise specified)	5%
(2)	Factory or workshop (excluding godowns, Offices and residential quarters)	10%
(3)	Furniture	10%
(4)/	Machinery and plant (not other-wise specified)	10%
(5)	Ships	
	(i) New	5%
	(ii) Second Hand	
	Age at the time of purchase:	
	(a) not more than ten years	10%
	(b) more than ten years	20%
(6)	Batteries, X-Rays and electro-therapeutic apparatus and accessories	20%
(7)	Machinery used in the production and exhibition of cinematograph films	20%
(8)	Motor-vehicles, all sorts	20%
(9)	Aircraft, aeroengines and aerial photographic apparatus	30%
(10)	Moulds used in the manufacture of Glass or concrete pipes	30%
(11)	Below ground installations in mineral oil concerns	100%

Extra depreciation allowance is also allowed for multiple shift working. In the case of machinery and plant, to which the general rate applies an extra depreciation allowance, equal to 50% of the allowance computed is allowed on account of double shift working and 100% of such allowance on account of triple shift working.

Limit for claiming depreciation allowance of original cost of motor vehicles has been increased from Rs. 75,000 to 100,000 for assessment year 1982-83.

V. Housing:

Tax relief has been provided to Pakistanis working abroad who maintain a house in Pakistan for their families. The mere maintenance of a house will no longer render a tax payer liable on foreign income. Further the condition regarding short visits to Pakistan has been relaxed and any tax payer, whose stay in Pakistan does not extend beyond 90 days, will not incur any extra tax liability.

W. Tariff protection:

Exemption from tax has been granted to new residential houses constructed between 1st July, 1981 and 30th June, 1983, and having annual rental value upto Rs. 18,000. For Islamabad, the exemption for new houses is Rs. 24,000/–.

X. Financing facilities:

(i) Lending rate for financing of fixed industrial investment has been reduced from 14% to 11%.
(ii) On rupee loans for purchase of locally fabricated machinery, IDBP charges incterest at the rate of 8½%. PICIC/NDFC also provide loan for purchase of locally fabricated machinery at concessionary rates.
(iii) Bakers Equity Limited have been established to make up rupee equity gap being faced by private investors.

Y. Tax concessions for the mineral industry:

(i) Depreciation is allowed @ 100% on below ground installations in mineral oil concerns.
(ii) Capital loss incurred upto the time of commercial production is treated as a revenue loss and allowed to be carried forward for a period of 10 years after the commercial production.
(iii) Depletion allowance is admissible @ 15% of the gross receipts in respect of exploration and production of petroleum and 15% of total income from extraction of other mineral deposits or 50% of the capital employed, whichever is the less.
(iv) Depreciation allowance @ 100% is allowed in respect of machinery and plant acquired for extracting mineral (other than petroleum) in the year in which they are used for the first time.
(v) Tax exemption upto 10% of the capital employed is available to an undertaking which is also engaged in the business of refining or concentrating in Pakistan the mineral deposits extracted by it in Pakistan. This concession is for mineral other than petroleum only.
(vi) Pakistani companies engaged in the exploration of selected minerals mentioned below have been given exemption for 5 years; and on the expiry of the 5 years, tax on such income shall be charged at 50% of the normal rate for next 5 years.

(i) Iron Ore; (ii) Byarite; (iii) Dolomite; (iv) Fireclay; (v) Lime Stone; (vi) Flourite; (vii) Bauxite; (viii) Phosphate; (ix) Chrome; (x) Soap stone and (xi) Copper.

Z. Export processing zone:

An export processing zone has been established at Karachi. Another one is contemplated near Lahore. These zones aim at enabling establishment of export-oriented industries. Exports from the Zones will be completely free from exchange control. Import of machinery, components, spare parts and raw matrerials for the industrial undertakings in the Zones and goods for re-export would be freely allowed and shall be exempt from all taxes and duties of both Federal and Provincial Governments including municipal taxes. The restrictions of Import Trade Control Act would not be applicable on imports into the Zones. Investors in the zones would be allowed following income tax relief:

(a) Income of the enterprise and of the foreign employees will be exempt from tax for five years which period is extendable by the Federal Government in the light of the performance of the enterprise.
(b) After the expiry of full tax-holiday period, a concessional rate of tax at ¼th of the prevalent tax rates shall be charged for next 5 years.
(c) Capital gains on sale of assets and shares will be exempt from tax.

INDIA:

IMPACT OF THE BUDGET*

No incentives to produce or save

By Kailash C. Khanna

In an address to the Income Tax Payers' Society in England, Sir Paul Chambers, who was responsible for an overhaul of the Indian income-tax law in 1939, once stated:

> It is easy to press for the separation of the taxation of individuals from the taxation of companies; once you have done that, the Chancellor, whatever his Party, will always be pressed to give more relief to individuals and classes of individuals because they are the people who vote and the taxation on industry will go up and up. And there again, politically companies are less articulate than individuals and classes of individuals. It is so easy to slip into doing the wrong thing.

The truth of this statement is amply borne out by India's corporate tax development. It was in 1959 that taxation of company profits was separated from taxation of shareholders. The rate of corporate tax was then fixed at 45%; it has since gone "up and up" and now stands at 55% for a widely held domestic company, exclusive of surcharge on tax (2.5%) and surtax (25% to 40%) on net profits in excess of 15% of capital and reserves. The aggregate tax burden can reach an unheard of maximum of 70%. The rates for closely held companies are still higher.

It was, therefore, expected that in his 1982-83 Budget proposals the Union Finance Minister, Mr. Pranab Mukherjee, would reduce company tax rates and modify the corporate tax structure. Belying these expectations, the Finance Bill does not suggest any noteworthy changes in the existing rates or basis of corporate taxation. Apparently, relying on scanty data and by citing stray cases of a few newly established or recently expanded companies which have derived full benefit of the initial tax reliefs and incentives, the Finance Minister's advisers came to the mistaken belief that corporate tax in India is not high. But it is fallacious to justify a high corporate tax rate on the grounds that numerous tax reliefs are available in the formative years. A company does not establish itself anew every now and then, nor does it acquire substantial new plant and machinery year after year. Consequently, the tax liability goes up when the initial allowances are exhausted or are nullified by disallowance of bona fide business expenditure. A low tax burden in the early years followed by confiscatory taxation in later years seems to justify the adage that tax incentives are short-term bribes for long-term handicaps. In any event, companies which have availed themselves of tax concessions are contributing to the development process and adding to the GNP. In fact, this is exactly what tax benefits are meant for and it should be a matter for gratification that the fiscal bait has worked.

A realistic basis for determining the average tax rate would be to ascertain the percentage of the tax levied on corporate profits during a financial year; this is likely to show a figure close to the standard rate. A study conducted by the Associated Chambers of Commerce & Industry of India showed that a 1% increase in corporate tax reduced resources of the company by 1.3%. Another study has shown that while corporate taxation has increased many times over the years, corporate savings have declined sharply. Apart from discouraging the generation of internal resources, high corporate taxation hampers corporate growth, distorts the debt-equity ratio, encourages corporate extravagance, erodes integrity and shifts the corporate tax burden, thereby mulcting the consumer and fanning the flames of inflation. It is, therefore, imperative to lower company tax rates, increase depreciation allowances, remove tax on all inter-corporate dividends and abolish surtax on company profits.

In the Finance Bill, the existing tax exemption limit of income from dividends, bank interest etc. is proposed to be raised from Rs. 3,000 to Rs. 4,000; that from Unit Trust from Rs. 2,000 to Rs. 3,000. Corresponding changes are proposed in the wealth tax law increasing the exemption limits to Rs. 165,000 and Rs. 35,000 respectively. It is proposed to increase the maximum amount of investment qualifying for the prescribed deduction relating to equity shares of an eligible issue of capital of new industrial companies or public housing finance companies from Rs. 10,000 to Rs. 20,000. The proposed changes are too trivial to have any effective impact on investment and savings.

The proposed tax relief to exporters, whose export turnover during the accounting year exceeds the export turnover of the immediately preceding year by more than 10% thereof is not available to all. The goods in relation to which the tax concession will be provided and the rate at which the relief will be calculated will be notified by the Central Government after taking into account the cost of manufacture of such goods, the prices of similar goods in the foreign market, the need to develop a foreign market for such goods, the need to earn foreign exchange, the destination of export and any other relevant factors. The maximum amount of deduction to which the taxpayer will be entitled will not exceed 10% of the amount of income tax otherwise payable by the taxpayer on the profits and gains from export of such goods. These limitations will detract considerably from the expected boost to exports. The tax benefit will be available for the 1983/84 assessment and 4 immediately succeeding assessment years.

With a view to encouraging contractors to undertake construction and engineering contracts outside India, it is proposed to provide that where an Indian company or a non-corporate taxpayer resident in India derives any profits and gains from the business of execution of a project under a contract entered into by him with the Government of a foreign State or any statutory or other public authority or agency in a foreign State or with a foreign enterprise, he will be entitled to a deduction, in the computation of his taxable income, of 25% of such profits

* This is a revised version of an article which appeared in *The Statesman* of 16 March 1982. The Editors of *The Statesman* kindly approved re-publication of Mr. Khanna's article.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

and gains, subject to certain conditions. This concession will also be available where the taxpayer undertakes the execution of any work in connection with any foreign project undertaken by any other person.

The benefit of this concession will be available in respect of projects for the construction of any building, road, dam, bridge or other structure outside India, the assembly or installation of any machinery or plant outside India, and the execution of such other work outside India of whatever nature as may be prescribed by the Central Board of Direct Taxes. The taxpayer will not be eligible for this concession unless the consideration for the execution of such project or work is payable in foreign currency and the following conditions are fulfilled:

(a) The taxpayer will have to maintain separate accounts in respect of the profits and gains derived from the business of the execution of the project or work forming part of the project.
(b) The taxpayer will be required to debit to the profit and loss account of the relevant accounting year and credit to a "Foreign Projects Reserve Account" a sum equal to 25% of the profits and gains from such project or work. The reserve must be utilised by the taxpayer during a period of 5 immediately succeeding assessment years for the purpose of his business and not for distribution by way of dividend or profits.
(c) The taxpayer will be required to remit into India in foreign exchange an amount equal to 25% of such profits and gains within a period of 6 months from the end of the relevant accounting year.

Where, however, the amount credited by the taxpayer to the Foreign Projects Reserve Account or the amount actually remitted into India by him or either of these amounts is less than 25% of such profits and gains, the deduction will be restricted to the amount so credited to the Foreign Reserve Amount, or the amount actually brought by him to India, whichever is less.

This is a useful suggestion and will be of value to specified overseas projects which make profits.

It is proposed to extend up to 31 March 1987 the grant of investment allowance now admissible at the higher rate of 35% to specified plant and machinery. Another suggestion seeks to exempt from tax intercorporate dividends in the case of 3 more industries, namely, synthetic rubber, chemicals and basic drugs.

In the field of personal taxation an increase in the standard deduction from 20% to 25% of salary, subject to a maximum of Rs. 5,000, is proposed; this will benefit salaried taxpayers only. Surely, salaried employees alone do not constitute the entire middle class; there is a very large number of self-employed small traders, retailers, artisans, builders, craftsmen and professionals who also form part of the same income group. Unlike salaried employees, the self-employed are not entitled to reimbursement of medical and leave travel expenses, gratuities and other like benefits. The apparent bias against the self-employed compels even the honest amongst them to seek redress in tax evasion and avoidance. Suitable amendments to remove these inequities are urgently called for in the interest of taxpayer morality.

A welcome feature of the Finance Bill is the promised modification of the provisions relating to the exemption from capital gains on transfer of house property. The condition of self-occupation of the property by the taxpayer will be deleted and the period for construction of a new property will be increased from 2 to 3 years. Likewise, capital gains arising from the transfer of certain long-term capital assets will be entitled to tax exemption provided the net consideration is utilised by the taxpayer for the purchase or construction of a house property within the specified period. But why restrict the utilisation to house property only? Mr. Pranab Mukherjee should go the whole hog and exempt all capital gains from tax if the net consideration is reinvested within the stipulated period in approved productive assets, movable or immovable. It is also proposed to relate the deduction in respect of long-term capital gains to the period for which the capital asset has been held; higher deduction being allowed if the capital asset is held for a longer period.

Under the existing provisions, an individual is said to be "resident" in India in any year, if:

(a) he is in India in that year for a period or periods amounting in all to 182 days or more; or
(b) he maintains or causes to be maintained for him a dwelling place in India for a period or periods amounting in all to 182 days or more in that year and has been in India for 30 days or more in that year; or
(c) having within the 4 years preceding that year been in India for a period or periods amounting in all to 365 days or more, is in India for a period or periods amounting in all to 60 days in that year.

In the case of an Indian citizen who is rendering service outside India, and who is on leave or vacation in India, the periods of 30 days and 60 days referred to in (b) and (c) are taken as 90 days.

With a view to avoiding hardship in the case of Indian citizens who are employed or engaged in other avocations outside India, the Finance Bill seeks to make the following modifications in the tests of "residence" in India:

(a) it is proposed to omit the provision relating to maintenance of a dwelling place coupled with stay in India of 30 days or more;
(b) in the case of Indian citizens who come on a visit to India, the period of "60 days or more" is proposed to be raised to "90 days or more";
(c) it is proposed to provide that where an individual who is a citizen of India leaves India in any year for purposes of employment outside India, he will not be treated as resident in India in that year unless he has been in India in that year for 182 days or more. The effect of this amendment will be that the "test" of residence in (c) above will stand modified to this extent.

With a view to encouraging the remittance of foreign exchange into the country by non-resident Indian citizens and foreign nationals of Indian origin, it is proposed to exempt from gift tax, gifts of foreign currency or other foreign exchange made by such persons to their relatives in India. For this purpose, "relative" in relation to an individual will mean the husband, wife, brother or sister or any lineal ascendant or descendant of that individual.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Gifts made by such persons out of the moneys to their credit in a Non-resident (External) Account in India will also qualify for exemption.

But tinkering with the tax rate schedule applicable to individuals with incomes between Rs. 60,000 and Rs. 100,000 is contrary to Mr. Mukherjee's declared objective of maintaining the stability of law. The increased annual tax burden on individuals with incomes of Rs. 100,000 and above will be a maximum of Rs. 688 only; the gain to the Exchequer will be negligible but the psychological damage to the taxpayer will be tremendous. Individual initiative and enterprise will be stifled and the Government will loss its credibility. The rationale behind the proposed change is not at all clear suggesting little more than a political gimmick; this illogical proposal should be dropped.

The suggested increase in tax relief in regard to long-term savings such as life insurance premia and provident fund contributions is again marginal and not of much consequence; few taxpayers, if any, will be able to avail themselves of the proposed increase in the monetary ceiling of Rs. 40,000.

The Budget speech highlighted the buoyancy in revenue, decline in inflation and an alleged environment of strong agricultural and industrial growth in 1981-82. But Mr. Pranab Mukherjee did not rise to the occasion; on the contrary, he failed to provide adequate incentives for increasing production and savings. His direct tax proposals are too feeble and halting to assist in the achievement of the aims and objects outlined by him.

UNITED STATES:

Competent Authority Consideration

Allocation of income or deductions*

SEC. 1. PURPOSE AND SCOPE

This revenue procedure explains the procedures to be used by the Internal Revenue Service and taxpayers in certain cases of double taxation that are governed by income tax treaties of the United States. The cases covered by this revenue procedure concern the allocation of income and deductions between a United States taxpayer and a related person (including a branch office) subject to the taxing jurisdiction of a country ("treaty country") that has entered into an income tax treaty with the United States. See Rev. Proc. 77-16, 1977-1 C.B. 573, for competent authority procedures used in resolving issues other than allocation of income and deductions, including the availability to United States taxpayers of credits against foreign tax, exemptions from foreign tax, reduced rates of foreign tax, and other benefits and safeguards. Rev. Proc. 70-18, 1970-2 C.B. 493, as amplified by Rev. Proc. 79-31, 1979-1 C.B. 599, is modified and superseded by this revenue procedure.

SEC. 2. BACKGROUND

01. Income tax treaties in force between the United States and other countries generally provide for the allocation of income and deductions among related persons whose dealings with each other are not the same as those that would be made between independent persons. These treaties recognize that taxation by a treaty country of a taxpayer with an affiliate or branch office that is subject to the taxing jurisdiction of the other treaty country may result in actual or economic double taxation. As a result, these treaties provide for consultation by the competent authorities of the United States and of treaty countries on the allocation of income and deductions between related persons. The provisions of this revenue procedure do not override the provisions of any income tax treaty entered into by the United States. Taxpayers should make themselves aware of the full content of the income tax treaty under which they are operating.

02. When the United States competent authority and a treaty country competent authority agree to discuss an allocation, whether made or proposed by the United States or by the treaty country, the United States competent authority will attempt to reach an agreement that is acceptable to the United States, to the treaty country, and to the related persons.

03. The Associate Commissioner (Operations) acts as the United States competent authority in administering the operating provisions of tax treaties and in interpreting or applying these treaties. In interpreting or applying tax treaties, the Associate Commissioner (Operations) acts only with the concurrence of the Associate Chief Counsel (Technical).

04. If the United States taxpayer fails to request competent authority consideration under this revenue procedure, the taxpayer may be denied a credit for foreign tax. See Rev. Rul. 76-508, 1976-2 C.B. 225, as amplified by Rev. Rul. 80-231, 1980-2 C.B. 219, and section 4.901-2(f)(5) of the Temporary Income Tax Regulations, T.D. 7739, 1981-1 C.B. 396.

05. The Associate Commissioner (Operations) may negotiate an agreement with the competent authority of a treaty country concerning the allocation of income or deductions between a United States taxpayer and a related person at the request of the United States taxpayer. The Associate Commissioner (Operations) also may initiate competent authority negotiations in any situation to protect United States economic interests. Such a situation may arise when a taxpayer fails to request competent authority consideration after agreeing to an allocation of income or deductions that creates either actual or economic double taxation.

06. The taxpayer should send written requests for competent authority consideration to the Associate Commissioner (Operations), Internal Revenue Service, P.O. Box 7799, Washington, D.C. 20044.

SEC. 3. GENERAL CONDITIONS UNDER WHICH THIS PROCEDURE APPLIES

01. The procedure prescribed in sections 3 through 9 of this revenue procedure apply when the United States or other treaty country allocates or proposes to allocate income or deductions and this allocation may result in actual or economic double taxation.

02. In seeking to arrive at an agreement with a treaty country, the United States competent authority will be guided by the standards of arm's length dealing (referred to in the regulations under section 482 of the Internal Revenue Code) and the equivalent standard of arrangements or conditions that would have been made between independent persons (referred to in a number of treaties). The United States competent authority also will take into account all of the facts and circumstances and the purpose of the treaty to avoid double taxation when negotiating agreements on the allocation of income and deductions.

03. It is the position of the United States competent authority not to re-open a case previously closed after examination to make an adjustment unfavorable to the taxpayer unless the exceptional circumstances described in Rev. Proc. 74-5, 1974-1 C.B. 416, are present. The United States competent authority may accept a taxpayer's request for competent authority consideration that will require the reopening of a case closed after examination.

04. If there is no income tax treaty between the United States and another country there is no authority for the Service to provide relief from United States tax due to double taxation arising under the tax laws of the other country and the United States. Therefore, in such a case the United States competent authority is unable to consider a taxpayer's request that involves a nontreaty country.

SEC. 4. PROCEDURES TO BE FOLLOWED IF TREATY COUNTRY PROPOSES ALLOCATION

01. If a treaty country allocates or proposes to allocate the income or deductions attributable to transactions involving a United States taxpayer, the United States taxpayer should request United States competent authority consideration.

02. The taxpayer must file a written request for competent authority consideration with the Associate Commissioner (Operations). Internal Revenue Service, P.O. Box 7799, Washington, DC 20044, as soon as practical after the treaty country's position on the adjustment has been sufficiently developed to permit consideration, whether or not the adjustment has been formally proposed. In any event, the request should be filed no later than 90 days after the treaty country's adjustments are formally communicated to the related person.

03. At the time of the request for competent authority consideration, the United States taxpayer must file an amended United States tax return (for exeample, a Form 1120X Amended U.S. Corporation Income Tax Return if a Form 1120 was originally filed), as provided by the regulations under section 6402, with the Internal Revenue Service Center where the original return for the same tax year was filed. On the amended United States tax return the taxpayer may claim a credit or refund of the taxes attributable to the proposed allocation and shall indicate that a competent authority request is being filed. A copy of the amended United States tax return shall be attached to the request for competent authority consideration.

* Rev. Proc. 82-29.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

04. The competent authority request must be signed by a person having authority to sign the United States taxpayer's federal income tax returns. The request must contain a statement that competent authority consideration is being requested and must include the following information:

(a) a reference to the specific income tax treaty provisions under which the request is made;
(b) the names, addresses, and taxpayer identification numbers of the United States taxpayer and all related persons involved in the proposed allocation and the tax years affected;
(c) the office where the United States taxpayer and the related person or persons filed federal income tax returns for the years in question;
(d) a statement whether the federal income tax returns of both the United States taxpayer and the related person or persons for the years in question were examined, or are in the process of being examined;
(e) a description of the control and business relationships between the United States taxpayer and the related person or persons;
(f) a statement of the status of the tax liability of the related person in the treaty country for the year or years of the proposed adjustment;
(g) actions requested of, proposed, or taken by the competent authority of the treaty country, a description of the pertinent transactions and the issues, and the amount of any correlative adjustment that would have to be made to the income or deductions of the United States taxpayer if the United States competent authority were to accept the position of the treaty country;
(h) copies of pertinent foreign income tax returns (with English translation), and a schedule (in United States dollars) showing the allocation proposed by the treaty country and computation of the resulting foreign tax;
(i) copies of pertinent correspondence from the treaty country, briefs, protests, and other relevant material (with English translation);
(j) copies of Foreign Tax Credit Computation (Forms 1118) that were filed with the tax return for each year under consideration;
(k) copies of powers of attorney on file with respect to the United States taxpayer; and
(l) on a separate document, a statement that the United States taxpayer consents to the disclosure to the competent authority of the treaty country (with the name of the country specifically stated) and the competent authority's staff of any or all of the items of information set forth or enclosed in the request for United States competent authority consideration. This statement must be dated and signed by a person having authority to sign the United States taxpayer's federal income tax return and is required to facilitate the administrative handling of the request by the United States competent authority for purposes of the recordkeeping requirements of section 6103(p) of the Code. Failure to provide such a statement will not prevent the United States competent authority from disclosing information under the terms of a tax treaty. See section 6103(k)(4).

05. If a treaty country is considering but has not yet proposed any adjustments to income or deductions arising out of transactions of or with a United States taxpayer, and the United States statutory period in which the United States taxpayer can file a claim for credit or refund of income taxes for the years involved is about to expire, the United States taxpayer should file a protective claim for credit or refund of these taxes on the appropriate amended United States tax return (including, to the extent available, the information required in a competent authority request under section 4.04 above). The amended United States tax returns must be filed with the Internal Revenue Service Center where the original tax return for the same tax year was filed. The taxpayer must send a copy of the amended United States tax return to the Associate Commissioner (Operations) (see section 2.06 above for address). Final disposition of the amended United States tax return will be deferred by the Service pending: (1) the perfection of the request for competent authority consideration under section 4.01 above and the disposition of the issues under consideration; or (2) the withdrawal of the claim for credit or refund by the taxpayer. Beginning 6 months after the amended United States tax return is filed and every 6 months thereafter, the taxpayer must state in writing (by a person authorized to sign its federal income tax returns) to the Associate Commissioner (Operations) that the treaty country is still considering an adjustment of the income or deductions. The statement must include any available information described in section 4.04 above not previously submitted and any necessary modifications or previously submitted information. The Associate Commissioner (Operations) may deny competent authority consideration if the United States taxpayer fails to file the supplemental statement within each 6 month period.

06. The amended United States tax return filed under this revenue procedure permits only the making of a credit or refund that is agreed to by the United States and the treaty country competent authorities or that is unilaterally allowed by the United States competent authority. This revenue procedure does not grant a United States taxpayer the right to invoke section 482 of the Code in its favor or compel the Service to allocate income or deductions or grant a tax credit or refund. If the United States taxpayer accepts the decision of the competent authority, the decision of the competent authority is not subject to judicial review.

SEC. 5. PROCEDURES TO BE FOLLOWED IF THE UNITED STATES PROPOSES ALLOCATION

01. If the Service allocates or proposes to allocate income or deductions attributable to transactions involving a United States taxpayer subject to the tax jurisdiction of a treaty country, the United States taxpayer should request United States competent authority consideration. (See Rev. Rul. 76-508, as amplified by Rev. Rul. 80-231. Also see section 6 of this revenue procedure for procedures to be followed by the related person if any.)

02. A written request for competent authority consideration should be submitted as soon as the amount of the adjustment is determined, communicated in writing to the taxpayer, and agreed to by the taxpayer subject to competent authority relief. Taxpayers who do not agree with the correctness of the adjustment are encouraged to pursue their right of administrative review befor the Appeals Division before requesting competent authority relief.

0.3 The taxpayer must file the written request for competent authority consideration with the Service office where the United States taxpayer's case is pending. A copy of the request must be filed with the Associate Commissioner (Operations), Internal Revenue Service, P.O. Box 7799, Washington, DC 20044. However, if the request for competent authority is not filed until after a suit contesting the tax liability of the taxpayer is pending in a court in the United States, the request should be filed with the Chief Counsel, Attention: Associate Chief Counsel (Litigation), Internal Revenue Service, Washington, DC 20044, and a copy filed with the Associate Commissioner (Operations).

04. The Internal Revenue Service office receiving the written request for competent authority consideration will promptly forward a copy of the request, pertinent files, and other appropriate information and documents to the Associate Commissioner (Operations).

05. If a request for competent authority consideration is filed, the Service will postpone further examination action on the issues accepted for competent authority consideration, except for cases pending in court and other cases in which action must be taken to avoid prejudicing the Government's interest. If there are other issues raised during the examination and the taxpayer is not in agreement with these issues, the district director will follow the usual procedures and issue the taxpayer a thirty-day letter. In preparing a protest of the unagreed issues, the taxpayer need not include any unagreed issue under consideration by the competent authority. Following the receipt of the taxpayer's protest, appeal procedures shall be initiated with respect to those issues not subject to competent authority consideration. If the competent authorities are unable to resolve the double taxation problem to the satisfaction of the United States taxpayer and the taxpayer wishes to then pursue other administrative or judicial avenues of appeal, the original protest will then be amended to include the issue unresolved by the competent authority.

06. The United States competent authority

© 1982 International Bureau of Fiscal Documentation – BULLETIN

will not accept any taxpayer's request for consideration of a case that is pending in court without Chief Counsel's consent. If the case is pending in the United States Tax Court, the Chief Counsel may in appropriate cases request the court to delay trial pending competent authority action. If the case is pending in any other court, the Chief Counsel will consult with the Department of Justice about appropriate action. Final decision on delaying trial rests with the court. However, the filing of a competent authority request does not relieve the taxpayer from taking any action that may become necessary with respect to litigation. On completion of the competent authority consideration, the taxpayer must reinstate litigation if the taxpayer decides to continue litigation.

07. The competent authority request must be signed by a person having authority to sign the United States taxpayer's federal tax returns. The request must contain a statement that competent authority consideration is being requested and must include the following information:
(a) a reference to the specific income tax treaty provisions under which the request is made;
(b) the names, addresses, and taxpayer identification numbers of the United States taxpayer and all related taxpayers involved in the proposed allocation and the tax year affected;
(c) the district office which has made or is proposing to make the adjustment;
(d) a description of the control and business relationships between the United States taxpayer and the related person or persons;
(e) a statement of the status of the tax liability of the related person in the treaty country for the year or years of the proposed adjustment;
(f) actions requested of, proposed, or taken by the competent authority of the treaty country, a description of the pertinent transactions and the issues and the amount of any correlative adjustment that would have to be made to the related person's income or deductions if the treaty country competent authority were to accept the position of the United States;
(g) the adjustments should be stated in United States dollars and the appropriate foreign currency, identifying the conversion method used to reconcile the United States entity's books and records with the foreign entity's books and records;
(h) copies of pertinent foreign income tax returns, correspondence, briefs, protests, and other relevant material (with English translation);
(i) copies of Foreign Tax Credit Computation (Forms 1118) that were filed with the tax return for each year under consideration;
(j) copies of powers of attorney on file with respect to the United States taxpayer;
(k) copies of pertinent Forms 2952 (Information Return with Respect to Controlled Foreign Corporations), including copies of the financial statements and surplus analysis required to be filed with the return for each related entity and for each year under consideration; and
(l) on a separate document, a statement that the United States taxpayer consents to the disclosure to the competent authority of the treaty country (with the name of the country specifically stated) and the competent authority's staff of any or all of the items of information set forth or enclosed in the request for competent authority consideration. This statement must be dated and signed by a person having authority to sign the United States taxpayer's federal income tax returns and is required to facilitate the administrative handling of the request by the United States competent authority for purposes of the recordkeeping requirements of section 6103(p) of the Code. Faillure to provide such a statement will not prevent the United States competent authority from disclosing information under the terms of a tax treaty. See section 6103(k)(4).

SEC. 6. NOTIFICATION TO RELATED ENTITY

In any case covered by section 4 or 5 of this revenue procedure, the United States taxpayer should either itself take, or advise a related person to take, such timely protective action as may be necessary with foreign tax authorities. This includes the staying of the expiration of the foreign period of limitations on the making of a refund or other tax adjustment, complying with any applicable procedures of the treaty country for invoking competent authority consideration, and attempting to resist an adjustment or obtain an appropriate correlative adjustment.

SEC. 7. CASES RECEIVED FROM AND REFERRED TO, FOREIGN COMPETENT AUTHORITIES

01. The United States competent authority will not initiate action under this revenue procedure with respect to foreign corporations, partnerships, or other entities of a treaty country. Requests sent to the United States competent authority by these taxpayers will be referred to the competent authority of the treaty country.

02. When a treaty country competent authority refers a request for mutual agreement to the United States competent authority, the United States competent authority will contact the United States taxpayer and advise the taxpayer to comply with this revenue procedure in order to obtain consideration by the United States competent authority.

SEC. 8. REV. PROC. 65-17

Rev. Proc. 65-17, 1965-1 C.B. 833, and Amendment I of Rev. Proc. 65-17, 1966-2 C.B. 1211, as amplified by Rev. Proc. 65-31, 1965-2 C.B. 1024, provide that the United States taxpayer must file a request for the treatment provided by Rev. Proc. 65-17 in writing with the appropriate district director before closing action is taken on the section 482 issue that forecloses availability of Rev. Proc. 65-17. Therefore, if a United States taxpayer desires competent authority action and the benefits provided by Rev. Proc. 65-17, the taxpayer must file a request under Rev. Proc. 65-17 before entering into any closing agreement or before any other closing action (as defined in section 4.03 of Rev. Proc. 65-31) is taken on the section 482 issue.

Rev. Rul. 82-80, page 7, this [Internal Revenue] Bulletin, states that a United States subsidiary, whose taxable income has been increased for a tax year because of an allocation under section 482 of the Code, may receive payment from its foreign parent corporation from which, or to which, the allocation of income or deductions was made, in an amount not in excess of the taxable income increase without further federal income tax consequences. For procedures to be followed in applying this position and requirements that must be fulfilled to qualify for such treatment, see Rev. Proc. 65-17.

SEC. 9. ACTION BY COMPETENT AUTHORITY

01. The United States taxpayer will be notified if the facts provide a basis for competent authority assistance. The United States competent authority will not assist the taxpayer if:
(a) under the facts and circumstances the taxpayer is not entitled to such assistance (for example, actual or economic double taxation does not exist);
(b) the taxpayer indicates unwillingness to accept a competent authority agreement except under conditions that are clearly unreasonable or unfairly prejudicial to the interests of the United States;
(c) the taxpayer does not accept the concept that competent authority negotiations are a government to government activity that does not include the taxpayer's participation in the negotiation proceedings;
(d) the taxpayer does not furnish, upon request, sufficient information to determine whether the treaty applies to the taxpayer's facts and circumstances, or the taxpayer otherwise fails to act as required by this procedure;
(e) the request is from a taxpayer under the jurisdiction of another competent authority (see section 7.01 of this revenue procedure); or
(f) the taxpayer has demonstrated an unwillingness to execute a consent extending the period of limitations on assessment of tax for the tax year or years under consideration (see section 9.02 of this revenue procedure).

02. If the United States competent authority accepts a request for consideration, the United States taxpayer must supply any additional information needed to resolve the case

© 1982 International Bureau of Fiscal Documentation – BULLETIN

and keep the United States competent authority informed about proceedings in the treaty country or any other pertinent developments. The taxpayer also may be requested to execute a consent extending the period of limitations on assessment of tax for the tax year or years concerned.

03. If the United States competent authority denies assistance, the United States taxpayer may ask the Commissioner of Internal Revenue to name a panel and have the panel review the denial of assistance. The panel will notify the taxpayer that the taxpayer may present oral arguments at a hearing, if so desired, in support of the taxpayer's request for competent authority assistance. The decision of the panel whether competent authority assistance should be provided is final and is not subject to judicial review. The United States competent authority will notify the taxpayer of the panel's decision. If the panel decides that the case is suitable for competent authority assistance, the United States competent authority will assist the taxpayer in accordance with this revenue procedure.

04. The United States competent authority will notify a taxpayer requesting assistance under this revenue procedure of any agreement or partial agreement that the United States and the treaty country competent authority reach with respect to the request. If such agreement or partial agreement is not acceptable to the taxpayer, the taxpayer may withdraw the request for competent authority consideration and may then pursue all rights to administrative and judicial review otherwise available under the laws of the treaty country and the United States.

05. When appropriate, in cases covered by sections 4 and 5 of this revenue procedure, the taxpayer will be requested to enter into a closing agreement reflecting the terms of the competent authority in accordance with sections 6.07 and 6.17 of Rev. Proc. 68-16, 1968-1 C.B. 770.

06. The United States competent authority will not grant unilateral relief to a United States taxpayer with respect to an adjustment to income, deductions, credits or other items solely because the period of limitations has expired in the foreign country and the competent authority of that country has declined to grant any relief from double taxation.

If the period provided by the foreign statute of limitations has expired, then the United States competent authority may take into account other relevant facts and may, as a matter of discretion, provide unilateral relief with respect to the adjustment to the extent necessary to avoid actual or economic double taxation of income. Relevant facts include the absence of actual or constructive notice of the proposed allocation so that the taxpayer could not avail itself of any remedies in the foreign jurisdiction; the absence of abusive tax arrangements in the structuring of the relevant international relationships and transactions; and the absence of recurring adjustments. In no event, however, will relief be granted where there is fraud or negligence with respect to the relevant international relationships and transactions.

Unilateral relief wil generally only be granted by the United States in the context of a tax treaty used by the other competent authority to grant unilateral relief to taxpayers of that country. If an income tax treaty is not in force with a particular foreign coutry, then the service wil not provide relief with respect to an adjustment because the period of limitations of that country has expired.

SEC. 10. REQUEST FOR RULINGS

01. Requests for advance rulings about the interpretation or application of a treaty on United States taxation, as distinguished from requests to the United States competent authority under this revenue procedure or Rev. Proc. 77-16, should be submitted to the Associate Chief Counsel (Technical) in accordance with Rev. Proc. 80-20, 1980-1 C.B. 633.

02. The Service does not issue advance rulings on the effect of the treaty on the tax laws of the treaty country for purposes of determining the tax of the treaty contry or the meaning of a treaty article for that purpose.

SEC. 11. EFFECTIVE DATE

This revenue procedure is effective 3 May 1982.

SEC. 12. EFFECT ON OTHER DOCUMENTS

Rev. Proc. 70-18 and Rev. Proc. 79-31 are superseded.

CONFERENCE DIARY

SEPTEMBER 1982

36th Annual Congress of I.F.A.: I. The tax treatment of interest in international economic transactions. II. Taxation of payments to non-residents for independent personal services. Montreal (Canada), September 12-17 (English, French, German, Spanish).

Confédération Fiscale Européenne (C.F.E.): Third European Congress of Tax Consultants (including: State of tax harmonisation in Europe; The application of wealth taxes and taxes arising on death to foreign assets and liabilities; The practical application of international tax provisions (working groups)). Aachen (Germany), September 30 to October 2 (English, French, German, Spanish).

Management Centre Europe: International Compensation (Briefing) (including: The tax element in compensation planning). Brussels (Belgium), September 29 – October 1 (English).

OCTOBER 1982

Management Centre Europe: International Tax Management (including: Inter-company pricing of goods; inter-company licensing; service fees; inter-company loans; handling of disputes between tax administrations) (Seminar). Nice (France), October 11-12 (English).

NOVEMBER 1982

Management Centre Europe: 11th International Finance Conference: Changes in international finance and their implications for business (including: Financial and tax incentives aimed at attracting investments). Geneva (Switzerland), November 3-5 (English).

DECEMBER 1982

Management Centre Europe: Taxation of International Group Companies and Branches (including: Taxation of branches and subsidiaries; taxation of shareholders; domestic and tax treaty "anti-avoidance" measures) (Seminar). Brussels (Belgium), December 2-3 (English).

OCTOBER 1983

37th Annual Congress of I.F.A.: I. Tax avoidance/tax evasion. II. International problems in the field of turnover taxation. Venice (Italy), October 10-15 (English, French, German, Spanish).

Contents

of the August/September 1982 issue

Max Laxan:

THE CONGRESS OF MONTREAL 1982 ..... **344**

Allan J. MacEachen, Minister of Finance, Government of Canada:

INTEGRATION OF TAX EXPENDITURES INTO THE GOVERNMENT FISCAL MANAGEMENT SYSTEM **347**

Canada has recently introduced a fiscal management system under which Federal Government outlays are divided into several policy areas controlled by Ministers' Committees. Tax expenditures are integrated in this system.

H. Heward Stikeman:

TAXATION OF OFFSHORE INCOME AND THE CANADIAN TREATY NETWORK **351**

Discussion of the tax consequences of investing abroad by Canadians. Creating a foreign branch or subsidiary company, the FAPI rules and Canada's tax treaties form the main part of this article.

Nathan Boidman:

STRUCTURING INVESTMENTS AND BUSINESS START-UPS IN CANADA **362**

The author analyses the general tax considerations at the time of investing in Canada or acquiring or creating a Canadian business. He points out that there are a host of rules and factors under both domestic laws and treaties and that careful planning is required. Although re-structuring or reorganization is sometimes possible it is preferable to achieve the optimum structure from inception.

CANADA: SUMMARY OF MODIFICATIONS IN DRAFT LEGISLATION **374**

Peter McQuillan:

WORKING WITH CANADA'S STATUTORY AND DISCRETIONARY INDUSTRIAL AND PETROLEUM ASSISTANCE PROGRAMS **375**

Canada makes available a vast array of assistance programs for both industrial enterprises and for petroleum development in the form of non-repayable grants, subsidies, incentive loan terms and income tax concessions.

Edwin C. Harris:

THE INFLUENCE AND THE IMPACT OF CANADA'S TAX ACCOUNTING RULES ON STRUCTURING CANADIAN BUSINESS OPERATIONS **386**

Tax accounting rules in Canada are not so artificial as to require unusual or complex corporate structures. However, the Government has to some extent neglected to invite a discussion on the relation between financial and tax accounting, a procedure which may prove to be highly productive at this time.

Piroska E. Soos:

THE LONG REACH OF THE UNITED STATES IN TAX MATTERS **393**

The United States District Court for the District of Vermont recently ruled that a Canadian bank must produce records located at the bank's branch in the Bahamas relating to a U.S. citizen being criminally prosecuted for tax evasion.

Ives Gandra Da Silva Martins:

THE SUPPLEMENTARY INCOME TAX ON THE REMITTANCE OF DIVIDEND INCOME – LEGAL NATURE AND COMPUTATION **395**

Brazil levies a penalty tax in the form of the supplementary income tax on dividends in excess of 12% of capital invested in Brazil. The author demonstrates that the tax offices in applying the pertinent legislation have exceeded their authority and have interpreted the law to the detriment of the taxpayers.

CONFERENCE DIARY **404**

H.W.T. Pepper:

BERMUDA: FISCAL STRUCTURE OF A LOW TAX COUNTRY **405**
Brief discussion of the current tax and social security system as well as a discussion of the changes proposed in the Budget 1982-83.

BERMUDA: BUDGET 1982-83 ..... **410**
Extracts from the Budget Speech pronounced on 26 February by the Honourable J.D. Gibbons J.P.; M.P. Minister of Finance.

Vito Tanzi:

TAX POLICY IN MIDDLE-INCOME COUNTRIES – Some lessons of experience **411**
Analysis of the economic development and tax structures of middle-income countries. The author gives a number of recommendations to render the tax systems of these countries more efficient.

A.C. Ezejelue:

TAXATION OF CONSULTANCY FEES IN NIGERIA **421**
The Nigerian tax authorities are currently imposing a flat rate withholding tax on consultancy fees paid by residents of Nigeria to foreign firms. The author discusses the motives of the Nigerian tax administration.

CONFEDERATION OF BRITISH INDUSTRIES SUPPORTS NEW DRIVE AGAINST UNITARY TAX **424**
The CBI gives its full backing to the statement which has been lodged with the U.S. Supreme Court by UNICE to the effect that the unitary tax system infringes on the U.S. Constitution.

PEOPLE'S REPUBLIC OF CHINA: OFFSHORE PETROLEUM **425**
Rules of the Ministry of Finance and the General Administration of Customs concerning the levy and exemption of customs duties and consolidated industrial and commercial tax on imports and exports for the Chinese-foreign cooperative exploitation of offshore petroleum.

Pedro Massone:

LATIN AMERICA: NEW STATUTE FOR ANDEAN MULTINATIONAL ENTERPRISES INTRODUCED **426**
The Commission of the Cartagena Agreement (Andean Group) recently approved a statute for Andean Multinational Enterprises which will enjoy a large number of benefits within the Contracting States.

BIBLIOGRAPHY **427**

CUMULATIVE INDEX **431**

SOMMAIRE

Max Laxan:

Congrès Montréal 1982 343

Allan J. MacEachen, Ministre des Finances, Gouvernement du Canada:

Intégration des dépenses fiscales dans le système de gestion fiscale du Gouvernement 347
Le Canada a introduit récemment un système de gestion fiscale dans lequel les dépenses du Gouvernement Fédéral sont divisées en plusieurs zones d'organisation contrôlées par les Comités ministériels. Les dépenses fiscales sont intégrées dans ce système.

H. Heward Stikeman:

Imposition des revenus de source off-shore et le réseau des traités canadiens 351
Etude des conséquences fiscales des investissements réalisés à l'étranger par des Canadiens. Création d'une succursale étrangère ou d'une filiale de la société, les règles "FAPI" et les conventions fiscales canadiennes forment la plus grande partie de cet article.

Nathan Boidman:

Planification des investissements et création d'entreprises au Canada 362
L'auteur fait une analyse globale de la fiscalité au Canada lorsqu'on veut y investir, y acquérir ou y créer une entreprise canadienne. Il fait remarquer qu'il existe un nombre incroyable de règles et de facteurs découlant à la fois des lois nationales et des traités et qu'une planification minutieuse est nécessaire. Bien que restructuration ou réorganisation soit quelquefois possible, il est préférable d'obtenir la structure adéquate dès l'origine.

Canada: Résumé des modifications contenues dans les différents projets législatifs 374

Peter McQuillan:

La confrontation avec les programmes canadiens, statutaires et discrétionnaires, d'assistance industrielle et pétrolière 375
Le Canada dispose d'un grand nombre de programmes d'assistance aussi bien pour les entreprises industrielles que pour le développement pétrolier sous la forme de subventions non-remboursables, de subventions, de prêts d'investissements et de réductions d'impôt sur le revenu.

Edwin C. Harris:

L'influence et l'impact des règles fiscales comptables canadiennes sur l'organisation des affaires commerciales au Canada 386
Les règles comptables canadiennes ne sont pas sophistiquées au point de nécessiter des structures sociales inhabituelles ou complexes. Toutefois le Gouvernement a, dans une certaine mesure, négligé la possibilité d'une discussion sur les relations entre la comptabilité fiscale et financière; une procédure qui actuellement peut prouver être hautement rentable.

Piroska E. Soos:

La portée inattendue de jurisdiction fiscale américaine 393
La Cour de District des Etats-Unis du District du Vermont a dernièrement décidé qu'une banque canadienne devait produire des documents qui se trouvaient dans sa succursale au Bahamas pour un ressorissant américain poursuivi pénalement pour fraude fiscale.

INHALTSVERZEICHNIS

Max Laxan:

Der Kongress 1982 in Montreal 343

Allan J. MacEachen, Bundesminister der Finanzen; Kanada:

Die Integration der "Steuerausgaben" in das System der Fiskalpolitik von Kanada 347
Das System der Fiskalpolitik, das Kanada kürzlich einführte, sieht vor, dass Ausgaben in verschiedene Bereiche eingeteilt und durch Ministerialausschüsse kontrolliert werden. "Steuerausgaben" sind in dieses System integriert.

H. Heward Stikeman:

Die Besteuerung ausländischer Einkünfte und Kanadas Netz von Doppelbesteuerungsabkommen 351
Dieser Artikel untersucht die steuerlichen Konsequenzen für Auslandsinvestitionen von Kanadiern. Bei der Errichtung einer Betriebstätte oder der Gründung einer Tochtergesellschaft sind die sog. FAPI-Richtlinien zu beachten; diese Richtlinien sowie eine Darstellung der kanadischen Doppelbesteuerungsabkommen stellen den Schwerpunkt dieses Artikels dar.

Nathan Boidman:

Die Strukturierung von Aktivitäten in Kanada 362
Der Verfasser analysiert die allgemeinen steuerlichen Überlegungen, die angestellt werden müssen, wenn in Kanada eine Investition getätigt oder ein Unternehmen erworben wird. Er weist darauf hin, dass eine Vielzahl von nationalen und zwischenstaatlichen Gesetzen zu beachten ist, was eine sehr sorgfältige Planung erfordert. Obwohl eine Umstrukturierung von Aktivitäten nicht unmöglich ist, so ist es dennoch zu empfehlen, von Anbeginn an eine optimale Gestaltung anzustreben.

Kanada: Zusammenfassung der Änderungen in den Gesetzentwürfen 374

Peter McQuillan:

Das Programm zur Förderung der Industrie- und Erdölunternehmen in Kanada – Praktische Hinweise 375
Kanada bietet ein breites Spektrum von Massnahmen an, mit denen Industrie- und Erdölunternehmen gefördert werden sollen. Diese werden in der Form von verlorenen Zuschüssen, Subventionen, verbilligten Darlehen sowie von Einkommensteuererleichterungen gewährt.

Edwin C. Harris:

Der Einfluss und die Auswirkungen der relevanten kanadischen Gewinnermittlungsvorschriften auf die Rechtsform unternehmerischer Tätigkeiten 386
Die steuerlichen Gewinnermittlungsvorschriften Kanadas sind nicht so gekünstelt, als dass sie ungewöhnliche oder komplexe rechtliche Gestaltungsformen erforderlich machen. Nichtsdestoweniger hat es die Regierung teilweise versäumt, eine Diskussion zum Verhältnis der handelsrechtlichen zu den steuerrechtlichen Gewinnermittlungsvorschriften stattfinden zu lassen; eine solche Diskussion hätte zweifelsohne zu sehr brauchbaren Ergebnissen führen können.

Piroska E. Soos:

Der lange Arm der USA in Steuerfragen 393
Das U.S.-Bezirksgericht für Vermont ordnete kürzlich an, dass eine kanadische Bank bezüglich eines U.S.-Staatsbürgers, der wegen Steuerhinterziehung angeklagt ist, Aufzeichnungen, die bei der Filiale der Bank auf den Bahamas aufbewahrt werden zur Verfügung stellen muss.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Ives Gandra da Silva Martins:

L'impôt supplémentaire sur le revenu sur la remise de dividende – légalité et computation 395
Le Brésil lève une amende fiscale, sous la forme d'un impôt supplémentaire sur le revenu, sur les dividendes correspondants à un montant supérieur à 12% du capital investi au Brésil. L'auteur démontre que le fisc, en appliquant la législation, a abusé de son pouvoir et interprété la loi au détriment des contribuables.

Carnet des conventions 404

H.W.T. Pepper:

Bermudes: Structure fiscale d'un pays à faible fiscalité 405
Brève étude du système fiscal et de sécurité sociale applicable actuellement aux Bermudes ainsi que des modifications proposées par le Budget 1982-1983.

Bermudes: Budget 1982-83 410
Extraits de la présentation du Budget prononcé le 26 février 1982 par l'Honorable J.D. Gibbons J.P., M.P., Ministre des Finances.

Vito Tanzi:

Politique fiscale dans les pays à revenus moyens – Quelques leçons tirées d'expériences 411
Analyse de développement économique et des structures fiscales des pays à revenus moyens. L'auteur donne un certain nombre de recommandations pour rendre plus efficace les systèmes fiscaux de ces pays.

A.C. Ezejelue:

Imposition au Nigéria des rémunérations pour consultations 421
Les autorités fiscales nigérianes frappent d'une retenue fixe à la source les rémunérations pour consultations versées par les résidents du Nigéria à des entreprises étrangères. L'auteur étudie les motivations de l'administration fiscale nigériane.

La Confédération des Industries Britanniques (C.I.B.) supporte une nouvelle action contre la taxe unitaire 424
La C.I.B. apporte son soutien total au texte envoyé par l'U.N.I.C.E. à la Court Suprême des Etats-Unis considérant que le système de la taxe unitaire viole la Constitution américaine.

République Populaire de Chine: Exploitation pétrolière off-shore ... 425
Règlements du Ministre des Finances et de l'Administration générale des douanes concernant la perception et l'exemption des droits de douane et la taxe industrielle et commerciale sur les importations et exportations pour l'exploitation coopérative sino-étrangère de pétrole off-shore.

Pedro Massone:

Introduction d'un nouveau statut pour les entreprises multinationales Andines 426
La Commission de l'Accord de Carthagène (Groupe Andin) a récemment approuvé un statut applicable aux entreprises multinationales andines auxquelles seront accordés un grand nombre d'avantages à l'intérieur des Etats contractants.

Bibliographie (Livres) 427

Index récapitulatif 431

Ives Gandra da Silva Martins:

Brasilien: Die Ergänzungsabgabe auf die Überweisung von Dividenden – Rechtsgrundlage und Ermittlungsvorschriften 395
Brasilien erhebt eine "Strafsteuer" in Form einer Ergänzungsabgabe auf solche Dividenden, die eine Rendite von mehr als 12% darstellen. Der Verfasser zeigt auf, dass die Steuerbehörden bei der Anwendung des relevanten Gesetzes ihre Ermessensbefugnisse überschritten und dieses zum Nachteil der Steuerzahler ausgelegt haben.

Veranstaltungskalender 404

H.W.T. Pepper:

Bermuda: Die Fiskalstruktur eines Niedrigsteuerlandes 405
Kurze Erläuterung des gegenwärtig gültigen Steuer- und Sozialversicherungssystems. Ferner werden die im Haushalt 1982-83 vorgesehenen Änderungen kurz besprochen.

Bermuda: Der Haushalt 1982-83 410
Auszüge aus der Haushaltsrede, die der Minister der Finanzen, Herr J.D. Gibbons MdP, am 26. Februar 1982 hielt.

Vito Tanzi:

Die Steuerpolitik in Staaten mit mittlerem Einkommen – Ein Erfahrungsbericht 411
Analyse der wirtschaftlichen Entwicklung und der Steuerstrukturen von Staaten mit mittlerem Einkommen. Der Verfasser macht eine Reihe von Empfehlungen, wie die Steuersysteme solcher Staaten effizienter gestaltet werden könnten.

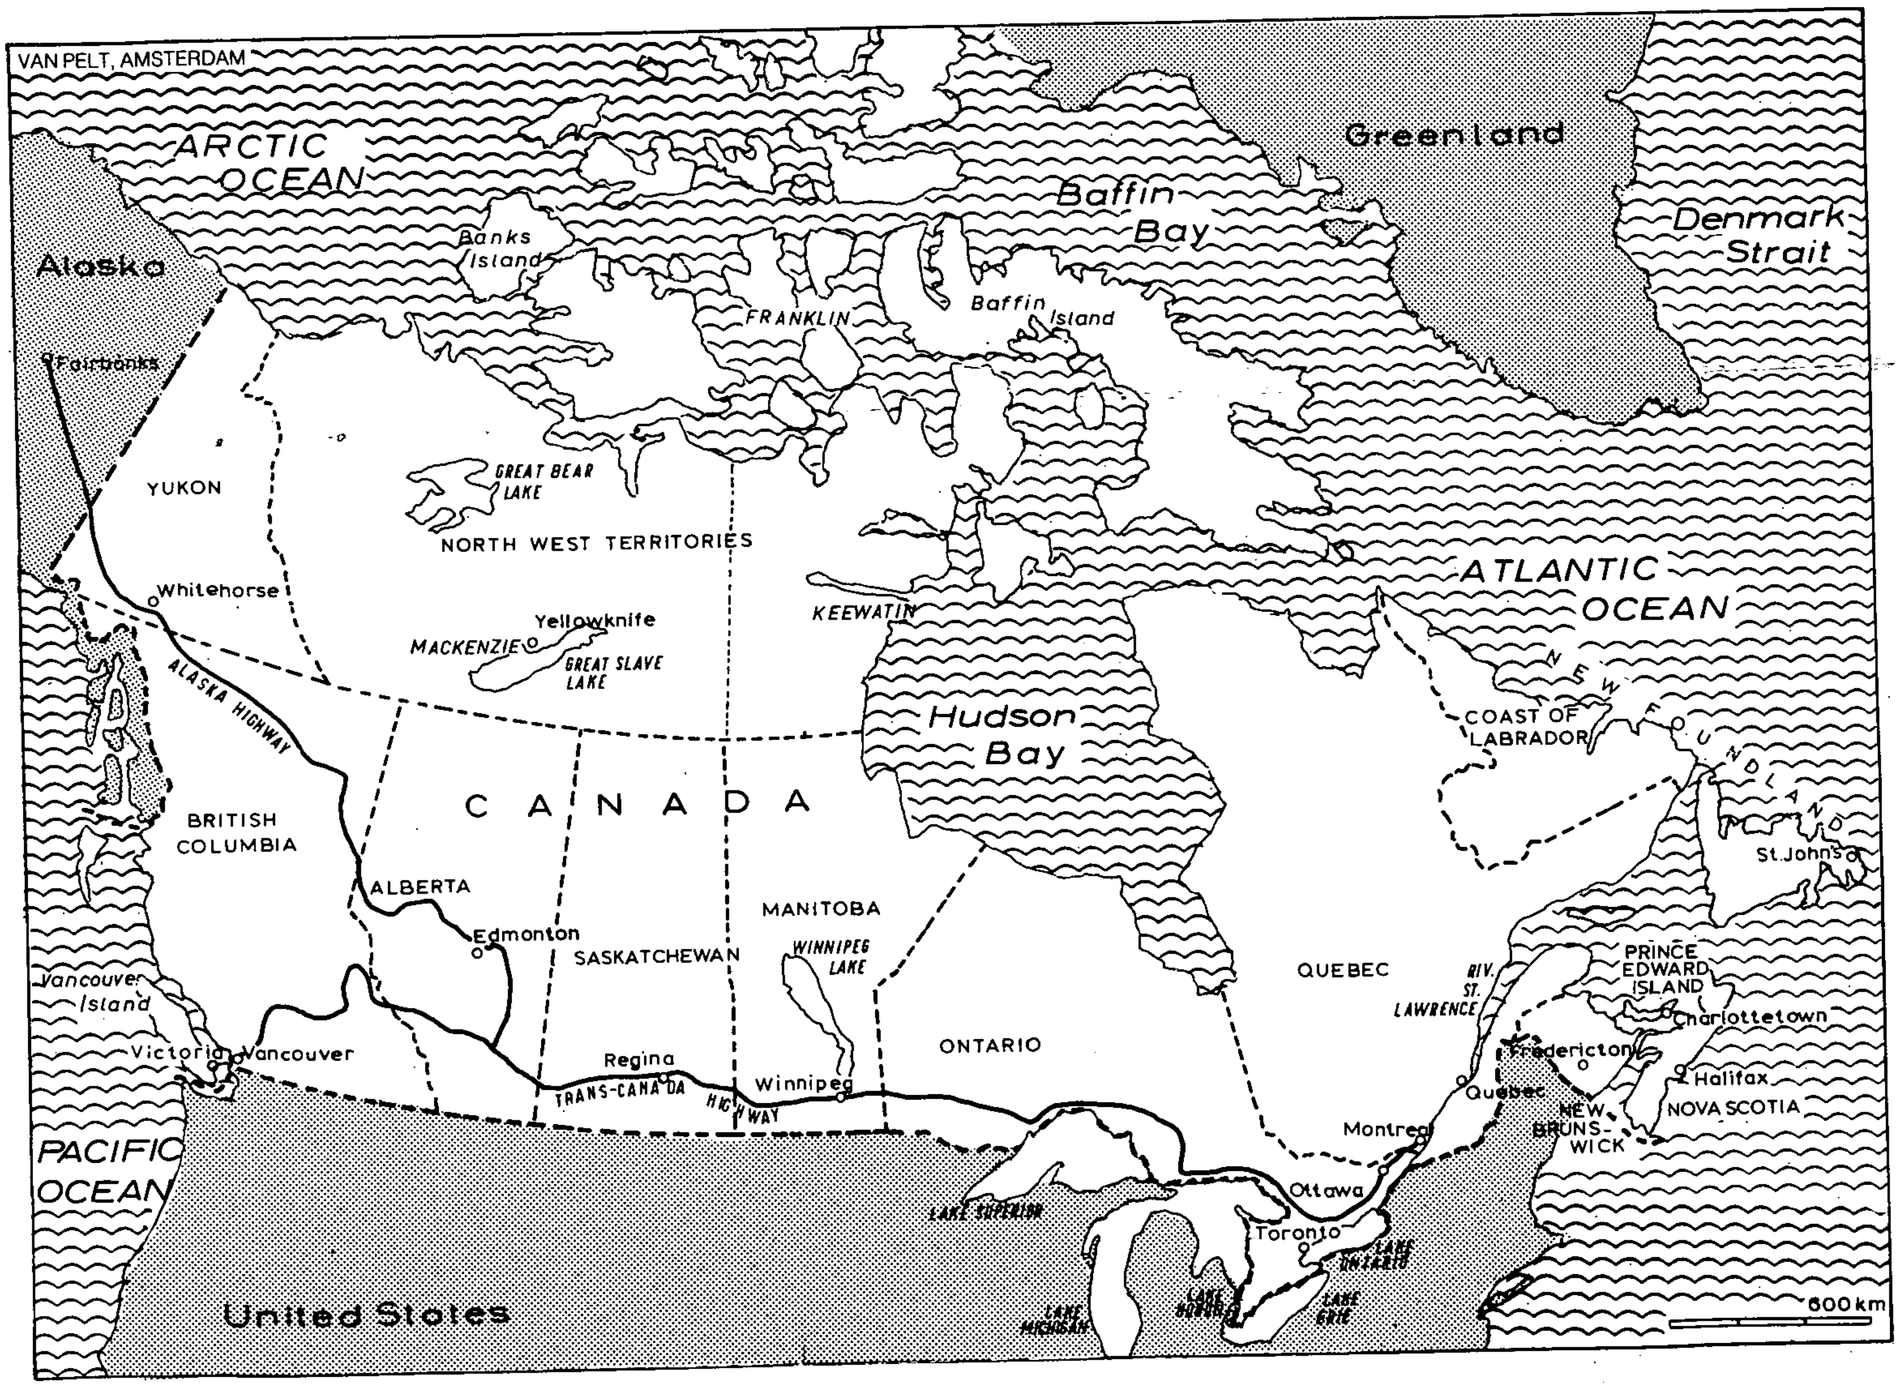
A.C. Ezejelue:

Die Besteuerung von Beratungsgebühren in Nigeria 421
Die nigerianischen Steuerbehörden erheben gegenwärtig eine pauschale Quellensteuer auf Beratungsgebühren, die von in Nigeria ansässigen Personen an ausländische Firmen gezahlt werden. Der Verfasser untersucht die Motive, auf die die nigerianischen Steuerbehörden diese Steuer stützen.

Verband der britischen Industrie (CBI) unterstützt neuerliche Aktion gegen das "unitary tax system" 424
Der CBI versichert der Klage, die UNICE beim höchsten U.S.-Gericht hinterlegt hat, seine volle Unterstützung. Durch diese Klage soll nachgewiesen werden, das das "unitary tax system" gegen die Verfassung der USA verstösst.

Volksrepublik China: Steuerfragen zur off-shore Erdölförderung 425
Richtlinien des Finanzministeriums und der Zollverwaltung betreffend die steuerliche und zollrechtliche Behandlung der Ein- und Ausfuhr von Gegenständen, die bei der off-shore Erdölförderung durch Gemeinschaftsunternehmen verwendet werden.

Pedro Massone:



Lateinamerika: Neue Richtlinien für multinationale Unternehmen für den Bereich des Abkommens von Cartagena (Cartagena Agreement) erlassen 426
Die Kommission des Catagena Agreements (Anden-Gruppe) stimmte kürzlich Richtlinien zu, die multinationalen Unternehmen aus dem Bereich des Abkommens von Cartagena umfangreiche Vorteile zugestehen.

NEED INFORMATION ON TAXATION IN CANADA ? CCH HAS A PUBLICATION TO SERVE YOU . . .

For over 40 years, CCH CANADIAN LIMITED has been supplying authoritative, up-to-date reporting on tax and business law in Canada. Always of special importance are the CCH TAX REPORTERS. Canadian tax laws and regulations, whether federal or provincial, are complex and constantly subject to change. For the tax practitioner involved with Canadian taxation, CCH publishes the following authoritative and current loose leaf reporting services:

1. CANADIAN TAX REPORTS—6 VOLS.

Complete weekly reporting on federal corporate and personal income tax laws, regulations and rulings, with comprehensive digests of Board and Court decisions. Expert editorial commentary. All federal taxing Acts and Regulations in full text including Bulletins, Circulars and Advance Rulings. "Tax Topics", the weekly newsletter summary, special reports and booklets, and "Canadian Master Tax Guide" (or "le Guide du Contribuable Canadien"), are included.

2. CANADIAN SALES TAX REPORTS—1 VOL.

Reports monthly on federal sales and excise taxes—statutes, regulations, court decisions, departmental rulings, with editorial commentary. Report Letter summarry included.

PROVINCIAL TAX REPORTS

Current monthly reporting covers every aspect of taxation for each of the provinces. Identical arrangement of contents makes for easy cross reference between jurisdictions.

3. Alberta, N.W.T. & Yukon—1 vol.

4. British Columbia—1 vol.

5. Manitoba & Saskatchewan—1 vol.

6. Maritimes—1 vol.

7. Ontario—2 vols.

8. Quebec—2 vols.

9. DOMINION TAX CASES—1 VOL.

Three reports a month give full texts and digests of all Court and Tax Review Board decisions on federal tax questions. Case Table, Citator and Topical Index.

10. CANADA INCOME TAX GUIDE—1 VOL.

Explanation of the federal income tax law with illustrative examples. Comprehensive digests of all significant Board and Court decisions. Filled-in forms for filing individual and corporate tax returns. Finding Lists, Case Table and Topical Index. Eighteen reports a year. "Tax Notes" newsletter summary included.

11. CANADIAN INCOME TAX ACT, REGULATIONS AND RULINGS—2 VOLS.

Consolidated texts of the Income Tax Act and Regulations, with historical notes, references to related sections, summaries of Amendments, Interpretation Bulletins, Information Circulars and Advance Rulings. Full texts or pertinent excerpts of tax-related federal statutes. Finding Lists and separate Topical Index in each division. These volumes are included with Canadian Tax Reports and may be added as an option with Canada Income Tax Guide.

12. CANADIAN INCOME TAX RESEARCH INDEX—1 VOL.

Indexes interpretive articles, court decisions, and other references relating to federal income tax. Speeds research on tax problems. Subject index references by subject matter. Legal Reference Index references numerically by section number of the applicable legislation. Tax Books-Finding Lists is a bibliography of recently published books on income tax. Quarterly updating.

Congrès Montréal 1982

MAX LAXAN
Président de l'IFA

Appelé à BERLIN, l'an dernier, à succéder à Alun DAVIES, je m'adresse pour la première fois aux lecteurs du Bulletin de Documentation Fiscale Internationale et, à travers cette livraison spéciale, que chaque congressiste trouvera dans sa serviette, à l'ensemble des adhérents de notre association. Je voudrais tout d'abord saluer K.V. ANTAL, qui vient de quitter, après quinze années de dévotion à ses fonctions, la présidence du Curatorium du Bureau International de Documentation Fiscale et adresser mes voeux les plus sincères à son successeur, le professeur A. NOOTEBOOM, qui a été choisi pour lui succéder et dont j'ai eu plaisir à prononcer la nomination. C'est aussi pour moi l'occasion de souligner la grande qualité de la documentation et des études que le Bureau met à la disposition des fiscalistes du monde entier, sous l'active direction de J. VAN HOORN et de son équipe, pour le plus grand renom de notre association.

Je dois maintenant, selon l'usage, présenter aux lecteurs du Bulletin le programme de notre trente-sixième Congrès.

En 1981, nous avons tenu notre réunion à l'avant-poste du monde occidental, dans une ville qui est le témoignage vivant de la division de notre planète. Cette année, nous portant à quelques milliers de kilomètres à l'Ouest, nous tiendrons congrès, à l'invitation du groupement canadien, dans une des villes les plus attachantes du continent américain, et dans un pays jeune qui a su concilier avec bonheur les deux cultures dont il est dépositaire. Après les déchirements de la vieille Europe, le creuset de civilisations du Nouveau Monde . . .

Les deux thèmes d'études qui nous sont proposés revêtent un grand intérêt et une réelle actualité dans la mesure où ils concernent les deux facteurs principaux du développement des échanges internationaux, à savoir la circulation des capitaux et celle des hommes. Sans doute, à travers l'un et l'autre sujets, ne s'agit-il que d'un cas particulier de mise en oeuvre de ces facteurs. Cependant l'internationalisation croissante du financement des entreprises comme le développement des technologies modernes donnent aux problèmes qui seront traités à MONTREAL une importance et un relief certains.

Le premier sujet, je le rappelle, concerne le régime fiscal des intérêts des prêts dans les relations transnationales. D'intéressantes contributions ont été apportées à l'examen de cette question à l'occasion de congrès précédents. Je citerai par example les études relatives à l'imposition des entreprises apparentées en 1971, à l'égalité de traitement entre investisseurs résidents et étrangers en 1978 ou encore, l'an dernier, aux mesures unilatérales tendant à éviter la double imposition. Mais il était assurément utile de procéder à un examen exhaustif du problème et il faut savoir gré au Prof. HÖHN d'avoir magistralement ordonné, avec beaucoup de clarté, dans son rapport général, les différentes questions se rapportant au sujet et d'en avoir effectué une brillante synthèse.

La principale difficulté provient de la circonstance que la plupart des pays entendent percevoir un impôt à la fois sur le montant des intérêts versés à des non-résidents et sur les intérêts reçus par leur propres résidents. On assiste, de ce fait, à l'application simultanée du principe de la source et du principe du domicile. Dans la plupart des cas, et notamment entre pays industrialisés, ce conflit se résoud dans le cadre de conventions internationales qui organisent en quelque sorte le partage de la matière imposable entre les deux administrations fiscales intéressées.

Ce partage s'effectue le plus souvent dans des conditions conformes aux recommandations des conventions modèles de l'O.C.D.E. et de l'O.N.U. Dans ce cadre cependant, l'impôt payé à la source – et qui frappe le revenu brut – ne peut pas toujours être imputé en totalité sur l'impôt dû dans le pays de résidence, qui s'applique à l'intérêt net: il subsiste alors une double imposition partielle. A l'inverse, c'est une exonération partielle qui peut intervenir lorsque l'imputation forfaitaire excède l'impôt reèllement payé à la source, dans le cadre de relations entre pays développés et pays en voie de développement.

A défaut de conventions internationales, de nombreuses dispositions unilatérales portent remède à la double imposition des revenus des capitaux prêtés. En bref, les dispositions prises au plan international ou au plan interne assurent aux dispositifs fiscaux qui enserrent les mouvements de capitaux une neutralité assez satisfaisante et ne constituent pas un obstacle au financement des investissements.

Les difficultés résiduelles concernent plutôt l'exigence, pour l'élimination de la double imposition, de la conformité aux taux du marché de l'intérêt servi au créancier, notamment entre sociétés apparentées: l'assimilation des intérêts réputés excessifs à des dividendes peut conduire à une surcharge fiscale, surtout lorsque les conséquences de cette qualification ne sont pas entièrement reconnues par l'administration fiscale du pays du domicile.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Le second sujet soumis à nos réflexions concerne le régime fiscal applicable à la rémunération des services rendus par un non-résident dans le cadre d'une activité indépendante. Le dépouillement des vingt-quatre rapports nationaux et l'analyse très pertinente et très approfondie qu'a faite du sujet, sous ses différents aspects, le rapporteur général, M. Gérard COULOMBE, permettent de cerner très complètement les problèmes que peut rencontrer un prestataire de service exerçant ses activités dans un pays étranger. Il faut noter d'abord, dans les législations nationales, d'intéressantes convergences, spécialement en ce qui concerne les critères permettant de distinguer l'activité exercée à titre indépendant de celle exercée en qualité de salarié, même lorsque ces deux types d'activités sont développés de façon concomitante.

Par contre les conditions d'imposition des services rendus par un non-résident dans le cadre d'une activité indépendante varient considérablement d'un pays à l'autre. Aux deux extrêmes on relève la subordination de l'imposition à l'existence d'un établissement stable et, à l'inverse, l'extension de la taxation à tous les services rendus à un résident ou mis à sa charge. Mais on trouve, en fait, toutes les combinaisons possibles en fonction de l'endroit où le service est rendu, utilisé ou rémunéré. Les modalités d'imposition sont également très diverses, même si la pratique d'une retenue à la source est généralement observé.

L'application de la convention modèle de l'O.C.D.E., qui prévoit l'imposition au profit de l'Etat de la résidence des revenus de ce type, sauf si le contribuable dispose dans l'autre Etat de façon habituelle d'une base fixe, est d'une application de plus en plus générale, du moins entre pays industrialisés. De même, s'agissant d'artistes ou de sportifs, la conception plus extensive du droit d'imposer reconnue à l'Etat d'exercice de l'activité selon la même convention est largement suivie. De la sorte, le bon fonctionnement des conventions a réduit, de façon satisfaisante, le nombre des cas de double imposition. Il reste, comme le souligne le rapporteur dans ses propositions, qu'il serait souhaitable de parvenir à une harmonisation plus poussée des régimes d'imposition en vigueur dans les différents pays. D'autre part le caractère forfaitaire de certains prélèvements ne devrait pas excéder la capacité contributive réelle des prestataires de services.

La qualité des travaux présentés par les rapporteurs généraux, avec l'aide de leurs collègues nationaux, la rigueur de leurs analyses et le soin apporté à la formulation de leurs conclusions doivent permettre que s'instaure, à MONTREAL, sur les deux sujets retenus, un débat approfondi et enrichissant.

Pour compléter le programme, trois séminaires prendront place au Congrès de MONTREAL. Le premier développera les objectifs et les conséquences du système d'imputation et devrait donner lieu à des échanges de vues doctrinaux et pratiques des plus vifs. Le second mettra en lumière les aspects récents de l'évolution de la législation fiscale canadienne et sera l'occasion pour les participants de recueillir à la source une documentation du plus grand intérêt. Le dernier, enfin, traitera du projet de convention à intervenir entre le Canada et les

Etats-Unis: même s'il intéresse au premier chef les ressortissants des deux pays, il sera certainement suivi avec attention par un grand nombre de congressistes.

Il me reste à former des voeux chaleureux pour la pleine réussite, au plan scientifique comme au plan amical, du Congrès de MONTREAL.

The Congress of Montreal 1982

For the first time since I took over from Alun DAVIES in Berlin last year, I address the readers of the *Bulletin for international fiscal documentation*. Through this special issue, which everyone attending the congress will find in his congress kit, I also address all the members of our association.

First of all I would like to say farewell to Mr. K.V. ANTAL, who has just resigned as president of the Board of Trustees of the International Bureau of Fiscal Documentation after 15 years of dedicated work. I extend a hearty welcome to his successor, Professor A. NOOTEBOOM, who was chosen to succeed him and whose nomination I have ratified with pleasure. I also take this opportunity to emphasize the high quality of the documentation and studies that the Bureau, under the active guidance of Mr. J. VAN HOORN and his staff, offers tax experts all over the world, thus enhancing the fame of our association.

As usual, I will now present the programme of our 36th congress to the readers of the *Bulletin*.

In 1981 we held our meeting at one of the outposts of the western world, in a city which is the living witness of the division of our planet. This year we are holding our congress several thousand kilometers further west, at the invitation of the Canadian chapter, in one of the most attractive cities of the American continent and in a young country which has understood how to reconcile harmoniously the two cultures which it comprises. After the torn Old Europe, the cultural melting pot of the New World. . .

We are offered two subjects of great interest, which are especially topical as they concern two main factors in the development of international relations, namely the flow of capital and the movement of persons. In fact, both

© 1982 International Bureau of Fiscal Documentation – BULLETIN

subjects show only a specific aspect of the operation of these factors. However, the increasing internationalization of enterprise financing as well as the development of modern technology invest the problems which will be dealt with in MONTREAL with an indisputable importance and significance.

The first subject concerns the tax regime of interest on transnational loans. At previous congresses interesting contributions have been made to the study of this matter. I would mention, for example, the studies on the taxation of related corporations in 1971, differences in fiscal treatment between local and foreign investors in 1978 and, last year, unilateral measures for the avoidance of double taxation. But it would certainly be useful to undertake an exhaustive study of the problem and we must be grateful to Prof. HÖHN for having arranged with great clarity the various questions on the subject in his general report and also for having brought about a brilliant synthesis.

The main problem arises from the fact that most countries want to receive taxes both on the amount of interest paid to non-residents and on the interest received by their own residents. Thus, the principles of source and domicile are simultaneously applied. In most cases, and especially between industrialized countries, this conflict is resolved through the conclusion of international conventions which provide for some kind of allocation of the income to be taxed between the two interested tax authorities.

This allocation is usually effected in conformity with the recommendations laid down in the model conventions of the OECD and the United Nations. However, notwithstanding the existence of tax conventions, tax withheld at source - which is imposed on the gross amount - cannot always be fully credited against the income tax which is due in the country of residence and which is levied on net interest: double taxation therefore remains to some extent. In contrast, where a fixed credit is granted which exceeds the tax actually withheld at source as is, for instance, often the case between developed and developing countries, there may be a partial exemption.

Where no international conventions exist, there are a great number of unilateral provisions which aim at remedying the double taxation of income from loan capital. In short, the measures which have been taken at international and national levels tend to ensure a satisfactory degree of neutrality and do not constitute an obstacle to the financing of investment.

Remaining problems concern, rather, the requirement that in order to obtain the elimination of double taxation, the rate of interest paid to the creditor must be in conformity with market conditions, especially in the case of parent companies: the labelling of interest deemed excessive as dividend may result in additional tax, in particular when such qualification is not fully accepted by the tax authorities in the country of residence.

The second subject which is submitted for our consideration concerns the tax regime applicable to the remuneration of services rendered by a non-resident carrying on independent activities. The General Reporter, Mr. Gérard Coulombe, has examined the twenty four national reports and his analysis, which is very relevant and very thorough, permits us to appreciate fully the problems which may beset a person supplying services and who performs his activities in a foreign country. It should in the first place be noted that there are interesting similarities in the national legislations, especially with respect to the criteria used to distinguish between independent and dependent personal activities, even where these two types of activity have developed concomitantly.

In contrast, the conditions under which services rendered by a non-resident in the framework of independent activities are taxed vary considerably from one country to another. There are two extreme positions: in some cases, the existence of a permanent establishment is a prerequisite for taxation whereas in other legislations tax is levied on all services which are supplied or charged to a resident person. However, one actually finds all kinds of possible combinations under which taxation may be based on the place where the service is rendered, utilized or remunerated. The manner in which taxation is effected also varies significantly, although in practice tax is generally withheld at source.

The application of the OECD Model Convention which prescribes that tax should be levied on this kind of income by the State where the recipient has his residence, except when the taxpayer habitually possesses a fixed base in the other State, is becoming more and more general, at least among industrialized countries. Also, with respect to artists and sportsmen, the more extensive concept to be found in the OECD Model Convention, under which the State where the activities are performed is permitted to impose tax, is now widely followed. Thus, a smooth functioning tax treaty network has satisfactorily reduced the number of cases of double taxation. As the General Reporter emphasizes in his suggestions, one problem remains which it is desirable to solve, i.e. a better harmonization of the tax regimes which are in force in the various countries. On the other hand, fixed withholdings should not exceed the capacity of persons supplying services to pay tax.

The quality of the studies presented by the General Reporters with the help of their national colleagues, the accuracy of their analyses and the careful formulation of their conclusions must result in a profound and rewarding discussion of the two selected subjects.

To round off the programme, three seminars will take place at the MONTREAL congress. The first will consider the aims and consequences of the imputation system and should provide an opportunity for a very lively exchange of theoretical and practical views. The second will shed light on the latest developments in Canadian fiscal legislation and will give participants the opportunity to obtain highly interesting first hand information. And last, the third seminar will deal with the new tax treaty which Canada and the United States are contemplating to conclude: even though it is of first and foremost interest to nationals of these two countries, this seminar will certainly be attended with interest by a large number of participants.

Let me finally express my warm wishes for a successful congress in Montreal, both on its scientific and social sides.

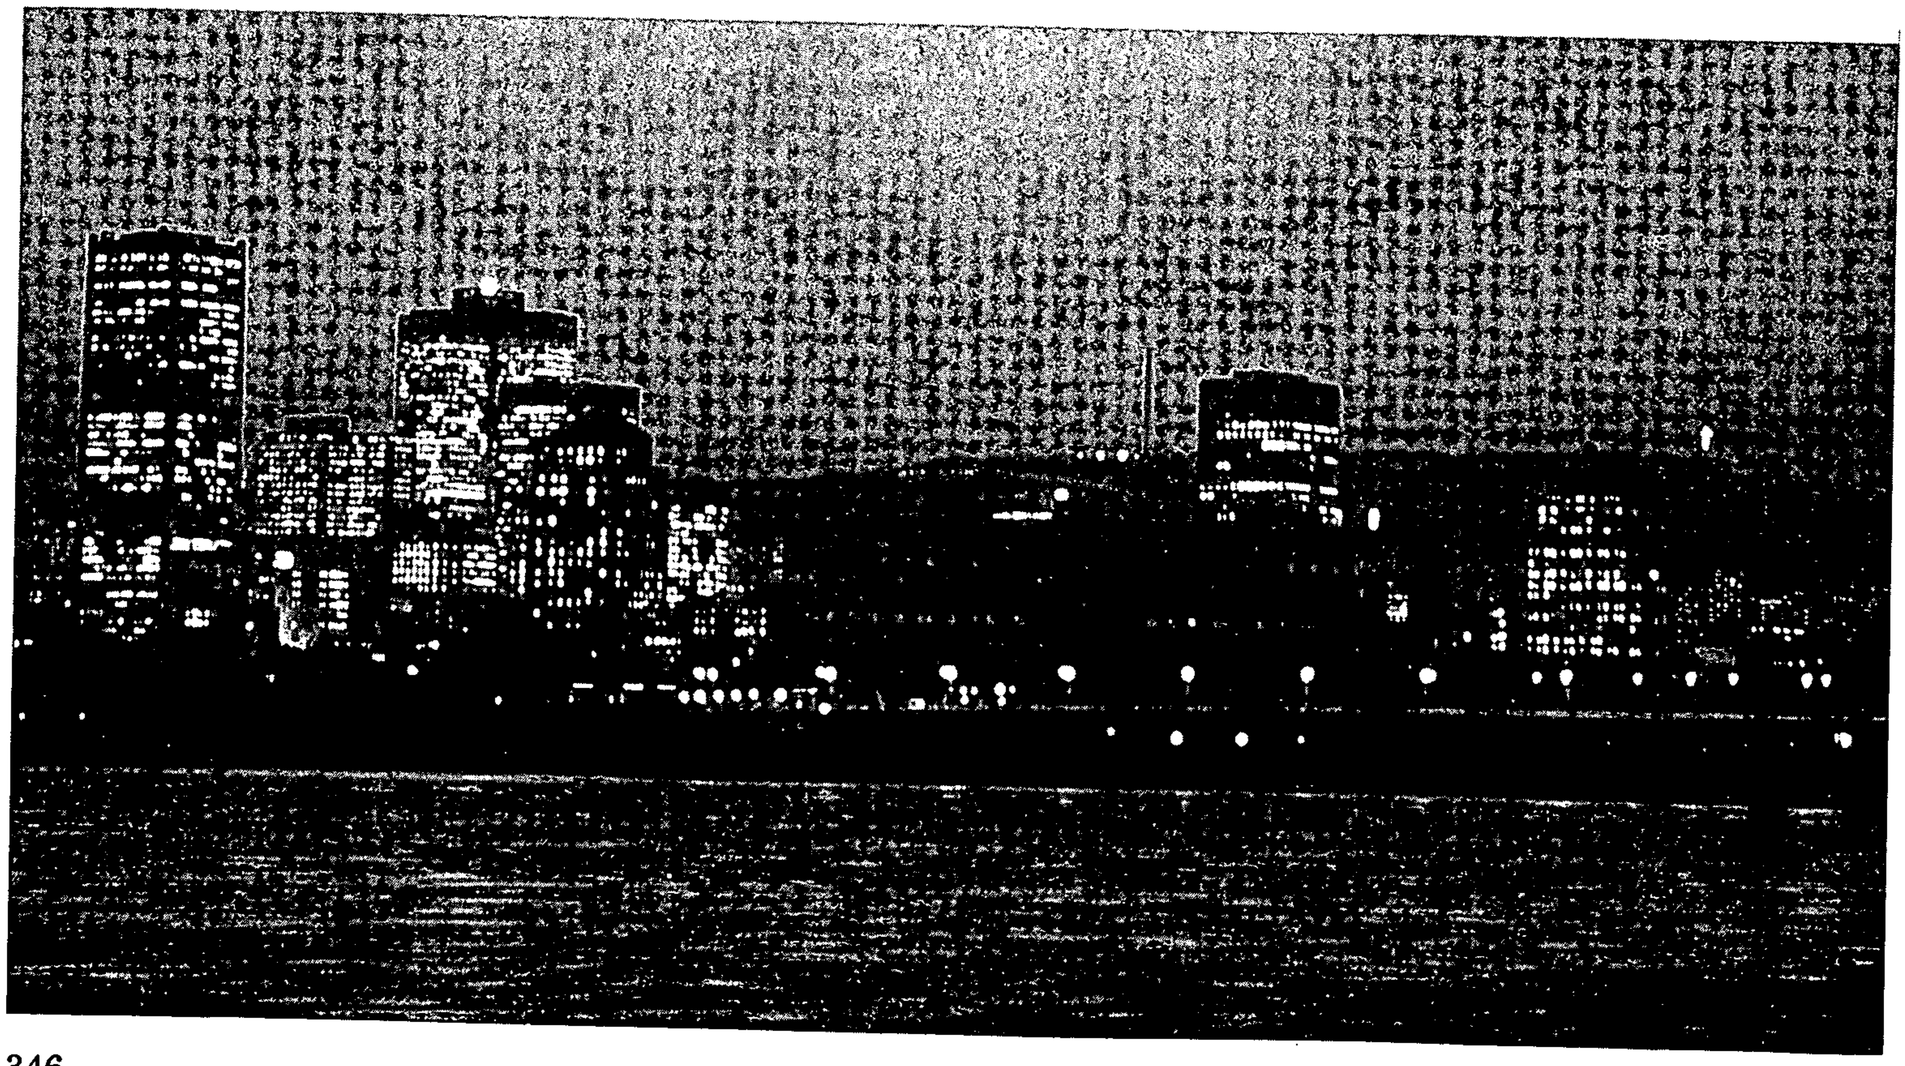
INTRODUCTION

With the advent of the 1982 IFA Congress in Montreal, it was considered appropriate to have some articles in the *Bulletin* commenting on the Canadian fiscal scene for the benefit of non-Canadian participants. To this end 5 papers have been assembled, each written by a separate and qualified fiscal expert. Each article covers a facet on the subject in terms which it is hoped will give the non-Canadian reader a useful overview of a field in which he may have an interest and yet also be sufficiently detailed and technically accurate to provide him with points of departure should he wish to study any particular area in greater detail.

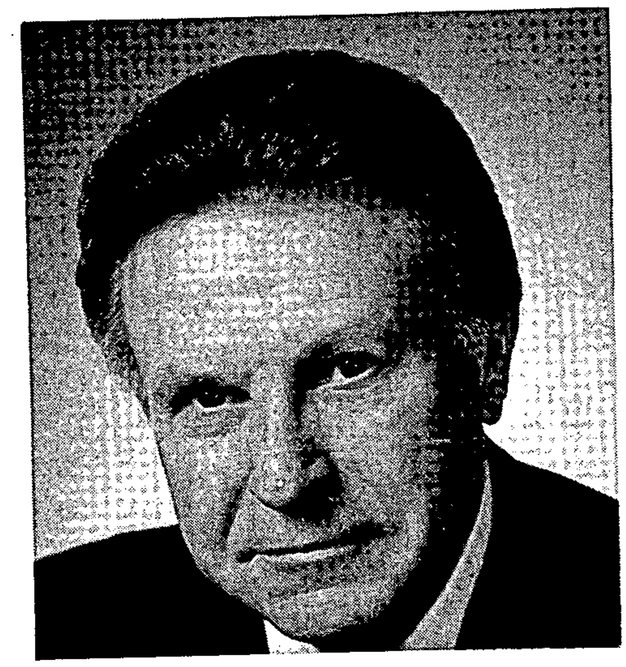


Two of the articles deal with doing business: one in Canada by non-residents ("Structuring Investments and Business Start-ups in Canada", by Nathan Boidman, a Montreal lawyer and international tax practitioner), the other doing business abroad by Canadians ("Taxation of Offshore Income and the Canadian Treaty Network", by H. Heward Stikeman, Q.C., also a lawyer practicing domestic and international tax law, based in Montreal and Toronto).

In addition to these rather specific articles, there are two more covering generalized fields: "The Influence and Impact of Canada's Tax Accounting Rules on Structuring Canadian Business Operations", by Edwin C. Harris, Q.C., a tax lawyer and lecturer in tax law at Halifax; and "Working with Canada's Statutory and Discretionary Industrial and Petroleum Assistance Program", by Peter McQuillan, C.A., a senior tax partner with Ernst & Whinney in Toronto. Mr. Harris's article deals with a subject that is important for any understanding of Canadian fiscal legislation: the growing divergence between the rules of tax accounting and the rules of public accounting. This divergence, which has been necessitated by the artificial structure of a so-called neutral tax system, often influences the choice of various courses of action in the commercial and financial world.

The article by Mr. McQuillan deals with the growing field of government grants and assistance programs which complement the fiscal system. These government programs either utilize the tax laws themselves or run parallel to them in such a fashion that any consideration of a problem based solely on the taxing statutes may be incomplete without a reference to and a knowledge of the various assistance programs that may affect it. Of particular importance, of course, is the recently introduced Canadian National Energy Program.

Finally we have been fortunate enough to obtain an article by the Federal Finance Minister, the Hon. Allan J. MacEachen, P.C. who describes how government fiscal needs and expenditure programs are developed. In particular he deals with the well known but recently introduced Envelope System of government budgeting and its impact upon tax expenditures and the rising of government revenue by fiscal measures.



It is hoped that this collection of articles will, within the covers of one small volume, provide a comprehensive view of the Canadian fiscal scene.

Integration of Tax Expenditures into the Government Fiscal Management System

by the Hon. Allan J. MacEachen
Deputy Prime Minister and Minister of Finance

Mr. MacEachen (61) received an M.A. from the University of Toronto.

He became professor of economics at St. Francis Xavier University at the age of 25.

Mr. MacEachen first entered federal politics in 1953.

In 1955, he attended the General Assembly of the U.N. as Parliamentary observer. He was alternate delegate in 1956 to the Economic and Social Council of the UN in Geneva.

In April 1963, he was appointed Minister of Labour. He, inter alia, piloted the Canada Labour Code through Parliament.

Mr. MacEachen was appointed Minister of National Health and Welfare in December 1965, and brought forward a series of major programs in the social security field.

Mr. MacEachen was Government House Leader in 1967-1968 and served as Chairman of the Committee on the Reform of Parliamentary Procedure.

In 1968 he was appointed Minister of Manpower and Immigration.

From 1970-74 he was President of the Privy Council and Leader of the Government in the House of Commons.

In August 1974, Mr. MacEachen became Secretary of State for External Affairs. He was responsible for the direction of Canada's effort at the Law of the Sea Conference. In June 1976, he announced the establishment of a 200-mile economic management zone for the continental shelf. Mr. MacEachen was also responsible for the Agreement on Commercial and Economic Cooperation between Canada and the European Economic Community. Between December 1975 and June 1977 he was co-chairman of the 27-nation Conference on International Economic Cooperation which was aimed at laying the basis for a more equitable world economic order. He also initiated Canada's successful bid for election to the Security Council of the United Nations.

In September 1976, Mr. MacEachen was appointed President of the Privy Council and Leader of the Government in the House of Commons. On September 16, 1977, Mr. MacEachen was appointed Deputy Prime Minister of Canada. He conducted the negotiations that led to the Northern Gas Pipeline Agreement with the United States in September, 1977 and subsequently piloted the Northern Pipeline Act through the House of Commons.

After the general election of February 18, 1980, he was appointed Deputy Prime Minister and Minister of Finance.

For the year 1980/81 Mr. MacEachen was appointed Chairman of the Group of Ten. In May 1981, Mr. MacEachen was elected, in Gabon, Chairman of the Interim Committee of the International Monetary Fund.

A proper fiscal management system is an important preoccupation of governments of most of the countries in the world. The principal objectives of a fiscal management system are to control the growth in public spending and to ensure an efficient allocation of public funds to various priority areas. It is also important that the system provide adequate opportunity for an ongoing review of the fiscal initiatives taken in the past, permit flexibility in shifting resources from one policy area to another in response to changing priorities, and provide for financial control.

To better achieve these objectives, Canada has recently adopted a new fiscal management system, under which the overall outlays of the federal government are divided into several broad policy areas or "envelopes". The spending decision within each envelope is then delegated to a committee of Ministers responsible for the policy areas within that envelope. While this system is similar in many respects to that found in some other countries, one unique feature of the system in Canada is the integration of tax expenditures or selective tax preferences within the system. This integration of tax expenditures into the system is in recognition of the fact that a variety of instruments may be used to achieve given policy goals. These instruments include grants, direct expenditures, loans and guarantees, and tax incentives. An appropriate fiscal management system should give a place to all of these alternatives so that the most appropriate mechanism is chosen. It should not bias the choice of instruments in a manner that is detrimental to the achievement of overall policy objectives.

THE ENVELOPE SYSTEM

The new fiscal management system, or the envelope system, as it is referred to, was adopted in response to a number of concerns that had developed over a period of years. The previous structure of federal government expenditure management presented certain difficulties which were articulated by successive Auditors General and by the government's Comptroller General. In November 1976 the government appointed the Royal Commission on Financial Management and Accountability, known as the *Lambert Commission*. The Commission's final report noted:

> Our review of the existing financial planning process revealed several fundamental weaknesses. None of the participants is held effectively accountable. Expenditures are proposed by departments in ignorance of projected revenues and without their being related to priorities. There is no public commitment to an expenditure plan and consequently no basis for effective parliamentary review. Finally, there is little public participation in expenditure planning.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Another important consideration was the effort by the Canadian government, like the governments of many other Western countries, to restrain the growth of the public sector. Expenditures since 1975-76 have been kept to an average growth rate slightly below that of GNP. This is reflected in the decline in the ratio of "total outlays", which is the sum of budgetary expenditures and non-budgetary loans, investments and advances, from 22.9% GNP in 1975-76 to 20.2% in 1980-1981. Such a period of restraint creates special pressures on a fiscal management system and highlights the need for an effective allocation of resources in relation to priorities including an effective review of existing programs.

The 1970s also saw rapid changes in Canadian society and many new issues facing governments. New government departments and agencies evolved and existing departments found more than ever that their responsibilities were intertwined with other policy areas. Clearly, this situation requires a high degree of budgetary control and a system that is designed to highlight trade-offs between competing programs.

The envelope system is intended to deal with the problems identified by ensuring greater Ministerial control over both policies and expenditures. The envelope system does this by assisting Ministers in integrating policy making and fiscal and expenditure planning within the Cabinet Committee system.

The outline of the basic system is quite straightforward. Its basis is a medium-term fiscal plan encompassing revenues and expenditures over a 5-year period. Each year, the Cabinet reviews the overall level of expenditures on recommendations by the Minister of Finance and President of the Treasury Board. These overall expenditures are then divided into 9 allocations for broad policy areas, or 9 envelopes as they are called. Formally, an envelope is an authorized expenditure limit, expressed in current dollars for the fiscal year in question. The 9 envelopes are Economic Development, Energy, Social Affairs, Justice and Legal, Fiscal Transfers to Provinces, External Affairs, Defence, Parliament, and Services to Government. A separate account is maintained for the costs of public debt.

Overseeing the operation of each envelope is a policy Committee composed of Cabinet Ministers with responsibilities in the policy area of the envelope. These committees have the responsibility of allocating expenditures within the envelope to particular departments and programs.

Each Policy Committee is provided with a basic operational level of expenditures within its envelope. This provides for the forecast cost of existing programs and an operating reserve to meet cost overruns, although the Treasury Board works throughout the course of the year to identify program savings to avoid net overruns in expenditures where possible.

Policy Committees may also be provided with additional amounts for the financing of new or enriched programs or they may be required to reduce expenditures. Policy Committees control the allocation of funds for new or enriched programs and designate existing programs that can be reduced or eliminated within their policy area.

The Policy Committees thus have two sources of funds for new or expanded programs. These are additional amounts provided for an envelope in the annual review by Cabinet and reallocation of amounts from existing programs. The incentive to identify programs that can be reduced or eliminated, thereby freeing funds for uses that are currently more in line with government priorities, is crucial to the system and makes it an effective means of fiscal management.

The foregoing represents a brief summary of the system in terms of expenditures. As was indicated earlier, this fiscal management system does not differ in broad outline from that used in some other countries. However, a unique feature of the Canadian system is its treatment of tax expenditures.

TAX EXPENDITURES AND THE ENVELOPE SYSTEM

The inclusion of tax expenditures in the fiscal management system is a very important feature and one that is of particular relevance in regard to the responsibilities of the Minister of Finance. The integration of the tax and expenditure sides of the budget reflects several considerations and experience gained in the period of restraint since the mid-1970s.

The basic concept of a tax expenditure is a provision in the tax system which provides certain taxpayers with preferential treatment in comparison to a benchmark tax structure. The benchmark tax structure is one that provides no preferential treatment to taxpayers on the basis of demographic characteristics, sources, or uses of income, geographic location or any other special circumstances applicable only to a given taxpayer or particular group of taxpayers. The preferential treatment or deviation from the benchmark may be in the form of deductions from income, exemptions, tax deferrals, lower tax rates or credits.

Tax expenditures are, in many respects, a substitute for direct spending. They both implement government priorities. As well, they both lead to increases in the budget deficits or require program cutbacks or increases in the general tax revenues for their financing. A proliferation of tax incentives eventually means higher tax rates for all because of a reduced tax base, which, in turn, has potentially serious implications for incentives to work, save and invest. Tax expenditures, just as direct expenditures, represent a form of government intervention in the economy. This, in itself, suggests that decisions about tax expenditures should be integrated into the fiscal management system.

Another consideration is that the size of tax expenditures is substantial, in both the number of items and the aggregate value of revenues foregone. In several policy areas they rival the value of direct spending. Moreover, tax expenditures were growing rapidly. From 1976 to 1979, the rate of increase in the value of tax preferences was some 50% higher than the rate of increase in direct spending.

It was perhaps not surprising that a period of rapid growth in tax expenditures coincided with increasing efforts to restrain government spending. Under the previ-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

ous system additional funds directed to a policy area by tax expenditures did not affect the budget of the sponsoring department. With government expenditure restraint blocking all but the very highest priority new programs or expansion of existing programs from the mid-1970s, the introduction of new tax expenditures thus became one of the few avenues available for government program Ministers to pursue policy objectives that they quite legitimately identified in their areas of concern. It created strong incentives for each program Minister to seek new tax expenditures in his area of responsibility, usually with the support of the population groups or industrial sectors whose interests he or she was expected to represent. The Minister of Finance was placed in the lonely position of attempting to couple expenditure restraint with deficit reduction while maintaining the credibility of the tax system as a fair and effective means of raising government revenues.

The process of integration of tax expenditures into the fiscal management system comprises a number of elements. In the normal course of events, a program Minister would, initially, identify various alternative means of achieving a given policy objective and consider their relative advantages and disadvantages. These would then be reviewed by the relevant Policy Committee to determine if any policy action is warranted and if there are adequate funds set aside for it within the envelope. If it is the view of the Committee that the given policy objective is best achieved by a new tax expenditure item or extension of an existing one, the measure is then forwarded to the Minister of Finance who has the overall responsibility for the tax system. If the measure does not conflict with the basic objectives of the tax system or give rise to other structural or technical anomalies, then the Minister concurs with its adoption, and the cost of the measure is debited to the envelope for that policy area.

One crucial feature of this system is the concurrence of the Minister of Finance with the adoption of any tax measure. This is based on the need to maintain a tax system that operates in a fair and effective fashion. Unlike individual expenditure programs that can operate to a large extent almost independently of the other programs, the tax system is an integrated one. Changes in one part of the system may lead to repercussions elsewhere in the system. The Minister of Finance might not consider it desirable to proceed with a given tax change if, for example, it were to lead to significant difficulties in compliance and administration or give undue benefits to certain groups of taxpayers and thereby calling into question the fairness of the whole system. A tax incentive to one group or in respect of one activity might lead to pressures for similar incentives to other groups or in respect of other activities. It might sometimes be easier to resist such pressures when the incentive is provided through a direct expenditure program as opposed to the tax system.

Tax changes may also flow in the opposite direction, that is, the Minister of Finance may propose changes to a Policy Committee with the cost of the new tax expenditure to be charged to their envelope. Finally, the Minister of Finance may introduce changes on his own initiative for tax policy, fiscal policy, or administration grounds without giving rise to adjustments in envelopes.

In integrating tax expenditures into the financial management system, a key issue involves the treatment of existing tax expenditures. Should these existing tax preferences be assigned to envelopes and form a portion of the envelope entitlement? The decision taken was to exclude existing tax expenditures from the system.

While this may be considered a flaw in the implementation of the system, I believe it was a necessary and practical step that does not detract from the potential effectiveness of the system. First, the definition of a benchmark tax system against which to measure tax expenditures is far from a clear cut task. Commentators can differ sharply on such features as the appropriateness of using the individual or family as a unit of taxation, or assumptions about the integration of corporate and personal income taxes. When the tax expenditure accounts are for informational purposes, these questions of definition are not an obstacle to their presentation and use. They would, however, become of paramount importance if the full accounts were to be integrated into the fiscal management system. It was found that most of these issues arose in the context of existing tax provisions and that it was relatively easy to determine whether a new change was a tax expenditure or part of the benchmark structure.

The implication of this exclusion of existing tax expenditures is that their elimination or reduction does not provide additional amounts for an envelope, although the envelope could be credited by an appropriate amount where the Policy Committee recommends a cut-back in tax expenditures as part of a package to retarget fiscal incentives in a given policy area. In general, only tax incentives that have been provided for within the envelope system, i.e. new tax expenditures, will give rise to additional funds within when they are eliminated.

The integration of tax expenditures should have two direct influences on the frequency and the nature of tax proposals arising from program Ministers. First, program Ministers discuss the request for tax expenditures within their Parliamentary Committee as part of the actual budgetary process for their envelope, and thus should have vital interest in screening requests for tax expenditures coming out of the Committee. Second, since tax expenditures and direct expenditures both impact on the available amount of funds in an envelope, the decision to seek delivery through the tax system versus the expenditure system will be based on the relative merit of the two approaches.

The tax system may be a more advantageous way to carry out government policy for a number of reasons. First, the tax system is a self-assessment system and taxpayers themselves have the discretion to act on an incentive themselves. The degree of bureaucratic discretion and "red tape" is thus limited. Second, the tax system contains well-defined concepts and considerable information that, if used in delivering incentives, may simplify the process considerably. Finally, in the Canadian federal system, the tax system lends itself to joint federal and provincial action because income taxes are, in most cases, imposed on a common base.

However, there are also a number of negative consequences which may flow from the use of tax expenditures rather than direct expenditures. Tax incentives fre-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

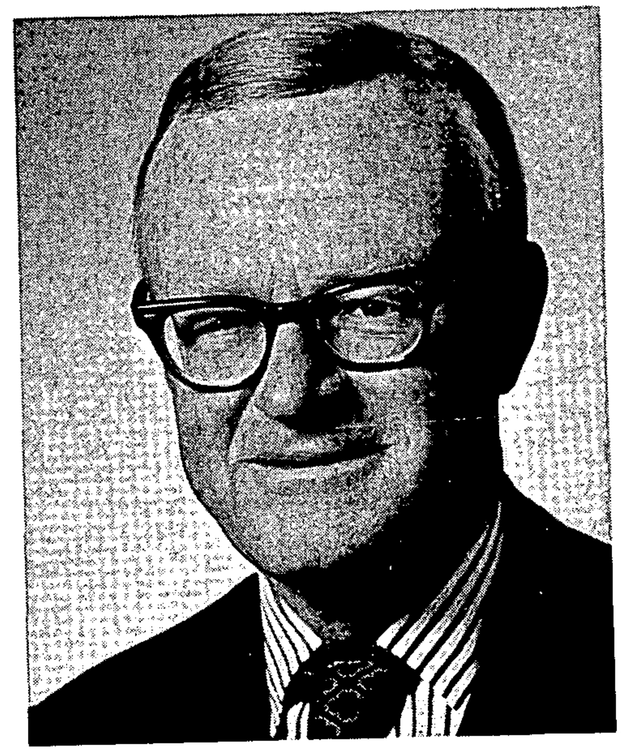
quently have effects that run counter to maintaining the fairness of the tax system. For example, deductions from income are generally of more benefit to those with the higher marginal tax rates.

Tax expenditures, once put in place, have proved remarkably difficult to remove with their elimination always billed as a tax increase. Tax expenditures are thus likely to remain in place past the time when they are required. It is also difficult to determine the actual advantage of tax preferences to various groups in the economy as the number of such incentives multiply, because the incentives often interact with each other and may be offsetting.

Tax statutes need to be extremely precise because of the self-assessing nature of the Canadian tax system. With precision comes complexity and opportunities for tax planning activities which may reduce the amount of time and effort devoted to productive activity. The precision required also eliminates discretion, which in some cases may make a program much less flexible and responsive than is desirable. Finally, tax expenditures do not lend themselves to strict budgetary control. They must be available to all persons meeting the criteria established.

The new system adopted in Canada is designed to ensure that all these factors are given adequate consideration in the choice of instruments for achieving the given policy objective.

CONCLUSION



Canada has only recently adopted a system of fiscal management that incorporates tax expenditures. The system holds considerable promise in improving government decision-making, helping government in achieving fiscal restraint and ensuring that the most appropriate vehicle is used, whether that be the tax system, the expenditure system or loans and advances, when government intervention in the economy is desirable.

There are some very encouraging signs. Tax expenditures are taking their place in public and parliamentary debates. There is now generally more awareness of the limitations in the use of tax incentives for achieving policy objectives.

Taxation of Offshore Income and the Canadian Treaty Network

by H. Heward Stikeman

H. Heward Stikeman, Q.C.
Senior Partner: Stikeman, Elliott, Tamaki, Mercier & Robb, Montreal, P.Q.
Senior Partner: Stikeman, Elliott, Robarts & Bowman, Toronto, Ont.

Educated at Trinity College School and McGill University where he received his B.A. and B.C.L. in 1938. Mr. Stikeman served as Assistant Deputy Minister (Legal) to the Income Tax Division of the Department of National Revenue in Ottawa during the second world war. After leaving the post in 1946, he was appointed Counsel to the Committee of the Senate formed to study and recommend a reformation of Canada's income tax laws. In this position he was responsible for the redrafting of much of the new Income Tax Act that emerged after the war. Concurrently with this task, he joined the form of Foster, Hannen, Watt, Stikeman and Elliot. In 1952, he formed his own law firm which has since become Stikeman, Elliot, Tamaki, Mercier & Robb where he is continuing his practice in taxation and administration law. In 1969, the firm opened a European office based in London, England. Since that time, the firm has opened offices in Hong Kong and Ottawa. In 1971, he and Mr. Elliot joined with the Honourable John P. Robarts, on his retirement from the premiership of Ontario, and with Mr. D.G.H. Bowman, formerly Director of Tax Litigation of the Department of Justice, to form a parallel law firm in Toronto under the name of Stikeman, Elliott, Robarts & Bowman.
He is an ex-governor of the Canadian Tax Foundation, Editor-in-Chief of the many tax publications of Richart de Boo Limited in Toronto, a director of a number of Canadian companies, and a member of the Bars of Quebec and Ontario.

In his accompanying article, Nathan Boidman has dealt with the appropriate structures by which non-residents may start up businesses in Canada. Ed Harris in turn has shown how the tug of war between income tax law and the principles of public accounting has helped shape Canadian income tax patterns.

The foregoing articles leave open for consideration some areas in which Canadian taxation affects Canadians, corporations and individuals investing or carrying on business outside of Canada. Any examination of this facet of Canadian income tax law must take account of the part which Canada's international treaty network plays in influencing overseas investment decisions by Canadians.

Throughout Canada's principal taxing statute, the Income Tax Act, R.S.C. 1952, c. 148, as amended by S.C. 1970-71-72, c. 63 (hereinafter ITA), are scattered isolated provisions with specific relevance to international taxation. In addition, there are certain areas of the Act which address themselves only to non-residents.[1] These last are dealt with in the paper by Nathan Boidman. Other provisions of the Act are only concerned with Canadians having interests abroad.[2] Finally, there are provisions which, though they do not distinguish between residents and non-residents, are of great importance when dealing with the subject of international taxation.[3]

The federal budget of 12 November 1981 contained a number of proposals for the amendment of the ITA which, if ever implemented, will radically alter many of its provisions. Reference should be made to the paragraphs of the Notice of Ways and Means Motion to amend the Income Tax Act that accompanied the Budget.[4]

Canada also has a network of tax treaty relationships with other countries which must always be considered as part of its fiscal law. However, before becoming part of the laws of Canada, a treaty must be enacted as a statute, instruments of ratification be exchanged, and only then will the treaty take effect in accordance with its terms. Lord Atkin in *Attorney General for Canada* v. *Attorney General for Ontario*[5] says:

> Within the British Empire there is a well established rule that the making of a treaty is an executive act, while the performance of its obligations, if they entail alteration of the existing domestic law, requires legislative action. Unlike some other countries, the stipulations of a treaty duly ratified do not within the Empire, by virtue of the treaty alone, have the force of law. If the national executive, the government of the day, decide to incur the obligations of a treaty which involve alteration of law they have to run the risk of obtaining the assent of Parliament to the necessary statute or statutes. To make themselves as secure as possible they will often in such cases before final ratification seek to obtain from Parliament an expression of approval. But it has never been suggested, and it is not the law, that such an expression of approval operates as law, or that in law it precludes the assenting Parliament, or any subsequent Parliament, from refusing to give its sanction to any legislative proposals that may subsequently be brought before it.

U.S. tax on real property gains by foreigners

1. Branch or subsidiary?

Generally speaking, the Canadian taxpayer dealing abroad will be faced with the same type of decision which confronts a non-resident coming into Canada. The Canadian taxpayer will consider a number of factors, many of which have also been reviewed by Nathan Boidman in his parallel article from the viewpoint of a non-resident dealing with Canada. Moreover, certain considerations must be weighed as regards transfers between parents and subsidiaries, and Canadian and foreign business operations. The use of a foreign branch is unusual, however, and generally confined to situations involving an unprofitable overseas operation. The profits earned by the foreign branch are deductible. This ability to deduct losses has prompted the use of foreign branches by Canadians in launching businesses abroad. Likewise, Canadian companies have established foreign branches during the start-up years in which losses could be anticipated so that these losses serve to offset other Canadian income. If it is expected that the losses will continue indefinitely or that the operations in the foreign jurisdiction will be run on a break-even basis, the branch is probably the best approach. If a Canadian subsidiary is used, losses in start-up years can only be applied against income earned by the subsidiary. On the other hand a profitable subsidiary will pay less tax if foreign tax rates are lower than those of Canada.

2. Differences in tax structures

As long as the Canadian taxpayer is not earning a profit on his foreign business operations, differences in tax structure between Canada and the foreign jurisdiction are of little interest. As soon as the branch begins to turn a profit, however, the Canadian taxpayer may decide to incorporate it. This decision may be prompted by a variety of tax considerations:

(i) the tax rates on business profits may be more attractive in the foreign jurisdiction than in Canada and neither the Canadian small business deduction nor the deduction of manufacturing and processing profits can be claimed in respect of foreign operations;[6]
(ii) tax incentives available in foreign jurisdictions may not be available in Canada; and
(iii) tax costs associated with remaining in Canada can be reduced or even eliminated.

3. Tax consequences of incorporating foreign branch operations

It is not possible for a Canadian taxpayer to utilize the rollover provisions of Section 85 ITA to transfer assets to a corporation which is not a Canadian corporation[7] except in the case of a transfer of shares in a foreign affiliate to a corporation which, immediately following the transfer, was also a foreign affiliate of the Canadian taxpayer. The Canadian taxpayer interested in doing business abroad must, therefore, decide at the very beginning of his foreign operations what form he wishes them to take. A transfer of property to a foreign subsidiary will subject the transferor to immediate Canadian tax on recaptured amounts of depreciation, capital gains and proceeds for goodwill. Where, however, such a transfer would result in a loss to the transferor, even though a rollover would be denied if a profit were involved,[8] the transferor's capital loss is deemed to be nil. An amount equal to the capital loss "disallowed" or "not recognized" is added to the adjusted cost base of the shares of the transferee corporation controlled by the transferor. In the case of a labour-intensive enterprise, the Canadian taxpayer could conceivably close his branch, and, using a subsidiary, start up his foreign operation a second time. Another alternative would be for the Canadian to transfer the assets to a Canadian subsidiary, leasing them to the foreign branch. See, however, the possible effect of Budget Resolutions Nos. 64 and 65.[9]

4. Withholding tax

It should also be noted that Canadian withholding tax could be exacted from payments to non-residents made in the course of a branch business. This tax liability would be eliminated if the Canadian incorporated a foreign subsidiary.

5. Loan arrangements between Canadian parent and foreign subsidiary

When a corporation resident in Canada loans money to its non-resident subsidiary and the loan remains outstanding for a year or longer without interest at a reasonable rate having been included in computing the parent's income, interest at the rate of 16% per annum (as of 1 January 1982) on the outstanding balance will be imputed to the parent and taxed in its hands.[10] The lender can, however, escape imputation if it withholds tax on the amounts advanced.[11] When the loan is made to a subsidiary controlled corporation and the money is used in the subsidiary's business for the purpose of gaining or producing income, no interest is imputed to the parent.[12] If more than 50% of the voting shares of the subsidiary belong to the parent, the latter qualifies as a "subsidiary controlled corporation".[13] In a recent decision of the Tax Review Board, *Distillers Corporation - Seagrams Ltd.* v. *M.N.R.*,[14] it was held that the word "belong" in the definition of "subsidiary controlled corporation" must be interpreted as connotating "property" and consequently that the parent's control must be direct. See, however, the possible effect of Budget Resolution No. 14.[15]

In *Massey-Ferguson Ltd.* v. *M.N.R.*[16] the plaintiff loaned $1,000,000 to its wholly-owned Canadian subsidiary. The latter subsequently reloaned the money to its wholly-owned American subsidiary. The Federal Court, Trial Division held that the substance of the transaction was a loan from the plaintiff to a non-resident corporation. No legitimate business purpose explained the involvement of the plaintiff's subsidiary. Nor could the plaintiff claim the benefit of the exemption contained in Subsection 17(3) ITA: the borrower was not a controlled subsidiary corporation because the plaintiff's control was indirect. This decision was reversed by the Federal Court of Appeal: cf. *Massey-Ferguson Ltd.* v. *M.N.R.*[17] Despite the appellant's admission that the arrangement was set up to circumvent Subsection 18(1) ITA, the evidence disclosed that the parties intended to and did, in fact, create first a debtor-creditor relationship between the appellant and its subsidiary, and secondly, between the Canadian subsidiary and the latter's American subsidiary. There was no such relationship between the appellant and the non-resident. The Court concluded that the loaning of money to subsidiaries was a legitimate part of the Canadian subsidiary's business and neither its business nor its corporate existence was a sham.

It is Revenue Canada's position that when a Canadian corporation has loaned funds without interest to a wholly-owned subsidiary and the latter invests the fund in the capital of a subsidiary which it controls, interest will not normally be imputed to the Canadian corporation if the only undertaking of the wholly-owned subsidiary is financing its own subsidiaries by lending them money at interest, or subscribing for shares of their capital stock, on the condition that the funds are ultimately used by the borrower for the purpose of gaining or producing income from its business. The number of loans and the interest rate charged would generally be factors in deciding whether such activity was a business. If the wholly-owned subsidiary makes an interest-free loan to its subsidiary, interest will be imputed because these funds are not gaining or producing income.

If the Canadian parent borrows the money which it loans to its non-resident subsidiary, the interest payable is deductible under paragraph 20(1)(c) ITA. It must be em-

---

free of foreign tax from the predecessor affiliates to the new affiliate,
(f) subsection 88(3) and paragraph 95(2)(e) of the Act relating to the liquidation of foreign affiliates of a taxpayer be amended to apply only to liquidations after November 12, 1981 of a foreign affiliate that was controlled by the taxpayer, and
(g) a rule be introduced to allow a tax-free transfer of any capital property on a liquidation after November 12, 1981 of a foreign affiliate of a taxpayer if the taxpayer's equity percentage in the foreign affiliate was at least 90% and the property was transferred free of foreign tax to another foreign affiliate of the taxpayer.

(65) That
(a) after November 12, 1981, the expression "excluded property" of a foreign affiliate be defined in the Act to mean property of an affiliate that is used in an active business of the affiliate, shares of the capital stock of another foreign affiliate all or substantially all of the property of which is excluded property and interests of the affiliate in partnerships, other than limited partnerships, in which the affiliate has at least a 10% interest where all or substantially all of the partnership property is used in an active business,
(b) any gain or loss of a foreign affiliate realized after November 12, 1981 with respect to indebtedness incurred for the purpose of acquiring excluded property be treated as a gain or loss from the disposition of excluded property,
(c) taxable capital gains and allowable capital losses of a foreign affiliate from the disposition after November 12, 1981 of excluded property (other than a disposition of shares to which paragraph 95(2)(c), (d) or (e) of the Act applies) be excluded from its foreign accrual property income,
(d) where at any time after November 12, 1981 a foreign affiliate disposes of shares of a second foreign affiliate that are excluded property (other than in a disposition to which paragraph 95(2)(c), (d) or (e) of the Act applies), an election under subsection 93(1) of the Act be deemed to be made in respect of such shares for a prescribed amount equal to the lesser of the proceeds of disposition and the amount that represents the portion of the net surplus of the second affiliate at that time that would be attributable to the shares sold if each foreign affiliate in which the second affiliate had an equity percentage had paid out its net surplus immediately before that time as a dividend, and
(e) a general anti-avoidance rule be introduced to deny the application of subsection 85.1(3) of the Act on a disposition after November 12, 1981 by a taxpayer of shares of a foreign affiliate, all or substantially all of the property of which is excluded property, to another foreign affiliate where the disposition is part of a transaction or series of transactions for the purpose of disposing of the shares to a person with whom the taxpayer deals at arm's length.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

phasized, however, that interest will only be imputed if the amount outstanding is actually a loan. Consequently, if the amount is owed under a creditor-debtor relationship, e.g. the balance owing on a purchase price, interest would not be imputed. Moreover, deemed interest will only be included in the parent's income so long as the lender-borrower relationship subsists. See, however, the possible effect of Budget Resolutions Nos. 12 and 23.[18] In the case of *Banister* v. *M.N.R.*[19] it was held that interest could not be imputed to the lender because the debt was validly extinguished according to provincial law.

In the provinces of Quebec and Ontario interest imputed to a parent company must be included in income whether or not the parent has paid tax on the amount of the loan under Part XIII of the federal Act.[20]

6. Inter-company pricing

A parent corporation, like any other party in a non-arm's length relationship, is required both to give and to receive adequate consideration when dealing with a subsidiary. Subsection 69(2) ITA provides that where a parent has paid or agreed to pay a subsidiary an amount for certain types of consideration which is greater than the amount that would have been reasonable in the circumstances if the two parties had been dealing at arm's length, then the reasonable amount only is deemed to have been paid. It should be noted that the criterion is not fair market value, but rather what would have been reasonable in the circumstances. The provision assures that the parent may not unreasonably reduce its Canadian income by way of overly large payments to its subsidiaries. Broadly speaking, this subsection is concerned with the price, rental, royalty or other payment paid or payable for use or reproduction of any property; consequently, payments for use and the actual price of property are both caught. Also included is any amount paid as consideration for the carriage of goods or passengers or for other services.

Subsection 69(3) ITA is the converse of Subsection 69(2) ITA and deals with payments by a non-resident subsidiary to its parent company. The enumeration of the types of payments involved is identical to that found above. Under this provision, where the amount is less than the amount which would have been reasonable in the circumstances if the non-resident payer and the payee had been dealing at arm's length, the reasonable amount is deemed to have been the amount paid or payable. Consequently, the parent may be forced to increase its taxable Canadian income in those circumstances.

However, the recent decision in the Federal Court of Appeal in *Spur Oil Ltd.* v. *The Queen*[21] would appear to give some support to the argument that so long as pricing is at fair market value or less, an arrangement entered into by the parties and clearly adhered to, though motivated by tax reasons, would not be artificial. See also *Dominion Bridge Company Limited* v. *The Queen.*[22]

The inter-company pricing rules are not a factor in determining whether a Canadian taxpayer doing business abroad selects a branch operation or incorporates a subsidiary. Rather, they affect the computation of branch profits if a branch operation is undertaken, as well as the incomes of both parent and subsidiary, if a second company is used.

7. Foreign tax credit and deduction of foreign taxes paid

Canadian residents who earn income from sources outside Canada may deduct, either wholly or partially, taxes paid to foreign countries from which their income is derived.[23]

There are a number of special rules for the computation and application of the foreign tax credit provisions that space prevents considering in this article.

8. Canadian taxation of profits of foreign subsidiaries – "The foreign affiliate rules"

For taxation years following 1975, a Canadian resident taxpayer must pay tax on his proportionate share of "passive" income (e.g. dividends, interest, rents, royalties, non-active business income and certain capital gains) earned by non-resident corporations and trusts which are or are deemed to be controlled foreign affiliates. The first $5,000 of passive income is exempted from Canadian taxation.

---

18. Budget Resolutions Nos. 12 and 23:
(12) That for the 1982 and subsequent taxation years, the provisions of subsection 15(2) of the Act apply not only to loans but also to other forms of indebtedness and, where an amount owing by a person who is connected to a shareholder is to be included in income by virtue of that subsection, the amount be included in the income of the shareholder.
(23) That for the 1982 and subsequent taxation years, the provisions of the Act relating to the deduction of interest be amended to provide that in computing the income of an individual or a partnership.
(a) any interest expense otherwise allowable as a deduction in computing the income of the individual or partnership from property for a year (referred to in this Motion as "restricted interest expense") be deductible only to the extent of the income from property for the year.
(b) the individual or partnership may elect to treat as a capital loss for the year any portion of the restricted interest expense for a year that is not deductible in the year, and
(c) the amount by which the restricted interest expense of the individual or partnership for a year exceeds the aggregate of the amount thereof that was deductible for the year and the amount thereof that was treated as a capital loss for the year may be carried forward and treated as interest expense incurred in the following taxation year,
and for this purpose
(d) any benefit required by virtue of section 80.4 of the Act to be included in computing the income of an individual for a year will be treated as interest expense incurred by him in the year,
(e) except where all or substantially all the property of a partnership is used in an active business or a non-qualifying business, any interest expense incurred by an individual or partnership in a year on loans made to invest in the partnership will be treated as an expense incurred to earn income from property, and
(f) the restricted interest expense of an individual or partnership will not include interest incurred on a loan (other than a non-arm's length loan) the proceeds of which were used to finance the acquisition by it on or before November 12, 1981 of a residential rental building in Canada or at any time to refinance such acquisition.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The significance of foreign affiliates, other than "controlled foreign affiliates",[24] is limited to circumstances in which their shares are owned by Canadian resident corporations. Foreign passive income earned by non-controlled foreign affiliates is not taxable in Canada until distributed as dividends to Canadian resident corporate shareholders. Where dividends are paid out of the foreign affiliate's taxable surplus, the income is taxed in the hands of the resident Canadian corporation. Where, however, the dividends are paid out of either exempt surplus or preacquisition surplus, they are exempted from Canadian tax. Dividends received from non-resident corporations which are not foreign affiliates are taxed at full corporate rates. Dividends received from non-controlled foreign affiliates by individual shareholders resident in Canada are also fully taxable, with no deduction on account of foreign tax paid on the underlying earnings. Consequently, an individual with interests abroad can realize a tax saving by establishing a foreign affiliate and holding his shares in it through a Canadian corporation.

9. The rules of foreign accrual property income (FAPI)

The main thrust of the FAPI rules[25] is to deem a Canadian taxpayer, whether individual or corporate, who has a controlling interest in a corporation or trust outside Canada, i.e. a corporation or trust[26] which qualifies as a controlled foreign affiliate,[27] to have itself earned the foreign accrual property income, or FAPI, in excess of $5,000, of such controlled foreign affiliate.[28] As a result, Canadian taxation arises immediately, even if the income is not received by the Canadian taxpayer at that time. Related rules ensure that appropriate recognition is granted to other taxes already imposed on the income, and that the income is not taxed a second time if it is ever paid up to the Canadian taxpayer by way of dividend or otherwise. In addition, the rules elaborate a system for the taxation of dividends received from foreign affiliates which are not controlled foreign affiliates. See possible effect of Budget Resolution No. 66.[29]

A controlled foreign affiliate is defined[30] as a corporation which is not resident in Canada, and is controlled either directly or indirectly by the Canadian taxpayer, either alone or together with related parties, or with not more than 4 other persons resident in Canada, even if they be unrelated. A trust may also be a controlled foreign affiliate's FAPI, i.e. passive investment income, which exceeds $5,000 and which is included in the Canadian taxpayer's income for the taxation year in which the affiliate's taxation year has terminated.

FAPI is basically income for the year from property, or from a business other than an active business. Paragraph 95(1)(b) ITA contains detailed rules setting out certain specific types of income which are or which are not included in FAPI. The Act also contains rules respecting the computation of the foreign affiliate's income from an active business.

10. Inclusions and exclusions from FAPI

There is included in active business income, and hence excluded from FAPI,[31] any income from sources in a country other than Canada that might otherwise be income from property or a business other than an active business to the extent that it "pertains to or is incident to" an active business carried on by the affiliate. This "pertaining" rule presupposes that the affiliate is carrying on an active business in a country other than Canada. Interest earned by a construction company on securities put up to guarantee the performance of its contractual obligations is an illustration of the "pertaining" rule.[32] There is also excluded from FAPI any amount paid or payable to the affiliate by another foreign affiliate of the taxpayer to the extent that it is deductible from that other affiliate's earnings from an active business other than a business carried on in Canada.

If a controlled foreign affiliate earns income from services or an undertaking to provide services, that income is deemed to be FAPI if the relevant amount is deductible in computing the income from a business carried on in Canada by the Canadian taxpayer.[33] Services include the insurance of Canadian risks, but do not include the transportation of persons or goods or services performed in connection with the purchase or sale of goods. If a controlled foreign affiliate earns income from services or an undertaking to provide services, that income is deemed to be FAPI if the services are performed or are to be performed by an individual resident in Canada who controls the foreign affiliate. This provision is aimed largely at professional entertainers and athletes.

Foreign exchange gains realized by the foreign affiliate, by virtue of a fluctuation of the rate of exchange prevailing between the Canadian dollar and another currency, on the settlement of debts between the affiliate and another foreign affiliate of the Canadian taxpayer are excluded from FAPI.[34] Similarly, FAPI does not include any foreign exchange gain or loss arising on the redemption or non-arm's length disposition of the shares of a foreign affiliate of a Canadian taxpayer.[35]

FAPI does not include any of the following:
(a) interest received on certain debts created upon the sale or nationalization, prior to 18 June 1971, of Canadian-owned foreign public utilities;
(b) inter-affiliate dividends;
(c) taxable dividends deductible under Section 112 ITA; and
(d) taxable capital gains arising in respect of property used principally in gaining or producing income from an active business.

On the other hand, most taxable capital gains, to the extent that they have accrued since 1975, are automatically included in FAPI. See possible effect of Budget Resolution 68.[36]

Apart from these statutory exclusions from and inclusions in FAPI, there is a middle ground. Here, income may fall to be either excluded from or included in FAPI, depending on whether the facts are such that an active business is or is not being carried on.

11. Active business income

Income from an active business is not FAPI but income from property and a business other than an active business is FAPI. The definition of "active business",[37] which adopts the meaning given for the purposes of the small business deduction,[38] is specifically restricted to corporations resident in Canada, and, therefore, does not apply in computing FAPI. Of assistance in understanding these concepts are IT-73R3, which discusses the meaning of "income from an active business", and the case law interpreting "active financial and commercial business" in somewhat different contexts.

In IT-73R3[39] the Department takes the position that once income is established as being derived from a business source, any appreciable activity expended in the actual income generating process of that business, other than usual housekeeping functions such as banking and record keeping, characterizes that income as income from an active business. As previously noted, income of any nature that is ancillary to the activities involved in carrying on a business is income from that business, notwithstanding the fact that it could be described as income from property or another source.

The determination of what precisely is active business income is one of the most perplexing in Canadian tax law. In *MRT Investments Limited et al* v. *The Queen*[40] the plaintiff and two other companies made mortgage investments on a comparatively small scale. MRT had no employees of its own but there were several persons who worked on behalf of the company and other companies in the group and these persons carried out significant investigations of investment opportunities. The Court was influenced by the fact that the making of investments was the very purpose for which the company was incorporated and the company did pursue its mortgage investment opportunities. The fact that the company did not pay salaries to its own employees or rent office space or equipment did not necessarily indicate that the companies were not carrying on an active business. The Court held that two of the companies were carrying on an active business by themselves, but that the third company did not carry on active business since it turned over the management of its investment to others without supervision or any direction in connection with its day-to-day operations. The decision in respect of the two successful companies was upheld in the Federal Court of Appeal and the decision in respect of the third company was reversed to hold that its income also constituted income from carrying on active business: *cf. The Queen* v. *Rockmore Investments Ltd., The Queen* v. *MRT Investments Ltd.* and *ESG Holdings Ltd.* v. *The Queen.*[41]

In *D.S.B.K. Management Ltd.* v. *M.N.R.*[42] a corporation which provided management services to a firm of chartered accountants was held by the Tax Review Board not to be carrying on an active business. The company received all its fees for management services related to the one firm of accountants. The judgment stated that the financial statements indicated little economic activity. The use of labour and capital was relatively insignificant, as no charge appeared in the financial statements for salary or wages. The statement was made that Parliament never contemplated this sort of activity carried on by the appellant as qualifying under Section 125 ITA for the small business deduction. However, on appeal to the Federal Court, the Minister granted the taxpayer's appeal by consent to judgment.

In *Cadboro Bay Holdings Ltd.* v. *The Queen*[43] the Federal Court, Trial Division, held that rental income received from a small shopping centre with 7 tenants represented income from an active business. The comment was made that in the absence of any indication in the Income Tax Act as to quantum of activity necessary for characterization as income from an active business, any quantum of business activity that gives rise to income in a taxation year for a private corporation in Canada is sufficient to make mandatory the characterization of such income as income from an active business carried on in Canada.

In *King George Hotels Limited* v. *The Queen*[44] the appellant operated a hotel but also leased certain properties to tenants. It was contended that the net rentals were income from an inactive business. The appellant was managed by JP Management Services Ltd., a company owned and operated by the same parties as the appellant. The net income from the rentals constituted 10% of the total net income of the appellant. The work in connection with the leased premises involved the employees of the management company for about one hour per month. The trial judge attributed these activities to the appellant, and the rental income qualified as income from an active business. It remained income from an active business when remitted to a third company in the group, Cavalier Enterprises Ltd. *Cf. Cavalier Enterprises Limited* v. *The Queen.*[45]

12. Computation of FAPI

FAPI is computed in accordance with the Income Tax Act, and not under the tax laws of the jurisdiction of the

controlled foreign affiliate's residence.[46] The calculation of certain capital gains and losses is excluded from this rule. In a given year, the FAPI of a controlled foreign affiliate is the aggregate of all of its FAPI less its foreign accrual property losses and its allowable capital losses for the year.[47] The FAPI of a controlled foreign affiliate for a particular taxation year may be reduced by the affiliate's deductible loss for that year and the 5 immediately preceding taxation years. FAPI is never a negative number. If a Canadian taxpayer has a controlled foreign affiliate with foreign accrual property losses, these losses may not be used by it to offset its income from other sources; nor can the negative passive income of one controlled foreign affiliate be used to offset the FAPI of another. On the other hand, the FAPI imputed to a Canadian resident corporation may be offset by that corporation's non-capital losses, and the FAPI imputed to a Canadian resident individual may be offset by his non-capital losses, and even by his allowable capital losses up to $1,000 per year.

A Canadian resident corporation disposing of shares in a foreign affiliate may elect to treat the proceeds of disposition as a dividend rather than a capital gain. Section 94 ITA applies the FAPI rules to offshore trusts. Section 95 ITA, in addition to containing the definitions of "controlled foreign affiliate" and "foreign accrual property income" discussed above, also sets out a special set of FAPI anti-avoidance rules and rollover provisions concerning the transfer of shares in a foreign affiliate on a share for share exchange, merger or distribution. See possible effect of Budget Resolution No. 64.[48]

The FAPI earned by a controlled foreign affiliate is attributed to the Canadian taxpayer in that taxpayer's taxation year in which the affiliate's taxation year ends. If a controlled foreign affiliate earns FAPI, the cost base of the Canadian taxpayer's shares in the affiliate must be adjusted,[49] but the adjusted cost base to a Canadian taxpayer of a share owned by him in a controlled foreign affiliate will be increased by the amount of FAPI which the Canadian taxpayer has been required to include in computing income.[50] Consequently, if the Canadian taxpayer disposes of the shares of the affiliate before receiving a dividend out of its FAPI on which he has been previously taxed, he will incur no further tax as a result of having realized a capital gain which reflects the amount of undistributed FAPI.

As far as corporate Canadian taxpayers are concerned, FAPI is included in the affiliate's taxable surplus.[51] Any dividend subsequently paid out by the affiliate is included in the corporation's income.[52] The corporation is, however, permitted to deduct underlying foreign corporate income tax ("foreign business income tax credit") and foreign withholding tax ("foreign non-business income tax credit").[53] The corporation may lastly deduct the remaining amount of the dividend if it is paid out of taxable surplus.[54] In this way, FAPI can be repatriated tax free and double taxation avoided.

Dividends paid after 1975 to a Canadian corporation out of the after-1975 active business income of a foreign affiliate, whether controlled or not, which is resident or carrying on business in a non-treaty jurisdiction, i.e. out of taxable surplus, are subject to Canadian income tax to the extent necessary to ensure that such income has borne tax which at least equals the Canadian tax level.[55] These dividends are included in the Canadian corporation's income when received by it, and the taxpayer is permitted to deduct

(a) the lesser of the relevant tax factor, i.e. 1/46% or 2.17391[56] minus 1, or 1.17391, times the underlying foreign corporate tax, or foreign business income tax, and the dividend, and
(b) the lesser of the relevant tax factor times the applicable foreign withholding tax, or foreign non-business tax[57] and the dividend less (a).

The full amount of a dividend to the extent that it is prescribed to have been paid out of the exempt surplus of a foreign affiliate may be deducted in computing the recipient Canadian resident corporation's taxable income.[58] Exempt surplus includes such items as capital gains not included in FAPI, post-1975 active business income earned in a treaty country, and pre-1976 earnings of all sorts net of tax.[59] Therefore, dividends paid out of the post-1975 active business income of a foreign affiliate resident and carrying on business in a treaty country are not subject to any Canadian tax.

Because of what is in effect a total exemption of dividends paid out of exempt surplus, no recognition is granted to the underlying income or profits tax and no foreign tax credit or other recognition is granted to the applicable withholding tax. Nor is the adjusted cost base of the Canadian taxpayer's shares in the foreign affiliate affected.

To the extent that a corporation resident in Canada receives a dividend out of a foreign affiliate's pre-acquisition surplus, the full amount of the dividend is deductible in the computation of its taxable income. A dividend is deemed to have been paid out of a foreign affiliate's pre-acquisition surplus when it no longer had exempt or taxable surplus.[60] Pre-acquisition surplus includes the earnings of a corporation accumulated at a time prior to the taxation year in which it first became a foreign affiliate of the Canadian resident corporation. The purpose of the exemption from Canadian tax of dividends paid out of this surplus is to permit its distribution to the Canadian corporation as a form of repayment of capital. This fact explains why paragraph 92(1)(b) ITA requires that the adjusted cost base of shares in a foreign affiliate be reduced by any dividends paid out of the pre-acquisition surplus.[61] Because of the effective exemption of dividends paid out of pre-acquisition surplus, no recognition

or foreign tax credit is granted in respect of the applicable foreign tax or withholding tax.[62] There is also a further reduction in the adjusted cost base of shares of a non-resident corporation.

Section 5901 of the Regulations determines the order in which dividends are considered to have been paid out of the various surpluses of a foreign affiliate:
- exempt surplus;
- taxable surplus; and
- pre-acquisition surplus.

A deduction is permitted in respect of a dividend received by a corporation resident in Canada from a foreign affiliate to the extent that the amount of the dividend has not been offset by the other deductions that are permitted.[63] This deduction is limited to the adjusted cost base of the share on which the dividend is paid as at the end of the 1975 taxation year of the Canadian resident corporation. This deduction is optional, and basically permits the pre-1976 investment of the Canadian resident corporation in its foreign affiliate to be recouped as a return of capital. As the deduction is claimed, the adjusted cost base of the shares concerned is reduced.[64]

CANADA'S TAX TREATIES

Notwithstanding the complicated and detailed provisions of Canada's domestic tax laws as described in the foregoing pages, any dealing with the subject of foreign investment by Canadians would be incomplete without some consideration of Canada's tax treaties with foreign jurisdictions.

In general, Canada's tax treaties attempt to relieve from double taxation income derived by residents of one country from sources within the other. Such relief may be provided by two methods: in the case of investment income by imposing a ceiling on the rate of withholding tax that the source country may impose and in the case of other income or capital gains by limiting the instances in which the source country can tax such gains. Accordingly, Canadians doing business or investing abroad must be concerned with the degree of treaty protection available to them.

During the negotiation of a treaty it is always assumed that the contracting parties are aware of the existing internal laws and that the treaty was negotiated in light of them. Accordingly, references to the internal laws of the signatory powers as subsequently amended are usually avoided since this might afford the opportunity to one of the parties to change the treaty unilaterally by amending its own internal law. Section 2 of the Protocol to the U.S.-Canada treaty foresees the possibility of change in internal law, and provides for a mechanism by which the provisions of the Treaty can be modified, if desired by the parties, in light of such changes. Section 2 of the Protocol to the Convention states:

> In the event of appreciable changes in the fiscal laws of either of the contracting States, the Governments of the two contracting States will consult together.

See also *Associates Corporation of North America* v. *Queen*.[65]

In Canada, therefore, treaty provisions override domestic law, past and future. In *Hunter Douglas* v. *The Queen*[66] the issue was whether the plaintiff should have withheld tax on dividends paid non-resident shareholders. Under the Income Tax Act, the plaintiff corporation was clearly resident in Canada and thus obliged to withhold tax on dividends paid to non-resident shareholders. Under Netherlands law, however, it was resident there. Due to a provision in the Canada-Netherlands tax treaty which deems a corporation to be solely resident in the country where its central management and control is located, if that country is either Canada or the Netherlands, the Federal Court found the plaintiff, on the facts, to be resident in the Netherlands. The Minister submitted that the plaintiff's Dutch residence should only be recognized in respect of its Dutch shareholders. The Federal Court, however, concluded that the treaty provisions overrode the definition of residence found in the Canada Act, regardless of the residence of the payees.

In Canada both the English and the French versions of a treaty are official.

Although the paramountcy of Canada's tax treaties is generally made explicit in Canada's enabling legislation, one should not assume, however, that such a result prevails generally. In the United States, for example, subsequent legislation can override existing treaties.

Canada's new treaty with the United States was initialled on 26 September 1980. It has not yet, however, been ratified by the American Senate, nor is the necessary enabling legislation before the Canadian Parliament. There are expectations that it will become law before the end of 1982. Canada's new treaty with West Germany, initialled on 17 July 1981, is not yet effective. Besides these treaties, Canada has more than 50 treaties or double tax agreements in force or under negotiation.

The renegotiation of the American treaty and the long years taken to reach agreement underline a problem that affects international businessmen everywhere: how to keep a treaty in step and current with domestic fiscal developments within the signatory countries. Business and investment cannot afford to wait out the potentially long delays between treaty amendments. Fortunately, however, tax treaties are anomalies in the fiscal system, and, unlike taxing statutes, they usually contain provisions known as "competent authority provisions" permitting the direct negotiation of administrative or interpretational problems between the government of Canada and the governments of other jurisdictions at non-political levels. Such provisions permit of a practical and non-technical approach to treaty problems without recourse to the courts. Largely as a result of the success of this approach over the years, under the U.S. treaty the concept of the "competent authority" approach has been elevated to an accepted general practice which has achieved a formalized structure and considerable efficiency.

In order to invoke the consultative or "competent authority provisions" such as that contained in Article XVI

62. Paragraph 53(2)(b) ITA.
63. Subsection 113(2) ITA.
64. Subsection 92(3) ITA.

of the U.S.-Canada income tax convention, the taxpayer needs to "show proof" that he has suffered double taxation as a result of "the action of the Revenue authorities of the contracting States" and lodge a claim. If the claim "should be deemed worthy of consideration", the "competent authority" of one state may consult with the other. Unfortunately "double taxation" is itself a fuzzy idea. The administrative tendency has been to restrict the notion to the taxation of the same gain in the same hands by two jurisdictions. Taxing the same economic benefit in different hands is not usually considered double taxation. However, in the light of Canada's attempt to shape new treaties on the O.E.C.D. model wherever possible, the double taxation relief may be enlarged, and inroads on treaty protection by the administrators or legislators of the signatory countries may be contained.

PROVINCIAL TAXATION: QUEBEC

Quebec's Taxation Act,[67] which levies income tax on both individuals and corporations, follows the Income Tax Act in many ways, but for constitutional reasons does not impact on certain areas of international taxation. In particular, Quebec does not levy withholding tax on payments to non-residents. The Quebec Taxation Act has no equivalent to Parts XIII and XIV of the federal Act. It should be noted, however, that Quebec respects the treaty arrangements entered into between Canada and other jurisdictions and will not include in income, for Quebec tax purposes, amounts which are specifically exempted from federal income tax pursuant to a treaty provision.[68]

PROVINCIAL TAXATION: ONTARIO

Ontario levies a provincial income tax on corporations only under the Ontario Corporations Act.[69] Unlike Quebec, however, it does not uniformly respect treaty arrangements concluded between Canada and foreign jurisdictions. A Canadian corporation having a permanent establishment in Ontario is liable to tax.[70] In the case of corporations incorporated outside of Canada, liability to tax arises in any of the following circumstances:

(a) the existence in Ontario, whether in the year or any previous year, of a permanent establishment;
(b) the ownership, whether in the year or in any previous year, of real property, timber resource property or a timber limit in Ontario from which income is derived from the sale or rental thereof or from royalties; or
(c) the disposition in the year or any previous year of property situate in Ontario that was "taxable Canadian property" as defined.[71]

Comparable provisions are found in Ontario law.[72]

If, however, the corporations were incorporated in a jurisdiction with which Canada has entered into a tax treaty, it is not required to pay tax in respect of its rental and royalty income unless it has elected to pay tax under Part I ITA as a resident rather than under Part XIII.[73] Capital gains realized in connection with real property are also exempt from Ontario taxation.[74] Moreover, the Ontario Corporations Tax Act Regulations[75] provide that where no federal income tax is payable on a disposition of taxable Canadian property because of an exemption in the applicable treaty, property otherwise situate in Ontario is deemed not to be situate there for purposes of Ontario tax and thus not taxable by Ontario. Consequently, all capital gains realized by a non-resident corporation which are exempt from federal tax under a tax treaty are also exempt from Ontario tax, provided that the corporation does not otherwise have a permanent establishment in Ontario.

It should also be noted that the meaning given by Section 5 of the Ontario Act to the term "permanent establishment" is not precisely the same as that given the expression in Part IV of the federal ITA Regulations. Unless it maintains a permanent establishment elsewhere in Canada, a corporation is regarded as having a permanent establishment in Ontario if its head office or registered office is located there.[76]

PROVINCIAL TAXATION: ALBERTA

The Alberta Corporate Income Tax Act[77] became law on 22 May 1980 with effect after 31 December 1980. The tax levied under the Alberta statute is based on taxable income as determined under the federal Act, i.e. the taxable income declared in the corporation's federal return. Such taxable income is then adjusted to take into account existing and new tax incentives. The corporation must, however, file a separate Alberta tax return. While as yet uncertain, it is doubtful whether this new legislation will give rise to any problems.

PROVINCIAL TAXATION: OTHERS

The remaining provincial income taxes are levied as a percentage of the federal tax payable, and are collected by Revenue Canada. The possibility of conflicting federal and provincial provisions has accordingly been effectively eliminated.

SOME TREATY PROBLEMS

As a practical matter, there are really only a few areas that regularly cause trouble in the interpretation of treaties. For example, many treaties define "permanent establishment" and "industrial or commercial profits"

67. L.R. Quebec 1977 c. I-3.
68. Section 488R1, Quebec Taxation Act Regulations.
69. Revised Statutes of Ontario 1980 ch. 97.
70. Subsection 2(1), Ontario Corporations Tax Act.
71. Subsection 248(1) ITA.
72. Subsection 2(2) Ontario Corporations Tax Act.
73. Paragraph 2(3)(b) ITA.
74. Subsection 29(2) ITA.
75. Subsection 717(2), Ontario Corporations Tax Act Regulations.
76. Subsection 5(11) Ontario Business Corporations Act.
77. Statutes of Alberta, 1980 ch. 10.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

but the definitions are not always given the same effect. This is because both definitions can be somewhat artificial and may vary from treaty to treaty, sometimes deviating from the commercial meaning of the same words used in ordinary business parlance. It is important, therefore, in order to determine the taxability of industrial and commercial profits that may be attributed to a permanent establishment, for a businessman to examine carefully the terms of the particular treaty. He may find that the words "industrial and commercial profits" are not necessarily the same as income as defined in the local laws of the signatory countries. In the case of the Canada-U.S. treaty, for instance, certain items have been excluded which in ordinary business usage would be included in the meaning of industrial and commercial profits: e.g. royalties, interest, rents, dividends, management charges and capital gains.

REALLOCATION OF INCOME

In all of Canada's tax treaties with other countries, except that with Jamaica, special provisions exist relating to the allocation or reallocation of income between related corporations.

The key provision in Article IV of the Canada-U.S. tax convention[78] and similar ones in other treaties is that adjustment to profits may be made by disregarding conditions "made or imposed by the two enterprises in their commercial or financial relations which differ from those which would be made between independent enterprises". There does not seem to be any real inconsistency between these provisions and those found in Subsections 69(2) and (3) of the Canadian Tax Act which purport to tax an amount that is "reasonable" in the circumstances if the non-resident person and the taxpayer had been dealing at arm's length. These provisions are most often involved in challenges by one of the contracting states against transfer prices charged by an entity of the other state. For example, in Article IX of the French treaty with Canada there is incorporated the associated enterprise rule contained in Article 8 of the Canada-U.K. tax agreement. Under this rule, commercial or financial relations between associated enterprises (as defined), different from those which would be made between independent enterprises, may be looked through by the national taxing jurisdictions.

The French treaty, however, adds a welcome relieving provision. Where the profits of an enterprise are altered by virtue of this rule with the effect that double taxation results, an automatic counterbalancing adjustment is provided in the other state. Furthermore, the initial adjustment made to the profits of one of the associated enterprises cannot be made "after the expiry of the time limits provided in the national laws" and in any case not after 5 years. This provision will prevent, for example, a readjustment by Canada of the profits of a Canadian establishment of a French enterprise beyond the 4-year reassessment limit under the Canadian Act. Following the wording[79] of the Canadian Income Tax Act this time bar does not apply in the case of fraud or wilful default. Generally this aspect of the French treaty seems workable and certainly superior to, for example, Article IV of the U.S. treaty under which adjustments to meet the initial reassessment require competent authority action, and without any protection against time-barred situations.

There may well be a problem as to the exact legal remedies available to the controlled Canadian resident corporation in the event of additional tax being levied by Canada by reallocating income to it on some basis not authorized by a tax treaty. A claim for relief under Article XVI of the Canada-U.S. convention, for example, with possible competent authority action, applies only with the government of the country in which the corporation is incorporated and then only if the taxpayer shows proof that it has suffered double taxation. In other treaties, such as that with the United Kingdom,[80] in order for a claim for relief to be lodged it need only be shown that the action of the taxation authorities of the contracting government has resulted, or will result, in taxation contrary to the provisions of the convention. Under these treaties, it is not necessary to show that the taxpayer, by itself, has suffered double taxation.

---

78. Article IV, Convention between Canada and the United States of America for the Avoidance of Double Taxation and the Prevention of Fiscal Evasion in the case of Income Taxes, effective January 1, 1941:
1. (a) When a United States enterprise, by reason of its participation in the management or capital of a Canadian enterprise makes or imposes on the latter, in their commercial or financial relations, conditions different from those which would be made with an independent enterprise, any profits which should normally have appeared in the balance sheet of the Canadian enterprise but which have been, in this manner, diverted to the United States enterprise, may be incorporated in the taxable profits of the Canadian enterprise, subject to applicable measures of appeal.
(b) In order to effect the inclusion of such profits in the taxable profits of the Canadian enterprise, the competent authority of Canada may, when necessary, rectify the accounts of the Canadian enterprise, notably to correct errors and omissions and to re-establish the prices or remuneration entered in the books at values which would prevail between independent persons dealing at arm's length. To facilitate such rectification the competent authorities of the contracting States may consult together with a view to such determination of profits of the Canadian enterprise as may appear fair and reasonable.
2. The same principle applies, mutatis mutandis, in the event that profits are diverted from a United States enterprise to a Canadian enterprise.

79. Subsection 152(4) ITA.

80. Article 24, Convention between the Government of Canada and the Government of the United Kingdom of Great Britain and Northern Ireland for the avoidance of double taxation and the prevention of fiscal evasion with respect to taxes on income and capital gains:
ARTICLE 24
Exchange of information
1. The competent authorities of the Contracting States shall exchange such information (being information which is at their disposal under their respective taxation laws in the normal course of administration) as is necessary for the carrying out of the provisions of this Convention or for the prevention of fraud or for the administration of statutory provisions against legal avoidance in relation to the taxes which are the subject of this Convention. Any information so exchanged shall be treated as secret and shall not be disclosed to persons other than persons (including a court or administrative tribunal) concerned with the assessment, collection or enforcement in respect of the taxes which are the subject of this Convention. No information as aforesaid shall be exchanged which would disclose any trade, business, industrial or professional secret or trade process.

PRACTICAL QUESTIONS FOR THE BUSINESSMAN-INVESTOR

Basic questions that should be asked by Canadians contemplating foreign investment are the following:

1. If I do make profits abroad, can I bring them home?

2. Can I withdraw my capital from the foreign jurisdiction at will or are there exchange regulations or fiscal or security provisions that would make it more difficult than if I made the investment in Canada?

3. Will I suffer double taxation by investing abroad?

4. Will profits abroad be treated as capital or income gains and are the rules for the determination of capital gains vs. income the same as those at home or will I be whipsawed by different definitions on either side of the border?

5. Can I compute my income from the offshore source by the same accounting standards and with the benefit of the same reductions for cost and depreciation as would be applicable if the gain were to be made at home? If I cannot, will one jurisdiction accept the rules applied by the other in its assessment of my gains or income? On this point see the accompanying article by Edwin Harris.

6. Alternatively, is there a risk that income might be computed differently abroad so as to reduce the benefit of tax credits or other offsetting provisions at home?

7. Will I be treated any worse than a resident of the jurisdiction in which I propose to invest or do business because I am a foreigner or a non-resident or a Canadian?

8. What remedies do I have through the courts in Canada or by virtue of the competent authority provisions in the relevant tax treaty if I have trouble with the provisions of the treaty as it may apply to my venture?

U.S. TAX ON REAL PROPERTY GAINS BY FOREIGNERS

Of particular importance to Canadians investing in the U.S. is the recent legislation by the U.S. imposing a capital gains tax of 28% upon the disposition of real property or any interest therein, including shares in a company owning real property, where the property was disposed of by a non-resident of the U.S. At the moment, Article VIII of the present Canada-U.S. treaty protects gains realized in one jurisdiction by a resident of the other from capital gains tax imposed by the country in which the gain arose. While this protection will be removed under the new treaty, it will still give Canadian investors a step up on their cost for purposes of computing the U.S. capital gains tax. The cost base will be the value of the real property as of the effective date of the new treaty. There will be thus for Canadians two valuation days – 1 January 1972 for all capital property save U.S. real estate, and the date of coming into force of the new Canada-U.S. treaty for the latter.

On reviewing the complicated and sometimes confusing rules that govern Canadian taxpayers as set out in this short series of articles, the non-Canadian reader might be pardoned for wondering how the Canadian business and investment community manages to cope and survive. The answer is by dint of much effort and application of time and intelligence. Over the years, Canada's fiscal system, under the guise of a series of ongoing "tax reforms", has become more confining and introverted and places a heavier burden and more severe penalties on initiative and foreign capital formation. This in turn imparts upon Canada's competitive abilities in the international commercial and financial world. The only mitigating force is the treaty network with other countries, which is why I have given it some prominence in this article.

Structuring Investments and Business Start-ups in Canada

by Nathan Boidman

I. INTRODUCTION

The advent of the 1982 I.F.A. Congress in Montreal is occasion to review the taxation parameters[1] of foreign investment in Canada, in general, and the impact thereon of recent developments,[2] in particular. The focus of this article will be the general tax considerations at the time of making the investment or acquiring or starting up a Canadian business, that is, "structuring" from the taxation standpoint.[3]

The initial structure normally establishes or fixes the manner in which Canadian tax will apply and, although re-structuring or reorganization at a later time may sometimes be feasible, it is usually possible and preferable to achieve the optimum structure from inception. For example:

- Whereas direct foreign ownership of Canadian real estate cannot be transferred subsequently to a corporation on a tax-free (rollover) basis, other types of directly held investments or business properties normally can be "rolled over" to a company formed under Canadian law.[4]
- An initial investment through a Canadian corporation[5] cannot be unwound on a tax-free basis in order to achieve direct foreign holding of the properties initially owned by the Canadian corporation.[6]

Mr. Boidman, Partner, Phillips and Vineberg, Advocats, Montreal. A chartered accountant with degrees in civil law and common law (McGill University) and called to the bar of Quebec in November 1981, Mr. Boidman practiced accounting from 1964 to 1973 following graduation from McGill University with a bachelor of commerce degree in 1962.

Since 1974, Mr. Boidman has restricted his practice to consulting in tax matters: he has authored numerous articles and papers on international tax and lectures frequently on the topic. Mr. Boidman, a member of the tax management advisory board on foreign income is contributing and consulting editor to several international tax journals and newsletters and is completing a book on treaty interpretation in Canada, and one on the impact of recent domestic tax law and treaty changes on structuring Canadian investment in U.S. real estate scheduled for publication in 1982, by CCH Canadian Limited; as well Mr. Boidman is co-authoring a book on taxation of foreign investment in Canada, to be published in 1983 by Kluwer.

1. The scope of this article is income taxation which is imposed by the Canadian Federal Government through the Income Tax Act, C.63 - 1970-71-72-73, as amended (herein the Act or I.T.A.) and by each of the 10 provinces through largely parallel legislation. The interplay of Federal and provincial law will be seen in various contexts below. Canada does not levy gift, estate, succession or inheritance taxes at either the Federal or provincial level except in the case of the Province of Québec; however, Canadian income taxes can arise at death in respect of unrealized appreciation of value of property. Retail sales taxes are levied at the provincial level while custom duties, excise and tax on manufactured goods are levied by the Federal Government, and in some areas by the provincial governments; these are beyond the scope of the article.

2. The impact of the Federal Government's 1980 National Energy Program on the oil and gas industry has been widely chronicled. In November 1981, the Federal Budget contained proposals for sweeping taxation changes, some of which will be seen in this article; however, at time of writing, detailed legislation in respect thereof had yet to be tabled in Parliament or published in draft form. Uncertainty brought about by unprecedented lobbying by various interested groups (business, etc.) and the broad imprecise language in which some of the proposals were couched (in the "Notice of Ways and Means Motions" which was tabled with the Budget) make it difficult to assess the full impact of the Budget on foreign investors.

3. The accompanying articles by Edwin Harris and Peter McQuillan address Canadian tax considerations of ongoing business operations, once structured and in place. Heward Stikeman's article on Canadian taxation of foreign investment by Canadians will be of interest to foreign investors considering Canada as a base for investment in third countries, such perhaps arising in respect of the redeployment of retained profits of foreign-owned Canadian subsidiaries.

4. Section 85 of the Act permits taxpayers to "roll over" most types of properties without recognizing appreciation in value, provided appropriate formalities (elections) and rules are complied with. However, foreign investors (that is, persons who are not resident in Canada) cannot transfer Canadian real estate under the protection of section 85.

5. "Canadian corporation", in this context, is one which is a resident in Canada. A company is resident in Canada if it has been formed under Canadian corporate law (Federal or that of a province) after 25 April 1965 or, where formed in another jurisdiction, has its "central mind and management" exercised in Canada - a case law doctrine which normally, but not always, refers to the seat of the board of directors; there are special rules of residency for companies formed in Canada before 26 April 1965.
However, the Income Tax Act uses the term "Canadian corporations" in a defined (and more narrow) manner: paragraph 89 (1) (a) of the Act reads as follows:

> 89 (1) (a). *"Canadian corporation"*. - "Canadian corporation" at any time means a corporation that was resident in Canada at that time and was
> (i) incorporated in Canada, or
> (ii) resident in Canada throughout the period commencing June 18, 1971 and ending at that time....

For most purposes of Canadian tax law, the distinction between a defined "Canadian corporation" and a foreign corporation which is resident in Canada under the common law rule is of no effect. However, there are important exceptions; most "rollover" and tax-free reorganization rules such as section 85 (see note 4) require a "Canadian corporation" and not one merely resident in Canada. To avoid confusion herein, where the tax rule under discussion turns on the question of corporate residence, reference will be to a "Canadian resident company" with the use of "Canadian corporation" being restricted to those circumstances requiring a company whose status is in accordance with paragraph 89(1)(a).

6. Where a Canadian resident company distributes property to its shareholders, whether in liquidation or otherwise, it is required to recognize a gain as if it had sold the property at fair market value (subsection 69(5)). The only exception to this rule is a liquidation of a Canadian corporation into a parent Canadian corporation (or one which owns at least 90% of its shares) (subsection 88(1) of the Act).

SUMMARY COMMENT

The article will proceed by considering, in section II, underlying and basic factors, concepts and patterns of taxation relevant to and important in establishing the optimum structure for business start-ups and investments, generally, from the Canadian tax standpoint; section III will deal with some additional factors particular to passive foreign investment in Canada.

II. BASIC FACTORS AND PATTERNS OF CANADIAN TAXATION – INFLUENCE ON STRUCTURING STRATEGY

A. Tax on net income v. tax on gross income

1. Tax on net income – Part I of the Act

Although general rules abound, the Canadian tax system is sufficiently complex and its double tax agreement network sufficiently wide[7] to require close attention to the particular factors of each situation – type of investor, his country of residence and type of investment – and, usually, consideration to several alternative structures and forms of investment. However, the general scheme of the manner in which Canada taxes foreign investment results in one of two taxation patterns, regardless of the particular facts or structure selected:

- normal corporate or progressive individual tax rates[8] applied to net income or profit;[9] or
- flat (25%) withholding tax applied to gross revenue or gross receipts.

---

7. Canada has 61 double tax agreements (tax treaties) in force or in some phase of negotiation or implementation, at the time of writing. Treaties have been signed and are in force with 32 countries, await ratification with 3 countries, have been initialled but not yet signed or published or are in negotiation with 26 other countries. In addition, 7 treaties in force at present are under renegotiation, to bring them in line with the 1977 OECD Model Convention, which serves as the basis for Canada's modern treaties. With certain exceptions, such modern treaties conform closely with the principles set out in the OECD Model. Two of the important pre-OECD Model treaties now in force are with the Netherlands and the United States, both offering tax planning opportunities, particularly in the area of real estate investment, not found in the modern or new generation treaties. The U.S.-Canada treaty has been renegotiated, and a new treaty was signed in 1980 and at time of writing awaits ratification. Renegotiation with the Netherlands is under way.

8. In this pattern, a foreign investor will be subject to the same type of tax rates applicable to a Canadian resident individual or corporation although modifications may arise where applicable to non-residents. For example, the normal aggregate Federal and provincial corporate tax rate is in the area of 50% but private Canadian corporations which are not controlled by non-residents ("Canadian-controlled private corporations", per paragraph 125(6)(a) of the Act, including situations where non-residents own up to but not more than 50% of the shares) may be entitled to a rate reduction of 21 percentage points in respect of Canadian business profits under section 125 of the Act (see also note 52). For individuals subject to a progressive rate scale, taking into account proposals of the 12 November 1981 Budget, maximum aggregate Federal and Provincial personal tax rates range from a low of roughly 47% in the Province of Alberta to roughly 61% in the Province of Québec. Foreign individuals subject to this first pattern of taxation may sometimes be liable only for Federal income taxes, in which case the aggregate rates (including a surtax in view of the absence of provincial taxation) would give rise to maximum rates of roughly 50%.
Unlike certain countries such as the United States, the Federal and provincial tax regimes are parallel and complementary in the sense that the Federal taxes are not deductible in computing the taxable income base for provincial purposes or vice versa, but rather the rates at the Federal and provincial levels are established in a fashion which take cognizance of the other. It can be noted that, at the time of writing (February 1982), the Federal and provincial authorities are experiencing difficulty in working out revenue sharing programs and it is not unlikely that provincial tax rates will increase, thereby increasing the aggregate Federal and provincial rates noted earlier. Prior to the 12 November 1981 Budget, aggregate personal tax rates ranged from roughly 59% in the Province of Alberta to nearly 70% in such provinces as Québec, and the present uncertainty from the Federal-provincial revenue sharing debate is whether the provincial governments will be forced to emasculate all or part of the cuts in personal tax proposed in the Federal Budget.

9. Net income or profit ("income" within the terminology of the Income Tax Act) means income determined in accordance with general accepted accounting principles unless modified by specific statutory or case law to the contrary. A more important aspect of such modification is the substitution of the Canadian "capital cost allowance" system for book depreciation. For a detailed review of these concepts, reference should be made to the papers by Harris and/or McQuillan.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(a) *Basic rule: Mainstream tax*

The first pattern of taxing regime arising under Part I of the Income Tax Act[10] applies to:

- business operations in Canada owned and carried on directly by investors, that is, not through a Canadian subsidiary;[11]
- certain gains realized directly by foreign investors in respect of certain types of Canadian property and which are not otherwise included in business profits;[12]
- investment income or business profit regardless of source or type earned through a Canadian resident (subsidiary) company;[13]
- rents derived from real estate the operation of which is not considered to comprise a business but in respect of which certain "net income" elections have been made.[14]

(b) *For corporations: Secondary taxes (branch v. subsidiary corporation)*

Where a company is involved, there may be a secondary tax.

(i) *Branch tax – Part XIV of the Act*

Under Part XIV of the Act, a non-resident company is subject to a "branch tax" on business income earned in Canada, whether or not involving a fixed place of business or permanent establishment within the treaty concept thereof. The rate of this tax is 25% and it applies to the excess of the income base determined for purposes of the mainstream corporate tax payable under Part I of the Act as described earlier, over the amount of such mainstream corporate taxes (including those levied by the provinces).

Generally, the rate of such tax is reduced by treaty, and the reduction normally is to the rate which would apply to dividends were the business carried out through a Canadian subsidiary. As in the case of mainstream corporate tax, where a treaty is involved, there is normally an exemption from the branch tax if the business profit earned in Canada is not effectively connected to a permanent establishment in Canada.

(ii) *Subsidiary: Dividend withholding tax – Part XIII of the Act*

Under Part XIII of the Act, where the foreign investor utilizes a Canadian resident company as a subsidiary to make the investment or carry on the business, profits realized by the subsidiary are subject to withholding tax when repatriated by way of dividend payments; the rate of withholding tax is 25%.[15] As a general rule, Canada's treaties do not reduce the withholding tax below 15%.[16]

The 12 November 1981 Budget proposes an important change to the dividend withholding tax rules. Under present law,[17] the rate of withholding tax otherwise exigible (whether or not the rate is subject to treaty reduction) is reduced by 5 percentage points where there is Canadian ownership of 25% or more of the Canadian resident company; accordingly, in a typical treaty situation where the withholding tax rate is normally 15%, there would be a one-third reduction to a net withholding rate of 10%. The Budget proposes to eliminate the 5 percentage point reduction.[18]

(iii) *Branch–subsidiary comparison*

Nominally, the branch tax is payable in the year profit is earned, with the result that the use of a subsidiary can appear to be more advantageous as the secondary tax (on dividends) due in respect thereof can be deferred for as long as profits are maintained in Canada; however, comparable timing results as between a branch tax or a tax on dividends paid by a subsidiary often arise where regard is had to the deferral available in respect of the branch tax where profits are reinvested in the business carried on in Canada.[19] Also, under certain of Canada's treaties, branch tax may be subject to broader restriction or exemption in favour of the foreign investor than dividends paid by a subsidiary.[20]

2. Tax on gross income – Part XIII of the Act

The second pattern of regime, comprising a flat withholding tax of 25% on gross revenue or receipts derived from Canada, arising under Part XIII of the Act applies to:

- passive income such as interest, dividends, royalties or rents realized directly by a foreign investor and not effectively connected[21] to a business carried on in Canada;
- certain "deemed" income amounts arising out of transactions between foreign shareholders and Canadian resident companies; for example, certain loans by such companies to such shareholders.[22]

10. The Income Tax Act consists of 258 sections divided into 16 parts, the most important of which is Part I comprising sections 1 through to 180, although for foreign investors Parts XIII and XIV (see below) are also of substantial application and import. Part XIII comprises sections 212 to 218 while Part XIV comprises section 219.
11. See, inter alia, paragraph 2(3)(b) and subparagraph 115(1)(a)(ii) of the Act.
12. See, inter alia, paragraph 2(3)(c) and subparagraph 115(1)(a)(iii) of the Act.
13. See, inter alia, paragraph 2(1) and (2) and Part I of the Act generally.
14. See, inter alia, section 216 of the Act, Section III below.
15. Subsection 212(2) of the Act.
16. Under Article X(2)(a) of the renegotiated but as yet unratified treaty between the United States and Canada, the withholding rate will be reduced to 10% in the case of corporate participations of 10% or more. Under Article VII of the Netherlands-Canada treaty, dividends paid by a Canadian resident company to a shareholder resident in the Netherlands stemming from non-Canadian source interest or dividend income, and where certain other requirements are met, are exempt from Canadian withholding tax. See also Article VII of the Canada-Ireland treaty.
17. Sections 212(3) and 257.
18. It is probable that the proposed rate reduction under the U.S. Treaty (see note 16) occasioned this proposal (see Resolution 154 of the Notice of Ways and Means Motion).
19. See section 219 of the Act.
20. Under Article X(6) of the Canada-Switzerland Treaty, there is a complete exemption from branch tax on business profits earned through a permanent establishment where the Swiss company's principal business is not carried out in Canada.
21. The term "effectively connected" is not used in the Act, rather the simple concept of income "from" a business or property.
22. Under subsection 15(2) of the Income Tax Act, certain loans made to shareholders are treated as income when not repaid by the end of the taxation year of the lending corporation following the year in which the loan is made. (It should be noted that the exemption where such loans are repaid does not apply if the loans are part of a series of loans or repayments. This rule also applies in the case of loans made to non-resident shareholders and the loan is treated as a dividend for purposes of the withholding rules noted earlier, pursuant to sections 212 and 214.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The tax is applied to gross revenue and, without benefit of deduction for expenses incurred by the foreign investor and in the case of rental income, may require that the gross revenue to which the tax applies be "grossed up" for payments required to be made by the tenant under the lease which normally constitute "owner" expenses.[23]

3. Structuring to achieve advantageous regime

(a) *Basic considerations*

There can be substantial differences in the net tax depending which of the two regimes applies; some situations are susceptible to "structuring" to achieve the optimum arrangements. The conceptual basis to "structure" or effectively select, as between the two regimes, is the underlying notion of whether or not the investment gives rise to a carrying on of business: if it amounts to a business, the Part I net income regime applies; if not, the Part XIII gross income regime applies.[24]

This dichotomy is similar to that of other tax systems such as that arising under the Internal Revenue Code of the United States.[25] Because there are no statutory rules for distinguishing between activities which amount to a carrying on of business and those which do not, the characterization is governed by somewhat flexible case-made law. This can give rise to uncertainties in marginal situations. Case law has generally involved issues respecting revenue-producing real estate in the context of domestic taxpayers where a similar distinction has been required for other purposes of the Canadian Income Tax Act.[26]

In principle, the distinction will turn on the degree of continuous entrepreneurial or managerial activity required to be exercised in earning the income from the investment. For example, in the case of the rental of property, particularly where the owner-lessor is not required to provide substantial services, it may be difficult to achieve taxation under the Part I net income regime, and a foreign lessor may well pay a greater tax under the Part XIII regime. However, in the case of rental real estate, foreign investors, otherwise subject to the Part XIII regime are entitled to elect to be taxed on a net income basis.[27] It will be noted below, under the section dealing with the role of a trust, that foreign investors can sometimes achieve net income taxation on purely passive payments by structuring a trust resident in Canada to make the investment.[28]

The general principle governing the distinction may well be subservient to a second principle, evolved in case law, that a corporation is presumed to be formed for the purpose of carrying on business with the result that what may give rise to passive income (from "property") in the hands of an individual may be considered to be derived from the carrying on of business in the hands of a corporation, particularly where it has no other activities.[29]

(b) *Withholding tax issues*

Finally, it should be noted that in unclear situations, the direct foreign investor may be subject to withholding tax at source, refundable to the extent that it subsequently can be successfully asserted that the income upon which withholding was levied was effectively connected to a Canadian business (and thus to be taxed in accordance with the Part I net income regime). The payor of an amount contemplated by Part XIII, such as dividends, interests, rents, royalties, to a non-resident is required to withhold the statutory Part XIII 25% tax regardless of whether the amount is earned by the resident in the course of carrying on business in Canada, unless the non-resident has obtained a certificate from the Minister of National Revenue evidencing that the payment is exempt from withholding tax on the basis of being connected to a Canadian business. The Minister is only required to issue this certificate where he is of the opinion that the payment is indeed related to carrying on a business.[30] Refusal of the certificate does not, in and of itself, establish the basis upon which the income is to be taxed, merely that the payor is required to withhold Part XIII tax and leaving it open to the non-resident investor to make a claim for refund of the tax under Part XIII[31] and file returns of income on the net basis under Part I of the Income Tax Act.

B. Joint investments: Partnership v. co-ownership

1. Basic considerations

Foreign investors also face choices with respect to appropriate structure for joint investments:

- whether to proceed in unincorporated form and to be taxed as a partnership or as a mere co-owner;[32]
- whether to incorporate, with the "joint" element being reflected simply by shareholdings.[33]

Although a partnership is not a separate person[34] for Canadian tax purposes (but, rather, usually serves as simply a tax accounting center with each partner thereof accounting for his share of partnership activities, profits, etc. as though a sole proprietor in respect thereof[35]), there can be important differences between the applicable rules so as to warrant an assessment of the feasibility of selecting or structuring for one mode rather than the other.

---

23. *Burland* v. *M.N.R.* 68 D.T.C. 5220.
24. Of course, as already noted net income taxation can always be achieved by utilizing a Canadian resident company to make the investment regardless of whether its activities amount to a carrying on of business. Also see section III. B. below dealing with the use of a Canadian resident trust.
25. Sections 861, 864, 871, 881 and 882 of the Internal Revenue Code, 1954 as amended.
26. See *Wertman* v. *M.N.R.* 62 D.T.C. 1020; *Walsh and Micay* v. *M.N.R.* 64 D.T.C. 2032.
27. Section 216 of the Act.
28. See note 24.
29. See, for example, *Birmount Holdings* v. *The Queen* 77 D.T.C. 5031, but also see the (contrary) views of Revenue Canada: paragraph 10 of Interpretation Bulletin IT-420R2.
30. Subsection 214(13) of the Act and section 805 of the Income Tax Regulations, which were amended in 1981 to include certain payments in respect of resource property.
31. Subsection 227(6) of the Act.
32. The Canadian tax system does not distinguish between a co-owner or joint venture or member of a syndicate, all such direct undivided interests (which are not considered to comprise a partnership) being treated as though the investor were a sole owner or proprietor in respect of his undivided interest in the property and related revenues, costs and expenses.
33. The possibilities of a third format – trust – are dealt with below.
34. Taxpayers under Canadian tax law are "persons" which include individuals, corporations or estates or trusts, but not partnerships.
35. Subsection 96(1) of the Act.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Generally, investors prefer to be treated as mere co-owners in order to have optimum flexibility in determining write-offs and deductions. These and other differences between partnerships and co-ownerships are reviewed in the third section below.

2. Structuring for the desired mode

In theory, it is always possible for joint investors to arrange either partnership or mere co-ownership, although in practice it is not feasible for certain types of joint investments to avoid characterization as a partnership. This is because (and unlike the United States, for example) the taxation law does not contain special or additional rules for characterizing a joint investment, leaving the determination to be made under the relevant property or contract law applicable.[36]

Joint investors can generally "structure" mere co-ownership by incorporating the following features in their arrangement:

- avoid formal declaration of partnership;
- avoid joint and several liability – both as between them and in their relationship with third parties;
- maintain investor interests in revenues, costs and expenditures in proportion to the interest in the underlying property;
- maintain the right to a direct interest in the gross proceeds or receipts;
- avoid having one co-owner act as general agent or mandatory, with a general power to contract, on behalf of the other co-owners.

Because the determination is left to commercial law, this means, in Canada, reference is made to provincial law of property or contract dealing with partnerships. The views of the Department of National Revenue, reflective of these principles, are set forth in Interpretation Bulletin No. IT-90 which outlines the issue succinctly as follows:[37]

1. The Income Tax Act does not define a "partnership", but outlines the tax consequences if one exists. Section 102 defines what is meant by a "Canadian partnership", but presupposes that there is a partnership. A partnership is not a person, nor is it deemed to be within the meaning of the Act, notwithstanding that section 96 provides that the income of a member of a partnership is computed as if the partnership were a separate person resident in Canada.

2. Generally speaking, a partnership is the relation that subsists between persons carrying on business in common with a view to profit. However, co-ownership of one or more properties not associated with a business (which under Common Law might be a joint tenancy or a tenancy in common) does not of itself create a partnership, and this is so regardless of an arrangement to share profits and losses. For guidance on whether a particular arrangement at a particular time constitutes a partnership, reference should be made to the relevant provincial law on the subject and such law will be viewed as persuasive by the Department of National Revenue.

3. A characteristic of a partnership is a sharing of profits of a business as opposed to a sharing of gross returns. Where the share of profits represents the payment of an obligation as opposed to a partnership right to so share, any presumption of partnership relating to the share of profits is rebutted.

4. A joint venture agreement, whereby two or more persons agree that each provides his own property to perform a specific task and receives a specific division of profits from such a task, may be considered a partnership as regards such profits; but as long as the property is not held under joint tenancy or tenancy in common, it is not considered to be partnership property. Thus the capital cost allowance provision relating to partnership property does not apply.

5. Where several persons form an association for the purpose of carrying out particular business transactions in which they are mutually interested, the association has the characteristic of partnership. However, such persons may associate without each accepting total liability for the association's debts. In these circumstances, contracts may indicate that the associated persons will be liable only for their respective agreed portions of the debts. The existence of such an arrangement is viewed as an indication that a partnership does not exist. One of the original examples of this type of association which does not constitute a partnership is a syndicate of insurance underwriters. Associations or syndicates in connection with natural resource industries often are in the same category.

6. Since a partnership is a relationship between persons carrying on business for profit, the type and extent of a person's involvement in the business is relevant in determining whether he is in reality a partner . . .

3. Differences in taxation of partnership and co-ownership

It was noted earlier that partners account personally for their shares of partnership activities, profits and losses, etc. and to that extent partnership income is taxed in Canada on a basis comparable to that earned by a mere co-owner. However, important differences between the two types of arrangement can arise and are as follows.

(a) *Timing of income*

A co-owner has more flexibility than a partner in determining the timing of claiming deductions in computing net income for Part I purposes where there is a discretionary element thereof. This is because in the case of partnership, it (the partnership) is required to compute income, and make appropriate deductions, with a partner accounting for his share thereof. Therefore each partner is subject to the will of the majority of the

---

36. In contrast, see sections 761 and 7701 of the Internal Revenue Code. It should be noted that also unlike the United States, in Canada an association of investors is never treated as a corporation unless actually carried out through a company formally incorporated under applicable company law: cf. section 7701, Internal Revenue Code.

37. See also: "The Business of Defining a Partnership under the Income Tax Act", Howard Kellough, *Canadian Tax Journal*, XXII (2), March-April 1974, p. 190.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

partners as to the manner in which such elections are made.[38]

For example, the system for deduction of depreciation, in the form of a capital cost allowance, on capital assets provides taxpayers with a great deal of flexibility in timing deductions inasmuch as the amount of such claim in a particular year is at the discretion of the taxpayer, subject to the maximum limits thereof.[39]

This can be of particular importance in the case of a foreign investor for the reason that if there is a net loss from the partnership business, the benefits thereof can only be carried forward and enjoyed during the subsequent 5 taxation years.[40]

To the extent that losses arise as the result of the manner in which timing options and elections have been exercised, the foreign investor, as partner, faces the possibility of losing the benefit thereof if the losses cannot be used in the 5-year carry forward period; in contrast, a co-owner would have been entitled to select a tax-accounting rule, in the initial year, that would have avoided the creation of losses which subsequently become stale-dated. The problem can be particularly acute where the foreign investor is in a joint investment with a Canadian person who may often be in the position to immediately enjoy the benefits of losses from the partnership, as an offset against other sources of income subject to Canadian tax,[41] whereas the foreign investor without other Canadian business activities would not enjoy such an advantage.

Conversely, if all of the joint investors are foreign persons, it is likely that their interest will be common and the agreed timing of recognizing income through partnership elections and options will not prejudice any particular partner.[42]

(b) *Partnership interests – Co-ownership interests*

Although a partnership is not a separate person for Canadian tax purposes, an interest in the partnership is recognized as a separate property and transactions in or in respect of such interests can give rise to Canadian tax effects – whereas a mere co-owner simply has a direct "undivided" interest in each property (comprised of the co-ownership) for Canadian tax purposes. Normally, a partnership interest is treated as a capital property with the result that a disposition thereof normally gives rise to capital gain taxation, whereas disposition of an interest in a co-ownership requires identification of the nature of each property disposed of and may give rise either to capital gain or ordinary income, the latter, for example, in respect of the disposition of inventories of the co-ownership or recapture of capital cost allowance previously claimed; the notions of capital gains and recapture of capital cost allowance merit further consideration.

(i) *Capital gains*

First, under Canadian tax law, the general rule is that where a property used to produce or gain income is disposed of, a capital gain arises, measured as the excess of the proceeds over the "adjusted cost base"; one-half of such "capital gain" is a "taxable capital gain" required to be included in income to be taxed at ordinary rates.[43] Where a foreign investor is involved, such taxation will arise (see above respecting the first pattern of taxation) if the property is considered to be a "taxable Canadian property".[44] Such property includes, inter alia, Canadian real estate, shares of private Canadian corporations,[45] movable or personal capital property used by a foreign investor in carrying on business in Canada or interests in partnerships 50% or more of the property of which comprises the type of property just noted.

The implications thereof are twofold. On the one hand, it is possible that a foreign investor's interest in a Canadian business partnership will not be subject to Canadian tax upon a disposition where, for example, the majority of assets of the partnership does not comprise taxable Canadian property. On the other hand, if the latter is not the case and the partnership interest is a "taxable Canadian property", the disposition thereof will generally give rise to capital gains, not ordinary income, notwithstanding that a sale of the underlying property would give rise to ordinary income. It should be noted, however, that the purchaser of the partnership interest does not achieve a step-up in cost base in respect of his interest in the underlying properties of the partnership for purposes of future computation of profit or loss from the operations of the partnership.[46]

The terms of a Canadian treaty can give rise to additional differences between the tax arising on the disposition of an interest by foreign investor as partner rather than as co-owner. Most new generation, OECD model-based treaties would allow Canada to tax a foreign investor disposing of a direct interest in properties owned in co-ownership and used in carrying on business in Canada.[47] However, these treaties normally provide exemption from Canadian taxation in respect of gains realized in

---

38. The only exception to this rule is in respect of certain exploration and development of costs in respect of resource ventures (subsection 96(1) of the Act).
39. See Part XI of the Income Tax Regulations: cf. the rule in the United States where minimum depreciation is deemed to be claimed.
40. Section 111 of the Act.
41. As a general rule, a Canadian resident taxpayer may offset losses from one source of business or investment against income from other sources, whether earned directly or through a partnership (paragraph 3(d) and section 96 of the Act).
42. Timing options can arise with respect to both the recognition of gross revenue or claiming deductions or expenses. Subject to important modifications proposed in the 12 November 1981 budget (see also the 18 December modifications thereof), taxpayers can normally, for example, claim reserves in respect of instalment sales. Timing options, arise, inter alia, in respect of the immediate deductibility of interest expense (under paragraph 20(1)(c)) or the capitalization thereof (under section 21), depreciation on tangible capital expenditures and on some forms of limited life intangibles (under section 20(1)(a) and Part XI of the Income Tax Regulations) and the deductibility of certain intangibles such as goodwill (collectively: "eligible capital expenditures") (under paragraph 20(1)(b) and related provisions of section 14 of the Act).
43. Sections 3 and 38-55, I.T.A.
44. Taxable Canadian property is defined in paragraph 115(1)(b), I.T.A.
45. Paragraph 89(1)(f) of the Act: that is, a corporation the shares of which are not treated on a stock exchange in Canada nor controlled by such a company.
46. Again, this is in contrast to the U.S. system (see section 754 of the Internal Revenue Code).
47. See, typically, Article 13(2) of Canada's newer treaties and the same article in the 1977 OECD Model Convention.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

disposing of an interest in a partnership unless the principal property thereof comprises immovables.[48]

(ii) *Recapture of capital cost allowance*

Any recovery (recapture) of capital cost allowance previously claimed upon the disposition of the subject depreciable property is required to be included in ordinary income and only proceeds realized in excess of original cost are subject to capital gains treatment.[49]

However, where an interest in such property is disposed of through the sale of a partnership interest, the general rule holds and the recapture realized in the form of a gain on the disposition of the interest is accounted for as capital gain; however, as already noted, the purchaser of such an interest would not enjoy a step-up in cost base in the underlying property.

(c) *Transactions between partner and partnership*

Another important difference between partnerships and co-ownerships to be noted and considered in structuring the joint investment is the general rule that transactions between a partner and a partnership are considered to take place at fair market value and that, for example, where a partnership property is transferred to a partner, a taxable gain may arise. The exceptions to the rule, providing for "rollovers", are restricted to transactions involving "Canadian partnerships" requiring that all partners be residents of Canada.[50] In contrast, there is no recognition of any transaction between an investor and the co-ownership, unless it entails a disposition of property by one co-owner to another. However, an important exception to the general rule is that the cash withdrawals by a partner, if and when in excess of his adjusted cost base, are tax-deferred.

4. Joint ventures through a "Canadian-controlled private corporation"

It was noted earlier[51] that private Canadian corporations may be entitled to a corporate tax rate reduction of 21 percentage points[52] where not more than 50% of their shares are owned by non-residents. This reduction, applicable to the first $200,000 of net income in a year, and subject to an overall limit of $1,000,000 (under the 1981 Budget proposals), can make it advantageous to carry out joint investments with Canadian partners through a single corporation, rather than by way of co-ownership or direct partnership.

C. Financing and licensing factors

1. General considerations

The combined effect of Part XIII taxes (25% flat withholding on gross payments) on dividends, interest, royalties and rents paid to foreign investors and deductibility of certain of such payments under Part I of the Income Tax Act can provide several options in structuring Canadian investment and business undertakings. Subject to the thin capitalization rules (below), equity provided in the form of debt can produce interest charges deductible against high taxed income, substituting therefor lower Part XIII withholding taxes. In contrast, equity provided either directly by the investor or by share investment in the company utilized to make the investment or undertake the business produces non-deductible dividend payments. Similarly, the licensing of technology rather than outright transfer or direct use thereof can produce different tax results. The range of the possible results, assuming one of Canada's newer treaties in respect to a business venture, may be seen in the following comparisons:

	Financing		*Technology*	
	Debt	*Equity*	*Licensing royalty*	*No royalty*
Profit	$100	$100	$100	$100
Interest or royalty charge	(100)	–	(100)	–
Taxable profit	–	100	–	(100)
Corporate profit tax (Part I) @ 50% (a)	–	$ 50	–	$ 50
Secondary – branch (Part XIV) or dividend (Part XIII) tax and Article X(2) @ 15% (b)	–	$ 7.50	–	$ 7.50
Part XIII and AXI (3) @ 15% (c)	$ 15	–	–	–
Part XIII and AXII (4) @ 10% (d)	–	–	$ 10	–
Net return	$ 85	$ 42.50	$ 90	$ 42.50

(a) Actual combined federal and provincial taxes may range from 25.5% to 51% depending upon applicability of a 6 percentage point reduction for manufacturing and processing operations or (section 125.1 I.T.A.) and the particular province involved (where tax rates may range from a low of 5.5% in the Province of Québec (in 1983 and subsequent years) to a high of 16% in British Columbia, and leaving aside a temporary 5% federal surtax (section 124.2 I.T.A.) which is to be extended through 1983 under the 12 November 1981 Budget. See notes 8 and 52 and related texts.

(b) See, for example, treaties with Switzerland, U.K., France, Germany (as yet unratified), Belgium and Italy.

(c) See treaties referred to in (b).

(d) See treaties referred to in (b).

2. Debt v. equity: Thin capitalization and withholding taxes

The general rule providing deductibility, under Part I, for financing charges is subject to thin capitalization restrictions where paid by a Canadian resident company to certain foreign shareholders or persons affiliated with them. In order for full interest charges to be deductible, the ratio between loans provided by such foreign shareholders owning 25% or more of the shares of the Canadian resident operating company and the balance sheet equity thereof must not exceed 3:1. Persons not dealing

48. See, for example, Article XIII(4) of the Canada-Switzerland income tax treaty.

49. Section 13, I.T.A.: this may be contrasted to the rule in the U.S. in respect of certain straight-line methods of depreciation of real property where recaptured depreciation is treated as a capital gain (see the Economic Recovery Tax Act).

50. See sections 97, 98 and 102 of the Act.

51. See note 8.

52. Where regard is had to the 6 percentage point reduction in corporate tax rates (5% where the 21% reduction applies) in respect of manufacturing profits under section 125.1 of the Act and recent corporate rate reductions in the province of Québec, overall corporate rates may be as low as 13%.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

at arm's length[53] with shareholders are taken into account for this computation as well as back-to-back loans made through foreign banks or other financial intermediaries.

Interest paid or incurred in respect of debt in excess of the 3:1 ratio is not deductible in computing taxable income under Part I of the Act. This means that in establishing a Canadian subsidiary with, for example, a $1,000,000 investment at least $250,000 must be invested by way of share capital in order that interest charges on the balance be deductible.[54] However, these rules do not apply to operations carried on in Canada through a branch of a non-resident Canadian company.[55]

Canadian withholding taxes under Part XIII in respect of such financing charges are exigible at the rate of 25% unless reduced by treaty which, as noted above, normally provides for reduction to 15%. There is also provision under the domestic law for exemptions from withholding tax on interest paid to arm's length persons on loans made before 1983 where no more than 25% of the principal amount of the loan is required to be repaid, in the absence of default, during the first 5 years of the loan.[56]

It is not known at the time of writing whether this exemption, introduced in 1976, will be extended, as it had been from the initial expiry date of 1979. Considering that arm's length relationship arises where the share ownership is restricted to 50% or less or that back-to-back loan arrangements are not specifically ruled out (as in the case of the thin capitalization rules), there is some degree of flexibility in some circumstances to take advantage of this exemption in financing business start-ups in Canada – although concerns respecting agency or sham and the imminent expiry of the exemption reduce substantially the potential interest therein.[57]

3. Transfer of technology

The basic question may arise as to whether to license or assign (outright) industrial technology (patents and other proprietary rights or non-exclusive or non-proprietary technology, such as know-how). The parameters are as follows.

From the standpoint of deductibility to the operating entity (say Canadian subsidiary), royalties or similar payments are normally deductible in the year in respect of which the payment arises while the cost of an outright acquisition is either deductible over the life of the technology in the case of limited life rights or at the rate of 10% but only on one-half of the cost of unlimited life rights, unless the benefits obtained are of current or short-lived duration in which case the entire cost may be deductible in the year in which acquired.[58]

From the standpoint of taxation to the foreign transferor or licensor, Canadian tax could arise under either Part I of the Act or Part XIII, as more fully discussed in the next paragraphs.

Normally, the transferor will not be subject to tax under Part I, on the net income basis, in respect of either a single transaction of transfer of his technology or licensing thereof to a Canadian business enterprise, whether in the form of outright transfer or technology license. This is because either the transaction does not amount to carrying on of business in Canada,[59] or, even if it does, exemption, in the case of outright transfers, should arise under the normal business profits rule of a Canadian treaty.[60]

Uncertainty can arise in respect to the outright assignment of some but not all of a transferor's proprietary interests in his technology, such as in the case of the provision of know-how. The issue will be whether or not a mere "use" is being provided; but, notwithstanding some uncertainty in the jurisprudence, it would seem that in the absence of any restriction on the use to which the technology may be put, withholding taxes under Part XIII should not arise.[61]

---

53. Non-arm's length relationships exist where there are certain defined relationships between persons such as a common parent or where a person controls a corporation or persons are affiliated by blood or marriage relationships (paragraph 251(1)(a) and subsection 251(2) of the Act or, in the absence of such relationships as a matter of fact, entailing the question of separate economic interests or a common directing mind whithin rules made under case law and pursuant to paragraph 251(1)(b)).

54. The 1981 Budget would exclude third-party shares, if any, from "equity".

55. Canada's treaties do not restrict the applicability of Canada's thin capitalization rules and, for example, the renegotiated treaty between the U.S. and Canada specifically precludes a claim under a non-discrimination clause (Article XXV(8)):

> 8. The provisions of paragraph 7 shall not affect the operation of any provision of the taxation laws of a Contracting State:
>
> (a) Relating to the deductibility of interest and which is in force on the date of signature of this Convention (including any subsequent modification of such provisions that do not change the general nature thereof)....

56. Subparagraph 212(1)(b)(vii) of the Act.

57. With respect to the concerns respecting sham or agency it should be noted, however, that for purposes of both the section 212(1)(b)(vii) exemption and the section 18(4) thin capitalization rules, a bona fide third-party loan simply collaterized or secured or guaranteed by a foreign shareholder would be perfectly acceptable. With respect to the concern respecting sham or agency in respect to back-to-back loan arrangements designed to circumvent the arm's length requirements of section 212(1)(b)(vii), see the decision of the Supreme Court in *Swiss Bank Corp.* v. *Her Majesty the Queen* 72 D.T.C. 6470.

58. As a general rule, case law distinguishes between a current expenditure for purposes of gaining or producing income, pursuant to paragraph 18(1)(a) of the Act, and a capital expenditure entailing one which provides an enduring benefit to the acquirer or increases or augments the income earning process pursuant to paragraph 18(1)(b); in the latter case, specific provision for deductibility must be found within the rules of the Act or the Regulations. Where an intangible capital expenditure with a limited life is involved, Part XI and Schedules 2 and 4 of the Income Tax Regulations (made pursuant to and for the purposes of paragraph 20(1)(a) of the Act) provide for straight line write-off over the useful life of the right acquired while section 14 of the Act provides for a 50% deductibility, at the rate of 10% per annum on a declining balance basis, in respect of intangible capital expenditures without a limited life, within the "eligible capital property" rule referred to above (note 42).

59. Section 253 of the Income Tax Act extends the meaning of carrying on business in Canada to include a mere offering for sale of anything in Canada. On the other hand, a single isolated transaction ("adventure in the nature of trade") has been held not to amount to the carrying on of business (*Tara Exploration Ltd.* v. *Her Majesty the Queen* 72 D.T.C. 6288).

60. The exemption would normally arise under Article VII of the OECD based treaties unless the payments in respect of the outright transfer are contingent in nature and thus perhaps are contemplated by the royalty provisions normally found in Article XII of such treaties.

61. Paragraph 212(1)(d) of the Income Tax Act provides for 25% withholding tax on rents, royalties and similar payments including, inter alia, any type of payment for the right to use in Canada know-how or other non-proprietary technology. In *St. John Shipbuilding Dry Dock Ltd.* v. *Her Majesty the Queen* 80 D.T.C. 6272, the Federal Court of Appeal suggested that lump sum payment for sale of a computer program to build ships would have been subject to withholding tax under the rent or royalty rule had it not been for exemption arising under provisions under the current treaty between the U.S. and Canada. However, it seems that restrictions placed on the right of the Canadian acquirer to alienate and the requirement to maintain confidentiality brought the

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Where the technology transfer arrangement involves the payment of either a conventional royalty or licensing fee or a lump sum price, the payment of which is contingent upon the use (sales, profits, etc.) of the transferee or licensee, the Part XIII, 25% withholding tax will apply.[62] Canada's newer treaties do not eliminate the liability but restrict the rate to 10%.[63]

4. Intercompany pricing considerations

As a general rule, intercompany pricing arrangements, including those respecting the provision of financing and technology, must conform to a fair pricing or reasonable price standard, in the absence of which deductibility for Part I purposes may be denied to the payor and Part XIII 25% withholding tax (to the extent not otherwise applicable) on disguised or deemed corporate distributions may arise for the payee in respect of an excess price. It is to be noted that the Canadian rules in this area are comprised largely of broadly stated principles[64] without elaborate statutory language or a substantial body of case law.

D. Anticipating the ultimate disposition

Structuring the investment or business start-up from the standpoint of minimizing Canadian taxes on an ultimate disposition turns on three basic factors:

- under the Income Tax Act, as already noted, gains realized on the sale of "taxable Canadian property" comprising, inter alia, shares of private Canadian resident companies, Canadian real estate, resource properties or capital properties used in carrying on a directly-held business[65] or other property thereof[66] are subject to tax;
- Canada's new generation treaties would generally exempt the sale of shares of private Canadian companies whose principal property does not comprise real estate;[67] and
- the sale of shares of a foreign company (a non-Canadian resident company) is not subject to tax under the Income Tax Act; but, on the other hand, a purchaser of the shares thereof cannot achieve a step-up in cost base for Canadian tax purposes in respect of the property owned by such corporation without undertaking a liquidation which would give rise to immediate taxation, in respect of the type of Canadian properties noted above.[68]

It was just noted that the purchaser of shares of a foreign company used to carry on a Canadian business does not achieve a step-up in cost base in the underlying properties on a tax-free basis, thus decreasing the potential benefits of a sale of the shares of such a company without liability to Canadian tax. However, the results are not much different in respect of a sale of the shares of a private Canadian company which, absent a treaty exemption, would be subject to Canadian tax. In particular, and unlike the rules, for example, in the United States,[69] a purchaser of the shares of a Canadian corporation may only achieve a step-up in cost base in respect of non-depreciable capital property (thereby excluding inventories and depreciable properties, such as plant and equipment or intangible assets such as goodwill, etc.) by acquiring the shares through a Canadian holding company and proceeding with the liquidation of the acquired company into such holding company.[70]

Accordingly, where the choice is between a Canadian resident company and one which is not resident, from the standpoint of ultimate disposition, the use of a foreign corporation will be preferable in the sense that reliance upon treaty exemption is not required. Finally, in this context Canada's treaties do not generally exempt a foreign direct investor from the sale of business properties or assets comprising a permanent establishment.

Individual foreign investors would also benefit from the insulation from Canadian tax, afforded by the holding of the shares of a non-resident company, arising under Canada's deemed disposition rules at death.[71]

III. ADDITIONAL FACTORS PARTICULAR TO PASSIVE INVESTORS

A. The role of the non-resident-owned investment corporation

Foreign investors in Canadian portfolio securities generally are exempt from Canadian tax in respect of dispositions thereof[72] and are subject to 25% withholding tax on

---

payment within the concept of a mere use (as opposed to an acquisition of outright ownership) within the meaning of subparagraph 212(1)(d)(i), thus leaving it open to structure arrangements not comtemplated by that provision. It is also to be noted that subparagraph 212(1)(d)(i) refers to a use in Canada and not, in concept, a lump sum payment for a right of use which is not restricted to Canada.

62. Section 212(1)(d) of the Act.
63. See, for example, Article XII of the treaties with Switzerland, France, the U.K., Italy, Belgium and Germany.
64. Subsection 69(1) requires a fair market value price with respect to the sale of goods between related or non-arm's length parties; however, subsections 69(2) and (3) deal specifically with international non-arm's length transactions and refer to "reasonable price in the circumstances" and there is no jurisprudence to date on whether there is a difference between the two concepts. For detailed discussions of the various factors noted in this section, see "Intercompany Pricing: In Search of Guidelines", by George Tamaki and Richard Pound, *Canadian Tax Journal,* XXII (5), September-October 1974, p. 460; "Working with Canada's Technology Transfer Rules", by Nathan Boidman, *Tax Planning International Journal,* August 1981, p. 3; "Intercompany Charges for Services and Use of Property – Canadian Income Tax Considerations", a paper presented to the Canadian Tax Foundation Annual Conference in Toronto in 1974, by André Gauthier and written by Gauthier and Nathan Boidman and appearing in the 1974 Conference Report at page 145.
65. Subparagraph 115(1)(a)(iii) and paragraph 115(1)(b) of the Act, note 43 above and related text.
66. Subparagraphs 115(1)(a)(ii).
67. E.g. Article XIII(4), Switzerland-Canada Treaty.
68. Subsection 69(5) of the Act.
69. Sections 332, 334(b) and 336 of the Internal Revenue Code.
70. See subsection 88(1) I.T.A.
71. See note 1: capital gains exemptions provided in Canada's newer treaties in respect of shares of private Canadian companies (not principally involved in real estate activities) apply to deemed dispositions at death. The contrary was suggested by the Federal Court, Trial Division in the case of *Davis* v. *The Queen* 76 D.T.C. 6109, in an obiter dictum respecting the exemptive provisions of Article VIII of the current U.S.-Canada Treaty in respect of a "sale or exchange" but the wider ambit inherent in the new generation treaty concept of "alienation" should make those comments of the Court, if correct, inapplicable.
72. A less than 25% holding in the shares of a public corporation that is, one whose shares are listed on a stock exchange in Canada (paragraph 89(1)(g) of the Act) and debt instruments of Canadian companies are excluded from the "taxable Canadian property" category and, in the absence of systematic and continuous trading activities in such securities in Canada, gains in respect thereof are not subject to Canadian tax.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

interest or dividend payments, subject to treaty protection.[73]

However, gains and income in respect of such portfolio investments may be subject to full Canadian corporate taxation if held through a foreign corporation portfolio which is managed on a discretionary basis by a Canadian broker or other advisory personnel.[74]

To guard against this type of concern, a non-resident can structure Canadian portfolio investments, or other types of passive activities, through a company formed in Canada and qualified for purposes of the Income Tax Act as a "non-resident-owned investment corporation" which is taxed on a "flow-through" type basis. The chief characteristics of such a corporation are:

- all shares are owned by non-residents of Canada;
- investment and other undertakings are primarily of the passive variety, in compliance with specific statutory rules and, for example, no more than 10% of the income of the corporation can be derived from rents or royalties;
- the corporation has made an election to be taxed as a "non-resident-owned investment" corporation within 90 days after its formation or start of business.[75]

The scheme of the rules governing an NRO is to provide a foreign investor with the same overall Canadian taxes on distributed income and profits of the corporation as though the underlying investments had been held directly. The principal rules and the procedures to achieve this result are:

- dividends, interest and other incomes are subject to an initial 25% tax in the hands of the corporation, which is totally refundable upon payment of dividends to shareholders;
- gains realized in respect of portfolio investments which if realized directly by the foreign investor (that is, shares of public corporations[76] and other non-"taxable Canadian property") are not subject to taxes at the level of the corporation.
- on payment of dividends, the NRO receives a refund of the initial 25% tax and Canadian withholding taxes on such dividend do not apply to the portion thereof stemming from capital gains which would be tax-free if realized directly.

There are, however, certain anomalies and difficulties in respect of:

- foreign investments by the NRO, and ideally the NRO is not used for non-Canadian investment purposes;
- investments in Canadian securities which if received directly would benefit from a reduction in or exemption from the standard 25%, Part XIII tax, such as corporate debt or bonds qualifying for the "5-year" exemption referred to earlier.[77]

An important manifestation of the last problem noted has been the loss of the 5 percentage point reduction in the rate of withholding tax on dividends paid by Canadian companies in which there is a 25% or greater Canadian ownership.[78] However, as noted earlier, the 12 November 1981 budget proposal to abolish this reduction will eliminate this particular adversity of utilizing an NRO to hold Canadian portfolio equities.

B. Role of Canadian resident trusts

A Canadian resident trust can serve to reduce taxation on Canadian source rents derived from personal or moveable property or royalty-type payments when such income is derived from investment activities which are not considered to amount to carrying on of business.[79] The trust provides a basis to achieve taxation under Part I[80] rather than under Part XIII,[81] and where tax under the former regime is less than that which would arise under the latter this approach is advantageous.

As already noted, a foreign investment which does not amount to the carrying on of business can be rendered subject to net income taxation by the use of a Canadian resident corporation. However, this entails not only the cost and complexities of a corporation but aggregate Canadian taxes (where regard is had to both the primary (mainstream) corporate taxes and the secondary distribution withholding taxes) of rates ranging up to 60% and greater.[82] A corporate structure may also prevent the investor from realizing optimum tax results in his country of residence; for example, it may preclude a flow-through of tax write-offs. It was noted in the preceding section that an NRO cannot be used to earn rents and royalties.

A trust can optimize results in both Canada and the State of residence by not only effecting net income taxation in Canada but, as well, a reduction of the overall Canadian taxes to a maximum of 25% of net income while possibly providing flow-through characteristics in the country of residence.[83]

The requirements of, and general considerations related to, effective trust arrangement in respect of passive rentals and royalties may be summarized in respect of a hypothetical situation where a helicopter having a cost of $100,000, financed at 20% per annum, is leased to a Canadian user at an annual rent of $30,000:

- if the helicopter is leased directly by the foreign investor(s) to the Canadian user, annual Canadian in-

---

73. Part XIII of the Act.
74. As noted (note 5 above), a foreign company can be considered resident in Canada on the basis of central mind and management which, although generally is a reference to the seat of the Board of Directors, could also be determinated on the basis of day-to-day operational management; see the decision in *Crossley Carpet* v. *M.N.R.* 69 D.T.C. 5015.
75. Sections 133 and 134 of the Income Tax Act.
76. See note 72.
77. See note 56 and related text.
78. See note 17 and related text.
79. See note 24 and related text.
80. See section II(A)(1) above.
81. See section II(a)(2) above.
82. See note 80. It should also be noted that the 1981 Budget increases taxes on investment income earned through a Canadian resident corporation by eliminating the applicability of the refundable tax provisions of section 129 to foreign controlled corporations.
83. For example, typical commercial trusts may often be ignored for U.S. tax purposes allowing the U.S. inventor, as beneficiary or unit holder, to direct write-offs of the costs and expenditures of the trust. This may either arise under the grantor trust rules or as a matter of the trust being characterized as a partnership.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

come taxes would arise at 25%, producing taxes of $7,500;[84]

- if a proper trust is constituted[85] and the trustee is a resident of Canada, the trust can acquire and lease the helicopter and be governed by the net income regime of Part I;[86]
- the trust could, for example, in its first year have no taxable income, the gross lease payments of $30,000 being offset by interest financing costs of $20,000 and depreciation claims of $10,000;[87]
- in a subsequent year when the gross lease payments exceed the aggregate financing and depreciation charges, the net income would either be taxed in the hands of the trust at the rate of roughly 50%[88] or in the hands of its beneficiaries at a maximum rate of 25%. Taxation in the hands of the trust would arise if the trust arrangements do not require that annual income be distributed to beneficiaries and in fact there are no such distributions in the year earned. Where such distribution is required and/or is made no tax arises under Part I in the hands of the trust, but rather a 25% withholding tax on the beneficiary under Part XIII.[89] If it is assumed that in the subsequent year in question aggregate financing and depreciation charges amount to $20,000, net income for Part I would amount to $10,000 and, in cases where the income is accumulating, Canadian taxes of $5,000, computed at the rate of roughly 50%, would be incurred, which may be contrasted to the gross withholding taxes of $7,500 which would arise where the helicopter is leased directly by the foreign investor; and where the income is payable to the beneficiaries, Canadian taxes would amount to $2,500 comprising the 25% withholding tax on the net income distributed to the beneficiary, comparing rather favourably with the gross taxes in the case of the direct holding;
- it is important to note that if the trust is not resident in Canada (that is where the trustee is a non-resident) the taxpayer would simply be a direct foreign investor, bringing into effect the flat withholding tax of 25% on gross lease payments under Part XIII of the Income Tax Act.

C. Revenue-producing real estate

1. Overview

In general terms, a direct foreign investor in Canadian revenue-producing real estate may elect to be taxed on either a net basis at regular rates of tax or pay a flat 25% withholding tax on gross rents; this is considered below in section 3. Full implications of Canadian tax results including issues of corporate taxes on capital are beyond the scope of this paper.[90]

The precise circumstances of the investment may affect to a considerable extent the overall results. The variables include the status of the investor (that is, individual versus corporation and in the latter case whether the Canadian rental property investment is a principal or ancillary activity), the size and nature of the property, the manner in which it is leased (gross lease versus net lease, single tenant or multi-tenants), and the manner in which it is managed (which may range from little if any under net leases, to independent property managers or the maintenance of a full time staff). Some of the variables and some of the effects arising thereunder are briefly reviewed herein.

Assessment of all factors determines whether the investment should be made directly by the foreign investor, through a Canadian resident company or perhaps through a Canadian resident trust: the factors include effects under Canada's domestic law and the extent to which a treaty may alter the results. Recent treaties largely permit Canada to fully apply its domestic law in respect of foreign investment in Canadian real estate held directly or through Canadian corporations.[91]

2. Financing considerations

The financing objectives are normally twofold: maximize the deductibility of interest expense in computing Canadian taxes on rental income and minimize Canadian withholding taxes on interest paid to non-resident lenders in order to minimize the cost of borrowing. The basic considerations and factors underlying these objectives have been considered in Part I, and in relation to investment in Canadian real estate may be summarized as follows (regard also being had to certain additional factors particular to real estate investment):

- Interest expense will generally be deductible where

---

84. It is assumed that the helicopter is leased on a net basis (the lessee assuming full responsibility for its maintenance and operation) comprising circumstances where the rental income should generally not be considered to be derived from carrying on of business in which case Part XIII of the Income Tax Act – Section 212(1)(d) and not Part I of the Income Tax Act will apply, resulting in a flat 25% withholding tax on the gross lease payment, subject to reduction under applicable treaty, if any.

85. Constitution of the trust would be governed by English common law principles in all provinces other than the province of Québec, in which it may be difficult to utilize the provisions of the Civil Code to constitute a commercial trust: see the Supreme Court of Canada in *Crown Trust* v. *Higher* (1977) I S.C.R. 418.

86. The trust will be considered resident in Canada: *Thibodeau* v. *The Queen* 78 D.T.C. 6376 and subject to Part I tax as an "individual" (section 104 of the Act).

87. Normally, a helicopter could be depreciated at rates of 25% per annum on a declining balance basis under the Income Tax Regulations and pursuant to paragraph 20(1)(a) of the Income Tax Act with the trust being entitled to such part of the maximum claim as is required to eliminate taxable income.

88. See Resolutions 95 and 101 of Notice of Ways and Means Motion, 1981 Budget.

89. In the latter circumstances noted, the trust income is considered as "payable" under subsection 104(24) and may thus be deducted in computing the trust's own income for purposes of Part I under section 104(6), thus giving rise to Part XIII withholding tax in respect of taxes payable by the beneficiary under Sections 212(1)(c), and (11) and 214(3)(f). (It is important to note that a trust is not entitled to reduce its income for purposes of Part I of the Income Tax Act in respect of income "payable" if the income is derived from Canadian real estate rentals, resource activities, businesses carried on in Canada or the disposition of "taxable Canadian property". None of these restrictions however could apply in the hypothetical case under consideration.) Care would be required in drafting the income interests to ensure that the amount "payable" is net of depreciation.

90. For a detailed study of this topic see "Investment in Canadian Real Estate by Non-Residents", a paper written by André Gauthier and Nathan Boidman, delivered to the Corporate Management Tax Conference of the Canadian Tax Foundation in June 1977 by André Gauthier and appearing in the Conference Report at page 195; a number of changes since the date of writing have not substantially altered the rules and results analyzed therein.

91. Present treaties with the U.S., Netherlands, Sweden and Finland can provide some interesting planning possibilities with respect to disposition gains, but as noted (note 7) these treaties are now being renegotiated.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

the investment is acquired by a Canadian resident corporation or trust or, in a case of direct foreign investment, the revenue property is considered to comprise a business in Canada, or in the absence thereof a net income election is made.[92] The constraints are the thin capitalization rules where a Canadian resident corporation is involved.[93] It can also be noted that interest incurred during a period of construction can be capitalized at the option of the investor.[94]

– With respect to Canadian withholding taxes, interest paid to a non-resident lender may be subject to Canadian tax in both the direct and indirect investment structure. Where the investment is direct, and interest is paid by the foreign investors to a foreign lender, Canadian withholding tax is applied to the extent that the interest is deductible and the loan is secured by the real estate[95] or the investment amounts to the carrying on of business and comprises the principal business activity of the foreign investor.[96] Where the investment is made through a Canadian corporation or trust, withholding taxes will generally apply.[97] In both the direct and indirect context if a corporate investor is involved exemption may arise under the 5-year rule.[98]

Participating or bonus financing arrangements, whereby a lender receives an interest in rents or eventual disposition proceeds, are being used more frequently and may arise in the context either of the financing available to the investor or may comprise the manner in which the investor makes his investment. When viewed from the former standpoint, the issues include the deductibility of contingent amounts paid under the arrangement by the investor and the extent to which a withholding tax obligation may arise. Where the context is the use of such arrangements by the investor as the means of participating in Canadian real estate, structuring issues are, in effect, the mirror image of the second consideration just noted, that is, the manner in which Canadian tax may arise on payments made to the investor under the participation arrangement or perhaps in respect of a sale of the instrument. As a general matter there is, at this time, a lack of precise law on this point, either under the Income Tax Act or in the cases, and it will be necessary to rely on the principles already discussed. The main issues will involve the questions of whether the participation should be treated under rules relating to loans, the payment of principal and interest, rules relating to joint ventures or partnerships, or some combination of the two. The particular features of the participating arrangement will have to be carefully examined in order to assess the most appropriate characterizations for and consequences under Canadian tax law.[99]

3. Selecting the regime of taxation

Normally, it would be desirable to be taxed in Canada on a net income basis. As already noted such treatment may be achieved regardless of the investment structure. It applies automatically where a Canadian resident corporation or trust is involved, and, in the case of direct investment, the foreign investor may opt for net income taxation by making an election under section 216 of the Income Tax Act if the activity is not considered to be the carrying on of business.[100] This may be contrasted to the difficulties foreign investors may have in regard to rents derived from moveable or personal property and the alternate strategies required and the specific need of utilizing the Canadian resident trust.[101]

Where the investment is direct, regardless of whether it amounts to the carrying on of business or net income elections are made under section 216 of the Act, withholding tax obligations may arise in the hands of the payor (lessee) of the rent (or Canadian agent of the lessor); these rules must be coordinated with the substantive tax regime selected. For example, in the case of direct investment amounting to the carrying on of business in Canada, a certificate would have to be obtained by a lessee under section 805 of the Income Tax Act Regulations made pursuant to subsection 214(13) of the Income Tax Act in order that there not be withholding taxes (which the investor would then have to claim as a refund upon filing an income tax return for the taxation year). Or where the section 216 election is involved, a lessee would have an obligation to withhold the 25% of gross rents, again causing the investor to suffer a reduction of cash flow and claim a refund on a tax return for the year; however, an intermediate regime of withholding, applicable to net cash flow available from the gross rents, may be opted for under subsection 216(4) of the Act by the filing of appropriate undertakings and forms by a Canadian agent with and on behalf of the foreign investor.

4. Cash flow

Canadian tax on cash flow, whether or not represented by taxable income, does not arise in the case of direct investment; for example, there are never Canadian withholding taxes on dividends or distributions made by a non-resident corporation to a non-resident shareholder. However, where the investment is made through a Canadian resident corporation, any distribution, whether or not represented by underlying net rental income, would

---

92. With respect to carrying on of business, see note 24 above and related text; with respect to net income election, see section 21t of the Act and next section.
93. Subsection 18(4) and following of the Act. See section II above.
94. Section 21 of the Act.
95. Paragraphs 212(1)(b) and 212(13)(f) of the Act.
96. Paragraphs 212(1)(b) and 212(13.2) of the Act.
97. Paragraph 212(1)(b) of the Act.
98. Subparagraph 212(1)(b)(vii), see note 56 and related text, bearing in mind that the exemption is scheduled to expire at the end of 1982 with the result that interest on loans entered into after 1982 will no longer be exempt.
99. Regard should be had to Resolution 151(b) of the 12 November Notice of Ways and Means Motion which excludes contingent interest payments from the 5-year exemptive provisions of subparagraph 212(1)(b)(vii). Thought should be given to the interrelationship between this new rule, the case-made rule that participation payments may not, in the first instance, have the character of interest and, therefore, whether the new Budget rule will have application. In this context, regard may also be had to paragraph 212(1)(d) dealing with rent or royalty payments and whether it can have applicability to participating payments under the bonus debt arrangement.
100. As discussed earlier, net income taxation, under Part I of the Act, applies, without need of an election if the rental property amounts to a business, under characterization criteria evolved in the case law.
101. See section III B respecting the use of a Canadian resident trust.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

be subject to dividend withholding taxes under Part XIII of the Income Tax Act.[102]

5. Dispositions generally

Any disposition of an interest in Canadian real estate will be subject to Canadian tax except in the case of the sale of shares of a non-resident Canadian corporation owning Canadian real estate or a beneficial interest in a trust not resident in Canada. All corporate liquidation procedures give rise to tax in the hands of the distributing or liquidating corporation, instalment sale reserves do not apply to non-residents who do not or cease to carry on business in Canada and tax-free exchanges of real estate are not permitted. Both direct and indirect dispositions are normally subject to the taxable disposition rules detailed to some extent in the first part of this paper. Aside from exemptions under a few of Canada's treaties,[103] the use of straight debt financing as a means of sheltering income including gains and the uncertain possibilities with respect to participating debt arrangements, strategies in structuring investments from the disposition standpoint will normally relate to differentiating aggregate Canadian tax burdens which may arise under different structures selected and normally within a relatively limited range of possible results, the average Canadian tax burden on gains realized from disposition of revenue property ranging from 25% to 35%.[104]

SUMMARY COMMENT

It is apparent that effective structuring of foreign investment and business operations in Canada requires identification and adroit use of a host of rules and factors, arising under both domestic law(s) and treaty(s). In most situations careful planning should improve the results which would otherwise be realized.

---

102. It is important to note for those who also invest in U.S. real estate that the distribution rules in Canada are quite different. Under U.S. law a distribution by a U.S. corporation may be taxed either as a dividend to the extent of underlying earnings and profits, per sections 301 and 316 of the Internal Revenue Code, or a capital gain to the extent in excess of earnings and profits and cost base in the shares of the payer corporation, pursuant to sections 301(c)(3) and 897; in Canada, in contrast, there is, as already noted in the text, no reference made to underlying earnings and profits in respect of corporate distributions with all such distributions being taxed as dividend, under subsection 212(2) of the Act.

103. See note 91.

104. Factors, discussed earlier, which can differentiate the overall results include dividend distribution rules, branch tax (Part XIV of the Act) considerations and taxes of the different provinces.

CANADA: Summary of Modifications in Draft Legislation (Finance Department Release of 28 June 1982)

The Honourable Allan J. MacEachen, Deputy Prime Minister and Minister of Finance, today tabled in the House of Commons comprehensive Notices of Ways and Means Motions relating to the budget of 12 November 1981. The motions set out the draft income tax legislation to implement proposals of that budget.

The draft legislation reflects the modifications to the budget measures announced by Mr. MacEachen on 18 December 1981. It also contains further alterations reflecting many of the constructive suggestions received over the past several months.

The legislation is being issued in draft form to afford those taxpayers whose interests are affected and their professional advisers an opportunity to review the proposed amendments and suggest modifications to ensure that the changes do not have unintended or inappropriate effects. Mr. MacEachen said that in order to provide ample time for review he would not be proceeding with final legislation in Parliament until after the summer recess.

The practice of tabling draft legislation in the form of comprehensive Notices of Ways and Means Motions was proposed in the document entitled "The Budget Process: A Paper on Budget Secrecy and Proposals for Broader Consultation" issued in April. In that document the Minister said this procedure, which has been followed in recent years, provides an opportunity for significant input by the public and the legal and accounting professions in the development of tax legislation.

Interest expense

The Minister said that a committee of tax professionals has been appointed to review proposals in Resolutions 23 and 24 of the November budget involving the deduction of interest expense. Their effective date is being postponed pending the review and would not in any event apply before 1983.

Standby charge and corporate distributions tax

More significant modifications to earlier proposals include a reduction of the automobile standby charge from 2½% per month to 2% and a postponement of the 12½% corporate distributions tax to 1 January 1983. The automobile standby charge is used in calculating the benefit to an employee from the personal use of a company car. The corporate distributions tax is intended to adjust for the difference between the rate of tax paid by certain small business corporations and the amount of the dividend tax credit to which shareholders are entitled when earnings are distributed.

Charities and insurance measures delayed

Draft legislation relating to charities and to the tax treatment of life insurance policies is delayed as a result of the extensive discussions that have taken place with representatives of both interests. Details of changes relating to life insurance taxation are outlined in a separate press release. The Minister said proposed amendments in these areas would be made public as soon as they are available.

Forward averaging

There are modifications in the draft legislation to the proposals relating to forward averaging which will improve its effectiveness. Forward averaging is a method of averaging tax rates so that someone with an unusually high, non-recurring income is not taxed at an excessive rate. The changes in this area will extend the application of forward averaging to all income earned by artists and athletes from their activities as such.

Working with Canada's Statutory and Discretionary Industrial and Petroleum Assistance Programs

by Peter McQuillan

Canada, like many industrialized nations of the world, makes available a vast array of assistance programs for both industrial enterprises and for petroleum development. At last count there were in excess of 300 federal and provincial government assistance programs for industrial development alone. The nature or type of assistance available ranges from non-repayable grants to ongoing subsidies, from incentive loan terms to income tax concessions. Proggrams may be characterized as either "incentive" in nature (i.e. reduced interest rate loans, outright grants, accelerated write-offs, etc.), or "last resort" in nature (i.e. government loan guarantees where debt security is insufficient for private sector lenders).

I. INDUSTRIAL ASSISTANCE

It is important to gain an understanding of several parameters within which Canadian government assistance programs operate. Of utmost importance to the non-Canadian reader is the fact that Canada has, over at least the last decade, evidenced a high degree of nationalistic and even protectionist economic policy. Foremost amongst such policies is Canada's Foreign Investment Review Act (FIRA). By rendering reviewable all new business start-ups and most acquisitions of control of a Canadian business, the Agency has significant power to influence the degree of competition in Canada. Within the context of government assistance programs this nationalistic flavour is apparent in one key way: the number of programs available to a foreign-controlled business, as opposed to the number available to a Canadian-controlled business, is dramatically reduced. Just as important, however, is the fact that the amount of funding available to foreign-controlled businesses as a percentage of total funding is not reduced so dramatically. In fact a Canadian subsidiary of a foreign company may be restricted in approximate terms to, say, 15% or less of the available programs in terms of number of programs, but will still qualify for well over 50% of government funding in terms of gross monetary incentives available in any one year.

A second key characteristic of Canadian government programs is the distinction between "statutory" programs and "discretionary" programs. The former type of incentive refers to those found in the various taxing statutes of Canada (primarily the Income Tax Act of Canada). These incentives differ from the second category in that they are part of the laws of Canada, and thus a taxpayer (whether Canadian or foreign-controlled) has a legal right to them provided the rules and regulations governing their administration are complied with. One major example of an incentive of this type is the federal investment tax credit program. New manufacturing and processing equipment, current and capital expenditures for research and development, and certain railway, air, water and long-haul land transportation equipment qualify for credits against income taxes otherwise payable in ranges of 5 to 50% of the eligible expenditures. The exact credit varies according to either the nature of the expenditures, the size of the taxpayer, or the geographic location of the taxpayer in Canada.

Peter E. McQuillan, born and educated in Toronto. Attended the University of Toronto and graduated Magna Cum Laude in Commerce and Finance in 1962, winning the Toronto Stock Exchange prize in corporation finance. Joned Touche Ross & Co. in 1962. Became a member of the Institute of Chartered Accountants of Ontario in 1965. Joined Ernst & Whinney in 1968 – Admitted to partnership in 1972. National Tax Partner from 1973 to 1981. Managing Partner of the Toronto Office – October 1, 1981. Selected as a Fellow of the Institute of Chartered Accountants of Ontario in 1976. Chairman, 1980-81, of Taxation Committee of the Canadian Institute of Chartered Accountants. President, 1980-81, of the International Fiscal Association (Canadian Branch). Special lecturer in Taxation and Corporation Finance at the University of Toronto from 1966 to date.

Other taxes – Some of the disincentives
(1) Petroleum and gas revenue tax (PGRT)
(2) Incremental oil revenue tax (IORT)
General investment considerations

Discretionary incentives are significantly different in that there is no legal right to assistance which may be available. A prospective recipient of this type of assistance must enter into an application process administered by any one of a number of government agencies or departments. Thus the success in obtaining assistance of this nature, and even the precise magnitude of the eventual assistance, is left to the discretion of program officials who act according to their perception of the specific circumstances surrounding that application.

By and large, discretionary programs are more difficult for foreign companies to qualify. Generally speaking, the economic benefit provided by a project proposed by a foreign-controlled entity must be significant enough to more than compensate for the potential negative (nationalistic) reaction often associated with granting assistance to a non-Canadian company.

Some final general characteristics worthy of note are:
(a) Canadian government incentives are usually geared to stimulate change in the enterprise, as opposed to maintaining the status quo;
(b) last resort assistance is available to prevent companies from becoming insolvent;
(c) true "incentive" assistance is available only in circumstances in which new initiatives are being proposed or in which corporate growth is sought.

Theoretically, the incentive becomes the inducement to act in a way which brings positive economic benefit to Canada. By the same token, every effort is made to ensure that incentive assistance is not given to situations in which a company would have gone ahead with a project irrespective of the availability of incentive assistance. Program officials administering discretionary incentive programs, however, are very careful to avoid granting assistance in situations where no inducement is felt to be necessary. Failure to demonstrate a need for an inducement is often the cause of otherwise eligible projects not receiving incentive assistance.

The number of programs and their various underlying objectives, administration and sensitivities are ever-changing. Thus it is difficult, and sometimes misleading, to attempt too specific an analysis of this topic at any one point in time.[1] Rather, the foreign business person interested in this aspect of Canada's business climate is better served by an overview of the key general characteristics of the major government programs.

Perhaps the best means to effect this type of overview is by examining an actual case example of a multinational corporation operating in Canada. The case discussed below involves a fairly common corporate situation for a multinational manufacturing company. Please note that while this narrative represents an actual situation, certain facts have been omitted or altered so as to preserve client confidentiality.

MAC Consolidated Inc. is a major, diversified, Canadian public corporation, which is controlled by a large foreign multinational. MAC's proposed project encompassed a $10 million modernization of one of its significant manufacturing divisions. This division employed in excess of 300 people and was located in a relatively small community in a region of Canada designated under the Regional Development Incentives Act (RDIA). This latter designation qualified the region as being one characterized by generally high unemployment and slow economic growth. Approximately 75% of Canada is similarly designated (i.e. all of the Maritime Provinces; Saskatchewan; Manitoba; most of Quebec; and the northern segments of Ontario, Alberta and British Columbia). Companies either presently located in RDIA regions or contemplating locating in them are eligible for incentive assistance in the form of outright grants for expansions, start-ups or modernizations. A modernization is intended to increase the productive abilities and efficiencies of a company as well as to strengthen medium to long term viability.

MAC proceeded to seek parent company approval for modernization of the subject division in order to ensure the commercial and competitive viability of the operation for at least another 10 years. The alternative to modernization was a gradual phase-out of the division over a 3 to 5 year period as profitability and cash flow diminished. Most of the modernization expenditures were to be capital in nature, such as the acquisition of new, more technically advanced production equipment. As a result, the company automatically qualified for a number of statutory incentives. These included a 10% investment tax credit based on total capital costs; a 2-year write-off (for tax depreciation purposes) of all manufac-

1. For specific details on every program please refer to the current edition of "Industrial Assistance Programs in Canada, 1981-1982", by Ernst & Whinney; CCH Canadian Limited.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

turing equipment purchased and duty remission on a significant portion of the equipment which had to be imported from the U.S. because comparable equipment was not available in Canada. Despite the benefits of the above incentives, as incorporated in the capital expenditure proposal and pay-back calculation, the parent company was reluctant to approve the project because the projected return on investment from the modernized facility was not as attractive as several other investment opportunities competing for parent company approval.

Although the Canadian company was aware of the discretionary RDIA program no application for assistance had been contemplated mainly because MAC had had no previous experience in dealing with the government department that administered the program (the Department of Regional Economic Expansion - DREE). Professional advice was sought and received concerning eligibility for assistance from DREE. Facing the impending turndown from the parent company, MAC initiated application procedures with DREE.

Given the magnitude of the number of jobs at stake, and the demonstrated reluctance of the parent company to approve the modernization, the DREE officials moved very quickly to review and approve a maximum non-repayable modernization grant of 20% of approved capital costs, or $1.9 million. Although a DREE grant is taxable in the sense that it reduces the overall capital costs available for future tax depreciation; it nonetheless improved the project's return on investment to a point where it made sense from an internal corporate point of view. The parent company subsequently approved the Canadian company's capital expenditure proposal and the modernization was completed.

The above case illustrates a number of useful points in addition to those covered in general terms earlier. The geographic location of a proposed project is extremely important because of the wide range of economic conditions in Canada. Regional development is a high profile concern of both the federal government (DREE is a federal department) and every provincial government. Further, when regional development is being enhanced, foreign ownership of the applicant company is usually of only minor concern. Likewise, applications to FIRA proposing a location in one of these areas are usually much more acceptable than those proposing locations in areas such as industrialized Southern Ontario (including Toronto). The size of a proposed project, and thus the economic impact, is also of critical importance for obvious reasons. Had only 50 or less jobs been at risk instead of over 300, it is unlikely that the project would have received the immediate attention that it did. At a minimum, the company probably would not have received a maximum modernization grant. Again, size can go a long way in tempering concern over foreign ownership.

Prior approval is necessary in virtually all incentive application situations. Had the above project proceeded in any tangible form prior to receiving official DREE approval, the application for assistance would have been automatically rejected in full. The incentive applied for must always be viewed by government as the inducement for the company to act.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

In addition to regional development and job creation/protection, governments in Canada have other high profile concerns as evidenced by the nature of other specific incentive programs. Foremost among the other areas of concern are enhancement of Canada's technological capabilities. There are significant statutory and discretionary incentives in place to encourage research and development. Foreign controlled companies can qualify for such assistance provided that the technology to be developed is commercially exploited from Canada (i.e. world product mandates for Canadian subsidiaries of foreign companies).

Another large area of concern which is common to any industrialized country is our Balance of Payments position. The creation of exports or the replacement of imports is always an important ingredient in qualifying for government assistance. The magnitude of a project's proposed impact on the Balance of Payments is again a key concern for foreign companies contemplating efforts in this regard.

Notwithstanding many of the comments made in this paper with respect to a foreign company's opportunity for government assistance, a significant project which addresses one or more of Canada's inherent economic concerns is always worth discussing in at least conceptual terms. Flexibility and a willingness to modify the rules of program administration will usually be exhibited when the benefits to Canada are correspondingly large.

II. PETROLEUM DEVELOPMENT ASSISTANCE UNDER CANADA'S NEW NATIONAL ENERGY PROGRAM

Canada's new and highly controversial and still evolving National Energy Program (NEP) is designed to meet three goals:

(1) the security of supply and ultimate independence from the world oil market;

(2) the opportunity for Canadians to participate in energy industries, especially oil and gas;

(3) fairness in pricing and sharing of revenues among governments and industry.

Petroleum Incentive Payments (PIP)

From the viewpoint of incentives for petroleum development, the NEP has had its most positive component with the introduction of cash grants for certain qualifying taxpayers. These new grants are called Petroleum Incentive Payments (PIP).

Petroleum Incentive Payments (PIP) were introduced under the NEP to replace earned depletion which is being phased out. They will increase as the corporate entitlement to earned depletion base additions decreases. The amount of PIP which will be received by an investor will be determined by a number of factors. These factors will be the degree of Canadian ownership – called Canadian Ownership Rate (COR, see following) – of the investor, the location of the expenditure and the date on which the expenditure was incurred. The availability of

PIPs is perceived by the Federal Government as a means of encouraging direct Canadian investment in the industry by increasing investor cash flow on a current basis.

The old system of earned depletion for oil and gas ventures favoured the more established companies that were already receiving resource income, because the earned depletion base accumulated was only deductible against resource profits. New companies having no resource profits could not immediately make use of the earned depletion base. In order to make smaller (and presumably Canadian) companies better able to compete with large, established foreign companies, the Government is phasing out the oil and gas earned depletion deduction and substituting direct grants called PIP payments. The amount of the PIP payments will be determined on the basis of COR, type and location of expenditures and the year in which the expenditure is incurred.

PIP summary

Qualified persons who incur eligible expenses on oil and gas exploration and development in Canada or who incur eligible costs in the purchase of certain assets can obtain PIP payments.

The amount of the PIP incentives will depend upon the:

(a) COR of the applicant;
(b) Canadian control status of the applicant;
(c) location of the expenditures;
(d) type of expenditures;
(e) year in which the expenditures are incurred.

Individuals, corporations, partnerships and trustees are qualified persons eligible to apply for the PIP incentives. Persons who are income tax exempt at the time the eligible expenses are incurred are not eligible for PIP incentives in respect of such expenses, other than the 25% Crown Share Incentive for exploration expenses on Canada Lands. Pension trusts, pension corporations and certain deferred income plans such as employees' profit sharing plans, supplementary unemployment benefit plans, registered retirement savings plans, deferred profit sharing plans, registered edutation savings plans and registered retirement income funds, to the extent they are permitted to participate directly or indirectly in the oil and gas business, are eligible for PIP incentives.

The COR of qualified persons is reduced for PIP purposes by the number of percentage points of the applicant that are attributable to ineligible persons.

There are 4 steps in determining the amount of the PIP incentive:

(1) calculate the amount of eligible costs or expenses;
(2) adjust the eligible costs or expenses by the appropriate adjustment factors; these adjustment factors are designed to prevent the transfer of the PIP benefits to non-Canadians;
(3) determine the appropriate PIP rate;
(4) multiply the adjusted eligible costs or expenses by the appropriate PIP rate.

After 1980, individuals will no longer earn depletion in respect of oil and gas resource expenditures. An earned depletion base will still be accumulated by individuals and corporations with respect to exploration expense in connection with mining properties. In addition, corporations will continue to earn depletion on exploration and development expenses and tangible costs in respect of prescribed enhanced oil recovery projects, oil sands and Saskatchewan upgrading plants.

Canadian ownership rate (COR)

On 22 June 1981 a discussion draft of the Energy Security Act, 1981 was tabled in Parliament by the Minister for Energy, Mines and Resources. This Act contains amendments to a number of existing Acts as well as introducing several new Acts. One of the new Acts is titled the "Determination of Canadian Ownership and Control Act" which sets out the legislation governing the determination of a person's COR and Canadian control status.

The COR is a central piece of the government's NEP and will be required to determine the applicant's PIPs, a person's ability to obtain a production permit on Canada Lands, the ability to obtain export permits for oil and natural gas, and to receive benefits conferred by means of the creation of the natural gas bank. For these purposes individuals and business enterprises will require a certificate which sets out both their COR and Canadian control status. COR means the degree of beneficial Canadian ownership of an entity as determined under the Act and the related regulations.

The COR of a particular entity will be one of the most important criteria in determining the level of PIP available to an investor. Individuals who are investors will not be directly involved in the determination process, other than that they will be required to complete information relevant to their Canadian status. In the case of corporate investors, they will be required, in most instances, to compute the COR of the corporation and forward the information to the manager of the investment. The Department of Energy, Mines and Resources has not yet made its final determination of the rules and the procedures which will be necessary, but, suffice it to say, they will be complex.

The main points of the Act and Regulations are:

1. It is a self-assessing system. The applicants determine their COR and apply for the COR certificate. The certificate will generally have a 1-year term.
2. Deemed CORs are provided in certain circumstances.
3. Non-public enterprises must make inquiry from all investors.
4. Public enterprises use an approximate COR based on the COR of a sample of the outstanding equity.
5. The required accuracy of measurement by an investor depends on the proximity to the applicant and the existence of special relationships.
6. Formal classes of shares must be combined where appropriate. Uncombined classes are measured separately and the results are averaged to obtain the COR.
7. The COR of optionees and owners of convertible securities will in certain circumstances be considered in the COR measurement of the applicant as well as "informal equity" such as overrides and management fees.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Basic scheme for COR determination

An applicant for a COR certificate is required to calculate its COR by applying the COR of each of its investors to the portion of the equity of the applicant owned by each investor. It is up to the applicant to make inquiries from investors as to the investors' COR. An investor that has been requested to supply its COR to an applicant is, in turn, required to calculate its COR either by applying one of the permitted deeming provisions or by applying the COR of each of its investors to the corresponding proportional ownership of equity.

This process of successive inquiries is pursued until a deeming provision is found to apply or an individual investor is identified. Generally, the inquiry will be cut off at the second level of investors. Inquiries are made to owners of shares as at one specific date. The application must be submitted within 120 days of the specific date chosen. Changes in share ownership will generally be ignored unless the result is a decrease in the COR of more than 1%. The COR certificate, when issued, will otherwise have a 1-year term. If an applicant's COR increases substantially, it may apply for a new certificate.

Qualified applicants

The following are qualified to apply for a certificate:

(a) an individual other than a non-eligible person;
(b) a corporation incorporated in Canada;
(c) a partnership constituted under the laws of a province;
(d) a trustee with respect to a trust, if the trustee and beneficiaries are, with respect to their status as such, governed by the laws of Canada or a province;
(e) an insurance company incorporated in Canada in respect of its segregated fund within the meaning of the regulations;
(f) any person prescribed as being qualified to apply for a certificate or who falls into a class of persons prescribed as being qualified to apply for a certificate.

Non-eligible person

For the purpose of this Act the expression "non-eligible person" has the same meaning as it has under Section 3 of the Foreign-Investment Review Act and the regulations made pursuant to that Act, with one exception.

A non-eligible person for the purposes of COR means:

(a) an individual who is neither a Canadian citizen nor a permanent resident within the meaning of the Immigration Act, 1976 and includes a Canadian citizen who is not ordinarily resident in Canada who has applied for citizenship of a country other than Canada;
(b) the government or agency of a government of a country or a political subdivision of a country other than Canada; or
(c) a corporation incorporated in Canada or elsewhere that is controlled in any manner, directly or indirectly, by a person or group of persons described in paragraphs (a) and (b) above.

The exception is that for the first 5 years after this Act comes into force, a permanent resident who has been ordinarily resident in Canada for more than 1 year after the time at which he first became eligible to apply for Canadian citizenship will be considered not to be a non-eligible person for the purposes of the COR determination.

Looking at the definition from the positive rather than the negative viewpoint, one could say that a Canadian citizen ordinarily resident in Canada or a landed immigrant is a qualified applicant.

Canadian control status

The question of Canadian control status, although related to the COR, is determined independently of the COR rules.

Presumption

In determining the control status of a partnership or trust, the partnership or trust will be deemed to be a corporation incorporated in Canada or elsewhere, the interests in its capital or income will be deemed to be shares of a corporation and the beneficial owners of those interests will be deemed to be shareholders of the corporation. The trustees of a trust will be deemed to be members of the board of directors of the corporation.

Control status

Pursuant to the regulations, an individual, a corporation, or a partnership or a trust, either of which is deemed to be a corporation, is Canadian controlled if he or it is not a non-eligible person.

Control of a corporation is often defined by reference to the ownership of the number of shares which represent a majority of the voting rights in a corporation. For instance, the Canada Business Corporations Act (CBCA) provides that a corporation incorporated under the Act is controlled by a person who beneficially owns more than 50% of the shares to which are attached the votes that may be cast to elect directors and who is in the position to elect a majority of the directors of the corporation. The various provincial statutes have similar provisions relating to control. Control defined in this manner by the CBCA and by the provincial statutes is generally referred to as "legal control" (de jure).

The Foreign Investment Review Act provides that a corporation is a non-eligible person if it is controlled in any manner that results in "control in fact" (de facto) by an individual or government that is a non-eligible person, or by a group of persons, any member of which is a non-eligible individual or government, whether directly through the ownership of shares or indirectly through a trust, a contract, the ownership of shares of any other corporation or otherwise. In many cases, de jure and de facto control, in fact, may be synonomous. In other cases, the identity of the person or persons who control the corporation will depend upon a factual determination of who effectively controls the corporation.

Location of expenditure and types of expenditures – Eligible costs and expenses

Eligible expenditures incurred on or after 1 January 1981 fall into three categories:

(1) eligible exploration expenses;
(2) eligible development expenses;
(3) eligible asset costs.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

In general, expenses are eligible exploration expenses and eligible development expenses if they fall within the definitions of Canadian exploration expense or Canadian development expense in the Income Tax Act. However, expenses in respect of a mineral resource (including oil sands), as defined in the Income Tax Act, do not qualify as eligible exploration or development expenses.

Eligible asset costs include capital costs incurred in the construction or improvement of a heavy oil upgrader or a tertiary oil recovery project located in Canada.

Generally, Canada Lands will include all northern and offshore areas. One of the reasons for the distinction in the rates of PIPs is the fact that the federal government collects no royalties from provincial lands.

Year in which expenditure is incurred

The amount of any PIP attaching to an expenditure must be accrued in the year the expense is incurred so as to reduce the balance of CEE and CDE available, whether or not the payment has been applied for or received. The PIP follows the relevant expenditure and, accordingly, will be available to an investor regardless of the nature of his investment.

The following chart illustrates the entitlement of PIPs for the various possible combinations of the factors.

Transition period for phasing in incentive payments

Year starting 1 January	*Level 1*	*Level 2*	*Level 3*	*Level 4*
1981	50%	50%+	60%+	65%+
1982	50%	50%+	61%+	67%+

* Level 3 is an addition to the PIP system. Levels 1, 2 and 4 were announced in the NEP.

PIP — The role of the province of Alberta

The PIP was initially conceived and was to be administered wholly by the federal government. The September 1981 Memorandum of Agreement between the Government of Canada and the Government of Alberta relating to energy pricing and taxation indicated that the Government of Alberta would administer and pay the incentives under the program for activities within Alberta. The Government of Alberta will have the authority to make its own rules with respect to the administration aspects of the Alberta portion of the PIP.

Any change in PIP incentives rates as specified in the NEP for activities on provincial lands will require agreement between the Government of Alberta and the Government of Canada.

Similar agreements have been entered into by the federal government and other provinces; however, Alberta is the only province administering and paying the PIP incentives itself.

Canadian exploration expense (CEE)

Canadian exploration expenses (CEE) which are eligible for a discretionary 100% write-off in the year incurred include:

(1) the costs of geophysical, geological and geochemical expenses incurred in order to determine the existence, location, extent or quality of a petroleum or natural gas accumulation in Canada;
(2) expenses incurred prior to 1982 in drilling or completing or preparing a site for an oil or gas well in Canada, if the expense was incurred in the year or in a prior year and, within 6 months of the completion of the drilling, the well is:
   (a) determined to be the first well capable of production from a previously unknown accumulation; or
   (b) it is reasonable to expect that commercial production will not commence within 12 months of completion (primarily in the case of gas or frontier properties where production permits are unavailable or production is not feasible, commonly referred to as "shut in");
(3) expenses incurred after 1981 in drilling or completing a well as in (2) if drilling is completed within 6 months of the year end and the well is abandoned within 6 months of the year end and 12 months of its completion;
(4) expenses incurred after 1981 in drilling or completing an oil or gas well in frontier areas, unless the well was drilled to obtain commercial production from a known accumulation or for the purpose of delineating a field or determining the extent or quality of the accumulation and the drilling was commenced after commercial production commenced.

The amount of an investor's CEE available for deduction is reduced by the value of any assistance or benefits received in the form of government grants, subsidies, benefits, etc., received after 25 May 1976 (see below, discussion of PIP and small explorer's credit). CEEs will be available to an investor who invests directly in a joint

© 1982 International Bureau of Fiscal Documentation – BULLETIN

venture, limited partnership units, flow-through shares or shares of a joint exploration corporation.

Canadian development expense (CDE)

Canadian development expenses (CDE) which are eligible for a discretionary deduction at, effectively, a 30% rate on the declining balance basis include:

(1) expenses incurred to drill or complete a well to the extent the expenses are not CEE;
(2) expenses to drill or convert a well to assist in production from an oil or gas well (this includes a wide variety of wells drilled or converted for stimulation of production);
(3) expenses for drilling or recompleting a well after the commencement of production;
(4) payments made to acquire Canadian resource properties prior to 11 December 1979.

CDEs will be available to an investor regardless of the form of his investment. Any government assistance received after 25 May 1976 will reduce the investor's CDE balance in the same fashion as described for CEEs above.

Canadian oil and gas property expense (COGPE)

Canadian oil and gas property expenses (COGPE), which are eligible for a discretionary deduction on the basis of a 10% declining balance, are the costs of acquisition of a Canadian resource property (see below) or a right to or interest in such a property. While the initial cost of acquiring a resource property is COGPE, any costs incurred in preserving the right are not COGPE, but rather are lease rentals and as such are not eligible for any deduction by virtue of paragraph 18(1)(m) of the Income Tax Act.

The balance of COGPE will be reduced in the same fashion as CEE and CDE with respect to the value of any grants or assistance received. Similarly, COGPE will be available to any investor regardless of the form of his investment.

Canadian resource property

A Canadian resource property includes any property, acquired after 1971, which is a right, licence or privilege to explore for, drill or take petroleum, natural gas or related hydrocarbons in Canada. In addition, a Canadian resource property includes a right, licence or privilege to store petroleum, gas or related hydrocarbons underground as well as any oil or gas well in Canada. Finally, the definition includes any rental or royalty which is computed by reference to the amount or value of production from an oil or gas well in Canada and any right or interest in any such property including the right to receive proceeds of disposition of any property described above.

Foreign exploration and development expense

Foreign exploration and development expense is subject to reasonably complex rules with respect to the amount of any claim by an investor. Foreign exploration and development expenses include expenses incurred for geological or geophysical exploration or drilling in respect of petroleum or natural gas outside Canada as well as any annual payments made to preserve a foreign resource property (the definition of foreign resource property is the same as the definition of Canadian resource property, except that it is outside Canada) and payments to acquire a foreign resource property. There is no provision to reduce the balance of foreign exploration and development expense for the value of any government assistance received. Foreign exploration and development expenses can only be incurred by a taxpayer through a direct investment, a joint venture or a partnership.

The deduction for foreign exploration and development expense is limited to the lesser of the taxpayer's foreign exploration and development expense account balance and the greater of:

(a) 10% of his foreign exploration and development pool; and
(b) the sum of his foreign petroleum and gas production, plus his foreign oil and gas royalty revenue, plus his proceeds from dispositions of foreign resource properties included in income for the year.

Resource allowance

The resource allowance was introduced to the Income Tax Act as a consequence of the historical disagreements between the federal and provincial governments. It is designed to partially offset the disallowance for federal tax purposes of provincial crown royalties. The pegging of the allowance at 25% is premised on the assumption that a 25% net royalty to the provincial crown would result in a reasonable "take" to the provinces.

Historically, prior to the federal-provincial pricing agreements signed in the Fall of 1981, the resource allowance available to a taxpayer with Canadian production income, including royalties, was 25%. Resource profits for this purpose have been: income from production and royalty income (net of losses from these sources) net of direct costs of production (referred to as "lifting costs"), the capital cost allowance referrable to the revenue and a reasonable allocation of general and administrative expenses.

No deduction is required in calculating resource profits with respect to interest expense, CEE, CDE, COGPE or earned depletion. It should be noted, as well, that for the purposes of this calculation, disallowed crown royalties and certain income deemed by the Income Tax Act to arise with respect to transactions with the Crown are included in income.

Profits derived from the processing and transportation of petroleum and natural gas are specifically excluded from the profits eligible for the resource allowance. The former, in the case of corporate taxpayers, are eligible for the federal deduction from corporate tax for manufacturing and processing profits.

Certain amendments are to be made to the resource allowance provisions. Commencing 1 January 1982, the resource allowance will apply to a taxpayer's total production profits prior to the deduction of royalties payable to other participants in the well and a royalty owner will no longer receive the resource allowance on his royalties.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Further, draft regulations available indicate that a new category of expenses, "Canadian exploration and development overhead expenses" (i.e. administration costs relating to CDE and CEE), will not be deductible in the computation of resource profits.

Those taxpayers who have production interests whose tax liability is unaffected by non-deductible crown royalties (i.e. those individuals paying freehold royalties only) will not receive the benefit of the resource allowance after 31 December 1981. It is unclear whether those producers paying nominal crown royalties are to be affected by this change or not.

The resource allowance is available to investors in joint ventures and partnerships but not to the investor in flow-through shares or shares in a joint exploration corporation, as these investors do not have production revenues. In the case of a partnership investment, the resource allowance is claimed at the partnership and not the partner level. The deduction is a permissive one, but if it is not taken in the year in which the resource profits are earned, there is no way to carry it forward.

Earned depletion

Earned depletion is another discretionary deduction based on resource profits. Earned depletion is restricted to the lesser of 25% of resource profits, but not the same resource profits calculation as for the resource allowance, and the earned depletion base. Resource profits for this purpose include the same revenues as for the resource allowance calculation plus the proceeds of disposition of resource properties and reserves on sales of resource properties brought into income in the year.

In arriving at the eligible resource profits, it is necessary to deduct direct costs, relevant general and administration costs, applicable capital cost allowance, the interest expense applicable to the earning of the production revenue, CEE, CDE, COGPE and the resource allowance. Profits or losses from processing, transportation and transmission of oil or gas are excluded for these purposes.

The earned depletion base of a taxpayer, prior to 31 December 1980, consisted of ⅓ of all expenditures for exploration and development, regardless of where the expenditures were incurred, and 50% of all expenditures made with respect to synthetic oil and prescribed enhanced recovery projects.

Subsequent to 1980, only corporations will be able to earn further earned depletion base, although those individuals who have not fully utilized their previously accumulated earned depletion base will be able to continue to do so. The rate at which the earned depletion base will be accumulated is illustrated by the following chart.

The foregoing changes with respect to the accumulation of the earned depletion base relate to oil and gas expenditures only and not to mining operations.

In general, then, an investor which is a corporation will accumulate an earned depletion base for CEEs and CDEs incurred and expenses which have been renounced to it. There has always been a requirement to exclude capitalized interest, expenses renounced by the

taxpayer and expenses recovered after 28 April 1979 and, as a consequence of NEP-related proposed amendments, it will be necessary to exclude capitalized general and administration expenses relating to exploration and development. Qualifying expenditures have never included the costs of acquiring a Canadian resource property.

Investment tax credits

Many of the tangible properties acquired through an oil and gas investment will be eligible for investment tax credits, with the rate of the credit determined by the location where the equipment is put into service. The assets which will qualify are new assets which are machinery or equipment acquired after 23 June 1975 to be used in the operation of an oil or gas well, the processing of heavy crude oil to the stage of crude oil or its equivalent and exploration and drilling for petroleum or natural gas. Assets which do not qualify are those which are eligible for classification as CEE or CDE, such as well casing. The amount of investment tax credit claimed will reduce the undepreciated capital cost of the equipment in the year in which it is claimed.

Investment tax credits will be available only to investors who invest by way of partnerships, joint ventures or direct investment, as the capital cost of equipment cannot be renounced by a joint exploration corporation and is not eligible for the flow-through under the flow-through shares rules.

Capital cost allowance (CCA)

Capital cost allowance (CCA) is the tax equivalent of accounting depreciation. Most assets acquired by oil and gas ventures will fall into Class 10 for CCA purposes, eligible for a write-off on a 30% declining balance basis by virtue of being:

(1) either oil and gas well equipment; or

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(2) property (provided it was acquired after 22 May 1979) designed principally for the purpose of determining the existence, location, extent or quality of accumulations of petroleum or natural gas, or drilling oil or gas wells.

Any storage tanks for oil acquired will be eligible for Class 29 treatment.

In the case of a partnership investment, the CCA will be claimed at the partnership and not the partner level. In the case of a direct or joint venture investment, the claim will be at the discretion of the investor; for those who invest in flow-through shares or shares in a joint exploration corporation, no CCA claim will be available to the investor.

The Budget Papers, tabled on 12 November 1981, contained proposals to restrict CCA in the year in which an asset is acquired to 50% of the amount otherwise available. Under the rules previously in existence, such CCA was prorated in the year of formation of a business venture to the proportion of the year the venture was in existence. It is unclear whether the proposal will create a compounded restriction or not. On 18 December 1981, the Honourable Allan MacEachen tabled a number of revisions to his previous Budget, some of which related to CCA. The available information is too imprecise at this time to allow for specific comment.

Interest expense

Prior to the Budget tabled on 12 November 1981, all interest expense with respect to oil and gas investments was generally treated as deductible in the year it was incurred. Resolutions 23 and 24 of the Budget contain provisions which would greatly curtail the deductions available with respect to the interest expense on certain types of investments. Because oil and gas operations are specifically included in the definition of active business income, interest expense relating to an investment in an oil and gas venture directly, through a joint venture or through a limited partnership, did not appear to be affected by the Budget. However, as the only income which an investor in a joint exploration corporation or flow-through shares could earn was dividend income, which is income from property, interest expense incurred with respect to such investments would be restricted to the dividend income earned from the shares which, in most cases, would be nil for a number of years. It appears that the Budget resolutions will now be amended in the following manner:

(1) for 1982, interest expense will be restricted only to the extent that it exceeds ⅔ of a taxpayer's total income prior to the interest expense claim;
(2) for 1983, the ⅔ will be ⅓; and
(3) there will be an additional $10,000 of interest expense which will be unrestricted for investments in taxable Canadian corporations.

All of the foregoing changes to the interest deductibility will tend to neutralize one of the biases against investment by way of flow-through shares or shares in a joint exploration corporation.

Small explorers' credit

The Province of Alberta provides certain incentives to industry participants, one of which has come to be known as the "Small Explorers' Credit". The credit is available as an offset to Alberta royalties and freehold mineral taxes. Prior to 1 September 1981, the total available for any well was $1,000,000 and from that date it will be $2,000,000. However, similar limitations apply on a per taxpayer basis. It is not necessary to have tax payable in Alberta in order to benefit from this credit and it is refundable, in cash, upon the filing of the requisite forms with a taxpayer's income tax return. Generally, the credit will be available only to direct, joint venture or partnership investors.

Forms of investment

Traditionally, the most common forms of investment offered to the public (whether through private placement or prospectus) have been limited partnership units and joint venture interests. Less common have been flow-through shares and shares in joint exploration corporations. These investment structures are discussed in the remainder of this paper.

(1) Joint exploration corporation

A joint exploration corporation is a principal business corporation which has not, since its incorporation, had more than 10 shareholders. A principal business corporation includes a corporation whose principal business is exploring or drilling for petroleum or natural gas, or the production, refining or marketing of petroleum, petroleum products or natural gas.

The method whereby an investor obtains tax benefits from his investment is through the mechanism of the joint exploration corporation renouncing its expenses to its shareholders. Expenses can only be renounced to corporate shareholders and are renounced in agreed proportions. Expenses which may be renounced are those for which payment was made by the shareholder to the joint exploration corporation in respect of CEE, CDE or COGPE.

(2) Flow-through shares

Flow-through shares are generally shares of a corporation, of a new class, issued under an agreement between the shareholder and the corporation whereby the shareholder contributes funds to the corporation to be used by the corporation to incur CEE, CDE or COGPE. The agreement specifies that the expenses are being incurred by the corporation on behalf of the investor and the expense incurred is the sole consideration for the issue of the share.

Prior to 13 November 1981, any shares issued under such an arrangement were treated for income tax purposes as inventory and not capital property, with a nil cost base. This treatment was not an unreasonable one as the expenditures in respect of which the shares may be issued are not capital property. The Budget, tabled 12 November 1981, contains a resolu-

tion which would make flow-through shares, issued after 12 November 1981, eligible for treatment as capital property (however, the shares will still be subject to the ordinary tests of income vs. capital). It is thought that this proposed amendment was to compensate for some of the proposed amendments to the reorganization provisions outlined below.

When CEE and CDE are incurred by investors in flow-through shares, the investors are entitled to the PIP incentives. The corporation will act for the investor in filing the application and receiving the incentives. The relevant COR is that of the corporation issuing the shares. A joint exploration corporation is a qualified person and entitled to incentives in its own right.

(3) Limited partnership

The limited partnership has become a popular vehicle for tax shelter investment because it allows for a full flow-through of tax deductions, while limiting the liability of the investor to the amount of his capital subscription. Because of this limitation of liability, it is Revenue Canada's position that an investor may not claim further deductions for income tax purposes when his adjusted cost base in the limited partnership is nil or negative. A limited partnership will be governed by the relevant law in the province of its formation.

Converting the investment to liquid form

Prior to the Budget tabled 12 November 1981, it did not matter much what form the initial investment in the venture took. Generally, the investor expected, at some point, to obtain shares in the operator/promoter, which would be readily saleable. This subsequent conversion of the investment interests relied upon the tax-free reorganization provisions contained in the Income Tax Act. The Budget, tabled on 12 November 1981, would have eliminated, in most cases, the opportunity to effect these transactions on a tax-deferred basis. One of the possible rationales for these proposed changes is that, as a consequence of these transactions, it was possible to convert income gains on a disposition of the direct investments to capital gains on a future disposition of the shares received on the reorganization. With the proposed abolition of the reorganizaton provisions in these circumstances, investors, to the extent they had insufficient balances in their CEE, CDE and COGPE pools, generally from other investments in the industry, would have suffered a recapture of previous deductions.

It appears, as a consequence of the Speech referred to earlier, that the reorganization provisions will not be amended prior to 1983 and that future amendments may differ radically from those tabled on 12 November 1981.

Alberta announces new incentives in April 1982

Leading a drive to improve the industry's cash flow position is the Alberta Government's package of financial incentives, a series of royalty cuts and special grants.

The Alberta package includes a $250 million grant to offset the costs of servicing existing wells in 1982. The grant can be taxed by Ottawa as income at a rate of 36%, reducing the benefit by $90 million.

Most of the benefits from the Alberta package are earned through reductions in provincial royalty rates. Because royalties are deductible before the Incremental Oil Revenue Tax (IORT) is calculated, royalty reductions increase the amount of the tax.

The IORT is calculated on incremental revenue, the difference between the actual price paid for oil and the price established by the NEP. The average price for 1982 is $24.63 a barrel, compared with $20.25 a barrel under the NEP, so incremental revenue is $4.38 a barrel.

Because of Alberta's changes, the new royalty on incremental revenue is $1.63 a barrel and incremental income subject to IORT is $2.75 a barrel (incremental revenue less royalty). Under the old rules, incremental income is $2.43 a barrel.

The new IORT, 50% of incremental income, is $1.37 a barrel compared with $1.22 a barrel under the old rules, an increase of 15 cents a barrel.

Alberta's royalty changes give companies a benefit of $1.80 a barrel, based on average rates, so the 15% IORT portion represents 8.3% of the benefit.

Alberta Premier Peter Lougheed said any attempt by Ottawa to increase its take would be considered a breach of the energy agreement and could lead to a new confrontation between the province and the federal Government.

Because the federal portion is small, however, Alberta's opposition is considered to be more of a question of principle than a financial issue that affects the industry, in the near term at least.

The federal Government says changes to the Alberta royalty structure were noted as a possibility during the negotiations that established the energy agreement in 1981 and the province realized that IORT would increase if royalties were cut.

All federal energy taxes are under review because of falling world oil prices but no changes are expected for several months.

Other taxes – Some of the disincentives

The NEP and the federal-provincial pricing agreements have spawned a new set of taxes.

(1) Petroleum and gas revenue tax (PGRT)

The petroleum and gas revenue tax (PGRT) was introduced effective 1 January 1981. It was prior to 1982, an 8% tax on production revenue. Production revenue is computed as revenue from production (including crown royalties, but net of freehold royalties paid) net of lifting costs, without any allowances for interest, CCA or rental payments in respect of tangible property. It is necessary to file separate returns for this tax on the due date of the investor's income tax return and also, in some circumstances, to make instalments with respect to this tax.

Commencing 1 January 1982, the rate of PGRT was increased to 16%, but a resource allowance equal to

© 1982 International Bureau of Fiscal Documentation – BULLETIN

25% of production revenue is available to those taxpayers whose tax is affected by the payment of non-deductible crown royalties.

(2) Incremental oil revenue tax (IORT)

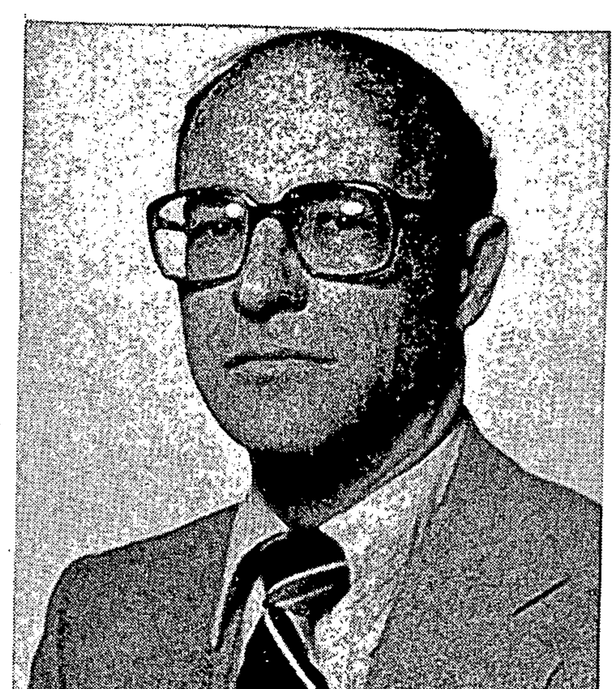
Generally, investors in new oil and gas ventures will be unaffected by the incremental oil revenue tax (IORT). The IORT is a 50% tax on the difference between the prices which would have been obtained under the NEP price schedule and the prices under the new pricing agreements. The tax is applicable only to oil production from accumulations known, prior to 1981, to exist in commercial quantities. The IORT is effective 1 January 1982 and any income subject to the IORT is exempt from income tax.

The profits for IORT purposes are reduced for related crown royalties which are calculated on a well-by-well basis, based on the average royalty rate for the well applied to the incremental revenue.

General investment considerations

Having examined various tax and incentive considerations associated with an investment in an oil and gas venture, it becomes necessary to examine the investment criteria to which a potential investor should have regard.

With the abolition of super-depletion, any investor in an oil and gas tax shelter will have a net cash investment in the project after his benefit from tax deductions.



There are a number of common-sense questions which an investor should ask. A brief checklist of some issues to be considered by a potential investor is provided:

1. A determination should be made of the amount of the promoter's "carried interest" in the project. A promoter's carried interest will be the percentage of the future profits which he earns from the investment property without incurring a proportionate amount of the costs.
2. The rate of provincial royalties which future production from the fund will suffer should be determined.
3. A determination should be made of the allocation of the various provincial drilling incentives between the promoter and the investors. If the investor is to share in the drilling incentives, he should ensure that he will be able to utilize them before they expire. If the promoter is to be the beneficiary of the incentives, the investor should ensure that he is receiving some compensation for the value of the incentives earned with his money but assigned to the promoter.
4. An investor should ensure there is a market for and a means of getting to market the production found by his investment. Many investors have invested in funds where there is no technology or availability of transportation to take the product discovered to market. The investigation should also encompass current and prospective government regulations relating to pricing, royalties, allowable production, import and export of the product and environmental protection regulations.
5. A determination should be made of the profitability, particularly in the case of gas discovered in Alberta, of the production being shut in.
6. Because of the fact that oil and gas reservoirs often extend over a number of leases, an investor should ensure that neighbouring lessors will not be able to draw upon the oil and gas on the investor's lease. This insurance generally takes the form of the driller entering into contracts with neighbouring lessors to prevent such "sucking out" of the investor's petroleum and natural gas reserves. Commonly, protection against this eventuality is accomplished by means of a "step-out" agreement, allowing the fund to drill development wells on its neighbours' properties and taking any oil or gas so found in return for a royalty, or a unitization agreement whereunder the fund obtains a share of all the oil and gas in the neighbourhood and the neighbours must reimburse the fund for its drilling expenses. These are only two of the methods of obtaining this type of protection. An investor should ensure that some form of protection has been obtained for his investment.
7. A potential investor should ensure that the geological information on which he is basing his potential investment has been provided by an independent geologist. Further, he should investigate the promoter's track record, his previous funds and their performance.
8. Some oil and gas ventures require that after a successful exploration effort, the investor will be required to provide additional funds for the development and commencement of production. An investor should evaluate his willingness and ability to contribute additional funds to the venture and the penalty for a failure to do so.

The Influence and Impact of Canada's Tax Accounting Rules on Structuring Canadian Business Operations

by Edwin C. Harris

Edwin C. Harris, Q.C., C.A., Partner of the law of Daley, Black & Moreira, Halifax, Canada.

Professor of Law, Dahousie University, Halifax.

Past Chairman, Taxation Committee, Canadian Bar Association.

Author of numerous articles on taxation and of the text Canadian Income Taxation (Butterworths, 2nd edition, 1981).

1. INCOME TAXATION AND TAX ACCOUNTING IN CANADA

(a) Evolution of income tax law

Federal income iax began in Canada in 1917 with the enactment of the Income War Tax Act. This legislation, as amended from time to time, remained in force until the first major effort at tax reform, represented by the 1949 Income Tax Act. In turn, this Act, as much amended, was substantially "reformed" after the appearance of the report of the Royal Commission on Taxation (the "Carter Report") in 1967. The new legislation, still known as the Income Tax Act, came into force in 1972 and is still the applicable law, though the volume of annual amendments has been substantial.

While it was always recognized that the determination of income for purposes of income taxation would involve questions of accounting, most questions of tax accounting were left to commercial practice, and relatively few such questions were directly addressed in the earlier versions of the statute. Even today, many issues of timing and other questions of accounting practice are not directly provided for in the Act.

(b) The accounting profession and income taxation

The development of income taxation and its growing importance in the Canadian economy have been accompanied by a remarkable growth in the accounting profession. Most of the personnel who administer the law for Revenue Canada, Taxation (popularly called the "Department"), as well as most persons in the private sector who advise on tax matters, are professionally qualified accountants or have had accounting training. Consequently it is not surprising that accounting principles and practices would be generally followed in measuring income for purposes of income taxation wherever there was no specific direction in the Act.

(c) Legislating generally accepted accounting principles

In the course of the discussions leading to each of the two major "reforms" of Canadian income tax law, the question was raised whether the Act should contain a provision to the effect that, absent any specific provision in the Act to the contrary, income for purposes of the Act shall be determined in accordance with generally accepted accounting principles (GAAP). Some commentators felt that both the statute and the case law required departures from GAAP that were not necessary to protect the national revenue, that often had inequitable consequences, and that needlessly complicated taxpayers' record keeping; in their view, the proposed statutory provision would permit income measurement for tax purposes to evolve in a manner parallel to the evolution of financial accounting principles.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

On each of these two occasions, however, after consultation with the accounting profession, the government decided not to add the proposed provision to the Act. On the first occasion, the profession did not appear to have sufficient confidence that GAAP could be clearly identified in a particular case, and it was feared that such a statutory provision might lead to more, rather than less, uncertainty. On the second occasion, the accumulation of formal pronouncements by the profession on accounting principles made the earlier objection much less valid; nevertheless many accountants felt that the proposed statutory provision would have a restricting effect on the application and development of accounting principles. While the Carter Report recommended that many of the rigid timing rules in the Act be removed, so that more reliance could be placed on accounting principles in determining matters of timing,[1] even this limited recommendation was not implemented.

(d) Generally accepted accounting principles and case law

Even so, much of the pre-1950 case law supported the application of accounting practice in the measurement of income for tax purposes in cases where the Act was silent. Partly because of changes in wording implemented by the 1949 Act, which specifically recognized accrual accounting, subsequent case law came increasingly to refer to accounting principles and practices to fill gaps in the Act. With occasional exceptions, this trend has continued to the present time and has taken Canadian tax law almost to the position where it would have been if the twice-rejected statutory reference to GAAP had been enacted. In some areas, however, the case law has recognized that a taxpayer may make a choice between following GAAP and following a less sophisticated approach to timing – as was the case for prepaid expenses before recent relevant amendments to the Act.

(e) Consolidated tax returns

While the idea of permitting a group of resident corporations under common control to file consolidated tax returns has been proposed from time to time, it has always been rejected by the government because of the complexity that it is thought to entail. No simple alternative procedure is available for shifting losses between affiliated corporations, though 1977 amendments to the Act permit accumulated losses to flow through an amalgamation of corporations and the winding up of a substantially owned subsidiary into its parent corporation, subject to certain restrictions. Consequently, when losses are anticipated, such as on the commencement of a new business, there is a tendency to have the business activity in question carried on by a profitable corporation rather than by a new corporation that will have no current profits against which to offset the early losses.

(f) The "matching" principle

The accountant's principle of matching revenues and related expenses in the same accounting period has received increasing, but not total, recognition for tax purposes in both the case law and recent amendments to the Act. In several cases, on the other hand, departures from the "matching" principles that appear to be permitted may give taxpayers a choice to accelerate the recognition of expenses.[2] Perhaps largely for this reason, the Department has abandoned its earlier hostility to the use of accounting principles for deciding timing questions and is trying to insist on more general application of the "matching" principle.[3] In some areas where the Department has attained, or anticipated that it would attain, little success, such as with respect to the deferral of deduction of prepaid expenses, it has recently obtained amendments to the Act to enforce the application of the "matching" principle.

Some years ago the case law decided that the "matching" principle could not be followed in measuring annual income for tax purposes from construction contracts. The case law required that billings on such contracts less holdbacks be included in the contractor's income and that all expenses be deducted as incurred, regardless of whether they related to amounts that had been billed. For administrative purposes, however, the Department has allowed the use of the "completed contract" method where the duration of the contract is not expected to exceed two years, providing that the taxpayer consistently follows this practice for all such contracts; subsequent additions to the job that may postpone completion are regarded as separate contracts.[4] Consequently, until Departmental practice changes, a series of shorter-term contracts may be preferable, for the contractor's tax position, to a single longer-term contract.

The Act has permitted individuals to account for interest revenue on either a cash or a "receivable" basis, depending on the accounting method that they regularly follow.[5] By administrative practice, the Department also permits the accrual method of accounting for interest revenue by individuals, though it has attempted to restrict the individual's right to change from one method to another.[6] Previously these options were available to most other taxpayers, but, by recent amendment, corporations, partnerships, and certain trusts are now required to account for interest revenue by the accrual method.[7] Thus individuals, but not corporations or partnerships, could defer recognizing interest revenue by investing in deferred annuities, coupon bonds, or bank deposit certificates on which interest payments are deferred. The amendments proposed in the budget of 12 November 1981, however, will require individuals to recognize accrued interest revenue at least every third year.

The case law allowed a taxpayer that has to treat foreign

exchange gains or losses on revenue account to recognize any such gains on outstanding indebtedness as of the end of each year, even though the debt might not be settled for some years.[8] While accepting this result, the Department is also prepared to accept any method of determining foreign exchange gains or losses on revenue account that is in accord with GAAP, if the same method is followed in the taxpayer's financial statements and is used consistently; in certain cases, however, the Department will accept a change to what it regards as a more appropriate accounting method for foreign exchange. A taxpayer is also permitted by the Department to choose not to recognize any foreign exchange gain or loss until the account is settled.[9]

2. Legislating conformity of tax accounting with business records

(a) An early attempt

When the present system of tax depreciation (known as "capital cost allowance") was instituted with the 1949 Act, the Regulations under that Act purported to limit the capital cost allowance that could be claimed on depreciable assets in any year to the amount of depreciation shown for the year in the taxpayer's financial statements.[10] Because diminishing balance rates of capital cost allowance were prescribed for tax purposes, allowing quite generous deductions in the early years that an asset was held, many taxpayers faced the dilemma of either recording excessive depreciation in their financial statements or postponing some of the capital cost allowance that would otherwise be available to them. Public corporations that were under pressure to avoid qualifications in their auditors' reports were at a disadvantage in this respect in comparison with closely held corporations. A growing level of protest against this rule led to its removal from the Regulations effective in 1954.

(b) Deferred taxes

A consequence of the freeing of capital cost allowance claimed for tax purposes from the amount of depreciation shown in the taxpayer's financial statements was the recognition, in the financial statements of many businesses, of growing amounts of deferred taxes in subsequent years. This recognition was required by the pronouncements of the Canadian Institute of Chartered Accountants in order to achieve a proper allocation of income tax expense to the appropriate accounting periods.[11] In the case of many corporations the deferred taxes have grown continuously and have reached very substantial levels, and all indications are that this growth will continue indefinitely. Many accountants are concerned about this result and would like to see existing accounting rules relating to tax allocation re-examined.[12] Some may argue, however, that any excess of existing deferred taxes over what might be regarded as more reasonable levels may be justified as an offset to the effect of failing to make provision in financial statements to correct the overstatement of accounting profit that results from inflation.[13]

It seems clear that the general system of capital cost allowance is widely accepted by both the Department and taxpayers, because of its simplicity of application and its relatively generous rates. Consequently it is unlikely that the tax depreciation rules will be changed to conform with depreciation for purposes of financial accounting. The solution to the problem raised by growing deferred taxes, therefore, will need to be developed by the accounting profession and is not likely to come from changes in tax law.

(c) Capital cost allowance as an incentive

The problems raised by divergent deductions for depreciation for purposes of income taxation and financial accounting can be aggravated where generous rates of capital cost allowance are granted as an incentive for taxpayers to invest in certain kinds of assets or industries. The fact that deferred taxes must be provided for in the financial statements of a taxpayer who seeks to take advantage of such an incentive may reduce the attractiveness to him of doing so.

3. "RESERVES"

The government's traditional concern about the possible use of conservative accounting principles to postpone the recognition of income is reflected in the long-standing prohibition in the Act against the deduction of "an amount transferred or credited to a reserve, contingent account or sinking fund" except where such a deduction is specifically permitted in the Act.[14] The specific provisions that allow deductions that are described in the Act as "reserves" indicate that the term "reserve" is being used in a broader and less precise way than under prevailing accounting practice in Canada.[15] According to the Department, this term when used in the Act "means more generally an amount set aside that can be relied upon for future use".[16] It might be more accurate to say that "reserve" in the Act means an expense the amount of which is only estimated or contingent as of the end of the year in question.

The restriction against deducting "reserves" has the effect of encouraging businesses to avoid contingencies applicable to the expenses that they claim or to take steps to bring themselves within the specific wording of a provision of the Act that expressly permits the deduction of a "reserve". Thus, careful documentation of executive bonus schemes appears to be necessary to ensure the current deductibility of bonuses payable.[17] A publisher or

wholesaler of publications who delivers the publications to a retailer who has a right to return items that are not sold is better advised to retain title to the publications until they are sold by the retailer than to transfer title to the retailer on delivery and later take back title to the items returned: in the former case no revenue need be recognized until items are sold by the retailer, whereas, in the latter case, sale revenue must be recognized at the time of delivery to the retailer, and no deduction can be taken for estimated returns, since such a deduction would represent a "reserve" that is not specifically provided for in the Act.[18] A transaction the only purpose of which was to enable a taxpayer to qualify to deduct a "reserve" and thereby to postpone the recognition of income has been held to be effective.[19]

The budget of 12 November 1981 proposes to eliminate the "reserves" that permit the recognition of gross profit on dispositions of trading property or capital property to be spread over the period during which the proceeds are to be collected. For dispositions after the budget date, the entire taxable gain must be recognized in the year of disposition, regardless of when the proceeds fall due. This can be expected to discourage sales on terms that provide for a substantial portion of the price to be paid over a period of time.

4. INVENTORY VALUATION

The earliest attempts by Canadian taxpayers to protect themselves against the distortion of taxable income caused by continuing inflation concentrated on the valuation of their inventory. An attempt to use he last-in-first-out (LIFO) method for determining inventory cost for tax purposes was judicially rejected some years ago;[20] and periodic suggestions since then that the law be amended to permit the use of LIFO have not borne fruit.[21]

Taxpayers have been permitted, by the Act and the Regulations, to value their inventory for tax purposes entirely at cost, entirely at market, or at the lower of cost and market. The method of valuation used for a taxpayer's closing inventory in any taxation year must also be used for his opening inventory in the next year.[22] It had been generally thought that a taxpayer remained free to change to another permitted method in valuing his closing inventory in any year, but the Department has recently taken the position that any such change is only permissible when it can be justified by reference to GAAP.[23] This Departmental position will probably be challenged in the courts.[24]

In 1977 the government responded to requests for relief from the effects of inflation by permitting an arbitrary 3% deduction applied to the tax value of a taxpayer's opening inventory of goods that are held for sale or to be incorporated into goods to be sold or to package these goods.[25] While this relief was welcome to taxpayers who could qualify for the deduction, it was not a meaningful solution to the inflation problem.[26] This rule undoubtedly is influencing some new businesses to choose their year end at a time when inventories are high, even though this may be undesirable from a business point of view.[27]

The Department will permit the cost of inventories of work in progress and finished goods to be determined by "direct costing" (excluding fixed overhead) or by "absorption costing" (including fixed overhead); "prime costing" (excluding all overhead) will not be accepted. The Department will accept a determination of the fair market value of inventory based on either replacement cost or net realizable value, if the method is followed consistently. It says that the method used to determine both cost and market for tax purposes must correspond to the method used in the taxpayer's financial statements; here, as elsewhere on timing questions, no statutory or case authority is cited to support the Department's position.[28]

For some years it had been accepted that, to reconcile accounting income with tax income, accounting depreciation would need to be added to accounting income, because the depreciation was not deductible for tax purposes.[29] Then the appropriate amount of capital cost allowance would be deducted, and, of course, any other applicable adjustments would be made. Eventually some taxpayers realized that the Act did not require them to add back to their accounting income for a year any portion of the accounting depreciation expense for that year that was included in the cost of closing inventory, since it would not be deducted in computing the taxpayer's income for tax purposes if it was left in closing inventory. The Department became alarmed by the amount of potential tax reduction that would occur if many taxpayers switched from adding back all depreciation to adding back only the part not included in closing inventory. Consequently, by recent amendment, any such amount in closing inventory must now be added back to income for tax purposes, and the same amount is deducted in computing tax income for the following year, when it would relate to opening inventory.[30]

5. ACCOUNTING FOR INFLATION

Monetary inflation has been a problem for Canadian accountants for many years and has accelerated in recent years. During 1981 prices will have increased in Canada at an annual rate of over 12%. Not surprisingly, the in-

come tax system, which uses only historical costs to measure expenses, has been criticized for imposing taxes on inflated profits. The existing indexing of "personal exemptions" and rate brackets for individuals does not remedy the overstatement of business income or capital gains for tax purposes. As mentioned earlier, generous rates of capital cost allowance and the 3% inventory allowance may offer some relief; but any such relief is arbitrary, is discriminatory among different classes of taxpayers, and in the great majority of cases is patently inadequate.

Understandably, the government regards requests for relief from the effects of inflation on the measurement of business income as involving threats to its revenues. Consequently it has not resisted the temptation of sheltering behind the accounting profession's failure to agree on a method of resolving the inflation problem for accounting purposes. In effect the government has said that once an appropriate method of accounting for inflation has become generally accepted, the possible adoption of that method for tax accounting can be seriously considered.

The Canadian Institute of Chartered Accountants has given careful consideration to the implications of adopting either price indexing or current cost accounting to resolve the problem of inflation accounting.[31] It now appears to be ready to recommend current cost accounting – initially as a supplement to financial statements prepared in accordance with traditional historical cost accounting. Obviously any such hesitant development offers little hope for a speedy resolution of the problem of tax accounting for inflation.

One thoughtful commentator has questioned the appropriateness of the government's "wait and see" position on addressing the inflation problem for tax purposes. According to G.E. Cronkwright,[32] a prominent Canadian tax accountant, current cost accounting would never be suitable to be used to measure income for tax purposes: the calculations and assumptions involved, in his view, are too subjective. Attempts should therefore proceed to resolve the inflation problem for tax purposes without waiting for a resolution of the problem for accounting purposes, since the solutions are likely to be different. This conclusion seems valid; but any resolution of the tax problem, unless it is to be totally arbitrary, still involves what is essentially an accounting question, which will need to be answered by skilled accountants.[33]

What seems to be required, therefore, is prompt action by the federal government to appoint a committee consisting of prominent accountants from the private sector and tax policy personnel from the Department of Finance, with a mandate to recommend a practical and equitable method of eliminating inflationary profits from the computation of taxable income. If and when such a system is implemented, a small standing committee representing both the government and the private sector should be charged with monitoring its effectiveness and with recommending any changes that appear to be required having regard, among other things, to any relevant developments in financial accounting.

In the absence of corrective provisions in the Act, Canadian businesses appear to have no direct way of insulating themselves specifically from the tax penalty that is imposed on inflationary profits. Obviously they will try to structure their operations as to minimize adverse effects from inflation – as by maximizing debt financing – and to take whatever steps are open to them to minimize or defer their income taxes. Largely because of the rate of inflation, however, debt financing has become very expensive.

The conclusion reached in 1977 by the Report of the Ontario Committee on Inflation Accounting still seems valid:

> It is clear that the impact of inflation on the taxation of business income creates major cash flow and liquidity problems. In addition, inflation also results in an unintended and automatic shift of wealth from business capital to government. To date, tax relief for the effects of inflation has been limited and largely fortuitous being based on the effect of allowances permitted for other reasons.[34]

6. REQUIRED CONFORMITY WITH FINANCIAL STATEMENTS

As indicated earlier, the Department in recent years has taken the position that, except where the Income Tax Act requires the adoption of a specific accounting method for tax purposes, a taxpayer's choice among alternative methods must conform with the choice made in his financial statements. Presumably the Department's concern is that taxpayers will choose for tax purposes, among acceptable alternatives, the method that will give them maximum tax advantage even though, by choosing another method for their financial statements, they indicate that the method adopted for tax purposes is not the most appropriate way of measuring their income.

There is no support in the Act for the Department's position, and some leading judicial decisions seem to have rejected it.[35] If that position did reflect the present state of the law, it would be open to the same objections as was the former rule, mentioned earlier, requiring the amount of capital cost allowance to be limited to the amount shown as accounting depreciation: it would force some taxpayers to pay more tax than they would otherwise have to pay, because they are unwilling or unable to report to shareholders and creditors in their financial statements in a way that minimizes their accounting income;[36] and taxpayers not so constrained would be induced to distort their financial statements in order to achieve a maximum tax advantage. As well, if the Department's

position is to become law, many of the same considerations that arose when it was proposed to legislate the application of GAAP for tax purposes may need to be debated again.

7. CONCLUSION

It is fortunate that, on the whole, tax accounting rules in Canada are not so artificial as to require, or make advisable, unusual or complex corporate structures. Inevitably these rules will influence business decisions, and there have been several recent statutory, judicial, and administrative developments relating to tax accounting that may affect business planning. Much of the current confusion and uncertainty can be traced to the failure of the government to invite discussion and seek a consensus on the appropriate relation between tax accounting and financial accounting. Such a dialogue might prove highly productive at this time.

CANADA:
Summary of Modifications in Draft Legislation

continued from page 374

Reserves

There are also modifications to proposals relating to the deduction of certain reserves on instalment sales of property where the proceeds are not received until a future year. The business reserves proposed for sales of real estate will be extended to sales of all inventory and the computation of the reserve will be based on the portion of the total proceeds that remain unpaid over a three-year period.

Foreign subsidiary loans and corporate reorganisation measures delayed

With respect to the changes proposed in Budget Resolution 14 relating to low-interest or interest-free loans by Canadian corporations to their foreign subsidiaries, and amendments affecting corporation reorganizations, Mr. MacEachen intends to further consider these particular changes. The treatment of loans to non-resident corporations is part of a broader study of the taxation of foreign source income that is currently under way. In the area of corporate reorganizations, the Minister intends to refer the amendments in this very complex area of the law to a group of outside consultants for review. Changes in these areas will not be proceeded with before the studies have been concluded and a discussion document has been made public.

Employees share purchase loans

The Minister said that the proposed restriction on deductibility of interest expense would not apply to interest under commitments prior to 12 November 1981 relating to employee share purchase loans. The decision to "grandfather" such loans recognizes that in many circumstances employees are locked into relatively long-term arrangements and are unable to reorganize their affairs. The application of the interest restriction to corporations under Budget Resolution 24 was intended as an anti-avoidance measure and the Minister confirmed that, as such, it would apply only to those private corporations that carry on either a personal service or a professional business.

RRSP loans

The draft legislation does, however, contain the proposals in Budget Resolution 20 relating to the non-deductibility of interest on loans to finance contributions to registered retirement savings plans (RRSPs) and certain other plans.

Non-resident withholding tax exemptions

The Minister also announced a three-year extension of the non-resident withholding tax exemption for interest paid on government and long-term corporate borrowings. The existing exemption is scheduled to terminate for bonds and other debt issued after 1982. The Minister indicated that the amendments necessary to provide for the extension of the exemption for interest on debt obligations issued before 1986, while not included in the draft legislation would be reflected in the implementing legislation to be introduced in the fall.

Draft regulations defining terms

In addition, Mr. MacEachen released the text of draft regulations (attached) that describe what is to be included in the expression "prescribed share" for the purpose of paragraph 112(2.3)(g) and paragraph (f) of the definition "term preferred share" in the draft legislation. The draft regulations are essential for an understanding of these two provisions.

Communication with Department of Finance

Mr. MacEachen said that taxpayers with particular technical concerns arising out of the draft legislation should write to the Tax Policy and Legislation Branch, Department of Finance, Ottawa, K1A 0G5.

DRAFT INCOME TAX REGULATION

SCHEDULE

1. Section 6201 of the *Income Tax Regulations* is revoked and the following substituted therefor:

"6201(1) Subject to subsection (2), for the purposes of paragraph 112(2.3)(g) of the Act and paragraph (f) of the definition "term preferred share" in subsection 248(1) of the Act, a share is a prescribed share with respect to a corporation (in this subsection referred to as the "recipient") that receives a dividend at any time in respect of the share if it was acquired after 28 June 1982 and is of a class or of a series of a class of the capital stock of a corporation that is listed on a stock exchange referred to in section 3200 unless in the aggregate dividends are received at that time from the corporation in respect of more than 10% of its issued and outstanding shares of that class or of that series, as the case may be, by

(a) the recipient, or
(b) the recipient and persons with whom the recipient does not deal at arm's length.

(2) For the purposes of paragraph 112(2.3)(g) of the Act and paragraph (f) of the definition "term preferred share" in subsection 248(1) of the Act, a share is hereby prescribed that is a share last acquired before 29 June 1982 and is of a class or of a series of a class of the capital stock of a corporation that is listed on a stock exchange referred to in section 3200 unless in the aggregate more than 10% of the issued and outstanding shares of that series or of that class, as the case may be, are owned by

(a) the owner thereof, or
(b) the owner and persons related to him."

2. Section 1 is effective on and after 13 November 1981.

A better approach to exploring Canadian federal income tax.

Organized by subject to save you valuable research time.
Rather than going through the Act and giving an explanation of its over 1800 sections one by one, Prentice-Hall brings together in one place, discussion of all relevant materials which apply to any given subject.

Authoritative real-world analysis. ITIC is written by practising lawyers and accountants from across Canada. Together they have built the most valuable income tax information resource available to Canadian business today.

Easier to access the information you need. In addition to providing you with the most complete set of indexes to the ACT, Interpretation Bulletins, Information Circulars, Tax Rulings and Tax Forms, ITIC includes a *"Consolidated Index to the Analysis"* and a *"Complete set of Cross-Reference Tables"* linking the sections of the Act to the related material.

Always up-to-date. *"Weekly Report Bulletins"* spotlight and summarize changes to any official material, budget proposals and their implications, and relevant news items. *"Weekly Supplements"* contain new commentary and replacement pages for outdated material. The *"Current Matter Section"* provides a comprehensive analysis of important new tax developments, and features recent tax case highlights.

The Long Reach of the United States in Tax Matters

by Piroska E. Soos*

In *United States v. Quigg,*[1] the United States District Court for the District of Vermont ordered a Canadian bank to produce certain records which were located at the bank's branch in the Bahamas and which related to accounts held by a U.S. citizen who was being criminally prosecuted on charges of federal income tax evasion. The District Court's decision was recently affirmed by the U.S. Court of Appeals for the Second Circuit.[2]

The case involved a U.S. taxpayer (hereinafter "T") as well as the Canadian Imperial Bank of Commerce (hereinafter "Bank"), a large bank based in Toronto with approximately 1,700 branches and agencies throughout the world, including the U.S. and the Bahama's. On 21 November 1980, in response to an application by the U.S. Government (hereinafter "Government"), the District Court (hereinafter "Court") issued a trial subpoena ordering the Bank to produce records of any account maintained by T at the Bank since 1972. The subpoena was addressed to "any authorized officer" at the Bank's agency in New York City and was served on an assistant accountant at the New York agency. Although the subpoena sought the production of records at any of the Bank's branches or agencies, the Government indicated that the subpoena was limited to a search of the records at the Nassau branch in the Bahamas.

The Bank objected to the subpoena on two grounds: (i) pursuant to cases decided by the U.S. Court of Appeals for the Second Circuit,[3] the Bank could not be compelled to produce bank records if production would subject it to criminal liability under the banking laws of the Bahamas, and (ii) service of the subpoena on the New York agency did not give the Court jurisdiction over the Bank's headquarters and branches located outside the U.S., and the New York agency could not produce the records because they were beyond its control. For the reasons stated below, the Court rejected both objections.

CRIMINAL VIOLATION OF BAHAMIAN LAW

In considering the Bank's first objection, the Court noted that, under Bahamian law, it was a crime for any officer or employee of a bank or trust company to disclose "information relating to the identity, assets, liabilities, transactions, (and) accounts of a customer" without the customer's consent, except under certain circumstances not relevant in this case.[4] Relying on principles of comity and international law, the Court refused to compel the Bank to disclose anything that would subject it or its employees to criminal liability. Enforcement of the subpoena, therefore, depended on T's consent to the disclosures.

T stated that he would not voluntarily consent to the release of the Bank's records and, thereupon, the Government requested the Court to order T to execute a consent form permitting the Bank to release the records. The Court granted the Government's request and, in so doing, rejected T's arguments that requiring T to consent would violate his rights under the due process and self-incrimination clauses of the Fifth Amendment to the U.S. Constitution.

The relevant part of the Fifth Amendment provides that

> . . . nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property without due process of law; nor shall private property be taken for public use without just compensation.

The Court generally agreed with T that the due process clause means that a criminal defendant is not obliged to cooperate with the Government in his own prosecution. However, the Court pointed out that T had not considered some important exceptions to the general rule. For example, a criminal defendant may be required to submit to a blood test, to participate in an identification lineup, to produce a handwriting sample, or to produce papers in his possession which may be damaging at trial but which fall outside the protection of the Fifth Amendment.

The Court relied on *Fisher v. U.S.*[5] in which the U.S. Supreme Court said that an individual under investigation for tax violations could not refuse to produce papers in his possession which were prepared by an accountant and thus beyond the scope of the Fifth Amendment. The Court concluded that, unless the privilege against self-incrimination or another constitutional right applies, a criminal defendant may be ordered to produce evidence in his possession or to cooperate in other ways.

The privilege against self-incrimination did not apply in this case since the records involved were not the kind (private or testimonial) protected by the Fifth Amendment. The Court cited two U.S. Supreme Court cases[6]

3. *Ings. v. Ferguson,* 282 F.2d 149 (2d Cir. 1960); *Application of Chase Manhattan Bank,* 297 F.2d 611 (2d Cir. 1962); *Trade Development Bank v. Continental Insurance Co.,* 469 F.2d 35 (2d Cir. 1972).
4. The Court cited the Bahamian Banks and Trust Companies Regulations (Amendment) Act, 1980. Section 101(1)(iii) of that Act states that one of the exceptions to the secrecy requirement concerns disclosures of records required by any court of competent jurisdiction within the Bahamas. The Court noted that, although the records sought by the Government could probably be obtained by requesting the courts of the Bahamas for an order authorizing release of the records, this procedure was not realistically available in this case since it was a time-consuming procedure and T's trial was scheduled to start in one week.
5. 425 U.S. 391 (1976); 37 AFTR 2d 76-1244.
6. *California Bankers Asso. v. Shultz,* 416 U.S. 21 (1974); 33 AFTR 2d 74-1041, and *U.S. v. Miller,* 425 U.S. 435 (1976); 37 AFTR 2d 76-1261.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

for the proposition that, for purposes of the Constitution, bank records are records maintained by a third party (the bank) and are neither private nor testimonial. The banking laws of the Bahamas did not alter this rule. In *U.S. v. Payner,*[7] the U.S. Supreme Court considered the bank secrecy laws of the Bahamas and concluded that the laws create no special expectation of privacy which is not present under American banking laws. Thus, the Fifth Amendment did not bar production of the records. The Court noted that, under the rule in *Fisher v. U.S.*, the records could be subpoenaed directly from T if they were in his possession. Ordering T to remove an obstacle created by Bahamian law was in effect no different from subpoenaing the records from T.

Finally the Court rejected T's argument that the act of executing the consent form was a testimonial act which is protected by the privilege against self-incrimination. In the Court's view, the consent merely permitted the Bank to release any records it might find, and the consent did not mean that T admitted ownership of an account in the Bahamas or vouched for the accuracy of the records.

JURISDICTION OF U.S. COURTS OVER RECORDS LOCATED ABROAD

The jurisdictional question related to the Court's subpoena power over the Bank's branches outside the U.S. The Government's position was that service of the subpoena on the Bank's New York agency subjects the Bank's headquarters and all the branches to the subpoena power of the Court.

The Court stated that the subpoena power of the Court in criminal matters is not explicitly conferred by statute but derives from the U.S. law which grants jurisdiction over offenses against the U.S. to the federal courts. The grant of subject matter jurisdiction (i.e. over the offense) necessarily carries with it an implied grant of the subpoena power subject, however, to certain restrictions not applicable here.

The geographic reach of power may be inferred from the Federal Rules of Criminal Procedure. Rule 17(e)(2) relates to service on a witness in a foreign country who is a national or resident of the U.S. This provision did not apply to the Bank since it was not a U.S. resident. Rule 17(e)(1), however, provides for service of a subpoena on anyone *found in* the U.S., and for this purpose, a foreign corporation may be found in the U.S. even though its headquarters and place of incorporation are in a foreign country.

The Court said that the Bank would be considered to be "in" the U.S. if it were "doing business" there. The Court examined the affidavits of the Bank's representatives and concluded that the Bank, through its New York agency, carried on activities in the U.S. on a scale sufficient to constitute "doing business".[8] Since the subpoena power over a foreign corporation doing business in the U.S. extends beyond the corporation's operations in the U.S., the Bank's records in the Bahamas could be reached by the Court.

The Court was not willing to go so far as to say that a foreign corporation might be obliged to open all its files to American courts and prosecutors merely because it opens an office in the U.S., but the Court did not say where it would draw the line. The Court noted, however, that, in this case, the subpoena was directed only at the bank records concerning a U.S. citizen who was under indictment for violations of U.S. tax laws. The subpoena, therefore, represented no great intrusion into the purely foreign affairs and operations of the Bank and its customers. In addition, the Bank should not be surprised that the Government is interested in the foreign bank accounts of its citizens. The Bank chose to enter the U.S. to conduct business and, by that act it became obliged to respond to reasonable requests for information concerning its transactions with Americans both in the U.S. and abroad.

COMMENTS

In *Quigg,* the Court stated unequivocally that it was unwilling to compel any disclosures that would subject the Bank or its employees to criminal liability in the Bahamas. This statement may be compared to an opinion rendered by the U.S. Court of Appeals for the Ninth Circuit in which the Ninth Circuit was less sympathetic to the taxpayer's plight that compliance with a summons would violate Swiss law.[9] In that case, the U.S. Internal Revenue Service sought production of certain records of a U.S. corporation and its foreign subsidiaries. Some of the records were in Switzerland, and one of the grounds on which the taxpayer objected was that production of the Swiss records would violate Swiss law that makes it a crime to disclose business secrets. The Ninth Circuit rejected the objection because the taxpayer had not shown a substantial likelihood of a successful prosecution in Switzerland. The Ninth Circuit also noted that the taxpayer would not be in this predicament had it complied with U.S. law which requires it to keep certain records pertaining to its foreign subsidiaries.

8. The Court noted that the Bank's objection was analogous to the affirmative defense of lack of personal jurisdiction which a defendant must raise and prove. The Bank had failed to meet its burden of proof as there was nothing before the Court which indicated that the Bank was not doing business in the U.S.
9. *United States v. Vetco, Inc. et al.*, 81-1 U.S.T.C. Para. 9428 (9th Cir. 1981); *certiorari denied* by the U.S. Supreme Court on 24 August 1981. For a discussion of this case, see 21 *European Taxation* 12 (1981) at 402.

BRAZIL:

The Supplementary Income Tax on the Remittance of Dividends Abroad — Legal Nature and Computation

by Ives Gandra da Silva Martins*

I. BRIEF INTRODUCTION TO THE BRAZILIAN TAX SYSTEM

The Brazilian taxation system, dealt with in the Federal Constitution under that heading, encompasses 5 different categories of taxation, namely, "taxes", "duties", "contributions", "special contributions", and "compulsory taxes".

Of course, the most significant of these are the taxes. The Federal Constitution sets forth the competence for the introduction of taxes in the following manner: 9 different taxes may be imposed by the Federal Union (Art. 21), 2 by State Governments (Art. 23), and 2 by municipalities (Art. 24). There is a narrow definition of each tax, and new taxes may be introduced exclusively through the residual competence of the Union (Art. 18 §5), provided that their computation basis and generating facts are different from those of existing taxes.

The imposition of the tax on income and gains of any nature is exclusively the prerogative of the Federal Union (Art. 21, item IV of the Federal Constitution). Art. 43 of the National Taxation Code delimits the scope of this tax. It reads as follows:

> The tax on income and gains of any nature is under the competence of the Union, and its generating facts are the acquisition of economic or juridical availability:
> I – of income, such as the proceeds of capital, of work, or of a combination of both;
> II– of gains of any nature, such as property increases not included in previous items.

The tax on income and gains of any nature is governed by Federal legislation of a varied nature, under which 3 different tax regimes exist, i.e. for individuals, for legal entities, and taxation by withholding.

A fourth regime can be mentioned, resulting from the 13 double tax treaties whereby Brazil, adjusting its tax system to the systems of other countries, has many times adjusted its internal system to adapt itself to systems of other countries under which the place where the service was rendered is considered as the generating fact of taxation and not the place of the source of payment. Such treaties have been concluded with: Austria, Belgium, Denmark, Finland, France, Germany, Italy, Japan, Luxembourg, Norway, Portugal, Spain and Sweden.

On the other hand, Brazil adopts generally a progressive rate system for the income of individuals, and a fixed rate for most legal entities. The rates of individual income tax range from 3 to 55%, and corporate income tax has a fixed rate of 35%, except for the few cases in which an additional 5% on taxable profits in excess of Cr $ 86,000,000 is levied (base year 1981, fiscal year 1982).

In addition to income tax on the profits of legal entities, there is an income tax on the distribution of dividends, ranging from 15 to 25%, in the form of a withholding tax for both individuals and legal entities.

When dividends are remitted abroad the rate of the withholding tax is 25% (except for reduced rates in double taxation treaties), provided that they do not exceed the limit of 12% per year (computed over a 3-year period), in which case the tax is considerably increased by the supplementary income tax ranging between 40 and 60%. Arts. 544 and 555 of item I of the Income Tax Regulation read as follows:

> Art. 544
> Dividends, cash bonuses, profits, and other interest, except for those referred to in items I, III, and IV of Art. 37 and those referred to in the introduction to Art. 547, are subject to withholding tax at the rate of:
> I –15% when distributed to individuals residing or domiciled in the country by open capital corporations and by service companies relative to the exercise of a duly regulated profession;
> II –25% when distributed to individuals residing or domiciled in the country by the remaining types of legal entities;
> III–15% when distributed by legal entities to other legal entities with head office in the country.
>
> Art. 555
> The following are subject to withholding tax:
> I –at a 25% rate, income received by individuals or legal entities referred to in the previous article, gains derived from short term operations included, as well as capital gains relative to investments in foreign currency, except for those referred to in items II and III (Law 3470/58, Art. 77, Decree-Law 1401/75, Art. 4); . . .

Our intention is to analyze the philosophy behind the supplementary income tax in view of the wide discrepancies of interpretation in Brazilian taxation circles. In order to provide the reader of the *Bulletin* with a clear view of such discrepancies, we first present our position and then Federal Revenue Ruling No. 77/78, which briefly presents the interpretation of the Federal Treasury.

* Professor of Economic Law at the Mackenzie University Law School, São Paulo, Brazil.

II. INTRODUCTION TO THE STUDY

Tax law is based on principles, norms, and institutions similar to those of other legal disciplines, but it is an autonomous part of Brazilian legislation. However, it has an important impact on other branches of knowledge such as economics, public finance, politics, sociology, and even ethics.[1]

There may perhaps be no other branch of law with such varied connections, which is reflected by its capacity of touching the very essence of the science it influences.

Poor formulation of taxation policy and subsequent application of inadequate laws has been a major factor altering history, examples being offered by the out-break of the American Revolution or by the Brazilian "Inconfidência Mineira".[2] Likewise, it is common knowledge that taxes are used to treat severe economic illnesses, namely, inflation, recession and underdevelopment. In addition, the socialist societies have their foremost trend indicator in the formulation of the taxation policy, and, in some countries, taxes are sometimes used to re-orient mores and preserve moral values.

Formally, a country's budget is, in practice, prepared on the basis of the forecast of tax revenues, the tax being the most relevant among the 5 classic public revenues.[3]

Taxation, therefore, is an essential and unique feature of Budget Law, far more so than its principles which, although pertaining to this area of law, are similar to principles of other areas of the law, for instance, *the principle of strict legality, the principle of characterization and the principle of the provision in law,* the latter also being peculiar to criminal law.

Taxes have such an important function, in any of their categories,[4] that they are always created by the legislator for a special purpose so that the essence of their creation rests on their teleological aspect. Taxes may have a wide range of objectives which determine the essence of their legal nature.

Among the most important intentions of the legislature are those which result in a tax being both a penalty and a guideline for economic policy, as may be seen in the case of the urban property tax: the City of São Paulo increased this tax to 200% on illegal buildings. In such a case, the penalty is incorporated into the very structure of the tax, serving as a strong disincentive to concealed operation and as a factor re-orienting municipal policy, and aiming at harmonious and planned urban development.[5]

It is in such light that one should carry out a preliminary study for purposes of discussing the supplementary income tax, i.e. taking into account this important aspect of the Brazilian legislation, which accepts that taxation is used to reach certain goals.[6]

Article 3 of the National Taxation Code defines the concept of tax:

> A tax is any mandatory money payment, in currency, or whose value may be expressed in currency, which is not punishment of an illegal act, provided by law and collected by administrative authorities vested with their lawful power.

This definition is accepted by the vast majority of Brazilian legal commentators[7] as having general validity.

This concept is supplemented by Article 113, which provides:

> Tax liability is either primary or accessory.
> § 1– Primary liability is brought about by the occurrence of the generating factor, its object is represented by the payment of the tax or fine, and is terminated together with the claim it entails.
> § 2– Accessory liability is a result of taxation legislation and its object is represented by positive or negative measures provided therein in the interest of tax collection or auditing.
> § 3– When not observed, the accessory liability becomes primary liability as regards the fine.

Two conclusions may be immediately arrived at: the Code explicitly defines the concept of tax and implicitly defines the concept of penalty, as the latter, although a punishment for an illegal act, has the same nature as a tax; and, secondly, that the above article places tax and penalty in the same category.

---

1. In the Second Latin American Regional Symposium of Taxation Law, Edvaldo Brito stressed such interaction in his paper "Social and Economic Contributions: Legal Nature and Prescription" *(Resenha Tributária,* 1976).
2. In our lecture opening the First Brazilian Congress on Revenue-Taxpayer, organized by the Federal Revenue, entitled "Taxes: Social Justice and Development" *(Revista Projeção,* pp. 68-71, December 1979), we said: "When we were invited to open the academic session of the Interamerican Association of Taxation dedicated to Interamerican Taxation Coding, in Rosário, Argentina, in 1976, we were surprised at the excellent studies prepared by the then dean of Rosário University, Prof. Manuel de Juano, current chairman of the Fiscal Commission of the Interamerican Bar Association. Prof. de Juano, when he organized the first Taxation Law Museum of the world, showed that there has never been a revolution or insurrection in the history of mankind that did not have an incorrect application of taxation policy at its roots. Such incorrect application generated tensions which directly led to the non-acceptance of the directions desired and led to upheavals, such as the "derrama" in the Brazilian episode of the "Inconfidência Mineira", or in the Townshend Law, imposing import duties on glass, lead, paper, paints and tea, by the time America was fighting for independence, starting in 1767."
3. Aliomar Baleeiro stresses this aspect in his well-known *Introduction to Financial Science* (*Forense* - several issues).
4. Authors do not agree as to the number of categories of tax. Geraldo Ataliba only distinguishes between taxes levied for a specific purpose and general taxes ("Em prol da contribuição de melhoria", *Resenha Tributária,* 1976); Paulo de Barros Carvalho discusses two categories: taxes and duties ("Comentários ao Código Tributário Nacional - Artigo 16º", *Revista dos Tribunais,* c/ Geraldo Ataliba and Rubens Gomes de Sousa); most authors tend to distinguish between 3 categories: taxes, duties, and special contributions – Ruy Barbosa Nogueira ("Curso de Direito Tributário", Saraiva), Fábio Leopoldo de Oliveira ("Curso Expositivo de Direito Tributário", *Resenha Tributária)* among others; Aires Fernandino and Manuel de Juano list 4 categories divided into 2 sectors: first, "improvement contributions" and "special contributions", excluding, however, the compulsory loan *(Caderno de Pesquisas Tributárias* 2), and, second, distinguishing the "improvement contribution" from the "special ones" *(Manual de Finanzas e Derecho Tributário,* Molachino); Ives Gandra da Silva Martins ("As Contribuições Especiais numa Divisão Quinquipartida dos Tributos", *Resenha Tributária),* Fábio Nusdeo *(Comentário ao CTN,* vol. 3, José Bushatsky) and Bernardo Ribeiro de Moraes *(Caderno de Pesquisas Tributárias* 2, *Resenha Tributária)* defend the existence of 5 categories (taxes, duties, special contributions, improvement contributions, and compulsory loans).
5. The Second Interamerican Congress of Taxation Law was specially dedicated to the theme "Determination of guidelines for a taxation policy for urban development" (papers published by *Resenha Tributária,* 1975).
6. See H.L.A. Hart: *The Concept of Law* (Clarendon Law series).
7. Geraldo Ataliba and Souto Maior Borges, in "Sistema Constitucional Tributário", in "1º Ciclo de Conferência sobre Temas Tributários" and "Lei Complementar" *(Resenha Tributária* and *Revista dos Tribunais,* respectively), do not totally accept it, and represent isolated positions which conflict with those of Gilberto de Ulhao Canto, Rubens Gomes de Sousa, Aliomar Baleeiro and Carlos de Rocha Guimarães, the drafters of the Brazilian tax system.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

On the other hand, such a legal frame leads to the existence of 2 special forms of tax assessment in the Brazilian legislation: "punitive taxation" and "discouraging taxation", with closely related areas of application, the former encompassing all characteristics of the latter, but the latter not always encompassing those of the former.[8] The taxes levied on disguised profit distributions (individual and corporate taxes are solely borne by individual taxpayers) or for the property tax mentioned above, with the objective of penalizing and discouraging, are considered "punitive taxation". An example from French legislation of simple "discouraging taxation" is the tax on real estate concentration, the aim of which is to reduce urban verticalization, although some commentators say that discouraging is a means of penalizing those activities which are supposedly legal, but in essence illegal.[9]

It is a fact that punitive or discouraging taxation, within the scope of defined objectives, occurs more in view of its extra-fiscal function than for its function of generating funds for public services.[10]

From the above concept one understands that the Brazilian legislature wished to liken their legal natures even when it stressed their differing elements (whether or not they should be considered a punishment), treating them as species belonging to the broader category of taxes in general. Tax liability is considered to become effective upon the occurrence of a generating fact, and it is transformed into a taxation claim upon the assessment. With respect to discouraging and punitive taxes, as well as taxation punishments, legal interpretation may not admit any principles other than those of strict legality, characterization, and of the provision in law as the only manner to avoid arbitrariness of interpretation.[11]

Such principles are applied to the entire tax system, for they are inherent to a system under which the taxpayer has only the law as his guarantee. As he cannot take part in the formulation of law, which is always imposed on him under the legal power of authorized Revenue agents, the only guarantee that nothing will be required from him in addition to what the law provides lies solely in the 3 mentioned principles.[12]

That is why legal theory and the courts do not grant any room to the administration to issue regulations with respect to the norm provided in the law, because the power of regulating is often confused with the power of demanding, and such integration in the person of the Revenue agent may lead to an interpretation to the benefit of the Revenue and thus always unfavorable to the weakest party, i.e. the taxpayer or the assignee.[13]

Thus, when the Constitution states that only the law creates tax liabilities, and the National Taxation Code provides that only the law may introduce an increase in taxes, the principles to safeguard the rights of the taxpayer or the assignee were obviously included in the legislation. Thus the drafters of the Constitution and the supplementary legislation adopted the 3 principles mentioned above, which prevent the analogical interpretation as to tax laws or the use of a "benigna amplianda" (extensive) interpretation and, in cases of doubt, the law must be interpreted in favor of the taxpayer.[14]

As this is the essence of the Brazilian tax system, under the principle of strict legality, only what is provided in the law may be demanded. As a result, taxation law encompasses the principle of provision in the law, meaning that under no circumstances is the legislative competence delegated to the Revenue agent nor permission given to use such extensive interpretation by such agent. This principle is absolute and not merely formal.

As a last corollary, the type of the tax is "closed", i.e. may not be extended, and must be fully described in the law due to 4 additional sub-principles: (i) the principle of exclusiveness, stating that such tax is exclusive and may not be mistaken for other types of tax; (ii) the principle of selection, according to which the law indicates the tax; (iii) the principle of determination, which after the selection of the tax delimits its scope in an accurate and objective manner; and (iv) the "numerus clausus" principle, which limits the number of taxes and prevents any addition not provided for in the law to this type of tax.[15]

---

8. *Caderno de Pesquisas Tributárias* 4, dedicated to the theme "Taxation Penalties" *(Resenha Tributária,* 1979) containing studies by 13 well known Brazilian and Argentine authors, in addition to the drafter of the ruling, studies several aspects of these two types of fiscal assessment.

9. In France, the higher taxes on luxury hotels and X-rated films (even when they are considered art films) intend to reach those grey areas, where the illegal dwells in a certain atmosphere of legality.

10. See Fábio Fanucchi, "A Tributação Penal", *Revista de Direito Público* 25, pp. 105-119.

11. Aires Fernandino Barreto prefers to call the first of them the "principle of absolute provision in formal law" ("Princípio de Legalidade e Mapas de Valores", in *Caderno de Pesquisas Tributárias* 6 of the Centro de Estudos de Extensão Universitária and *Resenha Tributária* - 1981, dedicated to the theme "Principle of Legality").

12. Yonne Dolácio de Oliveira, in her book *A Tipicidade no Direito Tributário Brasileiro* (Saraiva, 1980), states: "As the legal relation between the Revenue service and the taxpayer is established by law, creating a legal obligation for the legal subjects, the normative structural characterization limits the will of the parties, of the legislature and of the enforcer. This causes a great tension originating in the two values, "sureness" and "safety", calling for a closed type of law. These two values are different but imply each other: *sureness provides for a situation in which the scope of the law will not be extended; safety guarantees that only that which is the object of a legal definition shall be required"* (p. 180; our emphasis).

13. Gerd. W. Rothmann reaches the same conclusions in his study "O Princípio de Legalidade Tributária" in *Direito Tributário* - 5º Coletânea (Bushatsky, 1973), p. 154.

14. Art. 153 § 2 of the Federal Constitution, Art. 97 items I and II, Art. 108 § 1 and Art. 112 of the National Taxation Code read as follows:

"Art. 153 – The Constitution assures all Brazilians and foreigners residing in the country the inviolability of the rights related to life, freedom, safety, and property, on the following terms: . . .

§ 2. No person shall be obliged to do or not to do anything if not under the law."

"Art. 97 – Solely the law may determine:

I. the institution of taxes, or their termination;

II. the increase of taxes, their reduction, provisions of Arts. 21, 26, 39, 57 and 65 being observed . . ."

"Art. 108 – In the absence of express provision, competent authority, when enforcing taxation legislation, shall successively resort to, in the order indicated:

I– analogy;

II– general principles of taxation law;

III– general principles of public law;

IV– equitableness.

§ 1. The use of analogy may not result in the demand of a tax not provided for in the law".

"Art. 112 – Taxation law defining infringements, or attributing penalties to such infringements, shall be interpreted in a favorable manner to the defendant whenever there is doubt as to:

I– the legal classification of the fact;

II– the nature or material circumstances of the fact, or the nature or extension of their effects;

III– the nature of the applicable penalty or its grading."

15. P. 337 of *Caderno de Pesquisas Tributárias* 6 *(Resenha Tributária e Centro de Estudos de Extensão Universitária)* reads as follows: "It so happens that in the area of taxation law, the principle of legality, through the definitive pro-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

In sum there are the guidelines orienting the national taxation law, particularly in the areas of taxation punishments, punitive taxation, and discouraging taxation.[16]

III. SUPPLEMENTARY INCOME TAX – LEGAL NATURE

We will now try to see where the supplementary income tax fits in view of its legal nature.

Two questions immediately arise. The first one is to know whether or not such tax would fit in the category of discouraging taxation. The second is whether it would have the same legal nature as the regular withholding tax.

As to the first question, the answer seems simple.

When the law regulating the legal nature of foreign investments in Brazil (Law 4,131/62) was created, Art. 44 introduced the concept of the supplementary income tax, thus increasing the regular tax by an additional 20% for those foreign corporations of little national interest. The objective was to ensure the right of remittance of dividends, but, simultaneously, to show that their presence in Brazil was considered of little significance to that country, since they could be taken over by national capital. The 2 objectives laid down in Art. 44 in 1962 were: (1) the policy of discouraging the presence of foreign capital in Brazil and the remittance of profits, and, (2) encouraging the re-investment of profits within the country.[17]

In 1964, the legislation with respect to supplementary income tax was amended and the introduction of its current form made the governmental intention more clear. The present policy is to attract foreign capital, to stimulate its permanence and to reinvest the results in Brazil, and to discourage excessive remittances through the adoption of considerably higher and progressive tax rates.

Brazil is a country clearly lacking capital for development, and in need of both such capital and more developed technology from industrialized countries. Therefore, in 1964, the government tried to apply a formula with sufficient flexibility to attract capital from industrialized countries, allowing its repatriation and, at the same time, clearly discouraging the non-reinvestment of results in excess of certain limits, reflecting the average profitability figures of national companies.[18]

Therefore, the aim of the supplementary income tax was to discourage the taxpayer to remit too much profit abroad and to keep part of his profits in the country.[19]

Therefore, this is a type of tax which, even more than other taxes, is subject to interpretation under the foregoing principles, because the taxpayer who legally exercises his right to remit dividends abroad in excess of the limits set by the law will be subject to a higher tax.

There is no doubt that this concept fits within the category of discouraging tax mentioned above, so that the pertinent law may only be interpreted within strict limits, and the Revenue agent is not permitted to create, innovate, amend, change, or include any fact or norm which is not expressly foreseen by the law.

The second aspect concerns its legal nature. Does the supplementary income tax have the same legal nature as the withholding tax or does it have a different nature?

Although *Alberto Xavier* tends to find a different nature in this tax, and presents it in his brilliant and talented way, we do not agree with him.[20]

The famous author concludes that the characteristics of collection of the regular tax are different from those of the supplementary tax, first of all in view of the 3-year computation period, then in view of the factor reducing the percentage from one 3-year period to the next, related to those years in which remittance was above 12%, and, finally, in view of the factors related to the manner of computation.

We do not believe that this conclusion can be accepted, as all of the different characteristics refer to the mere collection technique and not to the structure and essence of the tax.[21]

The withholding tax assessed on remittances of up to 12% of capital or in excess of this amount has the same

---

vision in law, allows for the necessary characterization, which determines the tax obligation as well as its factors, namely: the exact quantification of the rate, of the computation basis, or of the penalty. To conclude, it becomes evident that the logical consequence of the application of the principle of selection, the taxation norm determines the type of tax or penalty; according to the "numerus clausus" principle, it voids the use of analogy; according to the principle of exclusiveness, it renders the factual situation different from any other, although the situations may resemble each other very closely; and, finally, according to the principle of determination, it states the event to be taxed in a clear and objective fashion, whereby the use of elastic norms is absolutely forbidden."

16. Alberto Xavier, in his small but brilliant book *Os Princípios da Legalidade e da Tipicidade da Tributação* (Revista dos Tribunais, 1978), states: "And it follows that the norms which institute must necessarily be material decision norms (Sachentscheidungsnormen), according to the work of Werner Flume, because, contrary to what happens to action norms (Handlungsnormen), *these are not limited to authorizing the enforcement agency to exercise power in a relatively free manner, they rather impose a concrete decision criterion, thus predetermining its behavior"* (emphasis added).

17. Art. 44 reads as follows:
"Said tax shall be collected with an added 20% in the case of companies engaged in economic activities of lesser interest to the national economy, considering its localization, as defined in a decree of the Executive Power and in view of a hearing of the National Economy Council and the Council for the Superintendence of Currency and Credit."

18. It is interesting to recall that a stricter formula was adopted under the revolutionary regime, whose politics were aimed at maintaining a market economy. See Roberto de Oliveira Campos and Mário Henrique Simonsen, *A Nova Economia do Brasil* (Livraria José Olympio Editora, 1974).

19. Law 4,390 dated 29 August, 1964.

20. In his "Direito Tributário Internacional do Brasil", p. 204, he says: "With the purpose of determining their legal nature, we tried to understand the basic characteristics of this tax distinguishing 4 different traits: (i) it is a withholding tax; (ii) it is a special tax; (iii) it has the nature of a surtax; (iv) it has an extra-fiscal nature, the center of gravity of our viewpoint lying in the extra-fiscal aspect of the tax (which, for scientific coherence, we would rather call a "discouraging tax", because this extra-fiscal nature is a fiscal nature for it takes a fiscal character and has a specific final purpose as any other tax). This, however, is not part of its legal nature, it is merely explanatory and marginal to its essence.".

21. On the occasion of the Third National Symposium of Taxation Law at the Centro de Estudos de Extensão Universitária, about the collection technique, the Plenary concluded that:
"No, the added value is not an element of the theory underlying the imposition of the ICM tax. The constitutional principle of non-cumulation consists solely of deducting the amounts payable in previous operations from the tax payable, not considering the existence of an added value" *(Caderno de Pesquisas Tributárias* 4, *Resenha Tributária,* p. 642), for one cannot equate a mere collection technique with the essence of the theory for the imposition of any tax.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

legal nature, only the rates differ. However, the taxes are assessed as a *withholding tax and on remitted values*. That is to say that both taxes have the same purpose aiming at imposing tax on profit remittances; only a higher rate is applied in the case of the supplementary tax. In the same token, there is a higher tax on the disguised distribution of profits, but this does not alter the legal nature of the income tax on distributed profits.

The difference lies in the field of collection, just like the collection technique in the cases of deferred ICM tax in relation to assessment immediately following the generating fact with no resulting change of the legal nature.[22]

Thus, although we usually take positions quite similar to those of Alberto Xavier expressed in his brilliant comments, we firmly believe that he confuses the external aspects of a tax with its essence. We cannot accept that a special tax may be considered to have characteristics different from those of the regular tax just because it employs different collection techniques.

The supplementary income tax (which is withheld) and the regular income tax are identical, differing solely in their external aspects, i.e. with respect to their collection methods mentioned in the law.[23]

IV. THE BASIS FOR THE CALCULATION OF THE SUPPLEMENTARY INCOME TAX

After these introductory remarks we will examine the problem which is discussed by tax experts and which has been the subject of litigation, i.e. whether the supplementary income tax assessed on excess remittances in the previous 3-year period may be the basis for computation of the tax payable in the following 3-year period.

Article 43 of Law 4,131/62, as modified by Law 4,390/64, provides:

> The amount of net profits and dividends effectively remitted to individuals and legal entities residing or with head offices abroad is subject to a supplementary income tax whenever the average of remittances in a 3-year period, starting in 1963, exceeds 12% of registered capital and reinvestments under Arts. 3 and 4 thereof.
>
> § 1– The supplementary income tax provided for in this article shall be levied in accordance with the following table:
>
> - between 12% and 15% of profits on the capital and reinvestments – 40%;
> - between 15% and 25% of profits – 50%;
> - above 25% of profits – 60%.
>
> § 2– Such supplementary income tax shall be withheld on the occasion of every remittance exceeding the 3-year average referred to in this article.

On the other hand, item 10 of Federal Revenue Ruling 77/78 sets forth that:

> Secondly, remittances shall be considered in their net amount, that is, the tax assessed under Art. 344 of RIR/75 being deducted. The basis for calculation, however, shall not exclude the amount of the supplementary income tax relative to the previous 3-year period, which, to facilitate collection, is deducted from the remittance itself.

A mere comparison of both texts shows that the inclusion of the supplementary income tax assessed in view of the excess remittance of the previous 3-year period in the basis for computation of the following 3-year period is set forth in a ruling and not in the law.

This interpretation of a legal provision by a ruling which expressly states that the supplementary income tax must be included in the taxable base makes one wonder whether such inclusion is implicitly prescribed by the law. Thus the question remains whether the ruling would, within the 3 principles mentioned above, merely be stating the meaning of the legislature, or whether it would introduce an additional obligation.[24]

This is exactly what we are going to discuss in this paper.

The legal text, first of all, does not contain *even a suggestion* that

> one shall not exclude the amount of the supplementary income tax relative to the previous 3-year period from the basis of computation.

What the text does contain is a different statement that the tax shall be deducted and withheld on the occasion of every remittance exceeding the 3-year average referred to in the article.

The FR Ruling and the law deal with 2 completely different matters: the ruling adds an amount corresponding to the tax deducted to the taxable basis which is represented by the remittances; and the law considers the withholding tax merely as a collection technique.

The theory expounded by the FR Ruling increasing the taxable base is nowhere to be found.

On the contrary, the law clearly provides that "the amount of profits and dividends effectively remitted" should be considered, which means the sums which have not *efficiently* been remitted, i.e. the sums which not *effectively* left the country and which have not *effectively* been received by the recipient, may not be used as basis of computation for the supplementary income tax.

In interpreting the law, words may not be carelessly used and thus misused. Every word has its own meaning and its sole and unique value, allowing for an exclusive interpretation.[25]

When the legislature states that only *effective* remittances are subject to the supplementary tax, it does not

---

22. As to this matter, we have already expressed our opinion in a report published by the *Revista Legislação e Jurisprudência Fiscal (Estudos LJF* 6, June 1980) under the title "Natureza Jurídica do ICM".

23. Dejalma de Campos clearly states the need for the law to hold the complete set of requirements: "This principle has a double concept: it obliges the legislature to formulate taxation-legislative commands with a rigorous absolute provision; it obliges the enforcer of law to exclude subjectivism in the enforcement of the law, the legal or administrative creation of taxation law, and the prohibition of analogy and discretion" *(Caderno de Pesquisas Tributárias* 6, *Resenha Tributária,* p. 218-219.

24. Commenting on Arts. 108 and 111 of the National Taxation Code, A.J. Franco thinks it is possible to render explicit a presumably implicit norm whenever the result represents a tax increase *(Comentários ao Código Tributário Nacional,* vol. I, José Bushatsky, edited by Hamilton Dias de Souza, Henry Tilbery and Ives Gandra da Silva Martins, 1974, pp. 147-237).

25. Francisco Ferrara *(Interpretação e Aplicação das Leis,* 2nd edition, Coimbra, 1963, p. 129) states that worse than a literal interpretation of the literal legal text is a forced interpretation, adding to the legal text what one would like to have included, or eliminating what is not in accordance with one's own preferences.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

mean "*effective* remittances and those which are neither *effective* nor *remittances*". The placement of adjectives by the legislature can, if teleologically interpreted, very clearly only be understood to mean that the tax should be assessed solely on what *actually* leaves country.

This is so because the introduction of the supplementary income tax is aimed at preventing foreign currency to flow away which would result in the removal of resources which the country needs so much, and which, although legitimately acquired, are thus encouraged to remain in Brazil and discouraged to leave the country.

In such light, only the sums leaving the country are subject to the supplementary income tax, for the legislature has only focussed on this situation. And, to avoid any doubts, it added the adjective *effective* to the noun *remittance,* or, more precisely, it used an adverb in the drafting of the legal text, the expression "effectively remitted".

To accept the introduction of a provision not written in the law would mean considering the Federal Constitution, the National Taxation Code, all principles of taxation law and the ordinary law unneccessary, and to grant to the Revenue the right to introduce and increase taxes not based on any legal provision.

The principles analyzed aboved are quite clear on this matter. To accept the FR Ruling means that the supplementary income tax will be increased, which is a blatant breach of Art. 97, item II of the National Taxation Code, which states:

> Only the law may determine:
>
> . . .
>
> II. The increase in taxes or a reduction thereon, provisions of Arts. 21, 26, 39, 57, and 65 being observed;

Here, once more, the legislature resorted to the strength of an adverb to exclude delegation of legislative competence, as it states that *only* the law (which means that *solely* the law, *exclusively* the law, *nothing but* the law) may increase taxes.[26]

When Alberto Xavier defended a treatment for the supplementary income tax different from that of the regular tax, excluding the latter and including the former in the basis for computation, he did so because he differentiated between the legal nature of the taxes and equated the different collection techniques with the structure of the taxes, which, as we have demonstrated, are similar.

As they have the same legal nature, the supplementary income tax, like the regular income tax, cannot serve as a basis for computation, otherwise the legislature would expressly state so, which, as has sufficiently been demonstrated, it did not.

Recently, the famous professor, chairing a round table at the *Office of Legal Studies* on international investment together with the author of this paper and who at that event acted as the representative of the *Instituto dos Advogados de São Paulo,* examined the legal nature of the supplementary income tax and admitted the possibility of revising his previous position, as the vast majority of the participants was favorable to the position expressed by the author.

Widely covered by the press, the round table was held on 15 July 1981 at the head office of the *Instituto dos Advogados de São Paulo.* A summary of the debates was published by the newspaper *O Estado de São Paulo,* and a more detailed report by the newspaper "*Diário de Comércio e Indústria*".[27]

Not only a number of participants in the round table, but also many commentators reacted unfavorably to the interpretation of Professor Alberto Xavier.[28]

It is noteworthy that the FR Ruling itself, when it gives examples of the manner of calculation, has not considered the interpretation given by its item 10 and has

---

26. In "O Princípio da Legalidade no Direito Tributário Brasileiro" *(Caderno de Pesquisas Tributárias* 6), we have written that: "In fact, in taxation law, it is only possible to study the principle of legality through an understanding that the formal provision in law is not sufficient for its characterization. The principle of the formal provision in law would allow for a certain discretionary power, which cannot be admitted either in criminal law or in taxation law."
As Sainz de Bujanda says in *Hacienda y Derecho* (Madrid, 1963, Vol. 3, p. 166): "the provisions in tax law may not be only formal, they must also be absolute. The law must contain not only the fundaments, the basis for the behavior of the enforcer, but also, and mainly, the very criterion for decisions in the concrete case. This requirement of a "lex scripta" peculiar to the formal provision in law, is added to that of "lex stricta", peculiar to the absolute provision" (pp. 336-337).

27. *O Estado de São Paulo,* p. 26, 25 July 1981.

28. Nilton Latorraca in *Legislação Tributária* (Atlas), p. 212: "Finally, there is another statement in FR Ruling CST 77/78 which goes against the legal norm. We refer to item 10, where it is said that the basis of computation shall not exclude the amount of the supplementary income tax relative to the previous 3-year period, which is deducted from the remittance. It so happens that the tax is not deducted from the remittance, but "debited to the account of the beneficiary abroad, to be deducted on occasion of subsequent remittances" (RIR, Art. 559 § 1). "Deducting on occasion of the remittances" means failing to remit. And as the supplementary tax is only assessed over amounts effectively remitted abroad (RIR, Art. 559), we do not see a way to calculate the tax over the same tax debited to the account of the beneficiary of the profit or dividend."
Hiromi Higuchi in *Imposto de Renda das Pessoas Jurídicas* (1981), p. 309: "FRR 77/78 item 10 states that remittances are considered at their net value, that is, the withholding tax is deducted under Art. 555 of RIR/80. The basis of computation, however, shall not exclude the amount of supplementary tax relative to the previous 3-year period which, for a mere simplification of collection procedures, is deducted from the remittance itself. We do not see the reason for which the supplementary tax is considered a profit or a dividend effectively remitted if, in fact, the amount of the tax is deducted from the profit or dividend to be remitted in the following 3-year period. The very legal provision leaves no doubts as it provides that the amount of net profits and dividends effectively remitted to individuals and legal entities residing or with head office abroad is subject to a supplementary income tax whenever the average remittances in a 3-year period exceed 12% of capital and reinvestments registered with the Central Bank of Brazil. The supplementary income tax has the purpose of controlling the outflow of foreign currency, that is why the law considers only those net profits and dividends effectively remitted."
Carlos Alberto Baroni, in "O Parecer Normativo 77/78 e o Imposto Suplementar de Renda. O que são Remessas líquidas?" *(Boletim de Estudos Jurídicos do Investimento Internacional* 2, p. 26, *Informações Objetivas – IOB e Gabinete de Estudos Jurídicos do Investimento Internacional:* "As to this aspect, however, we disagree with the interpretation given by the FRR, because it does not seem lawful to us to include the tax paid in the previous 3-year period in the basis of computation. Analyzing the above-mentioned Art. 43 of Law 4,311, we understand that the only possible interpretation is that the supplementary income tax relative to the previous period must be excluded from the basis of computation. Our opinion is based on the fact that the article says, "profits and dividends effectively remitted", and the supplementary income tax is not a remitted amount.
Our opinion is reinforced by items 35 and 41 of Regulatory Instruction SRF of 9/12/69.
"Item 35: Net profits or dividends *effectively remitted to individuals and legal entities residing or domiciled abroad . . .*"
As we can see, the two texts above expressly refer to "net profits or dividends effectively remitted". Thus it does not seem to us that the intention of the law was to include in this net amount the gross amount of the supplementary income tax".

© 1982 International Bureau of Fiscal Documentation – BULLETIN

made its computation based on *remittances effected* and not with these remittances plus the supplementary income tax of the previous year, which clearly demonstrates the addition of item 10 represents a misinterpretation corrected in the example.

The adverb *effectively* eliminated any possibilities of creating *legal fictions,* which certainly cannot be accepted as an act of the very authority interested in the collection of the tax. Legal fictions can be created *solely by law.*[29]

As demonstrated above, it is our opinion that the supplementary income tax collected in the previous 3-year period may not be used to compute the taxable base for the supplementary income tax assessed in the following 3-year period, because this would represent a "bis in idem" (double taxation). Its manner of computation should follow the same system used for the regular income tax, for neither Law 4,131/62 nor Law 4,390/64 indicates otherwise.

V. MANNER OF COMPUTATION

The seond aspect under discussion relates to the computation of the 3-year period as, also in this matter, the Revenue has adopted a position disadvantageous to the taxpayer.

Although the legislature provided that remittances exceeding 12% per year of the average capital cause the supplementary income to become due, it is evident that, due to the fact that the computation is made over a 3-year period, the rate will necessarily be multiplied by 3, as the total assessed refers to 3 years.

It is interesting to note that this multiplication is acknowledged by the administrative authority itself in the "a contrario sensu" interpretation of the subtraction factors of those fiscal years in which remittance percentages were beyond the 12% mark, when it states, according to item 41 of Regulatory Instruction 2/69, that:

> Remittances of the 2 last years of the 3-year period shall be considered in the 2 first years of the following 3-year period pursuant to effectively remitted amounts, except when they have already been part of a 3-year period in which there was excessive remittance, and the respective tax has been paid, in which case they will be computed only on the value corresponding to 12% of the average capital of each of these years.

It is the Revenue which states that the subtraction shall be done

> in accordance with the value corresponding to 12% of the average capital of *each of these years* (our emphasis).

If one admits that each year must be considered separately and that the 3-year period must be split up in 3 separate years, the logical consequence of what is stated in the Regulatory Instruction is that one admits that 12% corresponds to one year, 24% to two, and 36% to three.

Therefore, when Art. 43 mentions 12% per year, it undoubtedly means each year of the 3-year period, that is, for the calculation of the 3-year period one could only mean the multiplication of the percentages by 3, under the risk of reducing the range applied to each rate of the tax.

If we take the example of FR Ruling 77/78 (see Appendix), we will see that the correct computation would be:

	Capital	*Ranges*	*Excess value in the range*	*Rate*	*Tax*
FRR computation:	1000	12 to 15%	30	40%	12
		15 to 25%	100	50%	50
		above 25%	230	60%	138
		TOTAL	360		200
Correct computation:	1000	36 to 45%	90	40%	36
	1000	45 to 75%	270	50%	135
	1000	–	–	–	–
		TOTAL	360		171

As one can observe, the tax assessed would be only 171 and not 200. And if one applied the formula to determine over what percentage the tax would have started in each year, one would see that:

$$171 \times 12\% = 200 \times X \text{ (or } X = 10.26\%)$$

which means that the tax would become due on remittances in excess of 10.26% of the capital per year, and not 12% per year or 36% per 3 years, as provided for in Art. 43.

Commentators unanimously agree that the 3-year computation cannot be done on a per year basis.[30]

29. On this issue, see Ruy Barbosa Nogueira's "Da interpretação e da aplição das leis tributárias" *(Revista dos Tribunais,* 1965), in which he always eliminates the intended flexibility of the regulation of the norm and lets the right of the weakest party prevail in the taxation relationship.

30. Hiromi Higuchi (note 28): "FRR 77/78, item 24, has in our opinion given an example of the computation of the supplementary tax with a wrong result. If the average capital were 1,000 and the excessive remittance 360, the supplementary income tax would be 171, 90 being computed at the 60% rate. The computation was incorrect because he did not consider the 3-year period. The 40% rate is assessed on the excess over 3% per year, therefore, in a 3-year period, such rate is computed over the amount exceeding 9% of the average capital."

Nilton Latorraca (note 28): "there is a basic mistake in this computation: it compares excess remittances of 3 years to ranges determined for annual remittances. However, as acknowledged in item 6 of the FRR, the assessment of the excess remittance is done on a yearly basis. Thus, the excess of 360 considered for the 2nd 3-year period was calculated in view of a 120 annual limit, computed on a capital of 1,000. Therefore, as is provided by the law, profits between 12% and 15% over capital and reinvestment are subject to the 40% rate, and so forth.

According to the legal system, we would then have an annual excess of 120, subject to a tax of 57:

Capital	*Ranges*	*Excess in the range*	*Rate*	*Tax*
1,000	12% to 15%	30	40%	12
	15% to 25%	90	50%	45
		120		57

Should the 120 excess correspond to the annual average, the tax would have been 57 throughout the 3 years, thus amounting to 171 (57 × 3), as computed in the FRR CST 77/78."

Alberto Xavier (note 16): "Second principle of full offsetting: Considering the 3-year character of the basis for computation, a logical corollary results in the *principle of offsetting* within the 3-year period, computation of the limits year after year not being necessary. But, on the other hand, from the unity of that basis, it follows that the principle can only be operated *within each period,* offsetting beyond the limits of the 3-year period not being possible. As the legislature assumed the 3-year period as a time measurement, it did not take into consideration the manner in which the corporate taxpayer organizes its distribution schedule within the period. It is sufficient within this 3-year period that remittances not exceed 36% of registered capital and re-investments".

Henry Tilbery, in "Aspectos Polêmicos de Imposto Suplementar de Renda"

© 1982 International Bureau of Fiscal Documentation – BULLETIN

To adopt a different, odd, and incoherent criterion, trying to base the tax payable in a 3-year period on an annual computation is to thwart the logical application of the tax law. The interpretation adopted is not logical, it is not provided for in the law and it is more burdensome to the taxpayer and thus violates the principles of strict legality, of characterization, and of the provision in law. In addition, it violates another provision of a superior law, i.e. Art. 112 of the National Taxation Code:

> Taxation law defining offenses, or attributing penalties to offenses, shall be interpreted in a manner which is favorable to the defendant whenever there is a doubt as to:
> I–the legal classification of the fact;
> II–the nature or material circumstances of the fact, or the nature or extension of its effects;
> III–the authorship, imputability or punishability;
> IV–the nature of the applicable penalty or its grading.

The official interpretation seems to lead to the result that, whenever doubt arises, the interpretation adopted should penalize the taxpayer, which is absurd and cannot be admitted even for the sake of argument in view of the clear legislative intention.[31]

We feel that the fiscal authorities are incorrectly interpreting the law and that the 3-year computation should have the corresponding ranges, as indicated in the legal text, multiplied by 3, since the law requires such multiplication when it refers to the annual basis.

The official interpretation therefore, is illegal, because it considered a minimum percentage range inferior to 12% as taxable base. FR Ruling 77/78, in the example, started the supplementary assessment starting with remittances of 10.26% per year.

If the computation of a tax would result in a tax increase lacking any legal base, such computation is illegal, because any increase of taxes is the sole competence of the law.[32]

These are the most relevant legal aspects of the issue and those which we deem of interest to the readers of the *Bulletin,* which can be summarized as follows:

(a) inclusion of the supplementary income tax levied on the previous 3-year period as the basis for computation of this tax of the following 3-year period is incorrect;
(b) the percentage defining the range of assessment of this tax, in Art. 43, shall be multiplied by 3 because the computation of the tax payable encompasses a 3-year period, and one cannot consider the adopting of an annual criterion for the computation of the excess during a 3-year period.

(Resenha Tributária, secção 1.3, ano XII, p. 71): "Moreover, the full *offsetting possibility* between "excesses" and "remainders", *within the 3-year period,* is the key to the system, a principle which is uncontestedly and universally accepted, even though different opinions do exist as to other aspects of the issue. A "ratio legis", obviously, is to give a greater flexibility to the company, for instance allowing it not to remit dividends in 2 consecutive years in order to preserve the working capital, and effecting a bigger remittance only in the third year, of up to 36%."

Dalton Maranhão, in "O sistema de cálculo do Imposto Suplementar de Renda e o PN 77/78" *(Boletim dos Estudos Jurídicos do Investimento Internacional* 2, p. 33): "In addition, such system seems to lead to distorted values when it takes the excess (159,000) above the 36% of the average capital and reinvestments in order to submit it to taxes which start above excesses of 12%."

31. As we said in the beginning, "discouraging taxation" has some characteristics in common with "punitive taxation", so that Art. 112 must always be interpreted to the benefit of the taxpayer, as Aliomar Baleeiro wrote: "Using different words, as regards the penalties, the National Taxation Code said that the restrictive character of the Criminal Code is to be observed, resorting to analogy – except for isolated opinions. Here, too, the saying "in dubio pro reo" holds true. "Benigna amplianda", although it does not acknowledge an equation of fiscal laws to the "lege odiocese" as they were called by old authors" *(Taxation Law).*

32. Art. 97, item II of the National Taxation Code.

APPENDIX

FEDERAL REVENUE RULING CST NO. 77, 4 SEPTEMBER 1978

3.10.00.00 – Income of those residing or domiciled abroad
3.10.40.00 – Supplementary income tax

Supplementary Income Tax (Art. 43 of Law 4,131, of 3 September 1962):

Assessment. Make-up of the 3-year periods. Calculation of the excess remittances. Computation of the tax.
We are here examining issues relative to the supplementary income tax, involving a great part of its system. We shall analyze the different aspects separately for a better understanding of the problem.

Specific legislation

2. The supplementary income tax was introduced in its present form in Art. 1 of Law 4,390 of 29 August 1964, which modified Art. 43 of Law 4,131, of 3 September 1962, which is the basic legislation concerning capital invested in the country. (Law 4,131/62 was regulated by Decree 55,762, of 17 February 1965.)

3. According to Art. 43, which is the legal matrix of Art. 348 of the Income Tax Regulation approved by Decree 76,186, of 2 September 1975, net profits or dividends effectively remitted to individuals or legal entities residing or domiciled abroad are subject to a supplementary income tax when the average remittances in a 3-year period exceed twelve percent (12%) of the capital and reinvestments registered at the Central Bank of Brazil.

4. The Fiscal Administration has issued supplementary norms to Art. 43 of Law 4,131/62 through Regulatory Instruction SRF 2, of 12 September 1969, with the modifications introduced by Regulatory Instruction SRF 17, of 30 April 1971.

Time aspect

5. In the case of the supplementary income tax, the tax liability is a function of two independent variables (profits and dividend remittances, and capital and reinvestments) along a period of time: 3 years.

6. Although remittances made in a period of 3 years are taken as the basis of computation, the tax is assessed whenever the twelve percent (12%) limit is exceeded at the end of the 3-year period. Therefore, starting in the second 3-year period, calculation of the excess is made on a yearly basis, hence allowing for annual tax

© 1982 International Bureau of Fiscal Documentation – BULLETIN

liabilities, not triennial, always based on the amount of remittances in the 3-year period.

7. Item 40 of Instruction no. 2/69 made it clear that, in accordance with the provisions of Art. 43 of Law 4,131/62, the 3-year period is made up of calendar years.

8. It is now worth clarifying the initial term to determine the 3-year period.

For investments prior to 1963, 1963 is the first year of the period. Later investments shall consider as the first year the year in which the application for registration of the initial investment was submitted.

Amounts computed for remittances

9. Supplementary income tax is assessed over excess remittances, therefore only those amounts effectively remitted abroad are computed, even if they correspond to proceeds earned in previous years.

10. Secondly, remittances are accounted for in their net amount, that is, the tax levied under Art. 344 of RIR/75 being deducted. However, the basis for calculation shall not exclude the amount of supplementary tax relative to the previous 3-year period, which, to facilitate collection, is deducted from the remittance itself.

11. Finally, in accordance with provisions contained in item 36 of Regulatory Instruction SRF 2/69, for the purpose of assessment of the supplementary income tax, expenses which are not deductible in the calculation of real profit of a legal entity with head office in the country are considered profits.

Amounts attributed to capital

12. In accordance with the provisions of Art. 43 of Law no. 4,131/62, amounts transferred for capital and reinvestment are those registered at the Central Bank of Brazil.

However, computation of pending amounts "ex vi" item 39 of Regulatory Instruction SRF no. 2/69 are admitted.

13. In the calculation of the average capital, capital and capitalized profits shall be computed proportionately to the time in which they remained in the company during the 3-year period (item 38 of R.I. 2/69).

14. Thus, invested amounts shall be weighed as a function of the time they were present in the company, in conformity with the following formula:

$$\text{average } K = \frac{K_0 \times t_0 + K_1 \times t_1 + K_2 \times t_2 \ldots K_n \times t_n}{T}$$

Where: K = capital (investments and reinvestments)
t = number of days the capital was present
T = number of days in the 3-year period

Verification of the occurrence of excess

15. As we have seen above, the excess subject to taxation is calculated on a yearly basis after completion of the first 3-year period, which means that the 2 last years of a period will be the 2 first years of the succeeding period.

16. We shall now examine the point on which doubts existed, that is, which amounts are to be considered as remittances in the transfer from one 3-year period to the following. The specific question concerns the possibility of offsetting remainders observed in a 3-year period (the amount under 12%) with excess remittances in the following period.

17. In accordance with item 41 of Regulatory Instruction SRF 2/69, as modified by Regulatory Instruction 17/71, remittances of the 2 last years of a 3-year period are considered in the 2 first years of the following 3-year period:
(a) for the amounts effectively remitted, and
(b) for amounts corresponding to twelve percent (12%) of the average capital of each of such years whenever they are part of a 3-year period in which there was an excess.

18. The supplementary norm did not move away from the provisions of Law 4,131/62 when it set forth the criterion for the make-up of the 3-year period, because the latter, in Art. 43, determines that the computation of any excess be made with respect to the 3-year period, therefore the amount remitted in each year is not important, the excess of a year being offsettable against the remainder of any other year of the same period.

19. But, if offsetting is allowed among the years of a given period, the same reasoning does not apply to the transfer to the following period, since the law itself established that the calculation on the excess is limited to the excess occurred within each 3-year period. Thus, as a rule, amounts transferred are those effectively transferred.

20. Except for those situations in which there was an excess in the preceding period, amounts transferred shall be those corresponding to twelve percent (12%) of the average capital of each of the last 2 years of the period and one should not compute excess remittances already subjective to tax. In this manner, one avoids assessing the supplementary tax with respect to the same fact more than once.

21. For a better understanding we give an example in which capital is considered as not having changed, in the amount of 1,000 units, for the period 1970 to 1974:

Three-year period	Years	Capital (investments and reinvestments)	Effective remittances	Permitted remittances	Excess	Remainder	Supplementary tax
	1970	1,000	0				
1.	1971	1,000	120	120	–	120	
	1972	1,000	240	120	–	–	
			360	120	120	–	
	1971	1,000	120	360	120	120	none
2.	1972	1,000	240	120	–	–	
	1973	1,000	360	120	120	–	
			720	120	240	–	there is
	1972	1,000	120	360	360		s/360
3.	1973	1,000	120	120	–	–	
	1974	1,000	100	120	–	–	
			340	120	–	20	
				360		20	none

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Computation of the tax

22. The supplementary income tax is a progressive tax. The excess remittances in a 3-year period are divided into parts to which the rates are attributed.

23. Total tax payable is a result of the aggregation of the amounts obtained through the application of the rates to each of the parts, according to the table below:

Rates	Excess remittances
40%	between 12 and 15%
50%	between 15 and 25%
60%	above 25%

24. Hence, in the example above, an excess of 360 (2nd 3-year period), which is therefore in excess of 25% of the average capital (1000), the supplementary tax shall not be that resulting from the mere application of the 60% rate on such amount, which would result in a tax of 216, but 200:

Capital	Ranges	Amount of excess in the range	Rate	Tax
1000	12 to 15%	30	40%	12
	15 to 25%	100	50%	50
	above 25%	230	60%	138
	TOTAL	360		200

25. Finally, in accordance with provisions of item 42 of Regulatory Instruction SRF 2/69, as modified by Regulatory Instruction SRF 17/71, the tax shall be assessed within 30 days of the end of the 3-year period to which it corresponds in order to be deducted in later remittances.

Conference Diary

OCTOBER 1982

Management Centre Europe: International Tax Management (including: Inter-company pricing of goods; inter-company licensing; service fees; inter-company loans; handling of disputes between tax administrations) (Seminar). Nice (France), October 11-12 (English).

Steuer-Telex-Seminar: Hidden profit distribution in practice. Munich (German Federal Republic), October 30 (German).

NOVEMBER 1982

Management Centre Europe: 11th International Finance Conference: Changes in international finance and their implications for business (including: Financial and tax incentives aimed at attracting investments). Geneva (Switzerland), November 3-5 (English).

Management Centre Europe: Leasing; techniques and analyses (including: Tax aspects of leasing). Brussels (Belgium), November 17-19 (English).

DECEMBER 1982

Management Centre Europe: Taxation of International Group Companies and Branches (including: Taxation of branches and subsidiaries; taxation of shareholders; domestic and tax treaty "anti-avoidance" measures) (Seminar). Brussels (Belgium), December 2-3 (English).

Management Centre Europe: International cash management (including: International tax aspects in cash management). London (United Kingdom), December 6-8 (English).

Management Centre Europe: Stanley B. Lubman on China (including: The joint venture income tax law; the tax on individual income; the tax on foreign enterprises; recent regulations and interpretations by central and local tax authorities). Brussels (Belgium), December 9-10 (English).

OCTOBER 1983

37th Annual Congress of I.F.A.: I. Tax avoidance/tax evasion. II. International problems in the field of turnover taxation. Venice (Italy), October 10-15 (English, French, German, Spanish).

BERMUDA:

Fiscal Structure of a Low Tax Country

by H.W.T. Pepper

An island of 21.5 square miles, 600 miles from the nearest land, Bermuda, with a population of about 54,000, has limited natural resources, but does a rather splendid job of maintaining itself without calling for aid from industrial countries. Bermuda has fine harbours and some useful types of limestone or coralline bed-rock which can be used for building and roofing material. The islands have a pleasant climate, full employment, and excellent personal relations within a mixed population of about 60% black and 40% white residents.

Tourism is the main industry, but Bermuda also functions as a highly respectable financial centre, specialising in international insurance and in financial trusts. Apart from ship and boat repairing there is a perfume factory and medical services are provided for sick persons on passing vessels who can be brought in by helicopter. There is a U.S. air and naval base and the personnel help to maintain the airport.

The Bermudan dollar is maintained on a par with the U.S. dollar - both currencies circulate freely within the country.

1982-83 Budget changes

Budget

The country's Budget has been kept in surplus for each of the past 5 years, no mean feat when world tourism has been hit by fast rising fuel costs and air fares over the past few years. Bermuda has, in fact, no doubt because of the excellence of the service provided, managed to maintain healthy levels of tourist visits.

Fiscal "shape"

It used to be conventional wisdom that a country's fiscal structure should be roughly equally divided between direct and indirect taxation. Direct taxes would not normally burden the low income groups who would usually be within the exemption limits. Indirect taxes were practical because they were easier to collect, if levied at import or factory-gate level, and automatically covered a wider tax base while the regressive effects could be mitigated by not taxing food and by applying the higher rates of tax to luxuries.

Bermuda, as a country with no taxes on corporate or personal income and none on capital gains, nevertheless does manage to come near the old guidelines, by drawing a relatively high proportion of revenue from direct taxation, including some fairly moderate levies which fall on the tourist rather than on local wage-earners.

About 45% of revenue comes from customs duties, and wharfage charges at seaports and airport could be classified along with those duties. The remainder comes from a series of levies, including payroll taxes and stamp duties and from profits made from public services such as postal and transport services, so that the fiscal structure may be reasonably regarded as well-balanced.

The fact that the Budget has been in surplus for the last 5 years and that there is no national debt is also a tribute to the island's fiscal policies which, besides being well-balanced , display a measure of ingenuity and are efficiently administered.

Exemption guarantee: income taxes

In a low tax country, newcomers may fear that at some future date income taxes may be introduced. An exempted company may, however, apply to the relevant Government ministry, for an undertaking that in the (unlikely) event that corporation tax, dividend tax etc. might at some future date be imposed, the company will remain specifically exempted therefrom up to the year 2006.

Exchange control

Virtually all exempted companies are designated by the Bermuda Foreign Exchange Control Authority as "non-resident" for exchange control purposes.

Banks and insurance companies are exempt from Exchange Control which, however, applies to residents of Bermuda who pay a 10% levy for their foreign investments.

The levy also applies to interest on overseas loans taken out to finance foreign investment, and, of course, to the repayment of those loans.

Interest rates

Maintenance of exchange control makes it possible for interest rates to be kept low. The maximum bank lending rate is 7% although up to 2% may be added as a service

© 1982 International Bureau of Fiscal Documentation – BULLETIN

charge. The maximum interest rate allowed to depositors is also 7%.

Customs duties

Although producing 45% of revenue, customs duties are not unduly heavy. Duties are levied not on c.i.f. but on an f.o.b. basis. This has a healthy effect on keeping prices of imports competitive because the weight of duty would be the same on goods originating from halfway around the world in Hongkong, South Korea, Japan, etc., and those coming from the eastern seabord of the U.S.A. The standard rate of customs duty is 22% but some luxuries, e.g. boats, television sets, motor cars, bear duty at 33% ad valorem. Food is imported duty free and there are no internal commodity or sales taxes. See also "Budget changes" below.

Wharfage fees

There are, however, minor taxes on commodities in the form of wharfage fees charged at 1% ad valorem on goods imported by sea. The revenue yield goes to the Hamilton Corporation (Local Authority). A similar 1% charge is levied upon goods imported by air, the yield from which is shared by the Corporation of St. George, and the Central Government. Under the Agreement regarding the American naval and helicopter base, the cost of maintaining the airport and runways is undertaken by the Americans.

Charges on services

There are taxes on services referred to in the notes on Hotel Occupancy Tax and the Tax on Condominiums and Time-Shared Properties. Other charges are referred to under Social Security. The fact that the Post Office and Government transport services (buses and ferries) make moderate profits amounts to a form of levy on the users which comes in on the revenue side of the Budget. Of course, it is essential that the services should show a surplus so that adequate provision may be made for replacement of equipment to maintain the services efficiently.

Hotel occupancy tax

A tax of 5% on room charges is levied and there is a parallel charge in the case of certain types of letting of apartments. (See Condominiums, Time Sharing.) The tax is not levied on the precise charge for the room occupied but on a standard value known as a "rack rate".

Condominiums and time-sharing tax – services tax

There is a 10% tax, payable to the Ministry of Home Affairs on the cost of buying a condominium. The 10% rate also applies to the cost of buying a "Time-Sharing" interest in a property.

Where the owners of a condominium or of a Time-Share of a property pay fees for maintenance and other services, or "club dues" as they are sometimes called, a 5% tax applies, similar in a way to the Hotel Occupancy Tax.

Time-Sharing schemes do offer scope for possible sharp practice by the sponsors, but in Bermuda all money collected must go into escrow and a Trust Fund must be set up to protect the interests of the investors.

Transportation taxes

Vehicle licenses are payable annually and charged within the following ranges.

Motor cars

The fee varies from $80 to $240 according to the length of the vehicle.

Commercial vehicles

The fees vary from $160 to $1200

Motor cycles and motorised bicycles

The fees vary from $8 to $40. The maximum engine capacity permitted is 100 c.c.

Other charges related to transportation are referred to under Passenger Terminal fees.

Passenger terminals

A departure tax of $5 is charged on outgoing air passengers to cover administrative expenses at the airport. There is no charge on incoming or transit passengers, nor on children under 2 years old. A fee of $10[1] is charged on outgoing passengers at maritime passenger terminals.

Employment tax

Employment tax, basically a 5% payroll tax, has a similar tax base to Hospital Levy (see below), except that fringe benefits are included. The tax also applies to the self-employed on the same basis as for the Hospital Levy.

Exemptions and abatements

Small businesses, i.e. where payroll is less than $36,000 per annum, are exempt from the tax. Where payroll does not exceed $100,000 per annum, an abatement in the form of a deduction of $1,000 per month is made.

Complete exemption is accorded to international companies, registered charities, and public bodies, as well as to certain individual entrepreneurs, e.g. farmers, taxi-drivers, and commercial fishermen.

Abated tax rate

The 5% rate is abated to 2% for hotels and restaurants and for hotels the rate is reduced to zero for the low season of tourism, viz. the 3 months of December, January, and February.

Social security

Hospital Insurance is compulsory and is administered by the Hospital Insurance Commission. The full cost of hospital treatment for children up to 16 years of age, and 80% of the cost to persons over 65 years of age is paid by the Government which imposes a Hospital Levy (see below) to produce the required funds.

Social Security can be a troublesome, open-ended commitment which can create havoc with Budgets. It has done so, for example, in Britain, Holland and the U.S.A. so that using commercial financial institutions to

1. To be increased to 20% from 1 April 1983.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

provide the bulk of medical services through contributions by the beneficiaries makes excellent fiscal sense. The system also creates a stronger feeling of self-reliance among the public. Once taxpayers are led to expect all things to be provided by Governments, the appetite for aid quickly grows, Budget imbalance increases and public morale falls, processes which the Thatcher and Reagan Governments in Britain and the U.S.A. are presently trying to reverse.

Hospital Levy

This is a levy at 3% on all employers' payrolls.

The employers may collect 1½% from their employees. Gratuities, an important source of income for hotel employees, do not enter in the calculation. Taxable fringe benefits do not include payments by the employer for employees' health insurance, pensions and life assurance.

The tax is payable also by international companies, but on a notional basis, i.e. the pay of their employees in Bermuda is estimated at $21,000 per annum for tax purposes. The employer has the right to collect 1½% of the tax from the employee but only up to the limit of his actual pay should this fall short of the notional $21,000.

Self-employed

The self-employed are also taxable, on a figure equivalent to their own earned income from their business or profession. The gross income from a business or profession will normally include substantial elements relevant to the provision of premises, equipment, etc., whereas the hospital levy is intended to relate only to what the self-employed might receive for his services if all else were provided by others.

Abated rate

(a) Government, parishes, churches and charities are liable only at the rate of 1½% of payroll. Again the tax may be deducted from the employees' pay.
(b) For other employers where the payroll is less than $36,0000 the tax rate is reduced from 3% to 2%.

Payment

Tax is payable quarterly, within 15 days of the end of March, June, September, and December. If an employer did not deduct the tax when paying his employees' remuneration he must still pay the tax in full but has no legal right to make retrospective deductions from the employees.

The tax is collected jointly with Employment Tax (see above) and both levies are entered on a single form.

Land tax

Land tax is charged on improved values of land which is developed for houses, apartments, commercial or industrial businesses or used for quarries or as storage areas. Agricultural land is exempted. The yield is intended to help pay for services relating to health, education, police and for fire and ambulance services.

Revaluations are made quinquennially and tax is charged as a percentage of annual rental value (ARV).

Exemptions

(a) Properties owned by the Crown, local government, charities, schools, and by foreign governments, e.g. Embassies, are not taxed.
(b) Persons aged 65 or more who own and occupy property with an ARV of $6,300 or less are exempted from land tax.
(c) In cases of financial hardship, abatement or exemption may be granted by the Accountant General.
(d) Property incapable of occupation, e.g. premises severely damaged, which require renovation or substantial repair may qualify for relief from tax for the period when occupation is not possible.

Basis of valuation

The ARV is based on the fair rental per annum which a reasonable owner might expect from a reasonable tenant from the property in an unfurnished condition. No form of abatement is allowed for property which is in a bad state of repair – on the other hand no extra tax is charged on property which is exceptionally well maintained.

Rent control applies to residential units with an ARV of $7,500 or less and this is taken account of for land tax purposes.

In practice property tax assessable values are about 2/3 of the gross current rentals charged.

Dates of payment

The tax is payable half yearly but if property is mortgaged to a financial institution tax is usually collected by the institution on a monthly basis along with the mortgage repayment and interest.

As a device to assist with land tax collection, a person who wishes to register a motor car must, when applying, quote the street name and house number or valuation number of his residence.

Rates of tax

Properties with ARV's from $240 to $2,220 pay tax at 3% and the rates graduate to a maximum of 20%. These graduated rates apply to residential property and *a rebate of 5%* is deducted from the gross tax computed at those rates, where payment is made promptly.

Commercial and Industrial properties are taxed at a flat rate of 6.25% of the ARV.

Transfer taxes

Transfer taxes in the form of stamp duties are payable on
(a) the sale or transfer of real estate at ½% on the first $50,000 and 1% on the excess;
(b) transfers at death are taxed by a stamp duty on the total value of the estate at a rate of 3% on the first $100,000 and 5% on the remainder; and
(c) transfers inter vivos are taxable at ¼%.

2. There is a 10% levy on the Transfer of ownership of real estate by non-Bermudians.
3. Investments overseas by Bermuda residents are taxed under Exchange Control provisions at 10%. The same levy is charged on repayments of foreign currency loans and on investments in foreign currency.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Stamp duties

Apart from the stamp duties referred to under Transfer Taxes, there are also minor duties on certain financial transactions and most legal documents.

0.2% stamp duty is charged on the nominal value of any mortgage, bond, or debenture issued by a company, and 0.25% is charged on the authorized capital (and additions thereto) of Exempted Companies (see Company Registration Fees, below).

Company registration fees

Companies in Bermuda are divided into 3 categories –

(a) *Exempted companies* are those incorporated in Bermuda, but exempted from the requirement to register the nationalities of their shareholders, and which operate *outside* Bermuda from a principal place of business *in* Bermuda.

The minimum capital for an exempted company is $12,000. In the case of an insurance company the minimum is $120,000 fully-paid-up.

An exempted company cannot acquire a mortgage on land in Bermuda nor any bonds or debentures secured on Bermuda lands. Such a company cannot carry on trade or business in Bermuda either directly or by acquiring an interest in any other concern trading in Bermuda. There are, however, no restrictions on its trading outside the country.

(b) *Local companies* are those which may trade or do business *in* Bermuda. Such companies must have at least 60% of their shares and voting rights in the hands of Bermudians.

(c) *Non-resident companies* are those incorporated outside Bermuda and which operate *outside* Bermuda from a principal place of business *in* Bermuda.

Initial registration fees

Local companies, and *exempted* companies are registered in Bermuda and are subject to initial registration fees (in the form of stamp duties) of 0.25% on authorised capital.

For *non-resident companies* the initial fees are $2,250 for –

(i) Insurance (excluding management and brokerage);
(ii) Mutual funds;
(iii) Finance business; and
(iv) Management of Unit Trust Scheme (the fee is payable for each separate scheme).

The same fee is charged as an *annual* charge (see also below), sometimes referred to as "franchise fees". A fee of $1,200 (initial and annual) applies to the following types of activity. Both levels of fee are being increased by the 1982 Budget.

(v) Insurance management and brokerage;
(vi) Other types of business.

Annual fees

Local companies. The annual fees for local companies were increased by the 1982 Budget to a range of $500 to $5,000 p.a. according to the amount of authorised capital.

The annual fees payable by companies licensed to operate under various Acts, such as the Banks Act of 1969 and the Deposit Companies Act of 1974 are also being increased by the new Budget.

Business fees are payable annually to the Registrar of Companies not only for the different types of business carried on by companies, but also for the work of professional *personnel employed in certain activities.* The following fees, which are being increased by the 1982 Budget, applied at the beginning of 1982 –

Insurance manager	$500
Insurance broker	$500
Insurance agent	$500
Insurance salesman	$ 25
Real estate agent	$100
Real estate salesman	$ 10

Betting tax

There is a 20% levy on off-course betting stake-money, and also on football pools stake-money.

International futures exchange tax

A tax, announced in the 1982-83 Budget, is to be imposed on the revenue from futures transactions, but the transactions will be exempt from stamp duties.

1982-83 Budget changes

Broadening the tax base

Some of the measures announced in the 1982-83 Budget are designed to broaden the tax base rather than raise the level of taxation on the existing base. It is intended to extend the *Employment tax* to employees of international companies, at present exempt, and also to extend the *Hospital Levy* to that section of the emoluments of hotel and restaurant employees which comes from mandatory service charges on customers. Both steps are logical ways of making the coverage of the two levies more comprehensive. A new source of revenue will be the charges on international futures transactions mentioned above.

Indexing of existing levies

A number of levies in Bermuda have remained unchanged for some years, and the present Budget is designed partly to do a little catching up, in the case of *vehicle licences* only to the modest degree of a 10% increase, from which small cars will be exempt.

In the case of *land tax,* the revaluation will bring in new values for assessment which will only have the general effect of increasing the tax level by about 15% from 1 January 1983.

Annual company etc. fees are also overdue for increases and the Budget Speech which appears in this edition outlines the general pattern of increase.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Customs duties

Duties on imported materials used in the manufacture of gases, and shades and awnings are to be exempted, and the exemption is also to be extended to spare parts for agricultural equipment and certain marine navigation equipment.

A switch to ad valorem duties on fuel oils is to be made – the timing is appropriate because the price of such fuels is at present very stable, but when prices rise the tax will rise in parallel. The new rates will be slightly higher on gasolene and diesel oil, but a 50% decrease is being made in the duty on cooking oil and smaller decreases in the duties on kerosene and fuel oil as a sort of social benefit.

BERMUDA:

Budget 1982-83

Extracts from the Budget Speech pronounced by the Honourable J.D. Gibbons, J.P., M.P., Minister of Finance, on 26 February 1982.

To summarise, Mr. Speaker, the Current Account Estimates contain provision for expenditure of $ 139.7 million and the Capital Account Estimates of $15.2 million. The latter sum provides for $ 12.3 million in respect of development projects, both continuation and new, and $ 2.9 million in respect of Capital Acquisitions. Altogether, this brings the total expenditure budget for 1982/83 to just under $ 154.9 million.

Although staff costs, the grant to the hospitals and many other items of current expenditure will be significantly higher in 1982/83, payments on the public debt will be limited to interest and service charges on temporary bank borrowing at a saving of $ 4.6 million, and capital expenditure is also predicted to be $ 0.7 million below expected outlays in 1981/82. This makes the task of balancing the budget somewhat easier than might first have been thought. Some increases in taxation are necessary but not on the scale announced on this occasion last year.

Local company annual taxes have remained unchanged since 1964 and an adjustment is long overdue. An increase which reflected the decline in the value of money over that time would result in at least a trebling of current rates. However, in recognition of the burden imposed on companies from other forms of taxation, fees will be raised to slightly more than twice their current level. Currently the annual tax ranges from $ 240 to $ 1,200 depending on the capitalisation of the company. The new rates will range from $ 500 to $ 2,500 for companies with a capitalisation of less than $ 1 million. For companies with a capitalisation of $ 1 million or more the annual tax will be $ 5,000. The increase in revenue from this source will be around $ 450,000. In addition, licence fees for banks, deposit companies and companies licensed under the 1969 Companies Act will also be increased. The annual licence fee for banks will be increased from $ 7,500 to $ 25,000. For deposit companies the licences issued to companies under the 1969 Companies Act will increase from $ 240 to $ 1,000. Licence fees for real estate agents and salesmen will also be raised. These changes will provide an additional $ 135,000.

An increase in Motor Vehicle Taxes, of about 10%, will take effect from 1 May 1982. However, in order to encourage the use of small cars, the tax on the smallest two classes of private cars will remain unchanged. The rise is expected to yield an additional $ 450,000.

Revised assessments of annual rental values will be in force by 1 January 1983. I intend to bring proposals to this House which will revise the progressive rate schedule so as to yield an additional $ 1 million in a full year, equivalent to about 15% of the current annual yield. Honourable members will wish to note that this increase only partially restores the real value of receipts from this source which have fallen by over one third during the past five years. As I stated earlier, additional revenue is required to finance Government's commitment to provide adequate mortgage money at a reasonable cost to borrowers. It seems only fair that those who have benefited from the low domestic interest rate over the years, and whose land tax bill has largely remained unaltered despite inflation, should be asked to contribute to the resolution of our housing problem.

A number of changes will be made to the Customs Tariff Act. Although their overall effect on revenue will be small, the most significant changes will be made in duties on petroleum products. As I told the House last year, I intend to replace the existing specific rates of duty on bulk fuels with ad valorem duties. The change to ad valorem will also involve a restructuring of existing rates. As a result there will be a 2c per litre increase in the price of gasolene, BELCO fuels, and oil for ships bunkers. Prices of kerosene and fuel oil will, however, fall marginally. Although these changes will, overall, provide a small net increase in revenue, most of this will be offset by a halving of the current 20% duty on cooking gas.

As has been pointed out by the Energy Conservation Committee, cooking gas has up to now been taxed relatively heavily in comparison to competing fuels, once account is taken of its higher thermal efficiency. The reduction in duty will rectify this anomaly. The above

© 1982 International Bureau of Fiscal Documentation – BULLETIN

changes will take effect with the passing of legislation to be introduced during the budget debate.

Tariff concessions will be given for some of the raw materials used in the local manufacture of gases, and of shades and awnings. The range of aids to the disabled or chronically ill eligible for exemption from duty will be brought up to date. An exemption will also be provided for parts of agricultural equipment and certain marine navigational aids. A drawback of most of the dutiable content of fine artwork sold abroad after exhibition will also be introduced. Several amendments of a technical nature will be proposed including clarification of the tariff treatment of dressmaking patterns and a recasting of the present tariff item dealing with the importation of boats.

There will be a further change in the treatment of export liquor packages. Following the decision by U.S. Customs to switch to metric allowances for their returning tourists, provision will be made for 2 litre and 4 litre packages replacing the current standard U.S. gallon package with duty rate of $ 1.00 and $ 1.50 per package respectively. The provisions for storage charges for packages at the Queen's Warehouse at the Airport will be revised to reflect the new metric sizes.

A tax on the trading revenue of the new International Financial Futures Exchange will be instituted. The tax will yield at least $ 100,000 in the first full year of the Exchange's operations due to commence in July. Revenue in later years will depend on the volume of transactions conducted on the Exchange. Transactions on the Exchange will, however, be exempted from Stamp Duty and a bill including the relevant amendment together with several other changes, including a higher level of relief on house purchase, will be introduced shortly.

Taxes associated with timesharing developments also figure prominently in the estimates for the coming fiscal year. Timesharing Occupancy Tax, which is levied on the sale or resale of a timesharing interval, is expected to bring in a further $ 2.1 million. However, receipts in future years will be on a much smaller scale. Timesharing Services Tax, which is levied on the service charge paid by owners of intervals, is expected to yield $ 25,000 in 1982/83.

As the House is aware, Departure tax for cruise ship passengers is to be raised to $ 15 for the coming season. The resulting additional revenue will be of the order of $ 585.000.

Rental charges for postal boxes which were last fixed in 1973 will be substantially increased providing an additional revenue of $ 60,000 per annum.

Preliminary discussions have been held with some representatives of international companies regarding their privileged position in respect of employment tax. It is widely recognized that their exemption from this tax is anomalous and distorts the labour markets, in some cases placing local firms at a disadvantage. Consideration will be given to proposals later in the year which will have the effect of taxing the notional payroll of international companies at an equivalent rate to that currently applied to the payrolls of local companies.

Government's plans to apply Hospital Levy to gratuities paid to hotel and restaurant workers, where these are paid out of a mandatory service charge collected by the employer, are being pursued with the Union and I am hopeful that a solution can be found.

Mr. Speaker, against a background of an assured expansion of economic activity it is relatively easy to budget for a growth in the real level or government expenditure with the confidence that revenue will be sufficient for us to pay our way. However, following a year when real GDP has probably declined, renewed growth in 1982/83 is by no means certain. We have had to trim our expectations to meet economic reality while at the same time concentrating our efforts in those areas, especially housing, where action is required. I am confident that the proposals I have set before you represent a sound financial strategy for the year ahead. However, I trust that the House has a full appreciation of the uncertain times before us and is under no illusion as to the dangers of failing to resolve our differences, particularly in the area of labour relations. Our future prosperity depends on the mutual support of all members of our community. On this cautionary note, Mr. Speaker, I respectfully submit the budget for 1982/83.

Tax Policy in Middle-Income Countries: Some Lessons of Experience*

by Vito Tanzi**

I. CHARACTERISTICS OF MIDDLE-INCOME COUNTRIES

Many studies have dealt with the tax systems of groups of countries with common characteristics (Hinrichs; Musgrave; Tanzi, 1970 and 1981; Messere); however, they have concentrated either on "poor" countries, alternatively referred to as developing or less developed, or on "developed" or "industrialized" countries, often belonging to groups such as the Organisation for Economic Co-operation and Development (OECD) and the European Economic Community (EEC), or, at times, on countries belonging to the same geographical area. To my knowledge there has been no specific analysis of countries that may no longer be properly called poor but that at the same time may not yet be considered fully developed or industrialized.

Different criteria could be followed in defining these in-between countries. One possibility would be to follow the *World Development Report* of 1980, prepared by the staff of the World Bank. That report defines middle-income countries (MICs) as those which, in 1978, had per capita gross national product ranging from US$390 (for Egypt and Ghana) to US$3,500 (for Israel). According to this criterion, 52 countries can be classified as being MICs. I feel somewhat uncomfortable with this particular definition, as it covers an income range that is much too wide and includes countries that are just too different to be in the same group. Just how broad is the *World Development Report's* definition of an MIC can be seen from the following observation. It covers a group in which the per capita income of the richest country is almost ten times that of the poorest country. By contrast, in the same report the per capita income of the richest country in the group of "low-income" countries is only about four times that of the poorest. The same relative range separates the richest from the poorest of the "industrialized" countries.

The *World Development Report* breaks the group of the MICs into three subgroups: (a) semi-industrialized, (b) mineral economies, and (c) predominantly agricultural economies. In this paper I shall concentrate on those MICs with per capita gross national product (GNP) ranging from US$1,000 to US$3,500 in 1978. This group includes the 24 countries shown in Table 1. Most of these countries are semi-industrialized. Ten of them are from the Western Hemisphere.

Before discussing the tax systems of these countries, it is perhaps useful to outline, briefly, the broad changes that take place in the economic structure of countries when they move from lower-income groups to that of the MICs as defined in this paper (see Chenery and Syrquin; Chenery 1979). On the production side, the share of primary production falls sharply while that of industry (especially manufacturing and utilities) and services rises equally sharply. As we shall see later, this change has important implications for the kind of tax structure that becomes feasible in these countries. The change is also accompanied by some increase in the ratio of imports to GNP, and by increases in exports coming mainly from the manufacturing sector. The allocation of labor also changes although much less dramatically than that of production: the proportion of labor in industry rises while that in the primary sector falls. This change brings into the open the underutilization of labor that may exist in the

countries and creates pressures on the governments to pursue employment-creation policies. Life expectancy increases significantly and comes close to that of the industrialized countries. This change has obvious implications for social security programs and for payroll taxes. These countries are also much more urbanized than lower-income countries. This factor creates more opportunities for taxation but also more demands for public services, as urban dwellers consume much more of these. Besides the changes outlined above there are three aspects that distinguish the MICs from either lower-income or higher-income countries. These three aspects have important implications for their tax systems.

First, as a group, these countries have experienced much higher rates of growth than other groups *(World Development Report, 1980)*. For the 1960-78 period, their average per capita annual growth rate was 4.0%. Eight of the 24 countries included in this group had per capita annual growth rates over that period of more than 5%. By contrast, the group of countries with per capita income of less than US$390 had an average growth rate of only 1.6; the countries with per capita income ranging from US$390 to US$1,000 experienced a rate of growth of only 2.6; and the industrialized countries had a rate of growth of 3.7. To the extent that these growth rates reflect governmental policies or objectives, there are obvious implications for their tax systems.

Second, these countries have experienced much higher rates of inflation than the other groups. For the 1970-78 period, the group's annual rate of inflation was over 30%, although this average was somewhat distorted by the extreme experiences of Chile, Argentina, and Uruguay. Most of the MICs expierenced annual rates of inflation of more than 10%. When inflation becomes such a serious problem, it can no longer be ignored by the tax authorities. Unless adjustments are made to the tax system, it will end up being distorted to such an extent that it would bear little resemblance to the system that the authorities had originally intended to have.

The third aspect relates to the distribution of income. Several studies have shown that the distribution of income follows a kind of U-shaped curve, as the proportion of national income received by the poorer sectors of the population decreases at first as the level of income rises. It then reaches the bottom of the curve and starts rising again to reach the level common to the industrialized countries (Kuznets; Ahluwalia).

> *As national income rises from the lowest observed level to that of middle-income countries, the share received by the poor [lower 60%] declines on average from 32% to 23% of the total. In a hypothetical country following this average relationship, 80% of the increase in income would go to the top 40% of recipients.* (Chenery, 1980, p. 28)

According to Chenery, the most uneven income distribution is reached at a level of per capita GNP (at 1978 prices) of around US$1,500. After that the income distribution starts improving, first slowly, then more significantly.

Table I – Basic indicators for middle-income countries

	Population (millions)	Area (Thousands of square kilometers)	GNP per capita		Average annual rate of inflation (%)		Adult Literacy rate (%)	Life expectancy at birth (years)	Average index of food production per capita (1969-71 = 100)
			U.S. dollars	Average annual growth (per cent)					
	mid-1978		1978	1960-78	1960-70	1970-78	1975	1978	1976-78

This pattern of income distribution has at least two important implications for tax policy. First, as the poorer 60% of the population receives a relatively small share of total income, tax policy could concentrate on the richer 40% without any significant effects on tax revenue. This concentration, of course, would considerably reduce administrative difficulties. Second, as income distribution becomes more uneven, the pressure on the government to introduce progressive taxation becomes stronger.

II. ECONOMIC DEVELOPMENT AND TAX STRUCTURE

1. General aspects

Although there is little interest in the subject at the present time, the relationship between economic development and changes in tax structures attracted the attention of several researchers some years ago. The theory of tax structure change during economic development hypothesized that, as countries move from earlier stages of economic development to higher stages, some clearly discernible changes would be witnessed in their tax structure.[1] First, the ratio of direct to indirect taxes would fall at first, as traditional taxes on land would be replaced by other more convenient taxes such as those on foreign trade. Second, as countries develop, foreign trade taxes would progressively be replaced by domestic indirect taxes. And, finally, income taxes would gain in importance. This theory emphasizes the *economic* influences on tax structures, influences associated mainly with the varying importance of tax bases or "tax handles" (Hinrichs; Musgrave).

To a large extent, the theory ignores social, cultural, and political influences. It also ignores technological innovations which may, at particular moments in time, introduce new taxes which, given the proper environment, may become important (Tanzi, 1973). Therefore, given the economic structure of a country, its tax system may vary substantially depending on the relative strength of these political, sociological, or cultural factors. Furthermore, even when the changes in the broad tax categories follow the pattern outlined by the theory of tax structure change, the particular characteristics of those categories may be very different. These characteristics are also very important but have received little attention.

The tax systems of some Latin American countries have been influenced by the tax systems of European Latin countries. Those of other Latin American countries have been influenced by the U.S. tax system. The tax systems of the French-speaking African countries bear a close resemblance to that of France. And the same is true for former British colonies vis-à-vis the United Kingdom. Furthermore, depending on the political coloring of the governments in power, some aspects of the tax systems may reflect greater or lesser concern for the distribution of the tax burden. Keeping in mind these cultural or political influences, one could still postulate a kind of deterministic theory of tax structure change. Such a theory would indicate the general characteristics of the tax systems that one could expect to prevail in the MICs.

To start with, the change in the structure of production gives the MICs more options than are available to poorer countries. As foreign trade still remains very important in these countries, the MICs could continue relying on foreign trade taxes. On the other hand, since domestic production outside of the primary sector, and especially in the manufacturing sector, has become much more important, the MICs have the option of replacing foreign trade taxes with domestic indirect taxes. Furthermore, as the share of gross national income received in the form of wages and salaries or in the form of corporate profits is likely to have increased, they can also rely more on income taxes. Finally, an increasing share of national wealth is represented by buildings in the urbanized areas. The value of these buildings can be assessed much more easily than that of land; therefore, the possibility of relying on property taxes has also increased considerably.

However, even though more possibilities have been created by the changes in the structure of the economy, some new considerations become important, and these may limit somewhat the degrees of freedom acquired by the MICs. For example, some of these countries may attach a lot of importance to the objective of economic growth at a time when income distribution is becoming less even. Therefore, an important consideration in the tax policy of these countries must be the balancing of the growth objective against that of income redistribution. Some countries will want to give more weight to one objective; others will give more weight to the other. These political choices should affect their tax structure.

One of the characteristics of these countries is a higher rate of inflation. As they will often find it difficult to eliminate these inflationary pressures, they will have to pay attention to the impact that inflation will have on taxes. Without an explicit recognition of the problem, some tax sources (for example those on net wealth) might disappear, while others (general sales tax) might become more important. These inflationary pressures may in time bring about an increase in the level of taxation, especially when they are caused by fiscal deficits created by strong middle classes demanding greater expenditures for public services such as education, health, and social security.

For these countries, the temptation of generating revenue through an inflation tax must be tempered against the recognition that inflation will bring about serious distortions in the economy and that these distortions will inevitably affect both the rate of growth of the economy and its international competitiveness. It must also be tempered by the recognition of the effects of the inflation tax on other sources of revenue (Tanzi, 1978).

2. Specific aspects

Let us consider now, briefly, some of the major tax categories and speculate on the differences that one could expect to find between the proper countries and the MICs.

---

1. For a brief, critical overview of this theory, see Tanzi, 1973.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

a. Export taxes

In the MICs, there should be little scope for permanent export taxes. These should be eliminated unless they are kept for very specific, non-revenue-related reasons. For example, coffee producing countries that want to stimulate the domestic production of instant coffee might keep an export duty on the export of coffee beans. Temporary export taxes might also be used to reduce the windfalls that exporters may derive from large devaluations. These uses should be infrequent and limited, and one would expect to find little revenue associated with the export taxes in the tax system.

b. Import duties

The pattern that one would expect in a country's use of import duties merits some attention. In less developed countries, import duties represent the most important taxable base. At this level, one expects that a large share of the country's revenue originates from this source. It can also be expected that, to a certain extent, these taxes will be imposed with specific rates rather than with ad valorem ones. As countries begin to develop, the protective role of import duties will gain in importance. Public opinion will generally favor protection at this stage of development. As domestic production of non-primary products rises, the revenue and the productive roles will get mixed together. By the time a country reaches middle-income status, and alternative bases have become available, the revenue role of the import duties should become less important. If they are retained, they should be mainly for their protective role. However, as these countries become more export-oriented, the inefficiencies associated with import duties will begin to be recognized by both the policy-makers and the people at large. Therefore, protection will become a lively issue.

The next step for a MIC might be to replace the highly differentiated and protection-motivated import duties with more uniform rates that would provide some uniform level of protection to all industries rather than highly differentiated protection to specific ones. This seems to be the course followed by Chile at this time. At this point, of course, import duties would be levied with ad valorem, rather than with specific rates. This general level of protection should be progressively lowered and in time should disappear. Incidentally, if this general import duty rate were levied on all imports without exemption, the country might still get substantial revenues from this source even with low rates.

The pattern described above will inevitably have negative effects on some industries. Therefore, it may come about only after strong resistance has been overcome and after countries have already developed well beyond the level where it should have taken place. Undoubtedly, some countries will prevent this change from occurring: (a) for revenue reasons (but this is not a valid argument, as revenues can be generated through other sources), or (b) to continue providing protection for industries already in place. This second reason would be strengthened when the removal or the lowering of duties would lead to some social unrest or to political difficulties for the government in power.

c. Income taxes

At low levels of development, most of the revenues from income taxes are derived from large, and often foreign, corporations. The share contributed by individuals is relatively small and is normally limited to wages and salaries paid by governments or by these large corporations. Other sources of personal income pay almost nothing. At this early stage, income taxes are often schedular. The level of personal exemptions is very high, often amounting to several times the per capita income of the country. The marginal tax rates are reached at extremely high income levels (say 100 times the per capita income), the number of taxpayers is very small, tax incentives and tax evasion are widespread, and the impact of inflation on these taxes is ignored.

By the time the middle-income level is reached, several changes can and should take place. The share of the individual's contributions to total income taxes should increase because of, for example, (a) the broadening of the tax base (especially increases in wages and salaries in national income), (b) the reduction of the level of exemptions, and (c) the improvement in tax administration.

At this level of income, the limitation of the tax incentive legislation in achieving various goals should have been recognized, and the erosion of the tax base caused by incentive legislation and by evasion should have become an issue. At this level, some issues would move to the forefront of the discussion on tax policy.

The first issue should concern the progressivity of income tax. Here, the experience of different countries indicates that *high* marginal tax rates create many problems and they contribute little to revenue. A high marginal tax rate can clearly reduce or eliminate the base on which it is levied. Therefore, a good policy is one of pursuing an income tax with rates that are progressive, but not exceedingly so, and that are levied on as broad a base as possible. This approach not only minimizes the disincentive effects of high tax rates but also reduces the problem of horizontal inequity, a problem that becomes extremely acute when the rates are high on those who cannot evade them while those who can evade them end up paying little or nothing. A consensus seems to be developing that the higher marginal tax rate should not exceed 50-60%.

The structure of the personal income tax should be related to the distribution of income. The basic exemption should be tied to a level of income that would exempt a good share of the population without exempting too much of the total income. This objective is facilitated by the uneven income distribution that characterizes most of these countries (Tanzi, 1966). The level to which the marginal tax rate becomes relevant should also be related to the income distribution. A simple rule could be to make this rate applicable at a level of income near that received by the top 1% of the population.

Another basic issue relates to the use of incentives. As already indicated, by the time countries reach the middle-income level, they should be aware of the futility of trying to promote efficiency and growth by the use of fiscal incentives. Therefore, this is a good time to start dismantling the incentive mechanism that inevitably has accumulated over past years.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

A third issue, which has not really been solved by any country, concerns the difficulty of taxing the incomes of professionals, farmers, traders, independent contractors, and so forth. Perhaps for these incomes, the true or objective income cannot be determined. Therefore, the tax authorities should give up the futile effort to determine true, actual incomes and should instead develop alternative means of taxing these incomes through presumptive or potential taxation. Some experience along these lines is available in a few countries (Uruguay, Costa Rica, Portugal, Israel, etc.). (See Tanzi, 1980.)

Another issue relates to the problem of what to do about the effects of inflation on the income tax. Should these effects be ignored, neutralized, or taken advantage of in order to increase revenue? These effects will be related either to the distortion of income tax bases (interest, profits, capital gains, etc.) or to the progressivity of the rate structure. The effects related to the progressivity are easier to deal with. In all cases, the role played by delayed collections cannot be ignored (Tanzi, 1977).

Two extreme examples of reaction are provided by Uruguay and Turkey. In Uruguay, the authorities came to the conclusion that a personal income tax could not survive an inflationary environment; therefore they abolished it. Turkey ignored the effect of the inflation on the tax liabilities of wages and salaries, so that the rate structure was not adjusted. Given the progressive nature of this tax, the fact that it is collected with hardly any delays, and given the rate of inflation that has prevailed in current years (it averaged 21.5% annually for the 1970-78 period), the share of personal income taxes in GNP increased from 4.5% in 1970 to 9.4% in 1980. As a proportion of total tax revenue, the share of personal income tax increased from 28.7% in 1970 to 51.6% in 1980.

The correction of income tax bases for inflation is very difficult and has been attempted only on a limited scale in some MICs (Brazil, Chile, Israel, Korea and Argentina). One important issue is whether the tax system should be made to recognize the difference between the legal and the economic concept of income. This distinction becomes extremely important in an inflationary environment, especially vis-à-vis interest rates, profits, and capital gains. In many of these countries, the repression of the financial market has caused real interest rates to be negative, thus leaving the government with little choice but to ignore the taxation of interest income. For profits, some countries have attempted to introduce adjustments in depreciation, inventories, and so forth; others have, from time to time, allowed a revaluation of assets (Casanegra).

Another issue that is inevitably very important for the MICs relates to the taxation of retained profits vis-à-vis dividends. Some argue that, to promote the capital market, distributed profits should be taxed at lower rates than retained profits. Others argue that the corporation remains the most efficient instrument for reinvesting profits. In my mind, this is an unsettled issue where more country-related research would be beneficial. I have become less and less convinced that favoring distribution is always an efficient policy, even for MICs.

On the part of those who favor distribution, there is an implicit assumption that the corporation that reinvests profits will do it in the same line of activity. This is not what is happening in places like Korea and other fast-developing Asian MICs. In these countries, the corporations have reinvested their profits in those lines of activities that were most profitable at a particular point in time, and these were often totally different from the traditional ones. Branching out is a common phenomenon and for a time can lead to efficient investment.

One must ask the question about what the receivers of dividends would do with them if more profits were distributed. Unless the capital market is already substantially developed (in the sense that interest rates are not kept artificially low, the stock market is not too narrow and is well regulated, etc.), these dividends may either (a) leave the country, (b) be invested in real estate, or (c) lead to additional consumption. When financial reforms have made interest rates highly positive for savers, so that the dividends can be deposited in savings institutions, if the stock market is still undeveloped, the additional dividends may not lead to more equity financing (through the sales of shares) but may lead to an increase in the debt-equity ratios of companies. This will happen because companies will finance the additional capital needs by borrowing rather than by the sale of shares. Such an alternative might be less attractive and more costly than that associated with direct equity financing through the retention of profits.

d. Taxes on domestic transactions of goods and services

As countries move from the less-developed to the middle-income state, some basic changes in the structure of these taxes should be expected. In a schematic fashion, these changes can be outlined as follows.

At the earliest stage of economic development, domestic transactions may not be taxed at all. When they begin to be taxed, it will be through excises limited to a few products (tobacco, alcohol, gasoline, sugar, cement, etc.). Services will normally be exempted, and the excises will be specific rather than ad valorem. The first change that may take place with economic development will be an expansion in the number of products taxed; the second will be some conversion from specific to ad valorem rates.

Sooner or later the need for additional tax revenue will force the countries to expand the scope of domestic indirect taxation. This will take place also to substitute for some foreign trade taxes. A few countries , following the British tradition, may meet this need through a continuous expansion of the system of selective indirect taxation. But the majority will consider the introduction of some form of general sales tax. The sales tax, once introduced, will soon increase in importance as a revenue source. At this early stage the general sales tax will, most likely, have the following characteristics:

(1) It will be levied at a low rate.
(2) It will be applied at the manufacturer's level.
(3) It will be limited to products and will, thus, exempt services.
(4) It will exempt many products for administrative or social reasons.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(5) It will also be collected on imports.
(6) In terms of revenue the share derived from imports will be overwhelming.

Because of (a) the exclusion of services, (b) the limitation to few manufactured products, (c) the exclusion of value added generated by the distribution sectors, and (d) the inevitable evasion, the share of total domestic value added subjected to this tax will inevitably be very small. Therefore, one important step to be followed by countries approaching the middle-income level will be to try to broaden this narrow base. This can be done by (a) reducing the range of exempted products, (b) starting to bring some services into the tax base, and (c) trying to capture some of the value added that originates in the distribution channels. At the same time, the rate may be increased. These changes will bring into the open some of the problems caused by cascading. Therefore, steps will generally be taken to eliminate cascading either through the introduction of the ring system or by the explicit introduction of a value-added mechanism.

By the time countries join the middle-income group, they should have either a value-added tax (VAT) or a single-stage tax without the cascading effects of a turnover tax. Furthermore, the coverage should extend beyond the manufacturer's level although probably not all the way to the retail level. The share of the revenue from the general sales tax derived from imports should have fallen to well below 50%. By this time, the excises should be reduced in number and should be levied with ad valorem rates.

At the stage of economic development reached by the MICs, some issues related to domestic indirect taxation are likely to be hotly debated. First is the question of the proper base for the general sales tax. Most countries have exempted some products (unprocessed food, services) for administrative reasons and some others (books, medicines, basic foods, newspapers, etc.), for social reasons. In some cases, exemptions were given to some activities (cottage industry) as an incentive to the producers. In most cases, the granting of an exemption to one product or producer creates pressures for the same treatment by other producers. The result is an erosion of the base. This process of erosion should become controversial at the middle-income stage of development. Attempts are likely to be made to reverse that process and to enlarge the base. But how to accomplish this is likely to be a hot issue.

A second controversial issue is whether to attempt to make the indirect taxes progressive. Some countries have chosen to have a proportional (single-rate) general sales tax accompanied by some high-rate excises on "luxury" products. Others have attempted to introduce progressivity by leaving multiple rates within the general sales tax, the rate being higher the less "essential" the product is considered to be. Some experts now recognize that high rates on luxury goods yield little revenue and contribute only marginally to the progressivity of the overall tax system (Gandhi, 1979). The main justification for these high rates is essentially political. However, this remains a highly controversial area.

A third issue relates to the taxation of services. It is recognized that taxing services is difficult administratively. However, some experts have argued that taxing of services should make the tax system more productive and more equitable especially at the middle-income stage, where the share of services in national income has increased. A recent study, however, has cast doubts on both of these contentions (Gandhi, 1977).

Table 2 provides some information on the type of general sales tax now in use in 22 MICs. The table indicates the popularity of the VAT in recent years. Nine of these countries have some form of VAT. With one exception, all these taxes were introduced during the past decade. Five of the countries (Jamaica, Trinidad and Tobago, Venezuela, Hong Kong, and Singapore) still do not have a general sales tax, and a couple still have turnover taxes. There is a large variation in the rates of these taxes.

Table 2 – General sales taxes in MICs

Country	Nature of tax	Standard rate
Malaysia	manufacturers	5
Jamaica	none	—
Korea (Rep. of)	VAT (1977)	13
Turkey	manufacturers	various
Algeria	manufacturers	25[1]
Mexico	VAT (1980)	10
Panama	VAT (1977)	5
Taiwan	turnover	2
Chile	VAT (1975)	20
South Africa	manufacturers	10
Costa Rica	VAT (1975)	8
Brazil[2]	VAT (1972)	various
Uruguay	VAT (1972)	18
Argentina[3]	VAT (1975)	16
Portugal[4]	wholesale	10
Trinidad and Tobago	none	—
Venezuela	none	—
Hong Kong	none	—
Greece[4]	manufacturers[4]	8
Singapore	none	—
Spain[4]	turnover	2
Israel	VAT (1976)	8

1. Tax-inclusive rate.
2. Brazil has two general sales taxes (one federal and one state) and a tax on services.
3. Argentina has also a provincial turnover tax with rates from 1.6 to 2.2.
4. Within the next few years Greece, Portugal, and Spain are likely to introduce a VAT.

III. SOME COMPARATIVE TAX STATISTICS FOR MICs

Table 3 provides comparative tax statistics for the MICs in our sample. These statistics must be used with caution, as it is difficult to prepare comparable tax data for different countries. The most important problem is that the information normally available relates to central governments. However, in many countries local governments may be very important; furthermore, social security institutions may be outside of the national budget. An attempt was made in the table to use data that were as comparable as possible, but there is no assurance that the attempt was totally successful.

The key question to ask is the extent to which the statistical information in the table reflects the expectations outlined in the previous section. We shall consider in turn each of the major categories:

(1) We speculated in the previous section that the foreign trade taxes should be less important in MICs than in poorer countries. Table 3 bears this out. On average, only about 17% of total tax revenue is derived from foreign trade taxes, a percentage much lower than for all developing countries. This 17%, of course, hides wide dispersions within the group. In a few countries (Jordan, Malaysia, Taiwan, and Trinidad and Tobago), these foreign trade taxes are still quite important. In others (Chile, Greece, Israel, Jamaica, Portugal, Spain, South Africa), these taxes account now for less than 10% of total revenue.

(2) As anticipated, export duties have become relatively insignificant except in Malaysia, where they still account for 18% of total revenue.

(3) Also as anticipated, income taxes have become more important than in poorer countries. On average, they now account for about one third of total tax revenue compared with about one fourth for all developing countries. But, again, the range is very wide, with a few countries getting somewhat higher percentages from this source (Israel, Mexico, Singapore, South Africa, Trinidad and Tobago, Turkey, and Venezuela). On average, the proportion of income taxes collected from individuals and that collected from enterprises is about the same, but this equality hides important differences. In some countries with important mineral and natural resources, such as Venezuela and Malaysia, the taxes on enterprises are very important. On the other hand, in countries such as Turkey, Spain, Israel, and Jamaica, the taxes on individuals are much more important.

(4) The domestic taxes on production and consumption also reflect the discussion in the previous section. These taxes have now become significantly more important than those on foreign trade and account for about one third of total tax revenue. Excises have become much less important than general sales taxes. This is again as one would have anticipated from the previous discussion. However, excise duties do remain very important in some countries, such as Argentina, Costa Rica, South Africa, Jamaica, and a few others.

(5) The table shows also that social security has become of some importance in particular MICs, especially the European ones. Greece, Portugal, Spain, and Yugoslavia derive large revenues from social security taxes. Among the non-European countries, Brazil, Costa Rica, Chile, and Uruguay derive important revenue from this source. Although the table does not provide that information, social security is also important in Argentina.

(6) Generally, taxes on property and wealth are of some importance in a few MICs. Singapore is particularly notable, as it derives more than 15% of its tax revenue from this source. The highly urbanized nature of this country must surely be the main reason for this high proportion.

IV. TOWARD MORE EFFECTIVE TAX SYSTEMS FOR MICs

The purpose of this section is to present some desirable features that the tax systems of MICs should have. Or, alternatively, to emphasize pitfalls to be avoided. More than in the previous section, the discussion will be normative; however, it will not be based on theoretical or abstract reasoning but rather on a realistic assessment, based on the practical experiences of many countries, about what is feasible from an administrative point of view and what is desirable from a real-world point of view. An alternative to this approach would be to propose some theoretically "optimal" tax system that, though perfect in the abstract, could never be implemented in practice. Unfortunately, it has been a rather frequent occurrence in the field of technical assistance for foreign experts, with little practical experience and little understanding of a country's particular administrative, legal, and political constraints, to propose reforms that, though clever in theory, could never survive the test of reality.

At the level of economic development reached by the MICs, it should be possible for their tax systems to show the following characteristics.

a. Revenues from few sources

As countries move from being less developed to being middle income, a process of concentration of tax sources should take place. Taxes that generate, say, less than 1% of total revenues should not be levied. This criterion should apply not just to tax sources but also to rates within particular tax sources. For example, each rate of the income tax schedule should generate at least that percentage. This criterion would reduce the excessive fragmentation of the tax system and would simplify the administration. It could be relaxed only when a tax has been levied specifically to discourage some activity. How low this "concentration index"[2] can be, can be seen by the experience of Argentina, where in 1975-76 the Dirección General de Impuestos was collecting almost 100 different taxes, most of these generating insignificant revenues and costing a lot to administer or to comply with. No wonder that the Argentine taxpayer felt overtaxed, even though the ratio of total taxes to GNP was not excessive for the country.

b. Tax bases as broad as possible so that the tax rates applicable to them could be kept low

One of the basic problems of the tax systems of poor countries is the extent to which tax bases are eroded, not just by evasion but often by legal exemptions of various types. In one country on which I worked recently, the tax base of what was supposed to have been a general sales tax had been reduced to less than 10% of its national income. The same has happened frequently to income taxes for which, because of exemptions, deductions, incentives, and so forth, the income that is actually taxable

2. The share of total revenue coming from, say, the two or three major tax sources could be referred to as the concentration index.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

is a very small share of the potential base. Typically, one also finds that 40 to 60% of total imports are exempted from import duties for one reason or another. This very large erosion of bases brings about the necessity either to increase the number of taxes collected or to increase sharply the rates applicable to the reduced bases. Both of these alternatives are unattractive. Therefore, MICs should set as an objective the implementation of a tax system based on a few large bases levied at relatively low rates.

c. Objectivity in definition of bases

Here, again, a basic distinction should be made between the tax systems of the poor countries and those of the MICs. In poor countries, bases such as income, imports, or property, and, in some cases, even sales, may have an objective or true measure that is often totally different from the measure on which the taxes are actually calculated. For example, for incomes other than wages and salaries, the keeping of records and the accounting may be so bad that guesses replace actual measures; the tax base in these particular cases may end up bearing little relation to the true, objective base. The same is true for import taxes where the import prices used by the customs authorities to calculate the customs duties may be very different from the prices actually paid by the importers; and, of course, the assessed property values used for determining the tax liability bear little relationship to the actual market values.

In the MICs, the difficulties of determining the true tax bases will remain but the countries will have more resources to do it. Unfortunately, in many of them the effort required to bring the taxable bases closer to the true bases has not been made. The end result is that the taxpayer is often left with a feeling of arbitrariness on the part of the tax administration, and this feeling encourages non-compliance.

d. Collection lags minimized

In many countries the time that elapses between the moment a tax event takes place and the moment when the associated tax payment must be made (the "legal lag"), can be quite long (Tanzi, 1977). When there is little inflation this delay does not matter much, but, at the level of inflation now common to most of the MICs, the existence of these long collection lags can dramatically decrease the real value of the tax revenue. In Argentina, for example, in 1975/76 an average collection lag of five to six months for the total tax system, associated with a very high rate of inflation, led to a sharp fall in the ratio of tax revenue to GNP (Tanzi, 1978). Some countries have paid attention to this problem (Argentina, Chile, Brazil, etc.), but in most these lags remain still much longer than they should or need be. Long lags not only reduce tax revenue but create inequities when they are short for some taxpayers (wage earners) and long for others (receivers of capital incomes). In such cases, the effective tax rate for wage earners will become higher than that for other incomes even though the nominal rate may be the same.

e. Severe penalties for delayed payments

One common problem in many MICs has been the accumulation of unpaid tax bills (arrears). In some countries these arrears have reached very large proportions. When the penalties are low and the rate of inflation is high (a common situation in several countries), the taxpayers are given an incentive to postpone paying their taxes beyond the time they are legally due. Borrowing against tax liabilities becomes the cheapest source of credit. These "delinquency lags" become cumulative with the "legal lags" and bring about serious distortions. The problem is that the penalties, which often are in the form of monthly interest rates, were often introduced in periods when there was no inflation so that, for example, a penalty of 1% per month was a stiff one. In today's world, when the monthly rates of inflation for several MICs (Brazil, Argentina, Israel, etc.), are much higher than that, these penalties have lost any meaning. At a minimum, these penalties should reflect the current rate of inflation and should, perhaps, become progressively heavier the longer the payment is delayed. There must be some optimal structure of penalty. This is an unexplored area in which research could make important contributions.

f. Taxes as neutral as possible

Another general aspect of the tax system relates to tax neutrality. At this stage of economic development, the MICs should pay far more attention to tax neutrality, especially since their growth is often export oriented and is thus based on comparative efficiency. The problem of neutrality, of course , becomes less serious the lower the tax rates are. In countries with high export duties on some agricultural products but not on others, taxation has prompted a reallocation of the use of land toward non-taxed crops. And, of course, the export taxes have encouraged domestic consumption while discouraging production. In countries where small cottage-type enterprises are exempted from relatively high sales tax, these enterprises may come to acquire a substantial advantage over the large, more efficient, but higly taxed companies. These examples, which could be multiplied, are common to many countries. As countries become more exposed to international competition, they should become more sensitive to the distortions brought about by inefficient taxes.

g. Public expenditure covered over longer run

If large deficits develop, taxes should be increased or expenditures should be reduced.[3] Unfortunately, as Table 4 shows, in many of these countries the deficits have been extraordinarily large in recent years, and inevitably, these deficits must have been a major cause of inflation. Equally important, recurrent or permanent expenditures should be related to "permanent" tax revenue to avoid that extraordinary tax revenues associated, for example, with temporary export booms lead to permanently higher, and thus unsustainable, expenditure.

3. If a country receives large grants, its expenditure could exceed its tax revenue. But the country should anticipate the day when the grants may no longer be forthcoming. Therefore, it should be careful to avoid expenditures that are permanent.

Taxation of Consultancy Fees in Nigeria

by A.C. Ezejelue*

I. INTRODUCTION

In the Budget Speech of 1980 the Nigerian Federal Government proposed, inter alia, the application of deduction of tax at source or withholding tax to management fees, consultancy fees and such similar fees. The rate of the withholding tax proposed was 20% of gross for residents and 25% of gross for non-residents. The effective date for the operation of the withholding tax was to be 1 April 1980. It will be operated by companies making such payments as well as by all government departments, parastatals, statutory bodies, institutions and other established organisations approved for the operation of the PAYE system that make such payments. It was also proposed that such tax withheld in respect of payments due to companies and non-resident persons should be paid over to the Federal Board of Inland Revenue while those in respect of resident individuals should be paid over to the tax authority of the State in which the beneficiary is resident.

As usual, the proposals in the 1980 Budget statement are, where appropriate, expected to be embodied in the 1980 Finance Bill with retrospective effect from 1 April 1980. However, it is not known if there has been an Act of the National Assembly on the issue of withholding tax on consultancy fees. Yet there have been many cases of some withholding tax on consultancy fees, and this has aroused some doubts among many consultants as to the legality or otherwise of the recent withholding tax on consultancy fees without any supporting legislation.

The purpose of this article, therefore, is to explore the legal and/or practical basis for the withholding tax on consultancy fees in Nigeria.

II. BASIS FOR TAXING CONSULTANCY FEES

A. Relevant legislation

Some foreign consultants have often misconstrued our tax laws. It is the understanding of some of them that profits are taxable in Nigeria only if they can be attributed to an established place of business in Nigeria. Accordingly, if there is no such established place of business in Nigeria, as in the case where services are rendered from overseas, the profits therefrom will not be liable to Nigerian tax. This is erroneous.

The relevant sections of the Nigerian Companies Income Tax Act (CITA) 1979 which make such profits taxable in Nigeria are 8(1)(a) and (f) and 11. Section 8 appears to be too wide for this purpose and should be read in conjunction with Section 11.

Specifically, Sections 8(1)(a) and (f) provide that:

> (1) Subject to the provisions of this Act, the tax shall, for each year of assessment, be payable at the specified rate upon profits of any company accruing in, derived from, brought into, or received in, Nigeria in respect of –
> (a) any trade or business for whatever period of time such trade or business may have been carried on;
> . . .
> (f) fees, dues and allowances (wherever paid) for services rendered.

And Section 11 provides that:

> (1) The profits of a Nigerian company shall be deemed to accrue in Nigeria wherever thay have arisen and whether or not they have been brought into or received in Nigeria.
> (2) The profits of a company other than a Nigerian company from any trade or business shall be deemed to be derived from Nigeria to the extent to which such profits are not attributable to any part of the operations of the company carried on outside Nigeria.

B. Implications of the key terms used in Section 8 of CITA

The meaning attributable to the key terms "accruing in", "derived from", "brought into", and "received in", used in Section 8 of CITA, are worth considering for our purpose.

While "derive" means "to obtain or receive from a source", "accrue" may mean "to come to someone or something as a gain".[1] But in *Commissioner of Taxation v. Kirk*[2], their Lordships attached no special meaning to the word "derived", which they treated "as synonymous with arising or accruing".[3] In this case in which *In re Tinda*[4] was overruled, it was held that income which was

in part derived from the extraction of ore from the soil of New South Wales Colony, and from the conversion in the latter Colony of the crude ore into a sellable product was assessable under Section 15(3) and (4) of the New South Wales Land and Income Tax Assessment Act of 1895, notwithstanding that the finished products were sold exclusively outside the Colony. However in *Toufic Karam v. Commissioner for Income Tax*[5] the learned judge said (as it would apply to Nigeria):

> The words "accruing in" and "received in" appear to me to import a clear territorial limitation to *Nigeria;* the words "derived from" appear to me to be designed to meet among other things cases where profits arise from transactions carried out in Nigeria by a non-resident taxpayer.

Under our personal income tax system, income from employment shall be deemed to be derived from Nigeria if the duties of the employment[6] are wholly or partly performed in Nigeria.[7] The emphasis is on "derived from" because derivation in this context implies "obtained" or "acquired" or "got" via working or having worked in or for Nigeria. This is to be distinguished from "brought into" or "received in" or (to some extent) "accruing in", which may not necessarily imply worked or working in or for Nigeria. These terms as they apply to companies appear, by implication, to bring into the tax net profits from transactions carried on outside Nigeria by a Nigerian company,[8] but the tax is restricted to profits actually brought or imported into Nigeria.

C. Import of Sections 8 and 11 of CITA

It can be deduced that Section 8 tends to limit tax liability in a geographical sense to profits derivable in Nigeria and to restrict tax liability in respect of transactions carried on outside Nigeria to profits actually brought into Nigeria. However, Section 11 wraps it up with a distinction between a Nigerian company and a non-Nigerian company.[9] Section 11(1) provides that the tax liability in respect of transactions carried on outside Nigeria by a Nigerian company is not restricted to profits brought into or received in Nigeria, but that the world profit of the company for any year of assessment is assessable in Nigeria. Section 11(2) stipulates that the profits of a non-Nigerian company from trade or business shall be deemed to be derived in Nigeria to the extent to which such profits are not attributable to any part of the operations of the company carried on outside Nigeria.

For our purposes, there does not seem to be much distinction between subsections (1)(a) and (1)(f) of Section 8 – i.e. between trade or business on the one hand, and fees, dues and allowances for services rendered on the other. Rendering of services also amounts to carrying on business. When a company is formed with an established objective (which may be rendering of services) and this objective is in fact carried on, then the company is carrying on business.[10]

It must be emphasized that, as in the case of trade or business, it is the profit arising from the fees, dues and allowances for services rendered that is taxable. Therefore all expenses incurred in earning the fees, dues and allowances will be deducted in arriving at the net taxable fees.

D. Legality of taxing consultancy fees

The legal basis upon which fees on consultancy executed in or for Nigeria by foreign-based consultants or by non-Nigerian companies are liable to Nigerian tax is that the fees are *derived from* Nigeria in accordance with Section 11(2) of CITA. They are deemed to be derived from Nigeria once the services are done in or for Nigeria or are paid for by Nigeria, notwithstanding that part of the services may have been carried out outside Nigeria. The existence or non-existence of a permanent establishment or fixed base in Nigeria for the company is not relevant except under an existing double taxation treaty between Nigeria and the country of residence of the company.

A similar provision exists in our personal income tax in the case of a resident abroad who is deemed to be resident, for tax purposes, in Nigeria if the person has spent in the aggregate at least 183 days in Nigeria.[11] In an article on the subject it was said, inter alia:

> The fact of the 183-day criterion is not based on the existence of an established place of residence. Provided that the person spends an aggregate of 183 days in Nigeria, the availability of a permanent abode is irrelevant. Places of temporary lodging will satisfy this particular condition of residence.[12]

In support of the above statement, the author of the article quoted Rowlatt, J. who said, among other things:

> . . . one must remember . . . that one must not look for an establishment . . . . a tramp has a "residence" . . . . if a man chooses to live at hotels instead of in his own house, or even stay with friends, it really does not affect the question of residence.[13]

It is with this same spirit that Section 11(2) of CITA is construed. But under Section 11(1) of CITA consultancy fees of a Nigerian company are deemed to *accrue in* Nigeria from wherever they may have arisen and notwithstanding that they may not have been brought into or received in Nigeria.

III. AMOUNT OF WITHHOLDING TAX ON CONSULTANCY FEES

A. Legal or practical basis for withholding 12.5%

The proposal in the 1980 Budget for the introduction of withholding tax on consultancy and other similar fees was to the effect that it would be at the rate of 20% of gross for residents and 25% of gross for non-residents. However, it would appear that in practice what is being withheld for the time being is 12.5%. This has worried the minds of many consultants as the legality of a withholding tax of 12.5% is questionable in view of the fact that the proposal in the 1980 Budget for a withholding tax on consultancy fees is not known to have been passed into law yet. As would have been expected, the proposals would, where appropriate, be embodied in the 1980 Finance Bill with retroactive effect from 1 April 1980.

For all practical purposes, it could be deduced that the idea of withholding tax on consultancy fees seems to be borrowed from the 1980 Budget proposals. However, there is no intention to operate the proposal as if it is already law – otherwise the tax withheld could have been at the rate of either 20% or 25% whichever is applicable. Instead, 12.5% is being withheld.

What then is the legal basis for withholding 12.5%? Strictly speaking, there seems to be none yet. From experience, withholding tax on consultancy fees may eventually become law with a retrospective effect. This notwithstanding, the Revenue does not consider it appropriate to deduct 20% or 25%, as the case may be, as was proposed in the Budget statement. In retrospect, 12.5% appears to be a fair compromise figure which corresponds with the earlier withholding taxes introduced by the Federal Government.[14] Therefore, the working basis of 12.5% on consultancy fees seems to have been borrowed from the withholding taxes introduced earlier.

B. Rationality of basing withholding tax on gross fees

It is clear from Sections 8(1) and 11 that the basis of assessment of income of a company accruing in, derived from, brought into, or received in Nigeria in respect of trade or business, rent, dividends, fees, dues, etc. shall be profit.[15] This is not only reasonable but it is also in accordance with the usual practice. Only profit or its equivalent should attract tax. Nobody should expect a business entity to pay tax on a loss or expense.

In the case of consultancy fee, "contract fee" is not necessarily identical with "profit" except where there are no operating expenses, or where such operating expenses were provided for before arriving at the "contract fee".

However, the 1980 Budget proposal specifically based the withholding tax on consultancy and other similar fees on gross[16] and not net. The same is true of the earlier withholding tax on rent paid by companies.

It appears, therefore, on the face of it, that there is an obvious conflict between the provisions of Sections 8 and 11 of CITA 1979 which is clear on the issue of basing assessment on profits on the one hand, and the 1980 Budget Statement, on the the other hand, which bases the tax withheld on consultancy fees on gross.

C. Withholding tax versus final tax

However, there is a distinction between a withholding tax and a final tax. Withholding tax is in this context a portion of the gross fee withheld as partial payment of tax. It represents only a working basis for determining the actual and final tax payable. Therefore, since the deduction on the gross consultancy fee is only a withholding tax, it may not be right to assume that the final tax when it is determined shall not be based on the profit.

From the nature of consultancy services, instalment payments or remittances (in the case of foreign-based companies) are usually made as the work progresses. Tax on these instalment payments or remittances based on the deemed profit margin on the contract is withheld to meet the tax liability when this is finally determined.

The income statement of the company which is supposed to show the net profit which, after necessary adjustments for tax purposes, will form the basis for the assessment of the company may not have been prepared or presented at the time of the instalment payment or remittance when the tax is withheld. Yet tax has to be withheld on some rational basis at the time of payments and remittances. The most obvious and rational base, and the one which is independently measurable and verifiable at the time the payments and remittances are effected (in the absence of an income statement), is the agreed gross contract fee, reflecting, as much as possible, the deemed profit margin on the gross fee. Any other base may be purely arbitrary and unscientific.

Unless deductions are made by way of withholding tax from payments and remittances, it may be possible that by the time the accounts are presented for the final computation of tax liability, the company may have paid and remitted away part of its tax. Governments usually find it more convenient to owe than to be owed. Therefore, the Government will prefer to refund or credit a company for any excessive tax withheld than to become the creditor of the company for any underdeduction.

Since the tax deducted is only a withholding tax, the final tax to be paid when it is computed may be lower or higher than the withholding tax. This is because the final tax will be based, not on the deemed profit margin on the gross contract fee, but on the actual profit arising from the contract executed.

IV. CONCLUSION

Taxation of consultancy fees is not an entirely new phenomenon in Nigeria. It is covered under Sections 8

14. For instance, 12.5% withholding tax on gross rents paid by companies was introduced in 1979-80 and a withholding tax of 12.5% on dividends paid to shareholders was introduced in 1978-79.
15. Profits may be defined as the return received on a business undertaking after all operating expenses have been met (ibid., American Heritage Dictionary, p. 1045). By implication, profit here is taken to mean net profit and not gross profit.
16. Gross implies exclusive of deductions for expenses; i.e. total or entire fee, unmitigated in any way.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

and 11 of the CITA 1979. The only new dimension to it is the proposal in the 1980 Budget Statement that deduction of tax at source or withholding tax is to apply to interest, rents, royalties, management and consultancy fees and such similar fees. These provisions in the Budget Statement are expected to be passed into law with retrospective effect to 1 April 1980. Hence Revenue is applying the principle of withholding tax on consultancy and such similar fees only in the spirit of the new proposal pending the passing of appropriate legislation.

Withholding tax which is based on the deemed profit on the gross fee is not to be mistaken for the final tax which should be based on the profit of the contract executed.

The former is only an interim measure, a temporary surrogate tax withheld from instalment payments and remittances of the agreed contract fee. When the final tax is determined, it will reflect the necessary adjustments for any under or over deduction of this tax at source. The idea of withholding tax on consultancy and such similar fees is a welcome development which, while safeguarding the interest of the Revenue, does not place the taxpayer at a long run disadvantage.

Confederation of British Industry supports new drive against unitary tax

The Confederation of British Industry is supporting a new drive against American tax laws which are penalising the US operations of British and European-owned multi-national companies. In a move involving the American Supreme Court, the CBI, with other European employers' organisations, is arguing that some of the tax laws enforced by a number of States, including California, Oregon, Alaska and Illinois, infringe the US constitution. The Supreme Court will shortly be asked for a decision.

The challenge which has been mounted concerns "unitary taxation", a system under which a company's tax liability is calculated not on local operations alone, but on a proportion of the world-wide profits of the entire group to which it belongs.

Mr. Bryan Rigby, Deputy Director General of the CBI said today: "Our decision to give our full backing to the statement which has been lodged with the Supreme Court by the Union des Industries de la Communauté Européenne (UNICE) – the confederation of our European sister organisations – is the latest move in the battle over unitary taxation, in which we have now been involved for five years. Our case has the support of the British Government, the European Community, and the US Federal Government."

He said: "We have always argued that unitary taxation is a particularly obnoxious levy. It means some companies will be taxed twice for the same operation. At least 50 British companies with household names – including British American Tobacco, Cadbury Schweppes, Imperial Chemical Industries, Reckitt & Coleman and Unilever – are involved, as well as dozens of French, German, Italian, Dutch and other European multinationals."

Mr. Rigby added: "Not only does it result in multiple taxation. It undermines the arrangements which have been painstakingly built up between governments over the years, specifically to avoid this injustice."

See in this respect: "Identification of the source of income – The unitary system of taxation" by James C. Redmond and the opinion of the Netherlands Federation of Employers VNO and NCW on the unitary system in 35 *Bulletin for International Fiscal Documentation* No. 3/1981 at 99 and 107 as well as "The potential dangerous effect upon international commerce of the "global" or "unitary" basis of assessment", document in which the ICC sets forth its opinion on the unitary system of taxation in 35 *Bulletin for International Fiscal Documentation* No. 4/1981 at 170.

Offshore Petroleum

Rules of the Ministry of Finance and the General Administration of Customs Concerning the Levy and Exemption of Customs Duties and Consolidated Industrial and Commercial Tax on Imports and Exports for the Chinese-Foreign Cooperative Exploitation of Offshore Petroleum *

(Approved on 28 February 1982 by the State Council, promulgated on 1 April 1982 by the General Administration of Customs and the Ministry of Finance)

In order to encourage Chinese-foreign cooperative exploitation of offshore petroleum, rules for the levy and exemption of customs duties and the consolidated industrial and commercial tax on imports and exports for offshore petroleum exploitation are hereby drawn up as follows:

Article I. The following imported goods shall be exempt from duties and the tax:
1. Machinery, equipment, spare parts and materials verified and approved for direct use in exploration.
2. Machinery, equipment, spare parts and materials verified and approved as necessary imports for direct use in development, in accordance with Article 19 to Article 21 of the "Regulations of the People's Republic of China on the Exploitation of Offshore Petroleum Resources in Cooperation with Foreign Enterprises".
3. Parts, components and materials verified and approved as necessary imports for manufacturing machinery and equipment in China for the exploitation of offshore petroleum (including prospecting, well drilling, well cementing, well logging, mud logging, oil production, work-over, etc.).
4. Machinery and other engineering equipment, temporarily imported for exploitation of petroleum and guaranteed to be re-exported by foreign contractors, shall be exempt from the duties and the tax when imported or re-exported.

Article II. Crude oil received by foreign contractors in accordance with provisions of the petroleum contracts shall be exempt from export duties when it is exported.

Article III. Customs duties and consolidated industrial and commercial tax shall be levied on imports and exports beyond the scope specified in Article I and Article II above according to The Customs Import and Export Tariff of the People's Republic of China and the Regulations of the Consolidated Industrial and Commercial Tax of the People's Republic of China (Draft).

Article IV. All goods imported free of the duties and the tax shall not be used for other purposes without Customs' approval. Breaching of these rules shall be dealt with by the Customs in accordance with "The Provisional Customs Law of the People's Republic of China".

Annex: List of Imported Goods Exempt from the Duties and the Tax for the Chinese-Foreign Cooperative Exploitation of Offshore Petroleum

I. Goods verified and approved as necessary imports for direct use in exploration:

A. For geophysical exploration:
1. Ships for geophysical exploration and accessory equipment thereof.
2. Seismographs, components and accessories thereof, gravimeters and magnetometers and accessories thereof.
3. Hydrophone streamers and accessory equipment thereof.
4. Data processing computers and accessory equipment thereof.
5. Seismic tapes.
6. On-land navigation and positioning equipment and accessory facilities thereof.

B. For well drilling:
1. Various offshore drilling installations, including jack-ups and semisubmersible drilling rigs, floating drilling ships and drilling platforms as well as tender ships, working boats and service vessels.
2. Drilling rigs, and components, accessories or fittings thereof.
3. Well cementing equipment and auxiliary equipment, including cement mixer and feeding equipment.
4. Well logging equipment and auxiliary equipment including electrical logging instrument, mud logging instrument, directional survey instrument and other logging instrument.
5. Production testing equipment, work-over equipment, and components or accessories thereof.
6. Special tools for well drilling, including drilling bits, drill collars, drill pipes, deviation control tools, fishing tools and other tools.
7. Drilling mud treating equipment and chemicals.
8. Materials used exclusively for oil wells, including tubing, casing, wellhead equipment and subsea equipment and tools.
9. Oil well cements and various additives.

C. For safety and lifesaving:
1. Various kinds of equipment, spare parts and materials for blowout prevention.
2. Various kinds of equipment and materials for fire prevention and fire fighting.
3. Various kinds of equipment, accessories and tools for lifesaving.
4. Special labor protection outfits for personnel working offshore.
5. Equipment and materials for diving operations.

D. For transportation and communications:
1. Helicopters and facilities for helipad.
2. Vessels for transportation, communications and convoy, and accessory equipment therefor.
3. Various kinds of equipment and outfits for wire and radio communication.

* Unofficial translation.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

E. For fuels and oils:
Special fuels, lubricating oils and cooling fluids necessary for offshore petroleum operations.

II. Goods verified and approved as necessary imports for development, or, oil field construction:

A. For oil production:
1. Production platforms, including oil production platforms, oil-gas processing platforms, living platforms and flare platforms.
2. Offshore oil loading facilities, including single-point mooring, single articulated leg mooring, oil storage vessels, under-water oil storages and loading berths.
3. Vessels for offshore construction operations.
4. Power generating equipment and accessories thereof, including internal-combustion engines, steam turbines, gas turbines, steam engines, generators and electric motors as well as controlling panels and related installation.
5. Injection equipment and accessories thereof, including water and gas injection as well as facilities for water and gas treatment.
6. Downhole packers and downhole blowout preventors.
7. Cranes, lifting equipment and tools.
8. Oil (gas) transportation equipment, line pipes, and valves and pipe fittings thereof, equipment for pumping and boosting stations and onshore terminal, and valves and pipe fittings thereof, including various kinds of pumps, equipment for liquid separating, heat-exchanging, purifying, and compressing, various kinds of measuring, monitoring and parameter indicating meters, and various kinds of valves and pipe fittings thereof, various kinds of electric instruments and cables.

B. For automation, remote controlling and telemetering:
1. Various kinds of installation and meters.
2. Air-conditioning equipment.

III. Parts, components and materials verrified and approved as necessary imports for manufacturing equipment and machinery in China for the exploitation of offshore petroleum.

IV. The importation of the above-mentioned goods shall be subject to the verification and approval of the Ministry of Petroleum Industry.

LATIN AMERICA

New statute for Andean multinational enterprises introduced

by Pedro Massone

The Commission of the Cartagena Agreement (Andean Group) approved Decision 169 of 1982 containing a statute for Andean Multinational Enterprises (Empresa Multinacional Andina – EMA).

EMAs are enterprises which comply with the following conditions:
(1) have their domicile in a member country;
(2) at least 80% of their capital belongs to national investors from 2 or more member countries (for 10 years the percentage is 60% for Bolivia and Ecuador);
(3) investors from the country where the principal domicile of the EMA is located hold at least 15% of the capital; the same condition is to be complied with as regards investors from at least one other member country;
(4) the majority of Andean capital is reflected in the technical, administrative, financial and commercial control of the EMA; and
(5) the EMA is organized as a corporation and its capital is represented by registered shares bearing equal rights and charges.

EMAs can be established by the creation of a new corporation or by the reorganization of an old enterprise. They are subject to the law of the country where they have their principal domicile and are additionally registered with the Junta of the Andean Group.

EMAs organized under Decision 169 shall enjoy the following benefits:
(1) the advantages of the Andean liberalization program;
(2) the same treatment applicable to national enterprises performing the same economic activities, as regards internal taxes;
(3) access to local credit and financial transactions under the same rules applicable to national enterprises performing the same economic activities;
(4) exemption from authorization requirements for investments and reinvestments to be carried out in the country where the EMA has its principal domicile. Reinvestments are subject to registration. If the investment is carried out in a member country other than that where the EMA has its principal domicile, the investment is subject to registration; moreover, authorization from the recipient country is needed in order to participate in economic sectors reserved to national investors;
(5) the right to establish branches in any member country and to transfer full net profits of those branches to the EMA's head office in foreign currency and with the authorization of the competent authority (this means that the percentage limit established in Article 37 of Decision 24 does not apply);
(6) the right to transfer abroad, in foreign currency and with the authorization of the competent authority, the entire profits of the EMA belonging to foreign or to subregional investors (this means that the percentage limit established in Article 37 of Decision 24 does not apply);
(7) avoidance of double taxation of income, under the following rules:
- dividends paid by the EMA out of profits previously taxed in the member country where the EMA has a branch shall be exempt in the country where the EMA has its principal domicile. Subsequent redistribution made by the investor enterprises (i.e. EMA shareholders) out of the same dividends shall also be exempt as aforesaid; and
- income representing redistributions made by investor enterprises (i.e. EMA shareholders) out of dividends received from EMAs which have previously been taxed shall be exempt in other member countries.

Decision 169 shall enter into force upon the deposit of the instruments of ratification by two countries.

Decision 169 does not revoke the old statute contained in Decision 46 and once Decision 169 enters into force it will be possible to organize EMAs under either of the statutes. The possibility of benefiting from both statutes simultaneously is excluded and it can be expected that the new statute will be preferred.

of the October 1982 issue

I.W. Harris:

FINANCIAL INSTITUTIONS IN HONG KONG: A REAPPRAISAL **435**

The author describes the history of the taxation over the past years including the latest proposals to abolish the withholding tax on interest from foreign currency deposits and to reduce the rate of tax on Hong Kong dollar deposits.

H.W.T. Pepper:

BERMUDA: FISCAL STRUCTURE OF A LOW TAX COUNTRY – Additional remarks – **438**

George E. Lent:

PROPERTY TAXES IN THE CARIBBEAN COMMUNITY **439**

Study of the various forms of real property taxes levied in the Caribbean Community. The author points the way to a more rational system of taxation that will improve the economic and administrative efficiency and enhance revenue.

M.A.G[a] Caballero:

TAXATION OF JOINT VENTURES IN CUBA **445**

This article summarizes the organizational framework under which corporate joint ventures and other types of business associations may benefit from privileged (tax exemption) or special tax treatment and from State guaranteed remittance and repatriation.

Eugen Jehle:

THE TAX SYSTEM OF THE PEOPLE'S REPUBLIC OF CHINA – A Short Survey – **447**

The tax system of the People's Republic of China currently represents a mixture of well established taxes and newly introduced ones which need further elaboration. A major asset is, however, that they are short and not nearly as complicated as tax laws in the Western countries.

Nizar Jetha:

THE WELFARE COST OF TAXATION: ITS MEANING AND MEASUREMENT **453**

This paper provides an introduction to the concept of the welfare cost of taxation and its measurement. It tries to translate the cost of tax-induced distortions in money terms.

AUSTRALIA: AVOIDANCE OF INCOME TAX: TRUST STRIPPING **458**

The Treasurer states that "trust stripping schemes" will not be tolerated and should the courts accept the views of the taxpayers, retroactive legislation and penalties will stop these kind of practices.

INHALTSVERZEICHNIS

I.W. Harris:

Finanzinstitute in Hong Kong – Eine Neueinschätzung der Lage 435
Der Verfasser stellt die Entwicklung der Besteuerung von Zinsen in den letzten Jahren vor. Dabei berücksichtigt er auch die jüngsten Vorschläge zur Abschaffung der Quellensteuer auf Zinsen für Einlagen in ausländischer Währung und die Senkung des Steuersatzes für Einlagen in Hong Kong – Dollars.

H.W.T. Pepper:

Bermuda: Die Fiskalstruktur eines Niedrigsteuerlandes – Ergänzende Bemerkungen 438

George E. Lent:

Grundsteuern in der karibischen Gemeinschaft 439
Übersicht über die verschiedenen Arten von Grundsteuern, wie Sie in den Staaten der karibischen Gemeinschaft erhoben werden. Der Verfasser zeigt Wege auf, wie ein rationelleres Steuersystem aussehen müsste, wie die Effizienz der Verwaltung verbessert und wie schlussendlich das Steueraufkommen vermehrt werden könnte.

M.A.Gª Caballero:

Die Besteuerung von Joint Ventures in Kuba 445
Dieser Artikel fasst die Bedingungen zusammen, die erfüllt sein müssen, wenn ein Joint Venture oder eine andere Unternehmensart von den verschiedenen Steuerprivilegien profitieren will; dabei werden auch die Bestimmungen behandelt, die den Gewinntransfer und die Kapitalrückführung betreffen.

Eugen Jehle:

Das Steuersystem der Volksrepublik China – Ein kurze Übersicht – 447
Das Steuersystem der Volksrepublik China basiert gegenwärtig auf einer Mischung von bewährten Steuerarten und kürzlich eingeführten Steuergesetzen, für die die Einzelheiten noch durch die Praxis erarbeitet werden müssen. Ein grosser Vorteil der neuen Steuergesetze ist darin zu sehen, dass sie kurz und nicht zu kompliziert gefasst sind.

Nizar Jetha:

Die volkswirtschaftlichen Kosten der Steuererhebung – ihre Bedeutung und Bemessung 453
Dieser Artikel ist eine Einführung zur Theorie der volkswirtschaftlichen Kosten der Besteuerung und deren Bemessung. Er versucht, volkswirtschaftlichen Kosten zu quantifizieren, die als Folge der durch die Steuererhebung verursachten Störungen des wirtschaftlichen Kreislaufes entstehen.

Australien: Umgehung der Einkommensteuer durch "Trust Stripping" 458
Der Schatzkanzler lässt mitteilen, dass "trust stripping schemes" nicht toleriert werden. Sollten die Gerichte die Auffassungen der Steuerzahler teilen, so werden eine rückwirkende Gesetzgebung sowie Steuerstrafen diese Praktiken zu stoppen wissen.

Financial institutions in Hong Kong: A reappraisal

By I.W. Harris*

The 1982 Budget introduced by Hong Kong's new Financial Secretary Mr. John Bremridge earlier this year, in February, contained two further major proposals concerning the taxation of interest in Hong Kong. However, before detailing these proposed amendments to the Inland Revenue Ordinance it may be worthwhile to spend some little time, for those who are not familiar with the law, on the history of the taxation of interest in general in Hong Kong and the 1978 amendment in particular.

Hong Kong's tax legislation was introduced in 1947 and was based on the schedular system whereby income from "profits", "salaries", "property" and "interest" was all separately assessed. This departure from the normal full income tax system was due in the main to the local population's traditional opposition to the powers of Governments to probe into personal wealth. A further fundamental concept of the legislation is that it is territorial in nature and thus only seeks to bring into the charge income "arising in or derived from" Hong Kong. Over the years, Hong Kong has grown considerable, not only in terms of population from approximately 1.8 million in 1947 to over 5 million at present, but also in the nature of its trade. In 1947 Hong Kong was struggling to pick up the pieces after the Second World War and to establish itself once again as a premier port in the region, but successive waves of immigration from China not only had the effect of increasing the population but also brought in new skills, particularly the textile manufacturers who had come from Shanghai. Thus Hong Kong's role as an entrepot changed over the years until by the 1960's Hong Kong had emerged as a major manufacturing and trading nation and now ranks among the top 20 in the non-oil producing world. The expansion of the manufacturing sector necessitated a parallel expansion in the financial sector to finance trade and the necessary infrastructure. This vigorous growth coupled with the Hong Kong Government's traditional policy of laissez faire – including a benign tax law as to both its scope (territorial) and rates (from a standard rate of 10% in 1947 to 15% in 1966 and the present corporate tax rate of 16½% – led to Hong Kong becoming what is now considered the third most important financial centre in the world after London and New York.

With the rise in importance of Hong Kong as a financial centre, the importance of interest tax increased with collections rising from HK$ 3M in 1951/52 to HK$ 540M in 1980/81 and thus this is perhaps an opportune moment to stress the practical effect of Hong Kong's schedular system. Although perhaps roughly modelled on the U.K. Schedules contained in the Income and Corporation Taxes Act 1970, the Hong Kong system does, however, give rise to confusion in the minds of many, even in Hong Kong. Thus there is no full income tax in Hong Kong and only in certain restricted instances is a person required to complete one tax return showing all his income from, say, a business, a salary from an employer, rent from a property and interest on a fixed deposit. Instead, each source is assessed separately and different rules apply in relation to each of the 4 schedules. Interest tax is levied at the standard rate "on the recipient of any sum paid or credited to him in that year being (a) interest arising in or derived from the Colony . . ."[1] However, although the interest tax is a tax on the lender, the tax itself is paid by the borrower, ". . . at the time he makes the payment or credit".[2] There are a number of exemptions from interest tax, the 2 most important of which for the purposes of this article are (a) interest paid by banks or public utilities at, or lower than, what is generally known as the savings bank rate and, more importantly, (b) interest paid *to* a bank carrying on business in Hong Kong. Thus banks are exempt from interest tax but, of course, are liable to Profits Tax at the rate of 16½%, which I shall discuss in more detail below. Before leaving interest tax, mention must be made as to what determines whether interest arises in or is derived from Hong Kong. After years of uncertainty the Inland Revenue Department issued guidelines in 1978[3] which laid down that the true test was where the provision of credit was made available to the borrower. The Revenue's support for this view was obtained from a number of Commonwealth tax cases including CIR v. Philips[4] and CIR v. Lever Brothers[5].

We turn now to the Profits Tax which is levied on "every person carrying on a trade, profession or business on the Colony in respect of his assessable profits arising in or derived from the Colony . . .".[6] Assessable profits are defined as "profits in respect of which a person is chargeable to tax . . .".[7] The test for what profits are subject to Hong Kong tax is based on 2 Hong Kong court decisions in the Hong Kong and Whampoa Dock[8] and International Wood Products[9] cases, giving rise to what is known

as the "operations test". In other words, this test relies on the fact that the source is determined where the majority of the actions leading to the profit actually took place, which of course is very different from the test used for interest tax purposes. It may be easier for the reader to understand the "operations test" principle by a brief discussion of the 2 cases referred to above.

The Dock case concerned a salvage operation in the South China Sea many miles from Hong Kong which was where the company was incorporated and carried on its business. Although much of the initial work, including the contract concerning the salvage operation, was carried out in Hong Kong, nothing would have been earned if the rescue tug had not gone to sea to perform the actual operation. The Court held, therefore, that the profit was earned outside of Hong Kong.

In the Wood Products case the company acted as agent in Hong Kong for 2 companies in the Philippines for the sale of timber. The company appointed sub-agents outside of Hong Kong who sent orders direct to the principals, payment being made direct in most cases. The company received commission and passed on sub-commission and the Court agreed that the "operations test" applied and that the commission did not arise from the carrying on of a business in Hong Kong but as a result of the efforts of the sub-agents of Hong Kong.

Although the tax legislation was very productive of Revenue with yields from the Earnings and Profits Tax rising from HK$ 154 million in the year ended 31 March 1961 to HK$ 778 million in the year ended 31 March 1971 and to HK$ 7,964 million in the year ended 31 March 1981[10], it became clear that there was a need to step back and look at the position in the light of the current trading and economic situation in Hong Kong. Thus in 1976 the Third Inland Revenue Ordinance Review Committee (TIROC) was formed by the Government to "consider the present system of taxation of profits and other forms of income contained in the Inland Revenue Ordinance, and in particular:

. . .

d. the treatment of interest and the relief for interest paid;
e. the territorial ambit of the various charges (having regard, inter alia, to the effects of changing commercial practices and recent case law; . . ."[11]

The Committee issued its report in December 1976 and amongst its many recommendations was one that questioned the application of the territorial source concept as it related to financial institutions. The Committee felt in respect of offshore interest, i.e. interest arising outside of Hong Kong, that, ". . . the temporary reinvestment of money which a depositor places for the time being in the hands of a financial institution is one of the central activities of the institution's business . . .".[12] Thus the Committee argued the interest actually arose in or from Hong Kong and should be assessed accordingly.

To the financial institutions in Hong Kong this proposal came as an unprecedented move. The draft legislation was published as a Bill in March 1978 the main thrust of which was to add a further deeming clause to Section 12 of the Ordinance in the following terms:

(i) sums not otherwise chargeable to tax under this Part, received by or accrued to a bank or other financial institution by way of interest which arises directly or indirectly through or from the carrying on by the Bank or other financial institution of its business in the Colony, notwithstanding that the moneys in respect of which the interest is received or accrues are made available outside the Colony."

In addition, there were definitions of "financial institution" and for the purposes of this definition "associated corporation" was also defined. for those used to the convoluted and lengthy wording of the Australian, United Kingdom or U.S.A. tax acts, the length of the new legislation was perhaps surprisingly short. However, despite Hong Kong's importance as a financial centre and a major trading nation, the Inland Revenue Ordinance still contains only 88 sections and 4 very short shedules.

There followed a series of attacks both in the Legislative Council (Parliament) and in the press with the main focus being on the legislation's discriminatory nature and the apparent abandonment of Hong Kong's territorial source concept of tax legislation and its retrospective effect. In defending the proposals in the Legislative Council, the then Financial secretary, Sir Philip Haddon-Cave, said on 12 April 1978 that, "when a bank or a financial institution obtains funds, whether locally or abroad, through its operations in Hong Kong and places the funds abroad to earn interest, the profits from such interest will be taxed irrespective of the provision of credit test. To determine whether interest on a loan arises, directly or indirectly, through or from the carrying on of business in Hong Kong will require an examination of the totality of the circumstances relating to where and how the deposits are garnered and the funds on-lent. In most cases, the determination will be relatively straightforward, but in the case of some lare foreign currency loans problems may arise". He went on to say that there were a number of misconceptions in that, "it has been suggested that tax will be charged even where the role of the Hong Kong end of the business is negligible (for example, where it does little more than make certain book entries, commonly known as "book" or "garaging"). In these circumstances, the interest clearly could not be said to have arisen in Hong Kong". The Financial Secretary said that another misconception was that, "it has been suggested that the Bill fails to reflect the recommendation of the Review Committee in that, as drafted, it has the effect of bringing to charge a wider range of profits than was envisaged by the Review Committee and that the Bill should only seek to bring to charge profits derived "without the substantial intervention of a branch elsewhere". This is an expression used by the Review Committee to describe profits which it considers should be taxed, but, "if it is shown, on the facts of a particular case, that the profits from interest arise partly from the business in Hong Kong and partly from the substantial intervention of an overseas branch, a reasonable apportionment of the profits will have to be made". As regards the territorial source concept, Sir Philip said it

was not true that a change had been made from a source to a residence basis and said that, "where a business is carried on in Hong Kong and the profits of that business arise in Hong Kong, such profits clearly have a territorial connection with Hong Kong. However, because case law has established that artificial provision of credit test, some profits from interest have been escaping the charge to tax. The Bill does no more than correct this situation, but is does so by reference to business activities carried on here, and *not* by any arbitrary test related to residence".

On 16 August 1978 when the debate on the Bill was resumed, the Financial Secretary once again defended the Bill against its critics but he did however concede some points to the opposition, including:

(a) an amendment to the definition of "financial institutions"; and
(b) the delection of the words "directly or indirectly" from the main body of the amendments and thus the final version read as follows:
"(i) sums, not otherwise chargeable to tax under this Part, received by or accrued to a financial institution by way of interest which arises through or from the carrying on by the financial institution of its business in the Colony, notwithstanding that the moneys in respect of which the interest is received or accrues are made avaible outside the colony".

For most financial institutions the legislation was retrospective as it became effective as from 1 April 1978 in as much as the majority of them had financial years ending on 31 December or 31 March and thus had already earned profits prior to the passing of the amendment. The attention of the financial community then turned to the Inland Revenue Department in an attempt to obtain some comfort that the soothing statements of the Financial Secretary would be translated into practice by the Revenue despite the somewhat tougher stance reflected in the actual wording of the law. The Revenue did issue a Practice Note which, however, did little to clarify the position and did little else other than asking that the full facts should be disclosed in all cases. This attitude failed to mollify the critics or allay their fears although some commentators including the writer considered that the Revenue would take a reasonable attitude.

And so it turned out to be. Certainly the suggestion made in some quarters that the introduction of the legislation would mean a mass exodus of financial institutions to other centres did not take place. In fact, when the then current moratorium on bank licences was lifted in May 1981, a new surge of international banks arrived on the local scene. The first returns under the new legislation were not submitted until the middle of 1979, and not unnaturally it was some time before any pattern emerged from the Revenue. The Revenue's initial efforts appeared to be merely detailed requests for more information which some tax advisers considered unreasonable and unnecessary, but it was perhaps inevitable that the Revenue were almost as unsure as to how to interpret the new law as the tax advisers. In mid-1981, a change of personnel in the Revenue Department marked, some considered, a change of emphasis although it is probably fairer to say that the fact gathering stage had been completed an the Revenue were now able to issue assessments based on the new law. By the end of 1981, final assessments were being issued and initial indications were that the Revenue were indeed taking a reasonable attitude. One perhaps surprising development was, however, that the question of any apportionment had rarely been considered and what the Revenue was saying in effect was that either the interest was wholly from Hong Kong or wholly from outside, each case being decided on the weight of the facts. This at least avoided taxation problems and was generally welcomed by the financial institutions. In certain circumstances, however, where the Revenue considered that interest arose in Hong Kong, they were prepared to accept an apportionment where there had been a substantial intervention by a branch. A further concession readily accepted by the Revenue was that although the Financial Secretary had referred to the substantial intervention of a "branch", this was extended to include a company. Although most banks operating in Hong Kong operate through a branch, most deposit taking companies operate through a branch, most deposit taking companies operate through a subsidiary.

In the meantime, however, a further piece of legislation was enacted to counter an avoidance device that had been exploited by certain financial institutions. As can be seen from the wording of Section 15(1)(i) quoted above, only so-called offshore interest had been brought into the net. What a number of financial institutions had been tempted to do was to convert interest into discount by offering Certificates of Deposit and other similar instruments generally in U.S. dollars which, provided they were redeemed prior to maturity, did not give rise to any interest payment. Therefore they claimed that the profit was exempt from profits tax. In the writer's opinion, however, some of the schemes offered could have been caught by the existing legislation but nevertheless the Revenue, not unsurprisingly, moved to counteract such blatant avoidance devices and a Bill was introduced into the Legislative Council as a result of the 1980 budget speech. The effect to the proposed amendment was to bring in yet another deeming provision in Section 15(1)(j) which sought to close the 2 loopholes in the previous law:

(a) the disposal by individuals and corporations of Certificates of Deposits prior to maturity whereby the profit received is not interest but a profit on sale of a security which is not taxable unless of course the taxpayer was a dealer in securities;
(b) the purchase of bills of exchange and other similar instruments at a discount and the redemption thereof at face value which, again, if held by persons who were not dealers in securities would not be subject to tax.

It should be noted that there was no mention of the currency of the "instrument" in the law and therefore, although clearly Hong Kong dollar denominated Certificates of Deposits and Bills of Exchange came within the net, those denominated in foreign currency would only be brought in if the provision of credit test showed that the deemed interest had a Hong Kong source. The Bill became law on 28 May 1981 and was operative with effect from 1 April 1981.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

We now come to the 1982 amendments. Despite the number of international banks operating in Hong Kong, many bankers considered that Hong Kong's claim to be a major financial centre still had one major drawback: the interest withholding tax. This was despite the fact that it was relatively simple to avoid Hong Kong withholding tax by ensuring that the provision of credit was made abroad. This enabled Hong Kong depositors to place funds with offshore branches of local banks without incurring any interest tax liability and enabled Hong Kong businesses to borrow funds without the need to withhold tax. The Hong Kong Association of Banks made a submission to the new Financial Secretary, Mr. John Bremridge, and he was persuaded to abolish the withholding tax on foreign currency deposits. This meant that Hong Kong banks were able to accept foreign currency deposits. Under the previous system such deposits would have been booked in offshore banks such as Singapore, Bahrain, Jersey or Nassau. This may have been good news for depositors, but for Hong Kong based banks it meant that the profits earned on such deposits now came within the Hong Kong profits tax net. As a follow-up measure to the abolition of interest tax on foreign currency deposits, the Financial Secretary reduced the standard rate on Hong Kong dollar deposits from 15% to 10%. He said in so doing that unless such a measure was taken it would provide an encouragement for all Hong Kong depositors to switch from Hong Kong dollars to foreign currency with the resultant effect in exchange rates. He considered a 10% rate sufficient to retain Hong Kong deposits without incurring exchange risks.

So this is the position in the middle of 1982 – much has changed in the past 4 years, but it is probably fair to say that on the whole it has been for the good of Hong Kong although individual bankers facing increased tax assessments can hardly be expected to accept this position. The final story on Section 15(1)(i) has still to be written, but at least it can be said that the worst fears of bankers have not materialised, but it will not be until one or more cases come to the Courts, as undoubtedly they will, that the final chapter will be written.

BERMUDA:

Fiscal Structure of a Low Tax Country

By H.W.T. Pepper

The article under this title in the August/September 1982 issue described the Fiscal system in Bermuda. The author wishes to give further elucidation and updating.

Condominiums and time-sharing tax – service tax (P. 406, left column, last para). While Time-Sharing has given scope for sharp practice in some countries, in Bermuda all payments must *initially* go into escrow and then a Trust Fund is set up to protect the interests of investors.

Transportation Taxes (P. 406). The 1982/83 Budget increased the license fees for Motor cars, Commercial Vehicles, and motor cycles and motorised bicycles, respectively from $ 80 to $ 265, $ 175 to $ 1320, and $ 9 to $ 45.

Land Tax (P. 407). The second sentence of the second paragraph dealing with the *Basis of Valuation* should read "Rent control applies to residential units with an ARV of $ 7,500 or less but the land tax payable is taken into account in fixing the controlled rent". The second sentence under the heading *Dates of Payment* should read, "A person who wishes to register a motor car must, when applying, quote the street name and house number or valuation number of his residence. This requirement helps to enforce the rule that there may be only one motor-car per household". The first sentence under *Rates of Tax* should read "Properties with ARV's up to $ 2220 pay tax at 3% and the rates graduate to a maximum of 20%.

The *Transfer tax* (p. 407 last paragraph) of 10% on non-Bermudians referred to under sub-paragraph 2 is regarded as a licence fee.

Stamp Duties (P. 408 first entry) the rate of 0.25% applies to all items mentioned in the second paragraph.

Property Taxes in the Caribbean Community

by George E. Lent

Caribbean states that now compise the Caribbean Community (CARICOM)[1] provide an interesting study in the diversity of annual taxes on real property. A number of significant features emerge in this comparative study:

(1) All but a few of the states continue to levy rates based on the annual value system implanted by the British.

(2) Several governments have extended what is traditionally a tax on urban buildings to cover agricultural and urban land as well.

(3) Extensive cadastral surveys have been undertaken in many of the islands, some strictly for legal registry of land, others expressly for land tax purposes.

(4) Because of generally low rates, undervaluation and tax relief, property taxes have failed to realize their revenue potential.

(5) In no state does the annual tax on real estate make an important contribution to government revenue.

It is hoped that this survey will point the way to a more rational system of property taxes in this part of the world that will improve their economic and administrative efficiency and enhance revenue.

1. DIVERSITY OF THE TAX BASE

The British rating system, based on the annual rental value of buildings, provided a simple model for transplanting to the West Indian colonies. Similar systems, sometimes called a land or house tax, continue to be in effect in all but a few of these countries and territories. Barbados, Grenada, and Jamaica have replaced rental value and other rates by taxes based on the market value of land or of land and improvements;

Trinidad and Tobago had planned as early as 1962 to replace the annual value system with a modified site value tax but finally, in 1973, decided to retain annual value rating.

Jamaica was the first to rationalize its property tax system when in 1901 it replaced its quit rent based on acreage, a house tax based on annual rental value, and a graduated holdings tax with a tax based on the market value of land and improvements (capital value).[2] Tax was assessed on the value of property declared by landowners (so-called ingivings), which was updated in 1911, 1929 and 1937. By 1943 the chaotic state of the self-assessed property tax led to the appointment of a Commission of Inquiry under the chairmanship of Simon Bloomberg. The Commission recommended replacement of the capital value tax by a tax based on unimproved land value, also to be self-assessed. Work on the project was initiated in 1949 and revived in 1951 but was finally suspended because of the lack of maps and other resources. The unimproved land value principle was challenged in 1954 by the British economists Ursula F. and John R. Hicks who, in a broader study of Jamaica's finances, recommended revitalization of the capital value approach.[3] The issue finally was resolved in favor of unimproved land value when in 1956 a United Nations adviser, J.F.N. Murray, strongly supported it.[4] This concept was incorporated in Jamaica's Land Valuation Act which became effective in January 1957. The first 7 parishes were brought under the new law between 1959 and 1965, but with a change in government in 1962 work on the cadastral survey was suspended and was not resumed until 1972. The important urban parishes of Kingston and St. Andrew were then assessed and the old system finally phased out in 1974. During this period of 15 years, the new and old rating systems existed side by side.

Barbados had long imposed a tax based on annual ratable values when in 1969, following the recommendation of a United Nations report in 1963, it enacted a Land Valuation Act preparatory to introducing a tax based on unimproved land value. After completion of a cadastral survey in early 1973 and enactment of the Land Tax Act, rates under the new law were levied for the fiscal year 1972/73. In 1975, however, the site value system was modified to include tax on improvements with a value in excess of BDS$10,000 (1 BDS$ = U.S.$0.50).

As was indicated above, Trinidad and Tobago introduced a project to replace its annual value system with a modified site value tax.[5] The Valuation Land Act was approved in 1969 and the cadastral survey of the entire country was completed early in 1973. Despite plans to introduce property tax legislation in 1973 that would include a levy on land and the value of improvements exceeding a specified ratio to the site value, vigorous protests in the capital against earlier increases in the house tax deterred action. Sharp increases in the price of oil, produced domestically, then made higher taxes unnecessary, so that Trinidad and Tobago has never replaced its house tax based on annual rental values.

In 1965 Montserrat initiated a series of property tax reforms with replacement of its acreage tax by an annual value system at a rate of 5%.[6] This was revised in 1967 by adoption of a modified site value tax, but the form of annual value rating was retained by converting the market value of land to annual values, first at 15% and later (1974) at 20%. Buildings were taxed only when 5 or 6%

of the value of land and buildings exceeded 20% of the land value; the tax therefore fell most heavily on land. In 1974 graduated rates were introduced at 5% of the first $500 and 10% above that. By 1980 Montserrat considered abandoning its formal annual value structure in favor of modified site value tax which was believed to be more attractive from a rate point of view.

Grenada, in January 1982, was the latest of the Lesser Antilles to reform its annual value rating system. In March 1982 the Government announced a new rate structure based on the market value of land and improvements that were appraised by Government assessors the previous year.[7]

2. ROLE OF THE CADASTRE

Despite long established property taxes, in none of the 3 countries – Barbados, Jamaica, or Trinidad and Tobago – was there a complete official record of land holdings that would make it possible to identify their location, dimensions, and ownership. Indeed, there were no maps of the country that could be used to prepare a cadastre for tax purposes except in Trinidad and Tobago where local ward maps proved useful. Without extensive field work there would be no basis for determining the value of land parcels equitably, ensuring that all properties were covered, and identifying the persons liable for tax. The preparation of a cadastre was therefore indispensable to the administration and control of a national property tax.

It had long been believed that a cadastre of registered titles to land was essential for this purpose; in fact, proposals to introduce a general property tax in Jamaica before the turn of the century were frustrated by the great cost and time required for such a survey. Sir David Barbour, in his report, *Finances of Jamaica* (1899), stated:

> Until a cadastral survey of the Island has been made the assessment of the annual value of all land must be attended with much difficulty . . . . Such a survey was proposed, and strongly supported, in former years, but was ultimately dropped on the ground, apparently, of the cost involved in carrying it out.[8]

In embarking on the land tax projects in these 3 countries it was decided that a detailed cadastre that demarked boundaries and authenticated title was not essential for the proposed levy and would take undue time and cost to carry out. Something less definitive would serve the purpose; this is called a fiscal as distinguished from a legal cadastre.

The major stages in the process of preparing a fiscal cadastre include (1) mapping and editing, (2) referencing, and (3) market analysis and valuation.[9] Working from aerial photographs in Barbados and Jamaica, survey teams prepared valuation index maps (248 in Jamaica); on these maps were plotted the properties for which survey plans were available; missing areas were then filled in by surveys in the field. These maps served as the basis for the numerical referencing of all land parcels, each parcel being identified by map number, grid number, block number, and parcel number. The identification of ownership (or occupancy) and valuation of land was coordinated with the mapping. The Commissioner of Valuation was authorized to place on the roll as the taxpayer the person who on the best evidence available he believed to be the owner.

One of the advantages claimed for unimproved land value taxation is that mass valuation of properties is facilitated. Analysis of sales and other valuation data makes it possible to establish unit values which can be used to value parcels in different areas; weights can be assigned to different locational and physical characteristics of the land by multiple correlation techniques. Computer analysis of these factors in Trinidad and Tobago was based on a sample of 10,000 parcels; about 4,500 parcels were analyzed in Barbados.

Although the United Nations provided substantial support to these projects by underwriting the cost of administrative experts and equipment, the major cost was incurred by the countries themselves in the establishment of land valuation departments. Barbados had a staff of 42 persons, Trinidad and Tobago about 100 technicians and experts; the earlier (1952-62) staff of Jamaica totaled about 80 persons, and the later one (1972-74) about 150 persons.

Once a valuation staff was organized and trained and maps made available, the field work was completed fairly expeditiously. About 48,600 parcels in Barbados were identified, mapped, and valued over a period of about 2 years; in Jamaica 171,240 parcels were completed in 7 parishes over the 4-year period beginning in June 1957; and in Trinidad and Tobago about 160,000 parcels were valued within a period of about 2 years, 1971-73. It is noteworthy that all of these surveys turned up thousands of properties that were not previously on the tax roll. For example, Jamaica's earlier cadastre for 7 parishes included 23,800 parcels not taxed before – about 11.5% of the total. On the other hand, it was not possible to establish the ownership of land for many parcels, almost 10%, in Barbados.

Some indication of the quality of the undertaking is given by the record of objections to the assessed values. Over the entire project in Jamaica, owners of about 9% of the parcels filed objections; the ratio ran as high as 15% in the metropolitan area. This high ratio can be attributed in part to the substantial tax increase involved in most cases in the shift to the new site value tax as against previously self-assessed taxes.[10] This ratio contrasts with an objection rate of less than 3% in Barbados despite an average doubling of the tax on property. The experience of Trinidad and Tobago is moot because its proposed modified land value tax was never introduced.

In contrast to the fiscal cadastres completed in Barbados, Jamaica, and Trinidad and Tobago, legal cadastres have

been installed in several smaller islands of the eastern Caribbean with the technical assistance of the Directorate of Surveys of the British Overseas Ministry. These cadastres provide for registration of titles to land, hitherto incomplete, rather than as a basis for taxation. Additional steps therefore needed to be taken for the demarcation of boundaries and authentication of ownership before a certificate of title could be granted. The islands in which work was completed and the time period involved are the following: Turks and Caicos, 1968-72; British Virgin Islands, 1972-74; Cayman Islands, 1972-77; Anguilla, 1974-76; Antigua, 1975-80; and Montserrat, 1978-81.[11] The United Nations has drafted plans for a cadastral survey and land registration project for the Commonwealth of Dominica, but no action has been taken.

3. TAX RATES AND YIELDS

In one of the countries of the CARICOM do property taxes play an important revenue role. Jamaica's land taxes account for less than 4% of total tax revenue (3.6% in 1976/77); Barbados' modified land taxes contributed 3% of total tax revenue in 1980/81; Guyana's property tax amounted to 1% of tax revenue in 1978/79, and Trinidad and Tobago's to a miniscule one quarter of 1% in 1978/79. Of the smaller islands that comprise the Eastern Caribbean common market subregion, only Montserrat's system yielded as much as 5% of total revenue (Montserrat's population is about 12,000); in none of the others did property tax revenue exceed 1% of total revenue over the period 1975-1980.[12]

Realizing the revenue potential of a property tax is inhibited by the sensitive nature of a levy based on administrative assessment. Unlike an income tax or sales tax the payment of which generally reflects some measure of current taxpaying ability, a tax based on gross wealth is not well correlated with current income or liquid assets necessary to meet the payment. This fact places a certain political constraint both on tax rates and the tax base either through underassessment or special relief. It is also true, as in Trinidad and Tobago, that the availability of more important revenue sources relieves pressure on property taxes and they become neglected.

a. Tax rates

The negligible revenue of most of these countries with annual value taxes can be explained by the nominal rates of ½% to 1% that are in effect. Even rates of 7% to 9% that have been levied in Trinidad and Tobago have been unproductive by comparison with countries basing their tax on the value of land or land and improvements. Since capital value is some multiple of annual value, or yield, a multiple of, say, 5 would make an annual value rate of 1% equivalent to only 0.2% of capital value. Such a low capital value rate is rarely found. Montserrat beginning in 1967 calculated the annual value of land at 15% of its market value, and beginning in 1974 at 20%; its 5-10% annual value rate therefore was equivalent to 1-2% of land value – a level of rates found in Barbados. This rate barrier of 5-10% apparently was the main reason why Montserrat intended to replace its annual value rates with a capital value tax structure, thereby permitting a lower apparent rate.

The rate structures of Barbados, Grenada, and Jamaica are graduated with the value of individual properties. Jamaica's basic rate structure starts at a flat J$5 on the first J$2000 of land value; it then increases from 1% on land values between J$2000 and J$6000 to 4.5% on values over J$50,000. (The Jamaican dollar is equivalent to about U.S.$0.56.) These rates are subject to surtaxes which, commencing in 1976/77, ranged from 10% of tax on values between J$12,000 and J$13,000 to 50% of tax on values over J$50,000. Such rates may appear to be relatively high, but in 1975 about 80% of property owners paid only the nominal charge of J$5 and only about 6% (3050) paid the top marginal rate of 4.5% on property assessed to over J$50,000.[13] Moreover, the tax is applied to unimproved land value and would be equivalent to a much lower rate on capital value (including improvements). If, for example, a house were valued at twice the value of the site, the tax rate yielding the same revenue would be one third of that on the land alone, that is, a top marginal rate of 1.5% (plus surtax), rather than 4.5% (plus surtax).

Grenada's rates range from nil on residential property valued under EC$15,000 to a maximum of 0.5% on property valued at EC$200,000 and over. (The Eastern Caribbean dollar is equal to U.S.$.37.) Commercial property is subject to a 0.8% rate, and property used primarily for agriculture, only 0.1%. These rates are surprisingly low for a tax on land and improvements, especially for a leftist government.

Barbados' land tax was introduced in 1972 at a uniform rate of 1%. In 1975 a new concept, "improved site value", was established and differential rates were introduced. Improved site value is the value of all improved properties in excess of BDS$10,000; all improved land with a value under BDS$10,000 was taxed at a site value rate of 1%, while improved land with a value over BDS$10,000 was taxed at only 0.25%. In 1978 the corresponding rates were increased by 0.25 percentage points to 1.25% and 0.5%. In 1979 a graduated rate system was introduced as follows (the BDS$10,000 exclusion for improved land still applies):

Value in BDS$	*Site Value (%)*	*Improved site value*
under 50,000	1.25	–
under 50,000	2.00	–
under 250,000	–	0.5
over 250,000	–	1.0

The lower rate for improved site value has created many anomalies as land was developed. If, for example, plantation land with a site value of BDS$250,000 were improved by a house worth BDS$50,000, property taxes would be reduced by 62% – from BDS$4625 to BDS$1750. Because of various reliefs, tax exempt prop-

erty, and much property with unidentified owners, the average effective rate in 1981 was only about 0.6%.[14]

b. The tax base

If current market value of property or annual rental value in its highest and best use is accepted as a standard for assessment, the tax base in all these countries falls short of yielding the potential tax revenue at the rates described above. Such deficiencies arise from a bias inherent in the assessment process to undervalue property, the lag in assesment behind changes in property values owing to the assessment cycle, especially in an inflationary period, and the provision of categorical relief for agriculture, resort facilities, certain residential properties, and hardship cases.

In the absence of empirical studies it is not possible to determine the accuracy of asessments in reflecting market value. Inferences may, however, be drawn from the frequency of appeals. While these ran rather high in Jamaica's original reassessment program, especially in the urban areas, Barbados experienced fairly low ratios both in its initial land assessment and in the later valuation of improvements. Because of Barbados' lack of an experienced valuation staff and the haste with which the exercise was completed in 1975, an undervaluation bias would be indicated by the fact that only 884 objections were raised by 13,417 property owners.[15] Barbados has since introduced an intensive training program to improve its valuation techniques.

The length of the assessment cycle is an important factor in underassessment, especially in a developing economy. (The reverse may be true in a depressed economy, such as Jamaica and other countries of the area have experienced.) Some indication of the lag of assessed values behind real values is revealed by the experience of Barbados, which is on a fairly short cycle of 3 years. The following data show the aggregate assessed values since introduction of the new site value tax in 1972:

Revaluation year	*Number of parcels*	*Assessed values (millions of BDS$)*
1972	50,160	637.5
1975	54,389	1402.8
1978	62,117	1507.2
1981	66,515	2540.6

The sharp jump in 1975 can be attributed largely to the inclusion of improvements in the base. Despite a 14% increase in the number of land parcels by 1978, indicating substantial development, the assessment roll increased by less than 7%. Between 1978 and 1981, however, a period of inflation and expansion, assessed values increased by almost 70%. This implies substantial interim undervaluation that is characteristic of property taxation generally.

All of the countries, even those with nominal annual value rates, provide for property tax relief, whether in hardship cases or for certain categories of property owners.

Serious gaps between tax assessed on market value of property and ability to pay are not uncommon. This is especially true of agricultural land located in developing suburban areas. Various techniques have been devised to alleviate this problem, the most common being so-called value in use, that is, value based on estimated yield of the crops. Barbados provides relief for owners of agricultural land if valuation takes into account its potential for subdivision or other commercial use; application is made to a Land Taxation Relief Board and if relief is granted it is valid until the next assessment. Jamaica in effect derates the value of all land that is in agricultural production by an arbitrary 75%. (Hotels are derated by 25%.)

Relief is also generally granted to residential property owners who can show hardship. This is a common situation in the Caribbean Community when land originally acquired by liberated slaves in the early 19th century and now owned by their descendants has sharply risen in value because of its favorable location in developing areas. When the owner of such land does not have an income that reflects its assessed value, he may apply for relief under special provisions of the tax law in most of these countries. In Barbados, for example, the owner of a single family dwelling need not show hardship if the assessment reflects its site value for a hotel, commercial or industrial location, residential apartment, or subdivision.

4. COST OF ADMINISTRATION

It is generally recognized that an effective system of property taxes may entail greater comparative costs of administration than other sources of revenue, especially sales and income taxes. This is due largely to the cost of maintaining a valuation department, but also to the cost of enforcing payments of tax by the great majority of property owners in developing countries with only nominal tax liabilities. Because the valuation department is also charged with other duties, and the collection department's budget sometimes covers other functions as well, it is not easy to derive a pure cost estimate. Data for Barbados in 1981/82 show a gross cost ratio of 13.5%, but arbitrary allocation of costs of both the collection and valuation departments indicate a cost ratio nearer 10-11%.[16]

It should be noted that these data relate to a property tax that includes improvements as well as land, has a modest rate structure, and provides considerable relief. A tax based on site value alone and with appreciable higher rates and yield could be administered much more efficiently. The inclusion of buildings greatly increases the

---

14. Following the 1981 revaluation the comparative data for site value and unimproved site value were as follows:

	Site value	Improved value (BDS$ in millions)	Total
Number of parcels	47,162	19,353	66,515
Assessed value	BDS$346.9	2193.7	2540.6
Revenue collectible	BDS$4.3	11.0	15.3

burden of keeping up-to-date records of improvements, based on building permits. But more important, their valuation requires on-site inspection by trained valuers and a record made of the building's dimensions, floor plan, building type, quality of construction, age, and condition. Standards must be established for unit values for different types of construction and applied to the valuation of the building. Land, in contrast, can be valued on a mass basis once the land cadastre is established.

The determination of annual value is facilitated where tenancy prevails; serious problems may arise, however, in valuing land and owner-occupied buildings, especially factory and other specialized buildings. It is usually necessary in these cases to derive an annual value based on some arbitrary ratio to the estimated capital value of the property, as was described above for Montserrat. Sometimes standard units of value per square foot or cubic foot are applied to the area or cubic space of a building in arriving at annual values. In Roseau, Dominica, for example, the annual value of owner-occupied property is assumed to range from EC$1.00 per cubic foot for property up to 5 years in age to EC$0.40 per cubic foot for property over 20 years of age, less 40%. Rental property – less than 25% of all parcels – is valued at 10 times the monthly rental. This procedure is simple to apply but of course is fairly crude in that it does not distinguish between different qualities of construction or style of building. Accordingly, a movie theatre of simple frame construction but with large space could be assessed much higher than a masonry bank building.

It is sometimes charged that the property tax in the Eastern Caribbean Community subregion (i.e. the Leeward and Windward islands) is unproductive because the cost of administering the tax on low-valued holdings exceeds the revenue. St. Lucia's experience with its rural land and house tax is cited as an example of inefficiency in this respect. It is claimed that perhaps 80% of all properties on the tax roll, with a rental value of about EC$600 and less, contribute less revenue than it costs to administer.[17] Clearly, the problem lies in the unusually low rate of tax: ½% of annual value; should this be increased to a moderate rate of, say, 5%, the problem would largely disappear. (An annual value tax of 5% is equivalent to a rate of about 0.5% of capital value, assuming a 10% gross rate of return.)

Jamaica largely avoided this problem with its land tax by the levy of a minimum tax on property with an estimated value below J$2000; for such low-valued holdings it also is unnecessary to exercise the usual care of specific valuation. Barbados, on the other hand, does not provide for any special treatment of low-valued holdings. In excluding improvements on land with a value of BDS$10,000 and less, however, the 1.25% rate rather than the 0.5% improved site value rate applies, thereby increasing the collectible tax. Also, Barbados excludes virtually all wooden houses from the tax roll, including so-called chattel houses built on leased land, and thereby reduces the valuation burden for low yield properties. It is said that low-valued parcels do not present any special enforcement problem because payment of tax strengthens the claim of ownership of the property, in which the taxpayer takes pride.

5. REFORM OF THE PROPERTY TAX

The above analysis clearly shows that CARICOM countries are not realizing the revenue potential of their property taxes. The poorest record is that of the states that have clung to the traditional British annual value mode. But the others that have reformed their system – Barbados and Jamaica — have undermined revenue by undue concessions either in rates or base. Grenada's newly adopted capital value tax appears to be following the same path with concessionary rates and exemptions. Reform of property taxes in the CARICOM would therefore appear to warrant serious consideration.

In addressing the problem of reform it might be asked what the proper role of the property tax should be in mobilizing resources by the government. Traditionally, property taxes have been a principal source of local rather than national finance.[18] In addition to CARICOM countries, important exceptions are found in Colombia, Chile and a few small countries such as Mauritius. One objective is the mobilization of resources of the agricultural sector by the state; this approach is especially important when agriculture either is exempted from income tax or an income tax on farmers is difficult to enforce and no alternative approach is introduced.[19] CARICOM countries with no or ineffective income taxes on agriculture either do not tax agricultural land or tax it at preferential rates as in Jamaica and Grenada.

A property tax at the national level presupposes a centralized form of government where cities and towns are dependent on the national government for major support of services normally performed at their level. Local property taxes, however, generally are poorly administered when the jurisdiction is too small to support the technical skills necessary for proper valuation and maintenance of the system. Centralized control or administration better assures the enforcement of objective valuation standards and avoidance of discriminatory practices and other abuses. There is no reason, however, why local governments should not share in centrally administered taxes on property located in their jurisdiction. In Chile, for example, municipalities receive one fourth of the national revenue.

The smaller states of the Eastern Caribbean common market subregion as well as Guyana and Trinidad and Tobago would appear to have most to gain by radical reform of their annual value rates; Belize, with a tax based on land area, also could greatly benefit. Montserrat's experience sets an example for reform by the Eastern Caribbean group although it is questionable whether improvements should be included in the tax base (discussed below).

Annual value, of course, reflects capital value, that is, the value of land and improvements. But an annual value

17. In 1979 the 3,000 lowest valued parcels yielded only EC$10,000, an average of EC$3.33 per parcel. British Development Division, Bridgetown, Barbados.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

tax is bound to be a hybrid because of the necessity of estimating the rental value of owner-occupied property to arrive at uniform assessment with respect to rental properties. This is especially difficult in the case of owner-occupied land. Because most farm land and residential property in these countries is owned by the occupier, the annual value concept is basically incompatible.[20]

One important factor inhibiting revenue is the high level of annual value rates that would be necessary to equate tax with a rate based on capital value or site value. The traditionally low level of annual value rates in the CARICOM – ½ to 1% – yields only a fraction of the revenue that a comparable rate based on improved or site value yields. Moreover, as was noted above, such low rates are unproductive because the cost of administration may exceed the tax collected on a large proportion of the parcels, as in St. Lucia. The effectiveness of overcoming this "rate illusion" is attested by Montserrat's intended strategy of converting annual value rates to rates based on capital value.

If the validity of these objections to annual value rates is accepted, what system offers the best alternative – site value or improved land value (i.e. capital value)? The initial decision of both Barbados and Jamaica was in favor of site value, although only Jamaica has stuck with this decision. Trinidad and Tobago initially declared for a modified site value tax but new conditions militated against a change.

Either site value or capital value is more consistent with land tenure in these countries, where the preponderance of property is owned by the occupier. Assessment of property could be achieved on a more equitable basis by avoiding the intermediate step in annual value assessment of converting capital value of owner-occupied property to annual value by an assumed arbitrary rate of return or other formula. Perhaps a more important factor favoring site value was the administrative convenience of mass assessment of land, which greatly facilitated the transition. Valuation of improvements would have compounded the burden on a limited and virtually untrained staff, greatly delayed implementation of the new tax, and built in greater problems of maintaining future assessment rolls. Barbados' later experience with its modified site value system confirms the difficulties of coping with the additional task of valuing improvements.

Finally, a tax limited to site value is most consistent with economic development objectives in that improvements to land are not deterred by an additional tax on their value. Indeed, a high enough rate would spur more intensive use of idle land.[21] It is true, of course, that the tax rate on land plus improvements would be lower than the rate on site value alone to yield equivalent revenue. The greater investment that might be attributable to a site value tax, however, would induce a greater increase in land values – the "unearned increment" – that could be recaptured by the higher site value tax rate.

The above view assumes that the rate on the value of land and improvements would be the same, unlike Barbados' curious rate structure that reduces the rate applicable to improved site value. The anomaly of this schedule is evidenced by an average rate in 1981 of 0.5% on improved land as against an average rate of 1.25% on site value alone. This rate structure has the effect of placing a premium on low-valued improvements in relationship to the value of land, and thereby militating against optimum allocation of resources. For example, only if the value of the improvement on land worth BDS$500,000 were greater than the value of the land would the property tax be increased. The incremental tax on improvements of much greater value, at a 1% rate, would be much less than the tax increment of a uniform rate on land and improvements. In this respect, Barbados' rate structure places less tax penalty on new investment than an orthodox tax on improved value but more than a site value tax.[22]

It is concluded from the above analysis that reform of annual value rates by CARICOM countries could best take the form of a tax on unimproved site values. A modest rate of, say, 1% would greatly enhance revenue, improve administrative efficiency, improve equity, and provide incentives for new investment. Many of these countries already have in place a legal cadastre that would facilitate the transition; others would require the installation of a property cadastre for fiscal administration. All would require a program for valuation of land under the direction of experienced valuers. Such a program would take time for planning, organizing and training technicians, and installing proper records, preferably computerized.

Countries that have replaced the annual value and other forms of property tax also could improve revenue by reducing or eliminating undue relief provisions for agriculture and hotels and rationalizing their rate structure. Barbados, in particular, should revise its rate structure so as to avoid the anomalous effect of a lower tax on improved land than on land alone. Rather than reverting to a site value tax, one possibility is a two-level tax consisting of a (graduated) rate on site value and a somewhat lower rate on improvements. Another possibility is a modified site value tax patterned on that of Montserrat.

---

20. It is estimated, for example, that 93% of Dominica's rural land parcels and more than 75% of its urban land is owner-occupied.
21. In Montserrat it is claimed that the land tax has forced more productive use of land either in agriculture or in subdivision and development. Caribbean Community Secretariat, "Taxation of Land and Buildings in Montserrat", op. cit., p. 8.
22. The reasons for the change to modified site value are stated to be as follows: A site value tax can have little effect on development unless capital is available; improvements that have been made are evidence of access to limited financial resources and should be able to bear tax; and, a larger base would permit a lower tax rate and reduced taxes on vacant land and agricultural land. C.P. Thompson, "The Property Tax System of Barbados", op. cit.

CUBA

Taxation of Joint Ventures

By M.A. Gª Caballero

I. INTRODUCTION

In order to attract foreign investment to team up with Cuban concerns in selected projects required to fulfill economic development goals, Decree-Law 50/82 of February 15 provides the legal framework within which business collaborations are to be organized in order to be eligible for privileged or special tax treatment.

Decree-Law 50/82 provides the rules applicable to business collaborations between Cuba and foreign enterprises, distinguishing between joint ventures (empresas mixtas) which constitute separate legal entities, and other types of business collaboration (for instance temporary associations) which do not. Either type, however, may receive privileged or special tax treatment: in the case of a joint venture, it is the separate legal entity and its foreign shareholders, directors and employees who benefit; in other types of business association, it is its foreign members, directors and employees.

The discussion below describes the most important foreign investment and tax measures relating to joint ventures.

II. FORMING A JOINT VENTURE

1. Concept

A Cuban joint venture consists of a collaboration agreement between Cuban public or private enterprises and foreign individuals and/or corporate enterprises which contributes to the economic development of the country, especially in the export and touristic sectors.[1] A joint venture is created by a notarial deed and is a seperate legal entity.

2. Requirements

The requirements relate mainly to the capital investment and to labour.

1) Investment requirements

a. the investment project and the by-laws of the joint ventures must be apporved by an "ad hoc Commission" appointed by the cabinet;
b. the joint ventures must be organized as a corporation (sociedad anónima) and domiciled in the Cuban Republic.[2] However, the Cuban joint venture may have permanent establishments and subsidiaries abroad, and may also praticipate in the capital of foreign companies;
c. a majority of locally owned equity is required; foreign shareholding is limited to 49%, unless the cabinet allows greater participation (in exceptional cases). Foreign contributions may be paid in foreign currency or in kind;
d. a legal reserve account must be established out of the annual profits to cover eventual liabilities in the manner established by the State Finance Committee[3];
e. the joint venture must open its business account in a convertible currency with a local bank through which all transactions are to be channelled. The official exchange rate of Banco Nacional de Cuba (the central bank) applies.[4] The joint venture is entitled to borrow in foreign currency from local banks and from foreign sources[5];
f. the notarial deed of incorporation must be registered with the State Chamber of Commerce.[6]

2) Labour requirements

a. The workforce of the joint venture must be hired and paid by hired and paid by the Cuban partner enterprise or by an independent Cuban entity; the workforce must be composed of Cuban nationals. Some of the directors and some highly specialized technical personnel may, however, be foreigners. Subject to the immigration rules, the joint venture may hire the required technical and administrative personnel. The Cuban partner or the independent entity then hires the Cuban workforce to the joint venture for a monthly sum, calculated according to official Cuban wages. Cuban directors and managers, however, earn the remuneration agreed upon by the partners concerned, provided that such remuneration is similar to that earned by the foreign directors and managers.
b. It is compulsory for the joint venture to create an economic incentive fund for its Cuban employees, out of which each Cuban employee receives fringe benefits. The amount which the joint venture is obliged to allocate to such a fund and the manner in which fringe benefits are paid is established by the "ad hoc Commission" when the authorization to create the joint venture is granted.

---

1. The same definition applies to other types of business associations, except that no separate legal entity is formed.
2. The Republic of Cuba constitutes an archipelago made up of two main islands (i.e. Cuba and Isla de Pinos) and around 1,600 islets, whose total area is 110,922 km2 (42,823 sq. miles) and whose total population (census of September 11, 1981) is 9,706,369.
3. The address of the Comité Estatal de Finanzas is: Obispo y Cuba, Ciudad de la Habana.
4. The official average rate of the Cuban peso against dollar is P80.1 cents per 1US$. The address of the Banco Nacional de Cuba is: Cuba, 402, Ciudad de la Habana.
5. The members of other types of business associations may also do so.
6. The collaboration agreements of other types of business associations only enter into force after having been registered in such a Registry.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

III. TAXATION OF A JOINT VENTURE

1. Privileged tax treatment for qualified investments

Where a joint venture is engaged in the development of areas which have been declared zones of great interest for touristic purposes by law 33/81 of January 10, the joint venture may benefit from a total or partial exemption from taxes and from customs tariffs and duties. Provided that the investment project in considered to be highly beneficial for the national economy, the State Finance Committee may grant joint ventures[7] a total or partial exemption during a given period from tax on net profits (see taxation of a corporate joint venture below) and from customs tariffs and duties.

In any case, the corporate joint venture and its foreign shareholders, directors and employees[8] are granted special tax treatment. This treatment includes:

(i) an exemption from income tax levied on the gross income of private enterprises, individual shareholders, partners, directors and employees[9];
(ii) an exemption from transfer tax, levied at the rate of 3.6% on the value of alienated real estate, business establishments, and equity capital.[10]

2. Taxation of a corporate joint venture

Where no exemption is applicable, a corporate joint venture[11] is subject exclusively to customs tariffs and duties, to an annual tax on motor vehicles for land transport, to a stamp duty on the application for, obtaining and renewal of certain documents, and to two direct taxes: (i) the net profit tax and (ii) the payroll tax.

The net profit tax (impuesto sobre utilidades)[12]

The net taxable base is calculated by deducting from the annual net profits (i) the portion of profits reinvested in increasing the equity capital of the joint venture or contributed to other types of business associations, (ii) that portion of profits which is allocated to the legal reserve account, as established by the State Finance Committee, and the portion allocated to a voluntary reserve account as agreed by the parties concerned, and (iii) that portion of profits allocated to the economic incentive fund for the Cuban employees, as established by the "ad hoc Commission".

The net taxable base is then subject to tax at the rate of 30%. The tax liability so assessed must be paid before March 1 of the following year. No tax credits are available.

The payroll tax (impuesto sobre nóminas)

This tax was introduced by Law 1213/67 of June 27 and is generally levied on the total amount of salaries, wages and any other type of compulsory remuneration paid by private enterprises to their employees.

As an exception, the payroll taxable base for joint ventures[13] is the total amount of salaries, wages and any other type of compulsory remuneration paid to the Cuban workforce, except the fringe benefits paid out of the economic incentive fund.

The taxable base is subject to payroll tax at the rate of 25% which includes the compulsory social security charges.[14]

The tax liability so assessed must be paid each month, at the same time as the salaries paid to the Cuban workforce.

IV. REMITTANCE ABROAD OF INCOME AND REPATRIATION OF CAPITAL

Foreign employees may freely remit abroad the portion of earned income stipulated by the central bank.

Foreign shareholders in the joint venture[15] are guaranteed by the Cuban State the free remittance in foreign currency of gross dividends, interest and royalties, as well as the portion of the sale or liquidation proceeds corresponding to their participation in the Cuban joint venture, provided that such remittance and repatriation is effected through the central bank.

---

7. The members of other types of business associations may also benefit from these exemptions.
8. Also applicable to foreign members, directors and employess of other types of business associations.
9. The Cuban income tax (impuesto sobre los ingresos) was introduced by Law 998/62 of January 5, as amended by Law 1213/67 of January 10. Private enterprises are subject to this tax at the rates resulting from coefficients established by the State Finance Committee for the different types of business activities; the taxable income is the annual gross income without any deduction. Individual taxpayers are subject to this tax on the monthly income from labour and from capital at progressive rates. These rates are as follows:

Monthly income between Pesos$	Pesos$	Rate % to be applied on monthly income (per bracket)
0	250.	11.9
251	300.	14
301	400.	16
401	500.	18
501	600.	20
601	700.	22
701	800.	25
801	1,000.	30
1,001	1,250	35
1,251	1,500	50
1,501	1,750	55
1,751	2,000	60
2,000	2,500	65
2501	. . .	70

10. The transfer tax (impuesto sobre transmisión de bienes inmuebles, establecimientos mercantiles y herencias) was introduced by Law 998/62 of January 5.
11. Also applicable to the members of other types of business associations.
12. The tax is assessed by calendar years, thus the financial and fiscal year coincide with the calendar year.
13. Also applicable to the members of other types of business associations.
14. Employess receive benefits from the state social security fund for sickness, accident, maternity, disability, unemployment and retirement. Public enterprises must pay to the Social Security Fund 10% of the payroll expenses according the Decree-Law 44/81 of July 6.
15. Also applicable to the members of other types of business associations.

The Tax System of the People's Republic of China – A Short Survey

by Eugen Jehle *

I. INTRODUCTION – SCOPE OF ARTICLE

For about three years now, the People's Republic of China has aroused the interest of the international business community, which, of course, includes the interest of all those who are involved in taxation.

The tax laws that were introduced by the Chinese Government in the early 1950s and later amended in 1958 are now supplemented by new tax laws (and the pertinent regulations) which include the Individual Income Tax Law of 10 September 1980, the Joint Venture Income Tax Law of 10 September 1980, and the Foreign Enterprise Income Tax Law of 18 December 1981.

This article discusses the current tax system of China, and for that purpose, the taxes have been divided into three major categories: direct taxes; indirect taxes; and registration taxes and license duties.

It should be noted, however, that this discussion does not consider the taxation of state-owned enterprises which, until fairly recently, were fully integrated into the State's economic planning. This meant that all profits had to be transferred to the State and that the State had to bear the losses when they occurred. Since 1979, many experiments have been going on to change this situation, and eventually, state-owned enterprises will become subject to tax on profits, fixed assets and other items.

At this stage, however, it is too early to talk about *the* tax system for state-owned enterprises. There will always be differences in the various provinces and municipalities and with respect to different types of activities. In a recent article on this subject,[1] the author concluded that tax experiments in China are so numerous that attempting to obtain a complete understanding of the prospective tax changes is not yet possible.

IV. Conclusion

II. CLASSIFICATION OF TAXES LEVIED IN THE PEOPLE'S REPUBLIC OF CHINA

A. Direct taxes

1. The foreign enterprise income tax[2]

This tax is part of the most recent tax legislation and may well turn out to be one of the most important taxes, certainly as far as concerns the raising of revenue for the treasury. The purpose of this tax is to tax all Chinese-source income which is not otherwise taxed under other laws such as the Individual Income Tax Law or the Joint Venture Income Tax Law. As the name indicates, the tax concerns exclusively foreign enterprises, and with regard to such enterprises, the tax "takes over" the task previously carried out by the industrial and commercial income tax.

In identifying "taxable persons", a distinction is made between foreign enterprises that are actively engaged in business in China (i.e. enterprises that are present in China) and those that receive "passive income" from China (i.e. enterprises that are not present in China). This distinction is important with respect to the rate of tax that applies (see discussion below).

* Senior Research Associate, International Bureau of Fiscal Documentation. This article is based on a talk which the author delivered on 11 June 1982 at the *Workshop on Chinese Law* organized by the Europe China Association (Square de la Quiétude 7, B-1150 Brussels, Belgium) at the Institut de Recherches Juridiques Comparatives, Section Chine, Centre National de la Recherche Scientifique, Ivry, France.

2. The Foreign Enterprise Income Tax Law of 18 December 1981; Detailed Rules and Regulations for the Implementation of the Income Tax Law of the People's Republic of China concerning Foreign Enterprises of 17 February 1982.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The underlying legislation wisely uses the general term "foreign companies, enterprises and other economic organizations" and does not restrict itself to "corporations". Thus, it protects its tax jurisdiction over any entrepreneurial operations that are defined as taxable in this law.

Income of foreign enterprises from the active conduct of business in China includes profits from cooperative production, processing activities and other business operations, such as exploration and other projects performed under a contract. Such income also includes income from independent business operations undertaken through an establishment in China. At this time, however, it is not entirely clear which types of activities of an establishment in China trigger liability to this tax.

"Passive income" is defined as dividends, interest, income from the rental or transfer of property and other income which is not from the active conduct of business.

The following rules are important in determining the taxable income of enterprises that actively engage in business in China:

(i) the relevant accounting method is the so-called "accrual method", i.e. the value of the property of the enterprise at the end of the year is compared to the value at the beginning of the year and the difference is the profit or loss;
(ii) income must be calculated on an annual basis, and as a general rule, the tax year is the Gregorian calendar year; however, other taxable periods may be applied for;
(iii) the procedure for calculating taxable income is precisely set forth in the underlying rules and regulations which distinguish among industry, commerce, service trades and other trades.

The Foreign Enterprise Income Tax Law identifies certain expenses that are either not deductible at all or deductible only to a limited extent. Non-deductible expenses include payment of the national or local income tax, penalties for illegal operations, overdue payments and tax penalties, certain losses covered by insurance, royalties paid to the head office, and other expenses that are not relevant to production or to the business operation.

Expenses which are deductible to a limited extent basically include three types of expenses: administrative, interest, and entertainment expenses. Administrative expenses (also known as overhead expenses) are deductible only if certain requirements are satisfied. For example, any such payment must be for a service rendered directly to the undertaking in China. Interest payments are deductible only if the interest rate passes the test of "reasonableness". Entertainment expenses are deductible only if they do not exceed certain percentages, i.e. a certain percentage of either net volume of sale or the total annual business income. These provisions are clearly designed to combat tax evasion in its various disguises.

The provisions concerning depreciation, treatment of losses, valuation of stock, etc. are precisely set forth in the underlying legislation and they basically follow the schemes commonly employed in other countries.

The Foreign Enterprise Income Tax Law identifies several items of income that are exempt from the tax. Exempt income includes interest payments on loans given by international financial institutions to official Chinese bodies or on loans given by foreign financial institutions to Chinese State Banks which were given at a "preferential" rate. Whether or not the rate is "preferential" is usually specified in the underlying loan agreement.

The rate of tax depends on whether the income is from the active conduct of business in China or is passive income. The former is taxed at progressive rates that vary from 20% (for an annual income of less than 250,000 yuan) to 40% (for that part of the annual income that exceeds 1,000,000 yuan). In addition to this tax, which is in fact a national tax, a local income tax at the flat rate of 10% is levied on the same taxable income. Thus, if taxable income is 250,000 yuan, the actual tax burden is 75,000 yuan, i.e. 30%. If the annual income is 10,000,000 yuan, the total tax burden is 48.75%.

This tax burden may, however, be reduced by claiming the various tax incentives that are provided for particular types of activities. For example, long-term undertakings (i.e. which have been in operation for at least 10 years) in specific fields may apply for a tax holiday for the first year in which they made a profit and for a tax reduction of 50% for the subsequent two years. In addition, depending on various factors, they may apply for a reduction of 15% or 30% for the following ten years. Finally, an exemption from, or a reduction in, the local income tax may be applied for in specific circumstances.

Passive income received by a foreign enterprise is subject to income tax at the flat rate of 20%.

2. The industrial and commercial income tax[3]

The industrial and commercial income tax is levied on the profits of domestic (Chinese) "industrial and commercial enterprises", and until the promulgation of the Foreign Enterprise Income Tax Law, of business activities (in China) of foreign enterprises. With regard to the latter, it was, however, common practice to arrange, in the underlying contracts for a tax holiday, at least a temporary one.

This tax is not levied in a uniform manner all over China, and there are areas where industrial and commercial enterprises are temporarily exempt from this tax. The latest report on this subject indicates that such enterprises in Tibet have been exempt from the industrial and commercial income tax for several years.

Subject to this tax are "industrial and commercial enterprises" such as cooperative societies, industrial and commercial activities of people's communes, mixed enterprises (partially private and partially state-owned; the most prominent example is the Bank of China), and private enterprises. State-owned enterprises and agricultural activities carried on by people's communes are not subject to this tax.

Taxable income is net revenue calculated according to the accrual method. No distinction is made among vari-

3. Provisional Regulations for the Industrial and Commercial Income Tax of 10 December 1950, as amended.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

ous items of income. For example, capital gains, i.e. extraordinary profits from the disposal of fixed assets, are automatically included in the profits.

The following items are deductible in calculating taxable income: production costs, administrative expenses, and other expenses; depreciation using the straight-line method; and the industrial and commercial consolidated tax that was paid (see discussion under "Indirect taxes").

Many exemptions are provided, but it appears that the situation varies from province to province. An exemption may be for an area or for specific branches of industry and commerce, or the exemption may be granted for retained profits and for new industrial enterprises having financial problems.

The industrial and commercial income tax is levied, at the national level, at progressive rates ranging from 5.75% for incomes up to 300 yuan to 34.5% for incomes of 10,000 yuan or more. In addition, a local surcharge may be levied which ranges from 10% to 100% of the national tax.

3. The joint venture income tax[4]

The joint venture income tax is levied exclusively on enterprises that are established under the "Law on Joint Ventures Using Chinese and Foreign Investment" of 1 July 1979. This law states that a joint venture has to be established as a "limited liability company" which is the taxable person. The law also makes it possible for a joint venture to have branches abroad, and if it does, the head office in China will always be the taxable person for tax purposes and will therefore be liable for payment of the Chinese taxes.

Taxable income is the joint venture's world-wide income that represents (i) income from production and business (which covers virtually every activity) and (ii) income from other sources such as dividends, bonuses, interest, royalties, and other sources. Taxable income, determined according to the accrual method, is gross income less costs, expenses and losses. In addition, the following rules apply:

(i) the procedure for calculating taxable income follows closely the procedure in the foreign enterprise income tax, i.e. distinctions are made among industry, commerce, service trade and other kinds of operations;
(ii) the taxable period is the Gregorian calendar year;
(iii) the provisions regarding non-deductible expenses and entertainment expenses also closely follow the provisions in the foreign enterprise income tax;
(iv) losses may be carried forward and set against the profits of the next year; the maximum period for carrying forward losses is five years; and
(v) fixed assets will normally be depreciated using the straight-line method.

The Joint Venture Income Tax Law does not contain any exemptions. However, some tax incentives are available (see discussion below).

The joint venture income tax is levied at a flat rate of 30% which is the national tax. In addition, a local surcharge of 10% of the national tax is levied, and the total tax burden is thus 33%. However, the People's Government of the Province, Municipality or Autonomous Region in which the joint venture is seated may decide to grant a reduction of, or exemption from, the local surcharge on account of special circumstances.

If a foreign participant's share in the profits of the joint venture is remitted to a place outside China, an additional income tax of 10% is levied on the amount remitted.

Tax incentives are available which are very similar to those available under the Foreign Enterprise Income Tax Law, namely, a tax holiday in the first profit-making year and a tax reduction of 50% in the two subsequent years. In addition, a reduction of 15% to 30% may be applied for up to ten more years. Certain conditions must be satisfied in order to qualify for these incentives. For example, the joint venture must be long-term, i.e. have been in operation for at least ten years.

A foreign participant of a joint venture is entitled to a tax refund of 40% of the income tax paid on his share of the income that is reinvested in China for a period of at least five years.

Where a joint venture or its branch derives income from abroad and has paid foreign income taxes thereon, the foreign taxes may be credited against the income tax liability in China. In this regard, it may be noted that, to date, China has not concluded any comprehensive treaties for the avoidance of double taxation, but, reportedly, negotiations are going on with several countries.

4. The individual income tax[5]

On 10 September 1980, the Individual Income Tax Law entered into force. It is a kind of schedular tax (the method of taxation varies with the kind of income) which is in contrast to a global income tax pursuant to which all items of income are added together and taxed at a uniform rate. Before it entered into force, there was no individual income tax in modern China. The only exception referred to those cases where activities were undertaken by an individual (private enterprise) that qualified as an industrial and commercial enterprise and was thus subject to the industrial and commercial income tax.

Taxable persons are individuals who either live in China or who receive income from China, and the law distinguishes between residents and non-residents.

With regard to residents, further distinctions are made depending on how long the person has resided in China. Individuals who have resided in China for more than five years are, from the sixth year of residence, subject to Chinese income tax on their world-wide income. Individuals who have resided in China for one or more years but less than five years are subject to tax with regard to their Chinese-source income and that part of their foreign-source income that is remitted to China. Individuals who have resided in China for less than one year

© 1982 International Bureau of Fiscal Documentation – BULLETIN

are subject to Chinese income tax only on their Chinese-source income.

The individual income tax identifies six types of income that can be classified in three categories:

(i) employment income;
(ii) compensation for personal services; royalties; rental income;
(iii) taxable interest, dividends and bonuses; other kinds of income which the Minister of Finance has identified as taxable.

Employment income consists of wages, salaries, certain bonuses and year-end extras that are paid in the course of an existing employment relationship. However, the following types of income do not constitute taxable employment income: certain retirement and welfare payments; salaries of foreign diplomatic personnel; and remuneration paid by employers outside China to individuals whose period of residence in China does not exceed 90 days.

Employment income is subject to progressive marginal tax rates. The law provides for a basic exemption of 800 yuan per month. Amounts in excess of the exemption are taxed at rates that range from 5% to 45%, and the maximum rate applies to that part of the monthly income that exceeds 12,000 yuan. Thus, the actual tax burden on a monthly net income of 5,000 yuan is 11.70%, and a monthly income of 10,000 yuan is taxed at 20.85%.

Items of income that belong to the second category are, in principle, taxed at a flat rate of 20%. Residents are entitled to a lump sum deduction for expenses of 800 yuan per payment if the payment is less than 4,000 yuan or of 20% of the payment if it exceeds 4,000 yuan. Thus, if the single payment is 2,000 yuan, the effective tax burden is 12%. For payments in excess of 4,000 yuan, the effective tax burden is 16%. Non-residents are not entitled to this deduction, and the 20% rate applies to their income which falls in this category.

Items of income within the third category are, in principle, taxed at a flat rate of 20% and no deductions are allowed. However, some exemptions are available. For example, interest that is defined as interest from a savings deposits in a State or cooperative bank in China or any other bank authorized by the State bank is exempt from the individual income tax. Dividends derived from a joint venture or an urban or rural cooperative organization are also exempt for residents.

5. The agricultural tax[6]

The agricultural tax is levied on agricultural activities undertaken by people's communes, and the taxable person is the production team of the commune. The tax is levied on the "yield of the average harvest" which is a projected amount that is usually fixed for a certain number of years (normally 3-5 years) on the basis of the harvests of previous years. Any yield in excess of the "yield of the average harvest" is exempt from taxable income.

A basic exemption is allowed. In addition, exemptions from, and reductions of, the agricultural tax may be granted when a natural disaster occurs, when new cultivations are being started, or when the agricultural activities take place in so-called "handicapped" areas.

The agricultural tax is levied at a proportional rate, but the actual rate depends on the region and usually varies from 13% to 19%. In addition, a local surcharge of up to 22% of the tax may be levied. Usually this tax is paid-in-kind.

It should be noted that this method of taxation contains a built-in incentive to increase production, and this can be done without creating any additional administrative work. Thus, it might be worthwile for other countries seeking to increase agricultural production to study this method.

6. The urban real property tax[7]

The urban real property tax is a local (i.e. municipal) tax that is generally levied on the value of real property, and the taxable person is the owner, renter or user of real property located in urban areas. Various factors, such as location, condition, etc., must be considered in determining the value of the property. Some property, such as real property used for governmental purposes is exempt from this tax.

The tax rate varies from municipality to municipality. For land, the annual rate is usually about 1.5% and for buildings, it is usually about 1%. Under certain circumstances, this tax may instead be levied on the rental value.

B. Indirect taxes

1. The industrial and commercial consolidated tax[8]

This tax is currently the most important one in China and applies to all kinds of enterprises in China, including state-owned ones. The tax may be classified as a turnover tax that has some of the features of an excise duty.

A taxable transaction arises whenever a taxable item is transferred from one enterprise or person to another enterprise or person or when an item is imported or exported. With respect to imports and exports, the tax question is usually clarified in the underlying contract, i.e. it is common practice for the Chinese enterprise or person to satisfy the tax liability.

For enterprises or persons engaged in industrial or agricultural production or in retail trade, the taxable base consists of the gross receipts. For those engaged in transportation, postal and communication services, the taxable base is gross income, and for those engaged in the service industries, the taxable base consists of the commission earnings.

There are several exemptions from the industrial and commercial consolidated tax. For example, transfers within an enterprise are usually exempt. In addition, certain import items may be exempt, the most recent example being an exemption for items to be used in the exploration and exploitation of offshore petroleum. With re-

8. Regulations and Detailed Rules for the Industrial and Commercial Consolidated Tax of 13 September 1958, as amended.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

gard to transactions that occur in the context of compensation trade, processing trade and cooperative production, it seems to be common practice for the parties to arrange for an exemption in the underlying contracts.

As a general rule, the tax rates reflect the extent to which a particular commodity is necessary to the average consumer. The rate is low for items that constitute basic needs, but it is as high as 69% for luxury items. Industrial and agricultural commodities are taxed at rates that range from 1.5% to 69%. Retail sales are taxed at a uniform rate of 3%, and transportation services at 2.5%. A rate ranging from 3% to 7% applies to commissions earned by those engaged in the service industries. In addition, a surcharge of 1% of the tax due may be levied.

2. The salt tax

The salt tax is reportedly the oldest tax that is levied in China and is administered by the Salt Control Bureau. It is a tax on the production of salt and its rate varies. Certain exemptions are provided for, such as for salt used in agriculture or industry or salt that is to be exported.

3. Customs duties[9]

Although customs duties are usually not classified as taxes, they are briefly mentioned here because they are of great significance to China.

Certain exemptions are provided with respect to customs duties. For example, an exemption applies to the importation and subsequent exportation of equipment used in the exploitation of offshore oil. In addition, an exemption may apply to equipment imported for use in joint ventures and in compensation trade, processing trade and cooperative production.

a. *Import duties*

The tariff on imports is classified into 17 categories which are subdivided into 939 tariff numbers, and a distinction is made between the "minimum tariff rate" and the "general tariff rate". The former is the rate that is generally applied to imports from countries with which China has concluded a trade agreement, and the general tariff rate applies to imports from all other countries. The applicable rates may be as high as 400% for luxury items.

b. *Export duties*

Until very recently, no export duties were levied by China. However, as of 1 June 1982, an export duty is levied on 34 kinds of commodities. The export duty is usually levied on the export value and the rates vary from 10% to 60%. An exception exists with respect to coal which is taxed on a quantitative basis, i.e. 40 yuan per ton. No further details regarding export duties are available at this time.

C. Registration taxes and license duties

Taxes which, in fact, are in the nature of license duties include the slaughtering tax, the cultural and entertainment tax, and the transport means tax. These are all local taxes and the tax amount appears to vary significantly. In terms of revenue, they are of minor importance and are mentioned here only for the sake of completeness.

III. TAX TREATMENT OF SPECIFIC UNDERTAKINGS

A special tax treatment is provided for some types of undertakings and for activities in specific areas. For instance, a specific tax treatment applies to undertakings of any kind that are carried on in so-called Special Economic Zones.

To date, three Special Economic Zones have been established in Guangdong Province, namely Shenzhen, Zhuhai and Shantau. In Fujian Province, there is so far only one such zone, namely Xiamen. For the zones in Guangdong Province, detailed regulations have been released[10] that answer all kinds of questions. As far as taxation is concerned, the income tax rate has been fixed at 15%. There is, however, much room for negotiation for projects that are of specific interest to China.

The regulations for the zone in Fujian Province have reportedly been passed by the legislative bodies, and although no copy has yet been obtained, the regulations are not expected to differ widely from those in Guangdong Province.

Foreign shipping transport enterprises also enjoy a special tax treatment.[11] For them, taxable income is defined as 5% of the gross income from transport services for passengers and cargo within Chinese territory. This amount is then taxed at the rate of 4.025% which consists of 1% foreign enterprise income tax, 0.5% local surcharge thereon, 2.5% industrial and commercial consolidated tax, and 1% surcharge thereon, namely .025%.

There are other undertakings that enjoy a special tax treatment, but those mentioned above are the most important ones.

IV. CONCLUSION

The tax system of the People's Republic of China is, at this time, a mixture of well-established taxes and of newly-introduced tax laws. With regard to the latter, it will naturally take some time before all the details have been worked out.

At any rate, the Chinese authorities must be congratulated for having released, in the course of implementing the four modernizations, tax laws the brevity of which has caused much envy and admiration in the international tax community. Anyone who has to deal with the tax laws of other countries will no doubt agree with this statement.

PRENTICE~HALL,INC.
Englewood Cliffs,
New Jersey 07632
U.S.A.

Prentice Hall Announces:

The most strikingly different new tax guide ever published for taxpayers with income from foreign sources.

U.S. TAXATION OF INTERNATIONAL OPERATIONS

Continuously Supplemented. . . . . Always Up - to - Date

This outstanding new Service is created specifically to help save money for:

U.S. INDIVIDUALS
with investments and/or earned income from a foreign source

U.S. CORPORATIONS
with income from foreign sources

FOREIGN CORPORATIONS
with income earned or taxable in the U.S.

NONRESIDENT ALIENS
receiving income from, or taxable in the U.S.

If you fit any of these categories — or if you counsel, advise, or in any way service any of these categories — U.S. TAXATION OF INTERNATIONAL OPERATIONS will be an invaluable new tool for you.

It will deliver management benefits — operations benefits — tax benefits.

In clear, direct language, backed up by practical, tested practices of acknowledged experts in international business operations, the new work spells out how the taxpayer can best take full advantage of every popular, every sophisticated, and every little-known tax-saving device.

Authoritative, specific guidance from one source devoted exclusively to this kind of vital help has been non-existent — until now.
With the first 1972 publication of the innovative U.S. TAXATION OF INTERNATIONAL OPERATIONS this important need is now fulfilled. And bi-weekly "Report Bulletins" will keep the guide as new and up to the minute as the day you receive it.

Personal response to this new publication has been even more enthusiastic than our most optimistic projections. Subscriptions are now being accepted by mail for $ 231 a year.

Address your request to Dept. S-RR-103, Prentice-Hall Inc., Englewood Cliffs, N.J. 07632 and specify U.S. TAXATION OF INTERNATIONAL OPERATIONS, 1-year introductory charter subscription.

Annual payment is not due until 20 days after receipt of the new, ready-for-reference volume.

The Welfare Cost of Taxation: Its Meaning and Measurement

by Nizar Jetha *

I. INTRODUCTION

Statements such as "the welfare cost of tax X equals a% of its revenue yield" or that "the welfare gain from substituting tax Y for tax Z would equal b% of GNP" are to be found in a growing number of papers on tax reform. They refer to the cost of distortions caused by taxes through their effects on relative prices. All taxes, except the poll tax, distort the allocation of resources in the sense that the allocation of resources would change if the taxes were removed. The concept of the welfare cost of taxation attempts to translate the cost of tax-induced distortions in money terms. The concept is based on the notion of consumer's surplus.

This paper provides an introduction to the concept of the welfare cost of taxation and its measurement. In addition, it derives the basic conclusion of the theory of optimal indirect taxation by taking advantage of the close relationship between the concept of welfare loss and the theory of optimal taxation.

II. CONSUMER'S SURPLUS

The consumer's surplus is simply the difference between the amount a consumer is willing to pay for a quantity of a good and the amount he actually pays for it. Thus, if one is prepared to pay $1 for a can of beer but its price is 40 cents, the consumer's surplus is 60 cents. Every point on the ordinary demand curve represents the sum a consumer is willing to pay for various quantities. When the price of a good X is P_0 and the quantity X_0 is purchased, the amount the consumer is willing to pay for the X_0th unit and the price are equal, but the amounts the consumer is willing to pay for the other units purchased exceeds the (fixed) price of the commodity (see Figure 1). At price P_0, the total sum a consumer is willing to pay for the quantity X_0 is given by $OScX_0$, but the amount he actually pays is given by OP_0cX_0. The area of the triangle P_0Sc, therefore, represents the consumer's surplus.

Now suppose that a tax of Tx per unit of X is imposed. The price rises to P_1 and demand falls to X_1. The willingness to pay for X_1 is represented by $OSaX_1$ but the outlay made is OP_1aX_1. The consumer surplus is now P_1Sa. The reduction in the consumer surplus due to the increase in price is, therefore, P_0P_1ac.

The decrease in consumer surplus due to an increase in price gives the total welfare loss. However, when the price increase is caused by a tax, the additional tax revenues should be subtracted from the total welfare loss because the revenues, when spent, would bring benefits. The tax of Tx per unit of X would bring tax revenues of TxX_1, denoted by the area P_0P_1ab. Hence, we are finally left with the triangle abc as the measure of the welfare cost of taxation. The loss of welfare due to taxation is variously referred to as the "excess burden", "deadweight loss" and "efficiency cost".

III. CONSUMER'S SURPLUS AND COMPENSATING VARIATION

It has been suggested that a price-induced change in consumer's surplus is given by the area to the left of the demand curve between the two prices. Strictly, the change in the consumer's surplus is not given by the area to the left of the ordinary demand curve, but by the area to the left of a compensated demand curve. The present section explains the reason for this as well as the meaning of the compensated demand curve. In the process, further light will be shed on the concept of consumer's surplus.

The upper part of Figure 2 shows income on the vertical axis and purchases of a good X on the horizontal axis. U_1 and U_2 are indifference curves, and $\overline{Y}Z$ is the initial budget line corresponding to price P_1 for X. At the price P_1, the consumer spends $\overline{Y}R$ of his income on X, purchasing the quantity X_1. This gives us one point on the ordinary and compensated demand curves, denoted by a in the lower part of the diagram. When the price rises to P_2, the budget line changes to $\overline{Y}W$, giving a new equilibrium on the lower indifference curve U_2. The purchases of X fall to X_2 and a second point on the ordinary demand curve (b) is obtained. To obtain the corresponding point on the compensated demand curve, we need to ask what quantity of X the consumer would purchase at the higher price P_2 if his income were increased so that he could remain on the original indifference curve U_1. The answer can be found by "moving" the budget line $\overline{Y}W$ to the right, keeping its slope constant, until it touches U_1. As the diagram shows, the answer is that the quantity X_3 would be purchased, and this gives us the second point on the compensated demand curve (c). Other points can be derived by considering different prices. It should be clear that the compensated demand curve is a relationship between prices and quantities when a consumer remains on a given indifference curve (that is, when his utility is held constant).[1]

---

* Economist, The World Bank, Washington, D.C.

1. A simple mathematical derivation of a compensated demand curve may help. Let the utility function be of the form $U = Q_1Q_2$, where Q_1 and Q_2 are the quantities of goods 1 and 2 consumed, respectively. Let P_1 and P_2 be the prices of goods 1 and 2, respectively. Minimizing the expenditure on the two goods $(P_1Q_1 + P_2Q_2)$ subject to the initial level of utility (say U^o) being maintained will give the compensated demand curves. Minimizing the Lagrangean:

$$L = P_1Q_1 + P_2Q_2 + g(U^o - Q_1Q_2)$$

we get

$$\frac{\partial L}{\partial Q_1} = P_1 - gQ_2 = 0; \quad \frac{\partial L}{\partial Q_2} = P_2 - gQ_1 = 0; \quad \frac{\partial L}{\partial g} = U^0 - Q_1Q_2 = 0$$

which give

$$Q_1 = \left(\frac{P_2U^0}{P_1}\right)^{1/2} \text{ and } Q_2 = \left(\frac{P_1U^0}{P_2}\right)^{1/2}$$

the compensated demand curves for goods 1 and 2, respectively. See James M. Henderson and Richard E. Quandt, *Microeconomic Theory* (New York: McGraw Hill, 1980), pp. 20-21.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The amount of compensation that must be paid to the consumer in order to enable him to remain on U_1 when the price of X rises from P_1 to P_2 is given by $\overline{Y}Y^*$. In general, the amount of compensation paid or received that will leave the consumer in his initial welfare position following a change in price is known as "compensating variation".[2] To put it differently, compensating variation measures the change in utility due to a price change in money terms.[3] But this is precisely what the change in consumer's surplus was supposed to represent. It can be shown, but will not be shown here, that compensating variation equals the area to the left of the compensated demand curve between the two prices.[4] In terms of the diagram, $\overline{Y}Y^*$ corresponds to P_1P_2ca. This provides the rationale for the use of compensated demand curves.

In light of the above discussion, we can define excess burden as compensating variation minus tax receipts.[5] In practice the excess burden is often calculated directly by estimating the area of the relevant triangle under the compensated demand curve (eca in Figure 2).

IV. MEASUREMENT OF WELFARE COST OF TAXATION

Suppose that a tax of Tx per unit of good X is levied. Referring to Figure 1 but treating the demand curve as the compensated demand curve, the excess burden of the tax may be expressed algebraically as:

$$W = -\tfrac{1}{2}(P_1 - P_0)(X_0 - X_1)$$
$$= -\tfrac{1}{2}\, dP\, dX \qquad (1)$$

Multiplying and dividing this expression by dP gives

$$-\tfrac{1}{2}\, dP \frac{dX}{dP} dP$$

Now multiplying and dividing by XP^2 and rearranging gives

$$-\tfrac{1}{2}\left(\frac{dX}{dP}\frac{P}{X}\right) XP \left(\frac{dP}{P}\right)^2$$

But $\frac{dX}{dP}\frac{P}{X}$ (to be denoted by e_D) is the compensated elasticity of demand (elasticity of demand of the compensated demand curve) and $\frac{dP}{P} = \frac{Tx}{P_0}$ is the rate of tax (to be denoted by t). The preceding expression may now be written as:

$$W = -\tfrac{1}{2}\, e_D\, X\, Pt^2 \qquad (2)$$

(1) and (2) are two equivalent formulae for computing the excess burden of a single tax. These partial equilibrium formulations ignore the existence of other taxes. Moreover, frequently we wish to know the welfare gain or loss of increasing or decreasing one tax and changing another tax to keep the tax revenue constant. We, therefore, need a general expression for the excess burden of a given set of taxes. The general expression for the excess burden of N taxes[6] is:

$$W = -\tfrac{1}{2} \sum_{i=1}^{N} \sum_{j=1}^{N} S_{ij}\, T_i\, T_j \qquad (3)$$

where $S_{ij} = \left(\frac{\partial X_i}{\partial P_j}\right)_U$ is the compensated derivative of the demand for the ith commodity with respect to the price of the jth commodity,[7] and Ti is the amount of tax per unit of good i.

The general expression can be reduced to (2) in the case of a tax on a single good, as follows:

$$W = -\tfrac{1}{2}\, S_{11}\, T_1^2 \qquad \text{(since } i = j = 1\text{)}$$

$$= -\tfrac{1}{2}\left(\frac{dX_1}{dP_1}\right)_U (dP_1)^2$$

$$= -\tfrac{1}{2}\left(\frac{dX_1}{dP_1}\right)_U \frac{P_1}{X_1}\frac{X_1}{P_1} (dP_1)^2$$

$$= -\tfrac{1}{2}\left(\frac{dX_1}{dP_1}\right)_U \frac{P_1}{X_1}\frac{X_1}{P_1}\frac{P_1}{P_1} (dP_1)^2$$

$$= -\tfrac{1}{2}\, e_D\, X_1 P_1 t_1^2 \quad \left(\text{where } t_1 = \frac{dP_1}{P_1}\right)$$

---

2. For a lucid and more detailed discussion of compensating variation, see Robin W. Boadway, *Public Sector Economics* (Cambridge, Mass.: Winthrop Publishers, Inc., 1979), pp. 47-50.
3. Note that there is no unique measure of utility change in money terms. Equivalent variation could be used instead of compensating variation. See Henderson and Quandt, pp. 49-50.
4. This is not difficult to show using indirect utility functions and expenditure functions, but a discussion of these concepts will take us too far afield. See Henderson and Quandt, pp. 41-45, 49-52.
5. A simple numerical illustration of a compensated demand curve, compensating variation and excess burden will be found in P.B. Dixon, S. Bowles and D. Kendrick, *Notes and Problems in Microeconomic Theory* (Amsterdam: North Holland, 1980), pp. 144-146.
6. The expression is derived in a number of different ways in Arnold C. Harberger, "Taxation, Resource Allocation and Welfare", reprinted in *Taxation and Welfare* (Boston: Little, Brown and Company, 1974), pp. 25-62. It should be noted that one of the assumptions underlying the derivations is that outputs are produced at constant costs.
7. It will be recalled that the relationship between the derivatives of an ordinary (or uncompensated) demand curve and a compensated demand curve is given by the Slutsky equation

$$\frac{\partial X_i}{\partial P_j} = \left(\frac{\partial X_i}{\partial P_j}\right)_{\text{utility = constant}} - X_j \left(\frac{\partial X_j}{\partial y}\right)_{\text{prices = constant}}$$

where X_i = the demand for the ith good, P_j = the price of the jth good and y = income. The expression on the left is the derivative of the ordinary demand curve and the first term on the right is the derivative of the compensated demand curve. We denote the compensated derivative

$$\left(\frac{\partial X_i}{\partial P_j}\right)_{\text{utility = constant}}$$

by S_{ij}. It should be noted for later reference that $S_{ij} = S_{ji}$. For a derivation of the Slutsky equation and its interpretation, see Henderson and Quandt, pp. 25-32.

V. AN APPLICATION

Laidler[8] has estimated the welfare cost of income tax incentives for owner-occupied housing in a simple partial equilibrium framework.[9] The main features of his approach are illustrated in Figure 3. D represents the demand for housing services. S_1 is the supply curve and denotes the marginal private cost of providing housing services. The subsidy given through the tax system lowers the private marginal cost of housing to the levels represented by S_2. As a result of the subsidy, the consumption of housing services expands by Q_0Q_1.

The net loss of welfare is denoted by the shaded triangle fcg. This can be seen as follows. The expanded consumption of housing services increases the consumer surplus by ebcg. But the cost of the subsidy (ebdg) must be set against it to arrive at the net change in welfare. The net loss of welfare is, therefore, given by cdg. Since cdg and fcg are similar triangles, the area of the triangle fcg also gives the welfare loss. We obviously need to know the size of the subsidy and the increase it induces in the quantity of housing in order to estimate the size of welfare loss.

If a homeowner were taxed in the same manner as other investors, his taxable income would be given by:
Taxable income = (GR–PT–D–M–MI)V
where GR = gross rent,
PT = property taxes,
D = depreciation,
M = maintenance,and
MI = mortgage interest,
all expressed as a percentage of the value of the house (V). Taking the numerical values used by Laidler:
Taxable income = (.11–0.015–0.0225–0.0125–0.06)V (4)

This states that if the homeowner were to rent his house, he would have to charge a gross rent of 11% of the value of the house if he is to meet all expenses. However, tax laws in the United States and many other countries permit the homeowner to exclude gross rent from his taxable income and to deduct property taxes and mortgage interest from his other income. Taxable income from owner-occupied housing is, therefore, given by:

$$\begin{aligned}\text{Taxable income} &= (-PT-MI)V \\ &= (-0.015-0.006)V \qquad (5)\end{aligned}$$

Subtracting (5) from (4) would give the reduction in taxable income due to the special tax treatment of owner-occupied housing. Multiplying this reduction in taxable income by the taxpayer's marginal tax rate then gives the tax saving or subsidy associated with the tax incentive for owner-occupied housing. Thus,

$$\begin{aligned}\text{Subsidy} &= t\,(GR-M-D)V \\ &= .26\,(.11-0.0125-0.0225)V \\ &= .26\,(0.75)V \\ &= 0.0195V\end{aligned}$$

where the marginal rate of personal income tax (t) has been taken to be 26%. Hence the amount of the subsidy is \$0.0195 per \$ of the cost of the house, and the rate of subsidy is 17.7% (0.0195V/0.11V).

To estimate the change in the quantity of housing, we need to know the price elasticity of demand for housing and the stock ot owner-occupied housing. Laidler used an elasticity of –1.5 for his computations.[10] The value of owner-occupied housing owned by persons in the income group \$10,000 – 15,000 was \$61,956 million. Multiplying the rate of subsidy (17.7%) by elasticity of demand (1.5) will give the percent over-invested in housing of 26.6%. This translates into the amount over-invested in housing of \$13,011 million [(26.6/(100 + 26.6)) x 61,956].

The welfare loss may now be computed as follows:[11]

$$\begin{aligned}W &= 0.5 \triangle P \triangle Q \\ &= 0.5\ (\text{subsidy})\ (\text{amount over-invested}) \\ &= 0.5\ (0.0195)\ (13{,}011) \\ &= \$137 \text{ million}\end{aligned}$$

Making similar calculations for other income classes, Laidler arrived at the total welfare cost of the tax concessions for owner-occupiers of \$500 million per annum.

VI. EXCESS BURDEN AND OPTIMAL INDIRECT TAXATION

The concept of excess burden leads naturally to the theory of optimal taxation, and perhaps provides the simplest way of deriving a basic proposition in optimal taxation.[12] Optimal tax rates are defined as the rates that will raise the required revenue by minimizing the excess burden of taxation. We wish to investigate the main characteristic of the structure of optimal indirect taxation. The traditional theory of taxation concluded that an ad valorem tax at a uniform rate on all commodities would minimize the excess burden of taxation. Recent research has shown that this conclusion would only be valid if all final commodities (including leisure) could be taxed. The modern approach is based on the assumption that leisure cannot be taxed. The question that the theory of optimal indirect taxation then poses is: which tax rates will minimize the excess burden of indirect taxation given that a specific amount of revenue must be raised and that at least one commodity cannot be taxed? As will be shown, the answer is that the tax rates should be so chosen that the demand for all taxed commodities is reduced by the same proportion. A single rate for all goods will, therefore, not be optimal.

Harberger, "Efficiency Effects of Taxes on Income from Capital", reprinted in *Taxation and Welfare*, pp. 163-170; Michael J. Boskin, "Efficiency Aspects of the Differential Tax Treatment of Market and Household Economic Activity", *Journal of Public Economics*, Vol. 4, No. 1, February 1975, pp. 1-25; and Martin Feldstein, "The Welfare Cost of Capital Income Taxation", *Journal of Political Economy*, Vol. 86, No. 1, part 2, April 1978, pp. S29-S52.
10. Most early studies, including Laidler's, used the elasticity of the ordinary demand curve. For a more recent study using compensated elasticities, see Harvey S. Rosen, "Housing Decisions and the U.S. Income Tax: An Econometric Analysis", *Journal of Public Economics*, Vol. 11, No. 1, February 1979, pp. 1-24.
11. The minus sign vanishes because a subsidy is a negative tax.
12. A simple introduction to optimal taxation will be found in David E. Bradford and Harvey S. Rosen, "The Optimal Taxation of Commodities and Income", *American Economic Review*, Vol. 66, No. 2, May 1976 (Papers and Proceedings, 1975), pp. 94-101.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

To find optimal rates of indirect taxes, we minimize (with respect to tax rates):

$$W = -\tfrac{1}{2} \sum_{i=1}^{K} \sum_{j=1}^{K} S_{ij} T_i T_j \qquad K < N$$

$$\text{subject to} \quad \sum_{j=1}^{K} T_j X_j = R$$

where S_{ij} and T have already been defined, X_j = the quantity of the jth good purchased and R = tax revenue. $K < N$ denotes that at least one good cannot be taxed. The constraint (the second expression) simply states that the chosen tax rates must bring revenue equal to R.

We can simplify this problem without loss of generality. First, define $T_i = t_i C_i$, where t_i = percentage rate of tax on the ith good and C_i = the producer's price (cost) for the ith good. The solution will then contain ad valorem rates, which are of greater interest than specific rates (T_i). Second, let producers' prices for all commodities equal 1 (that is $C_i = 1$ for all i). This will simplify the mathematics by reducing the number of symbols. Note that the relationship between the consumers' and producers' prices will be given by $P_i = (1+t_i)C_i = (1+t_i)$, where P_i is the consumer's price for the ith commodity. Third, assume that there are only three commodities, two goods (X_1 and X_2), which can be taxed, and leisure (X_3), which cannot be taxed. This will make it possible to write out all expressions in full, thereby making the derivation clearer.

Our problem now is to minimize:

$$W = -\tfrac{1}{2} \sum_{i=1}^{3} \sum_{j=1}^{3} S_{ij} t_i t_j$$

$$\text{subject to} \quad \sum_{j=1}^{3} t_j X_j = R.^{13}$$

Recalling that $t_3 = 0$ and noting that $S_{12} = S_{21}$, minimization of W subject to the revenue constraint is equivalent to the minimization of the Lagrangean:

$$L = -\tfrac{1}{2}[S_{11}t_1^2 + S_{22}t_1^2 + 2S_{12}t_1t_2] + g[t_1X_1 + t_2X_2 - R]$$

We obtain

$$\frac{\partial L}{\partial t_1} = -[S_{11}t_1 + S_{12}t_2] + g\left[t_1 \frac{\partial X_1}{\partial t_1} + t_2 \frac{\partial X_2}{\partial t_1} + X_1\right] = 0 \qquad (6)$$

$$\frac{\partial L}{\partial t_2} = -[S_{12}t_1 + S_{22}t_2] + g\left[t_1 \frac{\partial X_1}{\partial t_2} + t_2 \frac{\partial X_2}{\partial t_2} + X_2\right] = 0 \qquad (7)$$

The next step is to transform expressions such as $\partial X_i/\partial t_j$ into S_{ij}. This can be done by noting that:

$$\frac{\partial X_i}{\partial t_j} = \frac{\partial X_i}{\partial P_j} \quad \frac{\partial P_j}{\partial t_j} = \frac{\partial X_i}{\partial P_j} \quad (\text{since } P_j = 1+t_j)$$

and recalling the Slutsky equation

$$\frac{\partial X_i}{\partial P_j} = S_{ij} - X_j \frac{\partial X_i}{\partial y}$$

Substituting the right hand side of the Slutsky equation for $\partial X_i/\partial t_j$ into (6)

$$-[S_{11}t_1 + S_{12}t_2] + g\left[t_1\left(S_{11} - X_1 \frac{\partial X_1}{\partial y}\right) + t_2\left(S_{12} - X_1 \frac{\partial X_2}{\partial y}\right) + X_1\right] = 0$$

Collecting terms in S_{11} and S_{12},

$$(g-1)[S_{11}t_1 + S_{12}t_2] = g\left[t_1 \frac{\partial X_1}{\partial y} + t_2 \frac{\partial X_2}{\partial y} - 1\right] X_1$$

$$\text{or } S_{11}t_1 + S_{12}t_2 = C X_1 \qquad (8)$$

$$\text{where } C = \frac{g}{g-1}\left(t_1 \frac{\partial X_1}{\partial y} + t_2 \frac{\partial X_2}{\partial y} - 1\right)$$

Similarly (7) can be reduced to:

$$S_{21}t_1 + S_{22}t_2 = C X_2 \qquad (9)$$

(8) gives an estimate of the proportion by which the demand for X_1 would decline as a result of the taxes on X_1 and X_2. (9) states that the demand for X_2 should decline by the same proportion. It follows that (8) and (9) together imply that tax rates should be so chosen that the demand for both X_1 and X_2 declines by the same proportion (along compensated demand curves). This proposition, known as the Ramsey rule, is what we had set out to establish.

A special case of the Ramsey rule arises when the demands are independent (that is, when $S_{12} = S_{21} = 0$). The implications of the solution will be more clearly seen if derivatives are replaced by elasticities, and the amounts of tax payable by ad valorem tax rates. To do this, we divide both sides of (8) by X_1 and multiply the left hand side by P_1/P_1. Similarly, we divide both sides of (9) by X_2 and multiply the left hand side by P_2/P_2. We get

$$\left(\frac{S_{11}P_1}{X_1}\right) \frac{t_1}{P_1} = C \qquad (10)$$

$$\left(\frac{S_{22}P_2}{X_2}\right) \frac{t_2}{P_2} = C \qquad (11)$$

$$\text{But } \frac{S_{ii}P_i}{X_i} = \left(\frac{\partial X_i}{\partial P_i}\right)_U \frac{P_i}{X_i}$$

is nothing but the compensated elasticity of demand for the ith good with respect to its price (to be denoted by e_{ii}) and t_i/P_i is simply the ad valorem rate of tax (amount of tax as a proportion of the gross-of-tax price) for the ith good (to be denoted by r_i). Combining (10) and (11)

$$\frac{r_1}{r_2} = \frac{e_{22}}{e_{11}}$$

In words, this states that the tax rates should be inversely related to (compensated) price elasticities. This result is referred to as the inverse elasticity rule.

13. The derivation given here is suggested by an example in Arnold C. Harberger, "Taxation, Resource Allocation and Welfare", *Taxation and Welfare*, p. 48.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

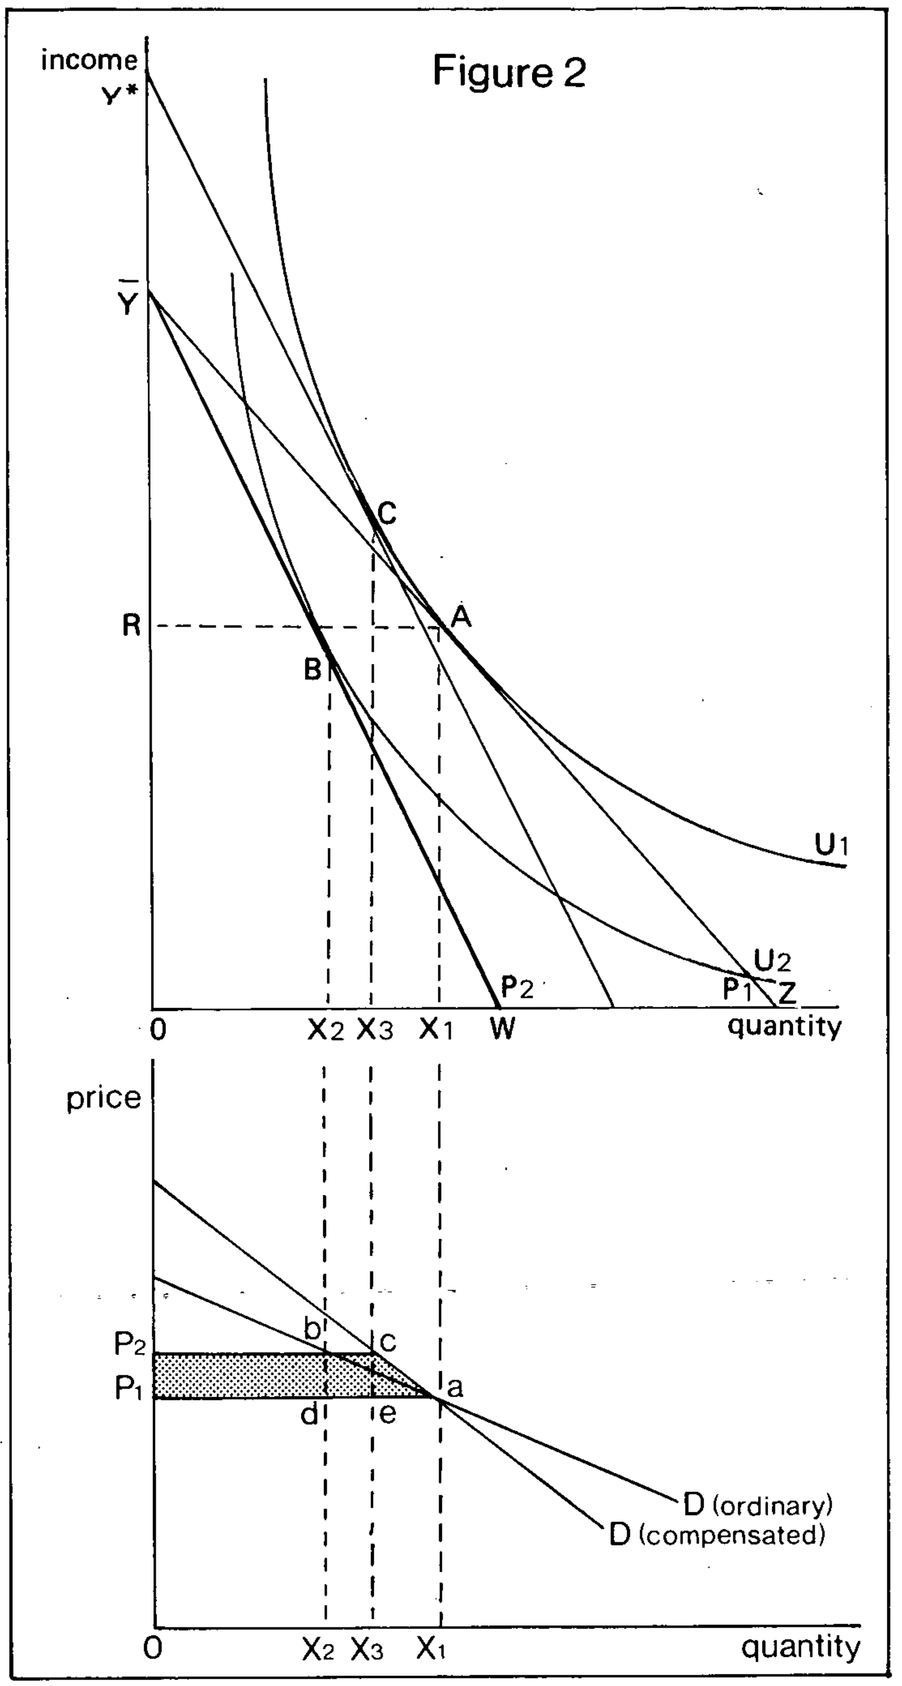
One special case where the conclusion of the traditional theory will hold when leisure cannot be taxed is worth noting.[14] This occurs when the supply of labor (and consequently the consumption of leisure) is fixed. Then, a tax at a uniform rate on all commodities other than leisure will not distort the structure of demand since the relative prices of taxed goods will remain unchanged, and the change in the relative price of leisure and other goods would not matter because the consumption of leisure could not be varied. The assumption that taxes do not affect the work-leisure choice lacks realism, however.

Optimal taxes have been discussed in relation to the allocation of resources. Equity considerations can also be introduced in the framework of optimal taxation.

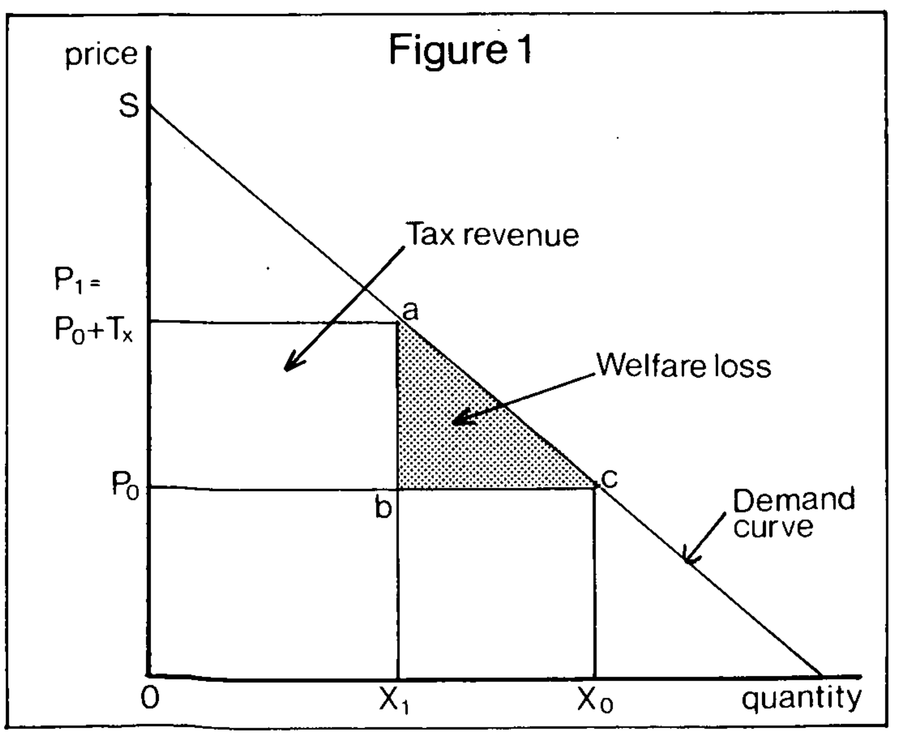
VII. CONCLUDING REMARKS

The increasing use of welfare cost calculations in applied public finance has stimulated renewed interest in better measures of consumer's surplus.[15] The usefulness of the concept of consumer's surplus for policy purposes has, however, always been surrounded by controversy.[16] The reader alone must, therefore, decide how much importance to attach to excess burden calculations in judging the merits of different tax reform proposals.

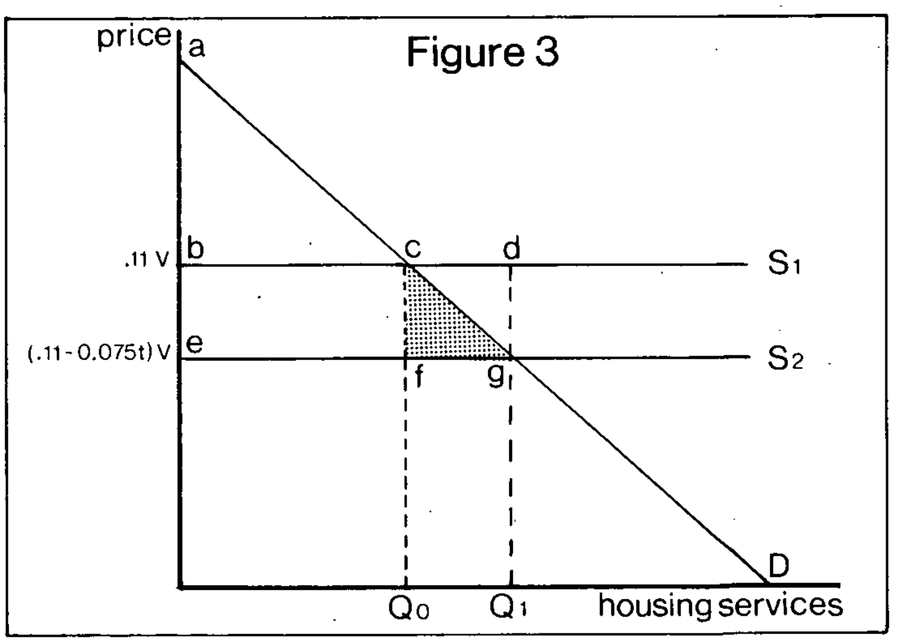
---



14. We have suggested, but not demonstrated, that a uniform rate of tax would be optimal when all final goods (including leisure) can be taxed. An equivalent expression for (3) when $T_i = t_i C_i$ and $C_i = 1$ is:



$$W = \tfrac{1}{2} \sum_i \sum_{j<i} S_{ij} (t_i - t_j)^2$$



It follows that the welfare loss will be minimum (in this case, nil) when tax rates on all goods (including leisure) are equal. See Arnold C. Harberger, "Taxation, Resource Allocation and Welfare", *Taxation and Welfare*, p. 39.

AUSTRALIA:

Avoidance of Income Tax: Trust Stripping *

This statement aims to make clear beyond all doubt that trust stripping schemes can no longer have their intended effect of enabling participants to avoid payment of income tax, and that taxpayers who pay fees to promoters for such schemes are simply wasting their money, as well as making themselves liable to heavy penalty taxes.

The essence of a trust stripping scheme is that income of a family trust is diverted, through a chain of trusts, to persons who are associated with the promoter but who do not pay tax on the income, perhaps because it has been moved off-shore to persons who are not residents of Australia for income tax purposes. The family members enjoy the benefit of the income, less the promoter's fee, in a non-taxable capital form.

Anti-avoidance legislation dealing specifically with these schemes has been enacted, with effect from 12 June 1978, and was the subject of amendments of a strengthening nature, operative from 6 March 1980.

The practical effect of that legislation, where it applies, is to tax the income in the hands of the last trustee in the chain, at the maximum rate of personal income tax, 60%. This basis of taxation accords with the general rule of the income tax law that income of a trust to which no beneficiary is presently entitled is taxed in the trustee's hands at the rate of 60%.

Trust stripping arrangements are also within the scope of the new general anti-avoidance provision of the Income Tax Assessment Act, Part IVA. Under that provision a person is taxed on income which might reasonably be expected, but for a tax avoidance scheme, to have been derived by the person as income subject to income tax. The family members from whom income is diverted under a trust stripping arrangement are accordingly taxed as if they had received the income.

Where Part IVA applies to strike down a tax avoidance scheme, the persons concerned are liable to pay not only the amount of tax sought to be avoided but also additional tax by way of penalty of an additional 200% of the basic tax.

It has recently come to the Government's notice that, despite its resolute attacks on these tax avoidance schemes, some promoters continue to market them. An outline of known features of schemes that have come under notice is contained in an appendix to this statement.

While the Commissioner of Taxation has come into possession of details of a number of such schemes, those who promote them make it their business to keep details away from the tax authorities and even, in some critical respects, away from taxpayers to whom the schemes are offered. Their aim in doing this is to delay administrative consideration of the schemes for as long as possible and the payment of tax ulimately found to be payable. It is because of this reticence that some of the examples in the appendix are sketchy.

The attempted exploitation involved in all of these schemes is blatant. A legal opinion used to assist in marketing the first of the schemes runs to some 54 pages and discusses at length the possible obstacles to the success of the scheme.

In discussing the possible impact of Part IVA, counsel writes:

> "The present proposal clearly involves a 'scheme' as defined, and it will be one entered into after 27 May 1981. It is hard to contest the view that it 'would be concluded', after considering the various matters listed in section 177D, that the dominant purpose of those who entered into it and carried it out was to effect a tax saving for the client group. But not all tax savings or adventages are within the definition of 'tax benefit'. For the Part to have an adverse effect upon [the client's trust] or any member of the client group it is necessary for the Commissioner to nominate a particular taxpayer, and a particular amount of assessable income which amount 'would have been included, or might reasonably be expected to have been included' in the assessable income of that taxpayer: section 177C(a). It is only where that can be done that the Part enables the Commissioner to assess."

While in this and other opinions on the matter, counsel put a number of arguments to the effect that the specific and general anti-avoidance provisions do not apply, the key line of argument is that it cannot be said in a number of cases that, but for the scheme, an amount would or might reasonably be expected to have been included in a particular beneficiary's assessable income.

The Government has sought the advice of the Commissioner of Taxation about the likely efficacy of the latest schemes. The Commissioner is strongly of the view that the courts will uphold his contention that it is practicable to find the identity of the persons who would have derived the income, or might reasonably be expected to have derived it, but for the scheme. On that basis there could on one view of things be no need for Government action – in due course persons concerned will be liable to pay the tax along with the penalty tax.

However, the fact remains that promoters are blatantly offering these schemes for sale. Equally, the Government cannot accept that such schemes should have even the remotest chance of success, either to escape payment of tax altogether or to defer its payment until after the process of appeals has been concluded.

The Government has considered whether Part IVA should be amended, but has concluded that it should not. The central test – whether there is an omission of income that otherwise might reasonably be expected to have been included in the taxpayer's assessable income – is, in the Government's view, a correct one. To express it in other terms would probably involve conferring on the Commissioner of Taxation the onerous responsibility of selecting, on a discretionary basis, the person to be

---

* Statement of 11 May 1982 by the Treasurer, the Hon. John Howard, M.P.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

taxed. That, in the Government's view, is the least attractive of the possible options.

Rather than adopt such a course, the Government intends to follow a procedure it has followed in relation to what have become known as "expenditure recoupment" schemes of tax avoidance. I indicated in a statement on 24 September 1978 that if further "expenditure recoupment" schemes were to surface, remedial legislation would be brought forward and be effective from that day. The Government has on subsequent occasions given effect to this warning, the most recent occasion being that of my statement of 9 February 1982 about certain tax rebate schemes of the "expenditure recoupment" type.

Accordingly, I now announce that, should existing legislation be found inadequate to strike down any scheme of the trust stripping type, the Government will introduce appropriate remedial legislation. That legislation will have effect after today, that is, it will apply to trust income of the current and subsequent income years, except where the income has been paid to or applied for the benefit of a beneficiary before tomorrow. The legislation will be structured so that tax is borne by the persons who are found to have rights to effectively enjoy the income, whether in a capital form or in any other way. Depending on the structure of the particular schemes, collection of the tax could be from beneficiaries, trustees or any other participants.

Although this action will make it certain that the tax will be paid, participants in trust stripping schemes cannot be allowed to have the advantage of a postponement of the time of payment of the tax. Therefore, I also make it clear that any legislation that it becomes necessary to propose will in addition make the people concerned liable to pay as penalty tax an amount at least as great as that which applies at present under Part IVA.

This statement is a clear and unambiguous warning as to the Government's intention in this matter.

Appendix to Treasurer's Statement of 11 May 1982

Trust strip using Australian and overseas trusts (1)

- The client's family trust makes a distribution of its income to a trust controlled by the promoter which, in turn, distributes the income to a third trust also controlled by the promoter.
- The trustee of the third trust distributes an amount representing the promoter's fee to a further trust controlled by the promoter. The trustee then resolves to hold the balance of its income for the benefit of an Australian unit trust, with the claimed result that the unit trust will in turn be deemed to be presently entitled to that income.
- The trustee of the third trust then enters into arrangements designed to ensure that the amount of the income, net of the promoter's fee, is in reality retained by the client's family trust. This is achieved by the trustee of the third trust lending the equivalent amount, in exchange for a promissory note, to a trust controlled by the client. That trust then uses the funds represented by the loan to purchase assets from the client's original family trust.
- The income to which the Australian unit trust has been made presently entitled (net of the "fee" distribution to the promoter's trust) is, without funds ever leaving Australia, successively applied for the benefit of six trusts each of which is established in Nauru. The income is accumulated in the sixth Nauruan trust.
- It is claimed that the income is no longer attributable to Australian sources. However, in the event that that claim is not successful and section 100A of the Income Tax Assessment Act applies to deem the trustee of the sixth Nauruan trust not to be presently entitled to the income a further mechanism is built into the scheme with a view to ensuring that the trustee of the fifth Nauruan trust is not subject to assessment under section 99A of the Act.
- Under this, a United Kingdom company becomes entitled to the income of the fifth Nauruan trust in the event that the trustee of that trust does not exercise its discretion to apply income for the benefit of the sixth Nauruan trust (i.e. in the event that section 100A applies to deem the sixth Nauruan trust not to be presently entitled to the income). The resultant income of the U.K. company is claimed to be exempt from Australian tax under the double taxation agreement with the U.K. by virtue of the income being "industrial or commercial profits" not attributable to a permanent establishment in Australia. The income is said not to be subject to tax in the U.K. as it is a fictitious entitlement to income that arises solely by the operation of Australian tax law.
- The final stages of the arrangements involve the sixth Nauruan trust lending an amount equal to the accumulated income to a seventh Nauruan trust which then subscribes for units in an eighth Nauruan trust which, in turn, settles the amount on a ninth Nauruan trust, which is capable of being controlled by the client.
- Ultimate beneficial entitlement to the funds represented by the promissory note issued by the client's second trust ends up with the ninth Nauruan trust and arrangements are made so that if the promissory note is presented to the client's trust for payment the client is able to obtain practical control of the trust.

Trust strip using Australian and overseas trusts (2)

- The scheme promoter's finance company makes a loan to an Australian discretionary trust controlled by the promoter by accepting a demand bill.
- The promoter's discretionary trust purchases units in the promoter's fixed unit trust by endorsing the bill to that trust.
- The promoter's fixed unit trust purchases – by further endorsement of the bill – special limited income units in a Northern Territory unit trust presently controlled by the taxpayer through a related discretionary trust holding a controlling interest in ordinary units. The limited income units are capable of being converted to ordinary units by a specified date.
- The Northern Territory unit trust then makes a loan to the client's operating trust, the income of which is to be stripped, by further endorsing the bill.
- The client's operating trust (which in the case of "in-house" arrangements may be the promoter's own trust having income that flows to it under other avoidance arrangements) then distributes its income down a chain of Australian trusts to the promoter's discretionary trust by further endorsements of the bill. The promoter's discretionary trust then repays its debt to the finance company by endorsing the bill.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

- The preceding steps complete a round-robin, the result of which is to ensure that the amount of the income of the operating trust is retained by the trust. As part of the scheme, the right of conversion attaching to the limited income units held by the promoter's unit trust lapses, ensuring that control of the Northern Territory unit trust (and so of the outstanding debt of the client's operating trust in respect of the loan) is retained by the client.
- An Australian unit trust is then made presently entitled to the income of the promoter's discretionary trust, which is represented by its present entitlement from the preceding trust in the chain.
- The present entitlement is then passed down through a number of foreign trusts to a Canadian resident. Again it is claimed that the income is no longer attributable to sources in Australia. The arrangements also incorporate the use of "secondary beneficiaries", similar in nature to those under the preceding scheme.
- The Canadian entity assigns its right to the trust income to a Nauru trust which gifts the right to the income to the promoter's fixed unit trust. This step is designed to ensure that the Australian unit trust and the trusts in the foreign chain are presently entitled to the relevant trust income.

Trust strip using Australian and overseas trusts (3)

- The client's operating trust (which again, under certain "in-house" arrangements, may be the promoter's own trust) distributes its income in the form of a bill of exchange through a chain of Australian trusts associated with the promoter.
- The last Australian trust assigns the bill of exchange to a discretionary trust (controlled by the taxpayer) in exchange for an unsecured note. The discretionary trust makes a loan to the operating trust by endorsing the bill of exchange in its favour.
- The effect of these arrangements is to complete a round-robin, by which money represented by the bill of exchange remains with the client's operating trust.
- The last Australian trust resolves to distribute the income to a tax haven trust in Nauru and holds the unsecured note for that trust.
- The tax haven trust sells its interest in the unsecured note to a second Nauru trust which in turn sells the note to a foreign company controlled by the client, or associates of the client, ensuring that there is no outstanding liability on the part of the client. The net result of this and the round-robin of the bill of exchange is to ensure that the amount of the income is in reality retained by the client's operating trust.
- The tax haven trust borrows from an associated tax haven trust and distributions of income in the form of a bill of exchange occur down a chain of foreign trusts. It is claimed that the income is no longer attributable to sources in Australia or, if that claim is not successful, that the income is exempt from Australian tax by virtue of the "business profits" article of Australia's double taxation agreement with Canada – the country of residence of the last two entities in the chain.
- The final entity in the foreign chain – a Canadian company – claims to avoid any liability to tax in that country offsetting assessable trust distributions by deductible interest payments which arise as part of the scheme. In addition no Canadian interest withholding tax is said to be payable because of the terms of the particular loan agreements.
- The off-shore arrangements, including the interest commitments, are financed by a complex series of round-robin transactions using a tax haven company.
- The client's operating trust passes a fee to the promoter by way of a second and parallel set of trust distributions down a second trust chain.

Trust/gift distribution scheme

- The operating discretionary trust distributes its income to a related discretionary trust, the beneficiaries of which are the same or substantially the same as those of the operating trust.
- The related trust invests the whole of the amount of the income in subscribing for special "A" class redeemable preference shares in a newly established private investment company, thereby acquiring control of that company.
- The company then lends an amount equivalent to the amount subscribed for the shares back to the operating trust.
- The preceding steps complete a round-robin, the net result of which is that the income of the operating trust is in reality retained by that trust.
- The beneficiaries of the related trust are made presently entitled to the income of the trust (now represented by the special "A" class redeemable preference shares), subject to their using that present entitlement to acquire the preference shares.
- The beneficiaries are "invited" to donate those shares to a charity, gifts to which are deductible for income tax purposes. The deduction claimed in respect of the gift is equal to the amount of the assessable trust distribution.

Trust strip through use of charitable trusts

- The client's discretionary trust distributes its income to a trust controlled by the promoter. The beneficiaries of that trust are the unborn children of the client and a further trust controlled by the promoter.
- The promoter's trust then distributes the income to the second trust controlled by the promoter, which in turn distributes the income to a "charitable trust".
- The charitable trust distributes the income to a second "charitable trust", the income of which is claimed to be exempt from income tax.
- The second charitable trust distributes a minor part of the trust income to a charity. The major part of the income is distributed to a specied individual beneficiary. It is claimed that the income from the exempt trust retains its exempt character in the hands of the beneficiary.
- A separate promoter entity reimburses the client's discretionary trust by way of a collapsible loan, i.e. a loan not intended to be repaid.

Family trust stripping scheme

- The trustee of a new discretionary trust is introduced as a beneficiary of a family trust.
- The initial beneficiaries of the new discretionary trust are the family members and the trustee of a trust controlled by the promoter.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

- Subsequently, the family members are excluded as beneficiaries both of the family trust and of the new discretionary trust.
- The original family trust then derives income from a distribution from a family company, which is in turn distributed to the new discretionary trust.
- The new discretionary trust then enters into arrangements designed to return the amount of the income to the family. These involve the trustee subscribing for special redeemable preference shares in a company, which are subsequently forfeited. The company then reimburses the family interest, either directly by the settlement of trusts for the benefit of the family members, or by settlements in favour of an associate which will acquire (and forfeit) redeemable preference shares in a company controlled by the family group.
- A further promoter's unit trust is then made "presently entitled" to the income of the new discretionary trust, which is represented by its present entitlement to the original family trust's income.
- The second promoter's unit trust "deals" with the distribution in ways that have not been disclosed.

Conference Diary

NOVEMBER 1982

Management Centre Europe: 11th International Finance Conference: Changes in international finance and their implications for business (including: Financial and tax incentives aimed at attracting investments). Geneva (Switzerland), November 3-5 (English).

Horizon International Tax Management: Tax and legal counseling for the foreign client (Seminar). Los Angeles California (U.S.A.), November 5 (English).

International Tax Planning Association: Singapore Seminar (including: South East Asia as a base for international transactions; current developments in international tax planning). Singapore (Republic of Singapore), November 10-12 (English).

Management Centre Europe: Leasing; techniques and analyses (including: Tax aspects of leasing). Brussels (Belgium), November 17-19 (English).

Tax Affairs Foundation of the Philippines: 2nd International Tax Convention. Singapore (Republic of Singapore), November 26-30 (English).

Steuer-Telex-Seminar: International Tax Law; (in particular business relations between Germany and Austria from a tax point of view). Vienna (Austria), November 19-20 (German).

DECEMBER 1982

Management Centre Europe: Taxation of International Group Companies and Branches (including: Taxation of branches and subsidiaries; taxation of shareholders; domestic and tax treaty "anti-avoidance" measures) (Seminar). Brussels (Belgium), December 2-3 (English).

Terzake Belastingen: Tax aspects of Doing International Business. Amsterdam (Netherlands), December 2 (Dutch).

Management Centre Europe: International cash management (including: International tax aspects in cash management). London (United Kingdom), December 6-8 (English).

Management Centre Europe: Stanley B. Lubman on China (including: The joint venture income tax law; the tax on individual income; the tax on foreign enterprises; recent regulations and interpretations by central and local tax authorities). Brussels (Belgium), December 9-10 (English).

U.K. Tax Congress: 2nd Annual U.K. Tax Congress (including: Current uses of U.K. offshore tax havens; taxation of commercial interest; tax deferral opportunities for individuals). London (United Kingdom), December 9-10 (English).

OCTOBER 1983

The Taxation Institute of Australia: Sixth National Convention (including: The role of the High Court in interpreting tax statutes; taxation of technology; tax shelters and planning for the '80s). Melbourne (Australia), April 10-15 (English).

37th Annual Congress of I.F.A.: I. Tax avoidance/tax evasion. II. International problems in the field of turnover taxation. Venice (Italy), October 10-15 (English, French, German, Spanish).

In memoriam

Professor Dr. J.C.L. Huiskamp

IFA announces with great sorrow the untimely death of its Assistant Secretary General, Professor Dr. J.C.L. Huiskamp, on 13 September 1982. His health had been indifferent during the last years but this did not prevent him from accomplishing the many tasks he imposed on himself. IFA is in particular grateful for the work he performed on its behalf.

Professor Huiskamp started his career in 1952 as a research associate with the International Bureau of Fiscal Documentation, where he worked with an interruption of some time for 15 years. He was the Editor-in-Chief of the *Bulletin for International Fiscal Documentation* and in 1967 he became one of the Bureau's deputy directors. In 1971 he left the Bureau and accepted a post as associate professor at the Erasmus University in Rotterdam and deputy director of the *Institute for Fiscal Studies*. Later he became a full professor and the director of that Institute.

His friends know that Joop Huiskamp had many adversities in his life and that only in the last few years did he again find happiness with his wife Lenie. We all mourn a dear friend whose capability and integrity were above question.

Some Highlights from the Secretary General's 1981-82 Report Presented at the Montreal Congress 1982

BERLIN CONGRESS 1981

The 35th Congress of IFA took place in September 1981 in the International Congress in West Berlin under the supervision of Dr. Karl Beusch, Chairman of the German Branch of IFA, assisted by Mr. Arnold Willemsen and Dr. Karl-Dieter Wingert.

With respect to Subject I – "Mutual agreement – Procedure and practice" – Prof. Dr. H. List (Federal Republic of Germany) acted as Chairman of the Working Session, Prof. Dr. P. Fontaneau (France) as discussion leader, Dr. K. Koch (Federal Republic of Germany) as General Reporter and Messrs. P.E. Coates (U.S.A.), J. de la Villa Gil (Spain), D.A. Ward (Canada) and J. Westenburgen (Netherlands) as panelists.

With respect to Subject II – "Unilateral measures to prevent double taxation" – it was Mr. J. Olinger (Luxembourg) who acted as Chairman, Prof. Dr. E. Höhn (Switzerland) as discussion leader, Dr. D. Juch (Netherlands) as General Reporter and Messrs. A. Timbart (France), G. Hill (Australia), R. Aguirre (Mexico) and H. Roe (United Kingdom) as panelists.

Chairman of the Seminar on "Taxation of the income arising from the international seabed" was Prof. Dr. K. Vogel (Federal Republic of Germany) and panelists were Messrs. C.M. Bruce (U.S.A.), Dr. P. Kirthisingha (UNCTAD), Dr. K. Oetting (Federal Republic of Germany) and Mr. J.C. Delespaul (France). These gentlemen were also instrumental in writing background papers to the Seminar provided to the participants in their congress kits.

MITCHELL B. CARROLL PRIZE

Dr. Moris Lehner (Federal Republic of Germany) won the Mitchell B. Carroll Prize 1981 for his work entitled *Möglichkeiten zur Verbesserung des Verständigungsverfahrens auf der Gundlage des EWG-Vertrages* (Possibilities of improving the mutual agreement procedure within the scope of the EEC Treaty).[1]

IFA OFFICERS COME AND GO

The Executive Committee regretfully announces the premature death of its member, Dr. Robert Bechinie, Chairman of the Austrian Branch. Two new members were appointed: Mr. M. Marin Arias (Spain) and Mr. R. Koch-Nielsen (Denmark). Dr. Antal (Netherlands) was replaced by Prof. A. Nooteboom, currently the Chairman of the Dutch Branch.

Mr. Graeme Herring (Australia) will be due for statutory retirement at the Montreal Congress.

NATIONAL BRANCHES

At the Berlin Congress the Singapore Branch was recognized. Sri Lanka is also interested in forming a branch and Mr. Ambalavaner has submitted a draft constitution for approval. A number of branches have faithfully sent reports on their branch activities and it is hoped that other branches will follow suit. There have been a number of bilateral meetings, e.g. the Belgo-Luxembourg Branch held a joint seminar with the German Branch.

MEMBERSHIP FEES

IFA will recommend – for the second consecutive year – not to increase the membership fees for 1982-83. Thus they will remain:

- US$ 38 for individual members of IFA branches;
- US$ 40 for direct individual members of IFA;
- US$ 90 for corporate members, both direct and of national branches.

MONTREAL CONGRESS 1982

At the time of writing the 1981-82 Report, preparations for the Montreal Congress were nearing completion. General Reporters are Prof. E. Höhn (Switzerland) and Me. G. Coulombe (Canada) for Subject I and Subject II respectively. The discussion leader will be Mr. R.M. Hammer (U.S.A.) and Prof. I. Claeys Bouuaert (Belgium). The Chairmen of the Resolutions Committees are Prof. Dr. H. Vogel (German Federal Republic) and Dr. R. Casas (Mexico).

The Seminar to be organized by IFA will have as its subject "Imputation Systems – Objectives and Consequences", and it will be chaired by Mr. D.A. Ward (Canada). Panelists will be Mr. P. den Boer (Netherlands), Mr. D.R. Tillinghast (U.S.A.), Dr. S. Mayr (Italy), Mr. S. Wright (U.K.), Mr. S. Poddar (Canada), Dr. P. Franken (German Federal Republic), Prof. P. Fontaneau (France), and Mr. A. Buelinckx (Belgium).

The Canadian Branch will organize two seminars, one on the Canadian tax system and one on the draft Canadian–U.S.A. tax treaty. Booklets containing background information will be prepared by Canadian tax experts.

FUTURE CONGRESSES

1. Venice Congress 1983

During its spring meeting the Permanent Scientific Committee discussed the directives for the Venice Congress. The subjects are:

Subject I: Tax avoidance/Tax evasion.
General Reporter: Prof. V. Uckmar (Italy).

Subject II: International problems in the field of general taxes on sales of goods and services.
General Reporter: Prof. DDr. H.G. Ruppe (Austria).

2. BUENOS AIRES CONGRESS 1984

The subjects which were selected for the Buenos Aires Congress are:

Subject I: Tax factors affecting the international flow of capital between the parent and its subsidiary.
The General Reportership is still under discussion, and will be known finally during the Montreal Congress.

Subject II: Social security contributions as a tax factor for enterprises engaged in international activities.
General Reporters: Profs. E.J. Reig and J. Macón (Argentina).

COLOMBIAN BRANCH OF IFA

Recent activities

The Colombian Branch of IFA currently has 41 active members including many leading experts in tax matters. Since June 1981 the Executive Committee has accepted five new members who have had a distinguished career in taxation. Some of its active members have been called upon to serve their country in high positions. For instance, Dr. Bernardo Ortiz has recently been appointed President of the Council of State and Dr. Simón Rodríguez President of the Administrative Court of Cundinamarca. The present National Director of Taxes has also been a member of IFA for serveral years. In addition, the Colombian Branch includes a number of former Finance Ministers, former directors of taxes and leading lawyers and professors specialized in taxation and public finance among its members.

The Executive Committee, which was appointed in June 1981, considered the legal regime for foreign investments of utmost importance and therefore focussed its efforts on organizing a seminar on this subject. This seminar was held on 26 February 1982 and lasted 10 hours and attracted 80 participants. Papers were read by five members of the Colombian Branch on the following subjects:

- The development of the institutional framework and foreign investment policy;
- Legal and exchange regimes;
- Tax treatment of profits; accounting and tax relations with the head office;

© 1982 International Bureau of Fiscal Documentation – BULLETIN

- Technical assistance and services, know-how and royalties;
- Public contracting – consortia and their tax treatment.

Other activities included the organizing of luncheon meetings which were devoted to the discussion of selected subjects. At one of these meetings members of the Bird-Wiesner Commission were invited to discuss a number of interesting issues dealt within their report on public finance which was prepared at the request of the national government. In November 1981, Dr. Carlos Ramírez presented his report on the "Tax treatment of interest in international economic transactions" which he prepared for the Montreal Congress.

These luncheons serve, in addition, to inform the members on subjects selected for future IFA congresses as well as to examine and comment on other activities of the Colombian Branch. A special task undertaken by the Branch is the publication of a bibliography and articles on tax subjects, including comparative tax law. For this purpose the *Bulletin for international fiscal documentation* has been of valuable assistance. Unfortunately, however, due to language barriers, these articles cannot be as widely distributed and used as they deserve.

MALAYSIAN BRANCH

On 11 June 1982 the Malaysian Branch of IFA held its inaugural meeting. On that occasion, Mr. Angel Q. Yoingco, Director of the National Tax Research Center, Republic of the Philippines, delivered a talk on Regional Cooperation in Taxation. The major part of this talk is reproduced here.

It does feel grand to be given the honor of being the guest speaker for the inaugural luncheon meeting of the Malaysian chapter of the *International Fiscal Association*. In the Philippines, we term this privilege as "buena mano." In commercial parlance, he is the first morning buyer. Normally, he is supposed to bring good luck to the business. I hope I brought all the luck with me. It may interest you to know, that I have a high batting average when it comes to being a lucky "buena mano."

I cannot help but entertain some suspicions however, on why I was extended this invitation by Mr. Lee Beng Fye, Secretary General of 12th SGATAR meeting and Tan Sri Lim Leong Seng, former Director General of your Tax Department and now Chairman of IFA, Malaysian chapter. Let me reflect aloud on two possible reasons.

First, being Mr. Lee Beng Fye's personal friend, I strongly suspect that he virtually pressured you in having his friend as the guest speaker.

Second, I would like to think that being the only participant who has been with the Study Group on Asian Tax Administration and Research (SGATAR) from the day it was conceived in 1970 until today, gives me enough experience to speak before a group of learned men.

Given the prerogative to make the choice, I shall take the last reason as the most plausible rationale why you have invited me. It is also for this reason why I chose to speak on a topic that is close to my heart and is of concern and interest to you: *Regional Cooperation in Taxation*. Let me warn you at this point that my ghost writer differed in his opinion of what I should talk about. Thus, he prepared a speech for me on an entirely different topic. I was therefore left on my own to prepare my short discourse for this afternoon.

The opening remarks of the Mayor of Copenhagen to the 1979 IFA meeting lucidly summarized the dilemma of many developing countries: The appetite of the public for paying taxes is not as strong as their demand for government services. Governments constantly face the problem of financing their continuously rising budgets. Quite commonly this situation will be met either through the increase in existing tax rates or through the enactment of new taxes. This process cannot go on indefinitely as there is a limit to taxation. At some point in time, taxation will affect incentives to work and invest. Already, we witness an evidence of people's aversion to taxes through non-compliance with tax laws. Policy makers must therefore find other avenues to increase the productivity of their tax systems. It is along this need that regional cooperation in taxation aside from bilateral tax treaties finds relevance. Through regional organizations countries can share information on tax policies, practices and experiences. They can also provide a forum where policy makers and administrators can learn from one another through study groups and regular meetings especially with regard to the improvement of tax administration.

A more concerted effort is also needed in confronting the problem of taxing multinational companies effectively. Given the lack of resources to adequately check the financial records of these corporations, countries, especially developing ones, should get more organized to draw up tax laws and measures to face the MNC's strategies in minimizing tax liabilities like the use of tax havens.

The other area calling for regional cooperation in taxation is the needed tax coordination for the elimination of trade barriers and the promotion of investments through the tax instrument. EEC countries for example tend to harmonize their tax laws to promote the free flow of goods and services in the region.

Among others, these could have spurred the organization of regional tax organizations. For the 20 Latin and American countries, there is the Centro Interamericano de Administradores Tributarios (CIAT) which was organized in 1967. The Caribbean Organization for Tax Administrators (COTA) organized in 1970 services the needs of countries in the Caribbean like Jamaica and the Dominican Republic. For members of the Commonwealth, the Commonwealth Association of Tax Administrators (CATA) has recently been founded. In Asia and the Pacific, we are proud of the SGATAR which had its first meeting in Manila in 1971.

A cursory look at the charters of these organizations reveal that they have common objectives. They purport to improve tax administration in member countries

© 1982 International Bureau of Fiscal Documentation – BULLETIN

through the mutual exchange of ideas and experiences; they aim to promote tax research and the conduct of studies on the various tax systems. They are also intended to review and exchange information about the tax policies and tax structures of member countries.

The fact that the said regional organizations have continued to function justifies their existence. I can speak more easily on SGATAR because I have seen it grow and mature. Although the structure of its membership has changed due to political developments in the region, the SGATAR now boasts of nine member countries as follows: Australia, Indonesia, Japan, Republic of Korea, Malaysia, New Zealand, Philippines, Singapore and Thailand. The SGATAR has provided an appropriate venue for cooperation and discussion in taxation among these member countries. In its annual meetings, member countries have freely discussed their ideas, practices and experiences on about 41 major topics in taxation such as direct taxation, incentive taxation and tax administration.

The problem of tax evasion has been discussed in almost three meetings. In the 1979 Manila meeting, the member countries identified the following as the most common forms of tax evasion:

1. Unreported income of taxpayers through non-filing of returns, omission of certain types of income like dividends and interest.
2. Understatement of income through reduction in or non-recording of sales and incorrect accounts.
3. Improper and unallowable deductions; and
4. False allocation of income through, among others, false charges for salaries and diversions to fictitious partners.

Member countries exchanged experiences in coping with evasion practices. Indonesia and Malaysia conduct inspection of business and residential premises, as well as examination of books of accounts. Japan resorts to auditing of books and other evidential documents, books of the taxpayer's business counterparts and simultaneous auditing of the head office and its branches. New Zealand and Japan use counterpart audit of bank accounts to check cases of tax fraud.

In the 1978 Wellington meeting, member countries acknowledged common problems with regard to the taxation of multi-national corporations. The difficulties as shared were mainly brought about by the following factors:

1. Insufficient information held by the resident company or subsidiary on the methods applied by the overseas parent company in fixing prices and other charges;
2. Lack of expertise on the part of tax officials in handling tax audits and investigations;
3. Inadequate comparative information, particularly where the MNC is in a monopoly situation; and
4. The processing of accounting information through highly sophisticated computer systems which are programmed and controlled within the parent company's country of residence.

To overcome the above problems, most SGATAR countries employ the "arm's length" method in determining the taxable income of MNC's. This means that the profit ratios expected are those that would have been derived had the parties to the tansactions been independent. Another technique employed by participating countries is the introduction of withholding tax systems at source with respect to payment of interest, dividends, and royalties to the parent companies. The Wellington meeting ended with an agreement of the need for greater cooperation and discussion among them in the exchange of information relative to MNC's.

The grant of fiscal incentives has also been a favorite topic for discussion in SGATAR as it has been studied in about three meetings. The dynamism of SGATAR and its response to the changing needs of the countries within the region are evident on the changing concept about tax incentives. In the 1971 Manila meeting, the participating countries were unanimous in acknowledging that fiscal incentives contribute to economic development by attracting investments into those areas which need to be developed. A minority pointed out however the disadvantages of granting liberal incentives which could cause, among others, undue competition among developing countries, in particular. This thinking became more pronounced in the 1975 Bangkok meeting. The delegates generally recognized that all concessions and incentives should be open to review and change with clearly stated time limits on measures such as tax holidays and deferred tax payments. It was also recognized that if all countries in the region were to use fiscal measures to promote exports, a conflict of interest may arise where two or more countries are exporting the same product. The 1975 meeting cautioned that developing countries should not compete excessively with one another in the grant of export concessions.

The attitude towards fiscal incentives radically changed in the 1980 Jakarta meeting. Some participants especially those from Singapore expressed doubt on the effectiveness of fiscal incentives in encouraging development and in attracting foreign investments. Malaysia and Japan could not say with certainty as to the extent the locational incentive was contributory to industrial development. The meeting concluded with the need of member countries to review their respective investment schemes.

Regional meetings in taxation such as the SGATAR do not only end up in conclusions and recommendations. The latter only serve as spring-boards in the introduction of improvements in the tax system of the participating country. They also serve as stimuli for regional projects and activities. Allow me to illustrate both.

1. An instance where one country learns from another is typified in the expansion of the tax withholding system of the Philippines. I have no doubt that the discussion of the Japanese withholding system during the 1976 Singapore meeting has given new insights to the Philippine participants. The Japanese delegation explained a comprehensive withholding scheme in Japan which covers wages, retirement allowances, interest, dividend and remunerations for almost every type of profession. The scheme as mentioned reduces administrative and compliance costs as well as assures a steady flow of government revenues.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The Philippine government introduced the expanded withholding system in 1978 which is similar in many respects to the Japanese system. Various forms of incomes are subject to a withholding tax ranging from 2½ to 35%. A feature has been added, however, in that the withheld tax is creditable.

2. The SGATAR has had opportunities for regional projects. Joint undertakings have been quite successful because of the cooperation of member countries. To date, SGATAR, has completed three publications which contain basic information about the tax systems in the region:

a. The *Glossary of Tax Terms* which is a handy compendium of the definitions of tax terms and phrases commonly used in SGATAR countries. It is intended to serve as a convenient reference material in international conferences, tax treaties and research studies.
b. The *Tax Systems of Selected Countries in Asia and the Pacific* is a synopsis of the tax systems in each of the SGATAR member countries and is aimed at providing information to investors, public officials, members of the academe and students.
c. The *Tax Administration Procedures of Selected Countries in Asia and the Pacific* analyzes the various stages of tax administration procedures in SGATAR countries and recommends measures to improve the efficiency in tax administration.

Cooperation among member countries has also been conducted informally. We have had chances of sending our personnel to train in taxation in other countries, such as in Singapore. The Philippine government, my office in particular, has also invited some of the tax personnel from SGATAR member countries including some junior tax officials from Malaysia to share our experience in policy formulation and research.

There are various areas in taxation through which countries in the region can help one another. SGATAR is one of the more effective tools for harnessing regional cooperation. It was in fact in the 1974 Malaysian meeting that the decision to continue SGATAR was firmed up due to the following reasons:

1. Immeasurable benefits are derived from the exchange of information among participating countries.
2. SGATAR meetings are opportunities for member countries to a) discuss problems and their possible solutions; b) keep abreast of new tax legislations and developments in other countries; c) share their experiences.

It is along these reasons that your chapter, the Malaysian IFA, International Fiscal Association, is looked upon with significance. In the IFA, you will study international and comparative law in regard to public finance. In connection with this objective, the birth of the Asian Pacific Tax and Investment Research Centre (APTIRC) based in Singapore is of common concern to us.

The speaker then went on by mentioning the International Bureau of Fiscal Documentation based in Amsterdam and founded by the IFA in 1938. The Bureau, so Mr. Yoingco said, is involved in the setting up of a similar research institution in Singapore. Mr. Yoingco, who is a member of that institution's founding committee, outlined some of the activities it may perform once it is established. He then continued:

Given your interest in fiscal matters not only in Malaysia but in Asia and the Pacific, I am positive that you will find APTIRC's objectives complementary to yours and its services as relevant to your needs. Prof. van Hoorn, in fact wishes your association success in a message to you which he requested me to relay. Let me quote a part of it:

On behalf of the International Bureau of Fiscal Documentation, a "child" of IFA born shortly after its mother's birth, I wish to congratulate the Malaysian chapter and to extend to all members my cordial greetings. The Bureau was originally meant to serve the members of the IFA. Now, it has a much broader objective, but my colleagues and I shall be at your disposal whenever you need our assistance. As a first token of friendship, I gave instructions to send to each member listed in the Yearbook of IFA a copy of the Bureau's annual report 1981. If it has not yet arrived, it should reach you shortly.

I wish the branch and each member a successful future in the field of our common interest.

In a way, I am more privileged than Prof. van Hoorn as I have this opportunity to personally wish all of you and the IFA, Malaysian chapter, success in all your undertakings. I hope that through a short discussion of the significance of regional cooperation in taxation, I have given you insights on how you can be of mutual assistance to each other within your organization and how you can reach out to others who are engaged in taxation outside Malaysia who may share your goals, interests and needs.

Thank you and Mabuhay.

SWISS BRANCH OF IFA

Overview of the activities in 1981

In 1981 the management of the Swiss Branch of IFA met three times. These meetings immediately preceded the general meetings of the members at which the subjects of discussion were current national and international developments. The management stresses the good relationship with the General Secretariat of IFA in Rotterdam (the Netherlands).

By the end of 1981 the Swiss Branch had 319 members (254 individual persons and 65 legal entities), i.e. 26 more than at the end of 1980. On 30 January 1980 Mr. Fritz Branderet (Head of the Legal Service of the Federal "Wehrsteuer" Division (income tax and net wealth tax)) of the Federal Revenue Service and Prof. Dr. Ernst Höhn, St. Gallen, read papers on "Income from capital and capital gains in income tax law". The discussion focussed on the practice of the Federal Court which considers tax-free capital gains as taxable income from capital. A number of delegates expressed their doubts whether this practice has a sound legal basis.[1] Another

subject which was discussed was an initiative taken by the Parliament of the canton of Graubünden with respect to the computation of the income of electric power stations working in more than one canton. The motives of the initiative were explained by Dr. T. Russi, Head of the Legal Service of the Tax Administration of Graubünden. The standpoint of the electric power stations and distributors of electricity was clarified by Mr. C. Hertig, notary and director of the Bernsche Kraftwerke AG. The problems have certain tax aspects and will also affect the users of electricity. The discussion showed that the problems could not be solved through the application of the Constitutional provisions prohibiting double intercantonal taxation.[2]

At the general meeting of 19 June 1982, Dr. K. Locher, Director of the Federal Revenue Service, Dr. Maurice Aubert, banker , and Dr. Lionel Frei, Division Head of the Federal Police Department, read papers on "Exchange of information in taxation". It was shown that the restrictive policy followed up to now by the Federal authorities has substantially changed. These changes are mainly based on Art. 3(3) of the new Federal Law on international aid in criminal cases of 20 March 1981 which will take effect on 1 January 1983. This provision will enable foreign States to obtain assistance from the Swiss authorities in cases of tax fraud, provided that a number of conditions have been met.[3]

During the meeting of 13 November 1981, Mr. Ludwig and Dr. Constantin reported on the results of the 1981 IFA Congress held in Berlin. The national reporters for the 1982 IFA Congress in Montreal presented their report. Dr. Alphons Schmid (Basel) treated the subject: "The tax treatment of interest in international economic transactions". In this connection it is noted that Prof. Dr. E. Höhn will be the General Reporter on this subject. Mr. George Muller (Lausanne) discussed the subject: "Taxation of payments to non-residents for independent personal services". Mr. Cl. Brélaz, President of the Appeal Committee of the canton Vaud, gave an overview of the work accomplished in harmonizing Swiss taxation.

OECD ACTIVITIES IN THE FIELD OF TAXATION

(January–June 1982)

During this period a number of important projects relating to tax policy issues and international cooperation have been completed. These are mentioned in the following paragraphs. In addition, the OECD Committee on Fiscal Affairs has continued to provide a forum where tax authorities of the OECD Member countries can meet regularly and exchange views on the current tax policy issues.

INTERNATIONAL COOPERATION

New OECD Model Double Taxation Convention on Estates and Inheritances and on Gifts

On 3 June 1982, on the proposal of the Committee on Fiscal Affairs, the OECD Council agreed to the derestriction of the new OECD Model Double Taxation Convention on Estates and Inheritances and on Gifts and recommended to Governments of OECD Member countries that they conform to the model when concluding new conventions or revising existing ones (see text in Annex below). This text will be published shortly.

Draft Multilateral Administrative Assistance Convention in Tax Matters

The Committee adopted on 7 July 1982 a draft Multilateral Administrative Assistance Convention in Tax Matters containing 35 Articles and the accompanying Commentaries which are for the use of the Council of Europe. It is expected that this draft will be forwarded to the Council of Europe in the Autumn when the OECD Council has approved its transmission. The draft will then be taken as a basis for the elaboration of an international convention.

Transfer Pricing, Corresponding Adjustments and the Mutual Agreement Procedure

A report on "Transfer Pricing, Corresponding Adjustments and the Mutual Agreement Procedure", which complements the 1979 OECD report on transfer pricing has been completed. The report assesses the legal and practical considerations involved in making use of provisions similar to those of Articles 9 and 25 of the 1977 OECD Model Convention and sets out the views of tax authorities of OECD Member countries on possible improvements in the mutual agreement procedure. The question is of considerable importance to private business. The text of the report will be available upon request as from the Autumn 1982 and is expected to be issued in printed form next year.

Specific activities

Other work related to international cooperation underway in the Working Parties deals with double taxation issues related to specific activities, such as leasing and improper use of tax conventions; on transfer pricing, the allocation of central costs, the tax treatment of foreign exchange gains and losses and transfer pricing in the banking sector are being examined. On tax evasion, key projects deal with the taxation of operations involving low-tax countries; consequences of bank secrecy for the administration of taxes and international cooperation; taxation of itinerant activities and hiring-out of labour and entertainment.

TAX ANALYSIS AND TAX STATISTICS

A new interpretative guide to the OECD Revenue Statistics series has been finalised and will be used for the 1983 data collection round. A report on tax collection lags will provide internationally comparable data on the lags between the collection of income taxes and the earning of the income which gave rise to the tax liability. It will be published next year but is already available on request. Reports on taxes on immovable property and on the macro-elasticity of the individual income tax will be finalized towards the end of 1982.

In July 1982, the Committee approved a new work programme for its Working Party No. 2 on Tax Analysis and Tax Statistics. The priority topics are: the interaction between inflation and the personal income tax systems; the use of tax expenditure budgets; quantitative illustration of corporate income systems; a review of the methods available to compare effective corporate tax burdens. The Group will continue to undertake international statistical comparisons on revenue statistics[1] and on the tax/benefit position of different income groups.[2]

Towards the middle of 1981, the Committee launched a new series entitled "OECD Studies in Taxation". It will be used to publish some of the more technical studies, mainly carried out by Working Party No. 2. The studies are, however, addressed to a wide audience and non-technical summaries are provided. To date, the following publications have been issued:

- The Impact of Consumption Taxes at Different Income Levels (June 1981);
- Income Tax Schedules: Distribution of Taxpayers and Revenues (November 1981);
- Long-term Trends in Tax Revenues of OECD Member Countries 1955-1980 (January 1982).

It is intended to publish in this series also the tax collection lags report and the macroelasticity report referred to above.

1. Last publication: Revenue Statistics of OECD Member Countries, 1965-1981, OECD, September 1982.
2. In October 1982 "The 1981 Tax/Benefit Position of a Typical Worker" will appear.

„Unternehmensbewertung"
eines der wichtigen Themen des

Steuerberater-Jahrbuch 1981/82

Zugleich Bericht über den 33. Fachkongreß der Steuerberater der Bundesrepublik vom 2.–4. 11. 1981. Herausgegeben im Auftrag des Fachinstituts der Steuerberater von Wp. und Stb. Prof. Dr. Rudolf Curtius-Hartung, Stb. Dipl.-Kfm. Dr. jur. Dr. rer. pol. Ursula Niemann und Stb. Prof. Dr. Gerd Rose. 473 Seiten DIN A 5, Ln. 85,– DM.
ISBN 3 504 62626 7

Das neue Steuerberater-Jahrbuch enthält wiederum alle Beiträge, die auf dem 33. Fachkongreß der Steuerberater gehalten wurden, in ungekürzter, zum Teil über den gegebenen Rahmen eines Vortrages hinaus erheblich erweiterter Form, sowie eine wörtliche Wiedergabe der Diskussion zu dem im Zentrum der Tagung stehenden Thema der Unternehmensbewertung. Auch für den 33. Band ist abermals kennzeichnend die Reichhaltigkeit der behandelten Themen sowie ihre gutdurchdachte Auswahl im Hinblick auf das, was derzeit im Vordergrund des Interesses von Wissenschaft und Praxis steht. Die hohes Fachwissen ausstrahlenden Beiträge zu den aktuellen steuerlichen Fragen sind nicht nur Wegweiser zur Fortentwicklung dieses Rechtsgebietes, sondern auch Marksteine einer bereits abgeschlossenen Bildung von Meinungen. Das gewohnt sorgfältig bearbeitete, differenzierte Stichwortverzeichnis bietet wieder eine praktische Hilfe, wenn es um die Lösung aktueller Steuerprobleme geht.

Aus dem Inhalt:

Stb. und Wp. Prof. Dr. Rudolf Curtius-Hartung, Vorsitzender des Fachinstituts der Steuerberater:
Zur Liebhaberei im Einkommensteuerrecht

Dr. Rolf Böhme, Parlamentarischer Staatssekretär im BFM:
Aktuelle Fragen der Finanz- und Steuerpolitik

Dr. Eckart Windel, Vorstandsmitglied des Pensions-Sicherungs-Vereins:
Pensions-Sicherungs-Verein (PSVaG) Praxis – Probleme – Prognosen

Heinz Gerlach:
Aktuelles zu steuerbegünstigten Kapitalanlagen aus der Sicht des Anlageanalysten

Dr. Adalbert Uelner, Ministerialdirigent im BFM:
Aktuelles zu steuerbegünstigten Kapitalanlagen aus der Sicht der Finanzverwaltung

Stb. Dr. Fritz Eggesiecker:
Aktuelles zu steuerbegünstigten Kapitalanlagen aus der Sicht des Steuerberaters

Prof. Dr. Dieter Schneider:
Kritische Anmerkungen zur Bilanzauffassung des Bundesfinanzhofs

Dr. Georg Döllerer, Vorsitzender Richter am BFH:
Die wesentliche Beteiligung im Ertragsteuerrecht

RA Dr. Wienand Meilicke:
Abzugsfähigkeit von Schuldzinsen – Ein Beitrag zur Vermeidung von Fehlern bei der Finanzplanung

Unternehmensbewertung

Dr. Carl Zimmerer:
Die Unternehmensbewertung in der Praxis

Prof. Dr. Walther Busse von Colbe:
Die Resonanz betriebswirtschaftlicher Erkenntnisse zur Unternehmensbewertung in der zivilrechtlichen und steuerlichen Rechtsprechung

Podiumsdiskussion
(Ltg. Dr. R. Curtius-Hartung):
Die steuerlichen Grundsätze der Unternehmensbewertung, insbesondere bei Anteilen von Kapitalgesellschaften

*

Stb. und RA Dipl.-Kfm. Horst Langel:
Ausgewählte Risiken bei der Umsatzsteuer zivilrechtlich – steuerrechtlich

Gustav Hübner, Ministerialdirektor im Bayerischen Staatsministerium der Finanzen:
Probleme des KStG 1977 aus der Sicht der Finanzverwaltung

RA Dr. Klaus Brezing:
Zwischenbilanz zum Körperschaftsteuergesetz 1977

Dr. Horst-Dieter Höppner, Vizepräsident des Bundesamtes für Finanzen:
Praktische Erfahrungen mit dem Außensteuerrecht aus der Sicht des Bundesamtes für Finanzen

RA Helmut Becker:
Praktische Erfahrungen mit dem Außensteuerrecht aus der Sicht des Steuerberaters

German Federal Republic

BECKER, Enno.
Die Grundlagen der Einkommensteuer.
Reprintausgabe.
Berlin, Verlag Neue Wirtschafts-Briefe, 1982. 548 pp., 98 DM.
Reprint of a source book entitled "The principles of income tax", first published more than 40 years ago. The book is not only of historical interest, but it is also of current interest to tax practitioners because of the many fundamental subjects discussed and the systematic explanation of the various concepts and of the references to various other legal provisions.
(B. 103.918)

TIPKE, Klaus.
Grenzen der Rechtsfortbildung durch Rechtsprechung und Verwaltungsvorschriften im Steuerrecht.
Cologne, Verlag Dr. Otto Schmidt, 1982. 446 pp., 85 DM.
Book containing a number of lectures dealing with various aspects of the question whether the courts and the tax administration may only interpret tax laws or whether they may extend the sense of the laws by analogy beyond the literal wording of the texts of the laws (and if yes, under what conditions).
The book also contains a number of surveys in which tax experts from various Western countries explain the situations in their countries.
(B. 103.873)

JOECKS, Wolfgang.
Rechtsprechung zum Wirtschafts- und Steuerstrafrecht.
Cologne, Dr. Peter Deubner Verlag, 1982. 232 pp., 78 DM.
Loose-leaf publication consisting of 116 summaries of court decisions regarding economic and fiscal criminal law, arranged and annotated in a systematic way. Updating suplements are published regularly.
(B. 103.905)

KNOPPE, Helmut.
Betriebsverpachtung, Betriebsaufspaltung.
Pachtverhältnisse gewerblicher Betriebe im Steuerrecht.
6. neuarbeitete und erweiterte Auflage.
Düsseldorf, IdW-Verlag, 1982. 398 pp., 65 DM.
6th edition of a book explaining the various tax aspects of leasing and splitting up of business enterprises, preceded by a general discussion of these topics and their meaning for tax law purposes.
(B. 103.876)

FICHTELMANN, Helmar.
GmbH & Still im Steuerrecht.
Cologne, Dr. Peter Deubner Verlag, 1982. 96 pp., 29.80 DM.
Monograph discussing the tax law aspects concerning a special form for business enterprises, i.e. a combination of a limited liability company (GmbH) and so-called typical silent company.
(B. 103.904)

ECKERT, Walter Ludwig.
Berufskompendium für Steuerberater, Wirtschaftsprüfer, Rechtsanwälte.
Beck'sche Textausgaben.

Contents

of the November 1982 issue

Sohrab Abizadeh and J.B. Wyckoff:

TAX SYSTEM COMPONENTS AND ECONOMIC DEVELOPMENT: AN INTERNATIONAL PERSPECTIVE .. 483
This article is a study of direct and indirect tax revenues in different countries at different stages of economic development. In the majority of cases studied, the structure of the tax system changes toward more intensive use of direct taxes as the nation's economy develops.

A.B.C. Emmanuel:

ZAMBIA'S 1982 BUDGET 491
The author discusses the recent "belt-tightening" Budget which relies heavily on the increase of indirect taxes.

Corazon P. Paredes:

RECENT CHANGES IN THE PHILIPPINE TAXATION OF INDIVIDUALS 493
In January 1982 the so-called modified gross income tax was introduced in the Philippines replacing the former tax on global income. The new tax is schedular and it is levied on three main types of income: compensation income (earned income), business income and passive income at varying rates.

A.C. Ezejelue:

RESIDENCY CONCEPT AND EMPLOYMENT INCOME IN NIGERIA 498
The provisions in Nigerian Income Tax Law with respect to the taxation of foreign nationals working in Nigeria are rather confusing. The author gives his opinion on the present status of law and shows when such persons are taxable in Nigeria or when not.

CONFERENCE DIARY 500

H.W.T. Pepper:

TAX CHANGES IN JAMAICA: THE 1982-83 BUDGET 501
The Government has been able to introduce a Budget without imposing new taxes, partly because of increased collection of taxes in arrear. The author discusses a number of changes which have been proposed to improve existing taxes.

JAMAICA: BUDGET 1982-83 502
Extracts from the Budget Speech pronounced on 22 April 1982 by the Hon. Edward Seaga, Prime Minister and Minister of Finance and Planning.

D.K. Uttum Corea:

BOTSWANA: THE FINANCIAL ASSISTANCE PROGRAMME 504
This article describes the proposals contained in a recent white paper, the report of an inter-ministerial working group and the income tax amendments mentioned in the Budget Speech 1982-83.

REVISED DOUBLE TAXATION CONVENTION BETWEEN AUSTRALIA AND THE UNITED STATES OF AMERICA 506

UNITED STATES: OVERVIEW OF FEDERAL EXCISE TAXES 508
Pamphlet prepared by the Joint Committee on Taxation providing summary information on Federal excise taxation, and also showing recent historical trends.

BANGLADESH: BUDGET 1982-83 516
Extracts from the Budget Speech pronounced by Mr. A.M.A. Muhith, Minister of Finance and Planning, on 30 June 1982.

IFA NEWS 528

ERRATUM

Article by Prof. Frans Vanistendael entitled: *Cutting Taxes on Business and Investment Income* in Bulletin for International Fiscal Documentation of July 1982.

On page 302, left column, fifth full paragraph, part of the first sentence was left out which completely changes the meaning of the text. This sentence should read: "Dividends distributed on the newly issued shares are exempt from corporate income tax up to 8% of the capital actually paid in."

The error is very much regretted.

INHALTSVERZEICHNIS

Sohrab Abizadeh und J.B. Wyckoff:

Der Aufbau eines Steuersystems und die wirtschaftliche Entwicklung – Ein internationaler Vergleich 483
Dieser Artikel untersucht das Steueraufkommen aus direkten und indirekten Steuern in verschiedenen Ländern mit unterschiedlichen Entwicklungsstufen. Für die Mehrzahl der Fälle kan festgestellt werden, dass sich die Struktur des Steuersystems eines Landes mit fortschreitender Entwicklung zugunsten der direkten Steuern verschiebt.

A.B.C. Emmanuel:

Sambia: Der Haushalt 1982 491
Der Verfasser stellt den kürzlich vorgelegten "Sparhaushalt" vor, der hauptsächlich eine Erhöhung der indirekten Steuern vorsieht.

Corazon P. Paredes:

Kürzliche Änderungen im Steuerrecht der Philippinen betreffend natürliche Personen 493
Im Januar 1982 wurde in den Philippinen die "Steuer auf des bereinigte Roheinkommen" eingeführt, die die frühere globale Besteuerung des Gesamteinkommens ersetzt. Diese neue Steuer basiert auf dem Schedulensystem und wird auf drei Haupteinkommensarten erhoben: Lohneinkünfte, Einkünfte aus Gewerbebetrieb und "passive Einkünfte", wobei jeweils unterschiedliche Steuersätze zur Anwendung kommen.

A.C. Ezejelue:

Das Konzept der "Ansässigkeit" und Arbeitseinkünfte in Nigeria 498
Die Bestimmungen im Einkommensteuerrecht Nigerias, die die Besteuerung der ausländischen Staatsangehörigen regeln, die in Nigeria arbeiten, sind ziemlich verwirrend. Der Verfasser stellt seine Auffassung bezüglich der derzeit relevanten Gesetzesbestimmungen vor und zeigt auf, in welchen Fällen solche Personen in Nigeria steuerpflichtig sind.

Veranstaltungskalender 500

H.W.T. Pepper:

Steueränderungen in Jamaika – Der Haushalt 1982/83 501
Die Regierung konnte einen Haushalt vorlegen, der keine neuen Steuer vorsieht; dies kann teilweise darauf zurückgeführt werden, dass Steuerrückstände in grösserem Masse eingetrieben werden konnten. Der Verfasser analysiert eine Reihe von Änderungen, die zur Verbesserung der derzeitigen Steuersystems vorgeschlagen wurden.

Jamaika: Der Haushalt 1982/83 502
Auszüge aus der Haushaltsrede, die der Ministerpräsident und Minister für Finanzen und Planung, Herr Edward Seaga, am 22. April 1982 hielt.

D.K. Uttum Corea:
Botsuana: Das Wirtschaftsförderungsprogramm 504
Dieser Artikel stellt die Vorschläge vor, die in einem kürzlich vorgelegten "white paper" und in einem Bericht, der von einer interministeriellen Arbeitsgruppe erarbeitet wurde, aufgenommen wurden; ferner kommen die Einkommensteueränderungen zur Sprache, die in der Haushaltsrede für 1982/83 erwähnt wurden.

Das geänderte Doppelbesteuerungsabkommen zwischen Australien und den USA 506

U.S.A.: Überblick über die Verbrauchsteuern der Bundesstaaten ... 508
Diese Brochure, die vom Joint Committee on Taxation verfasst wurde, vermittelt einen Überblick über die Verbrauchsteuern der Bundesstaaten und zeigt zu beobachtende Trends auf.

Bangladesh: Der Haushalt 1982/83 516
Auszüge aus der Haushaltsrede, die der Minister für Finanzen und Planung, Herr A.M.A. Muhith, am 30. Juni 1982 hielt.

IFA Mitteilungen 528

SOMMAIRE

Sohrab Abizadeh et J.B. Wyckoff:

Système fiscal et développement économique: une perspective internationale 483
Cet article est une étude des recettes fiscales directes et indirectes dans différents pays et à des niveaux différents de développement économique. Dans la majorité des cas étudiés, la structure du système fiscal recourt de plus en plus aux impôts directs au fur et à mesure que l'économie de la nation se développe.

A.B.C. Emmanuel:

Budget 1982 pour la Zambie 491
L'auteur étudie le récent budget austérité qui compte essentiellement sur l'augmentation des impôts indirects.

Corazon P. Paredes:

Récentes modifications de l'imposition des personnes physiques aux Philippines 493
En janvier 1982 l'impôt "modifié" sur le revenu brut a été introduit aux Philippines en remplacement de l'ancien impôt sur le revenu global. Le nouvel impôt est cédulaire et est levé, à des taux variables, sur trois sortes de revenus: revenus salariaux, revenus professionnels et revenus de capitaux.

A.C. Ezejelue:

Concept de résidence et revenus tirés d'un emploi au Nigéria 498
La législation nigériane de l'impôt sur le revenu est assez confuse quant à l'imposition des étrangers travaillant au Nigéria. L'auteur émet son avis sur l'état actuel de la loi et fait ressortir quand une telle personne est, ou non, imposable au Nigéria.

Carnet des Conventions 500

H.W.T. Pepper:

Modifications fiscales en Jamaïque: Budget 1982-83 501
Le Gouvernement a réussi à introduire un nouveau Budget sans nouveaux impôts grâce en partie à l'augmentation du paiement d'arriérés d'impôts. L'auteur étudie un certain nombre de modifications proposées afin d'améliorer les impôts existants.

Tax System Components and Economic Development: An International Perspective

By Sohrab Abizadeh* and J.B. Wyckoff**

Research in the area of public finance has traditionally focussed on the economic impact of taxes and government expenditure upon a region or a country. In recent years much of the applied and theoretical work has been related to the task of constructing tax systems suited to the particular economic and social conditions prevailing in a given year. In the most recent studies, however, the emphasis has been placed upon the relationship between tax ratio and the degree of economic development.

The following reports on an international study of the government direct and indirect tax revenues in different countries at different stages of economic development. The methodology consists of a number of short-run as well as long-run analyses. Pooled cross-section time series data are used. It is observed that, in the majority of cases studied, the structure of the tax system changes towards more intensive use of direct taxes as the nation's economy develops.

INTRODUCTION

Developing countries have long been frustrated by the dilemma of developing a system of taxation which will provide the necessary resources to develop the infrastructure necessary for economic development, while providing incentives in the private sector for increased investment and output. Attempts to provide policy formulas through scientific studies of tax ratio differences and changes in tax components within given developing countries have taken different forms.

Martin and Lewis (1956) compared the revenues and expenditures of 16 countries at different levels of economic development. Their main objective was to see how patterns of expenditure and sources of revenue varied with economic development and what patterns of taxes and expenditure are appropriate to different levels of development.

Williamson (1961) in a follow-up of Martin and Lewis' study took more countries and a longer time period (1951-1956), including 17 developed countries with tax ratios (total tax revenue divided by gross domestic product) ranging between 20 and 35% and 15 LDCs ranging between 9 and 21%. Both of these studies concentrated on public expediture and revenue and their relationship to per capita national income.

Hinrichs (1965) questioned the former findings and tried to present a "better" explanation for the tax changes through a multiple regression study of 60 countries using data from the years 1957-60. He implicitly assumes that per capita income is the only factor needed to estimate the degree of economic development. Consequently, if there are other variables which explain tax ratio changes better than per capita national income, the conclusion that the tax ratio is related to the degree of economic development, as reflected by per capita income, should be rejected. He states:

* Assistant Professor of Economics, the University of Alberta, Canada.

** Professor of Agricultural and Resource Economics, Oregon State University, U.S.A.

> Conventional wisdom holds that government revenue shares of gross national product increase with economic development. This is obvious when contrasting the level of government revenue shares between developed and less-developed countries. However, when observing differences among less-developed countries only, this proposition is misleading at the best or worst just plain wrong (p. 564).

Hinrichs (1966) in his more thorough study of taxes attempted to deal with both tax ratio and tax component changes during the course of economic development. He performs a multiple regression study of 60 countries for the period 1957-60 in order to identify the determinants of government revenue as a share of gross national product. Regional factors played an important role in his analysis of structural tax changes. The final outcome of past studies was the development and acceptance of the hypothesis that there exists a direct relationship between the degree of economic development and total tax ratio (see Abizadeh 1979). Despite all these efforts, analysis leading to policy recommendations on an improved combination of components within a tax system at differing stages of economic development has not been forthcoming.

RATIONALE

The position that, "Generally, however, tax systems have tended to be more of a determined than determining factor" (Hinrichs 1966, p. 63) is frequently found in writings on economic development. Bangs (1968) makes even a stronger assertion stating, "the tax changes are, in the main, effects rather than causes of economic progress" (p. 15). He further indicates that direct taxes are applicable only to those economies which have passed a certain stage of development (pp. 15-16). Hinrichs (1966) supports this, observing that the extent of reliance on direct taxation usually increases with greater economic development.

This would seem logical in examining the feasibility of direct tax collection in less developed countries compared with that of more developed countries. In general, corporate taxes are levied at a flat rate on all companies in less developed countries. The revenue yield generated by such a levy would be low because (a) company income is often only a small part of national income; (b) the tax rate must be low to encourage private investment; (c) developing companies do not have any revenue to be taxed; and (d) more importantly,

> . . . there takes place a substantial avoidance of the tax on corporate profits in underdeveloped countries because of the "loophole" in the law in the form of the system of prerequisites such as office-provided cars, living accommodation, travel expense accounts in general which are charged off to business expenses (Thripathy 1968, p. 201).

Direct taxation of capital values, whether land or personal property, would be expected to have a relatively less adverse effect upon incentives. The problem in underdeveloped countries has been that the owners of capital assets have had a high degree of control over political institutions, through which they could influence tax legislation in their favor. Goode (1964) points out that, "Intensive use of the property tax is blocked in most Latin American countries by a small but politically powerful group of large landowners" (p. 178). This is true in most underdeveloped countries - especially if land reform has not taken place. Inadequate records and appraisals of properties lead to comparatively low tax yields. "In many countries taxation of agriculture, particularly land tax, does not yield amounts considered adequate when compared with taxation of other sectors" (Basch 1964, p. 95). Unless there are some changes in the social, economic, and political institutions within underdeveloped countries, adoption of capital and wealth taxes - without wholesale evasion - would seem unlikely.

The use of personal income taxes has also generally been very limited in underdeveloped countries. In LDCs the agricultural sector is frequently exempted for constitutional or administrative reasons. Since agriculture is usually the main source of income for much of the population, the personal income tax plays a less significant role in the tax structure of LDCs than has been the case in the more developed countries.

Other reasons for the radically different performance of the personal income tax in underdeveloped as compared to developed countries include the following. First, there are the widely recognized problems in defining income. Second, there are difficulties in determining individuals' income, even after income is defined. In underdeveloped countries, a large sector of the economy is nonmonetary or unrecorded. Wage-earners, independent craftsmen, and small shopkeepers cannot read and write well enough to maintain accounts or complete even the simplest income tax return. Sometimes, even literate income earners do not keep reliable records of their income. As in developed countries, more than one set of income records may be kept in order to avoid taxes (see Goode 1964). With unsophisticated banking and credit systems, it is difficult to trace cash and barter business transactions.

A third reason for the radically different performance of the personal income tax is related to the application of tax rates and allowances. It is difficult to fully apply the taxation rates of developed countries to less developed countries. This is because of the difference between the income distributions. If the tax rates found in the U.S. were applied to, say, Egypt or Iraq, the key to the revenue yield would depend upon whether they are applied at the same absolute level of income or at the same relative level of income.

The fourth difficulty relates to the collection of taxes. Voluntary tax payment is not common in underdeveloped countries. The alternative is a pay-as-you-earn system. Such a system would cover only a small percentage of income earners, i.e. those whose income, wages, and salaries can be identified and, therefore, raises the question of equity (i.e. only part of the country's income earners are subject to tax).

Thus, it is no accident that the more developed countries have usually progressed from indirect taxes such as customs duties, property taxes, and excise taxes during the early stages of their development, to the more sophisti-

© 1982 International Bureau of Fiscal Documentation – BULLETIN

cated forms of direct taxation, such as personal and corporation income taxes (Bangs 1968, pp. 135-136).

HYPOTHESIS

On the basis of this previous work, a general hypothesis was formulated: as a nation's economy develops, the structure of the tax system changes toward intensive use of direct taxes, i.e. the relative proportion of direct and indirect taxes changes toward a higher and higher direct tax ratio.

This hypothesis was tested by a model containing variables representing and reflecting the degree of economic development as independent variables and the direct tax ratio (total direct tax revenue divided by total tax revenue) as the dependent variable. The general hypothesis was tested by the model for different time periods for the same group of countries and different groups of countries for the same time period.

The countries were selected with a view toward giving representation to a broad range of institutional conditions as well as stages of economic development. Countries from different regions of the world were selected, although the original analysis did not involve a regional factor.

GROUPING COUNTRIES BY FACTOR ANALYSIS

The task of selecting variables to indicate the degree of economic development was most difficult. The 1973 and 1976 studies by Irma Adelman and Cynthia Taft Morris were consulted. Based upon these studies a decision to employ quantitative information while avoiding qualitative measures seemed appropriate. Data were obtained from sources such as the United Nations and the International Monetary Fund.

Data were collected for a 23-year period (1950-1972). The period was divided into two sub-periods, a "first decade" (1950-1959) and a "second decade" (1960-1972). Forty-one countries were included in the analysis of the first decade and 46 in the second decade.

Although many researchers have classified countries according to their stage of development, none has developed a method universally acceptable to economists. Per capita income and its substitutes have been a widely used criteria (see Chelliah 1971, p. 277). Hinrichs (1966) groups countries on the basis of per capita GDP, the natural rate of population increase, and energy consumption per capita, with a relatively heavy reliance on per capita GDP. He states:

> Although GDP/N tends to be an unreliable estimate of the welfare of the consumers of a nation, and the statistics themselves are usually somewhat inaccurate, they are useful data for stage classification. . . Although GDP/N is a poor estimate of welfare, it is, in relative terms, a good measure of development (p. 130).

Because of the important role assigned to the grouping of countries in this study, a more comprehensive approach was employed. A multi-variate statistical technique, factor analysis, was used to perform this grouping function. Ten variables were selected for the factor analysis:

(1) per capita GDP in U.S. dollars;
(2) international trade tax ratio (defined as trade taxes divided by total tax revenue);
(3) percentage of total government expenditure on health (defined as total government expenditure on health divided by total government expenditure);
(4) percentage of total government expenditure on education;
(5) proportion of national income generated in agriculture, forestry, and fisheries;
(6) demand deposit ratio (defined as demand deposit divided by total money supply);
(7) export plus import divided by GDP in U.S. dollars;
(8) net balance on current account divided by GDP in U.S. dollars;
(9) exports divided by GDP in U.S. dollars; and
(10) imports divided by GDP in U.S. dollars.

Each of these variables was hypothesized to directly or indirectly represent the degree of economic development within a country.

The factor analysis identified 3 "factors" in each time period which accounted for virtually all of the variations (Tables 1 and 2). The grouping of countries was done for each decade with the same analysis being used to facilitate the possibility of interdecade as well as inter-country comparisons. Tables 3 and 4 show the respective country groupings for decade 1 and decade 2.

TABLE 1

Cumulative percentages of 4 factors for the first decade

THE MODEL

The relative importance of tax components (groups of taxes) may be analyzed either as their percentage in total tax revenue or as their ratio to GNP. Chelliah believes that the first alternative more clearly defines the differences in the patterns of taxation between different countries, irrespective of the level of taxation (1971, pp. 267-368).

In this study, the tax components were analyzed in terms of the percentage of direct taxes in total tax revenue. It was hypothesized that, as an economy develops, the tax structure of the country changes toward more intensive use of direct taxes, i.e. the relative proportion of direct taxes in total tax revenue tends to increase. It was decided to test the hypothesis using long-run data to insure that sufficient time for a transition, in terms of economic development, was involved.

The following relationship was postulated to test the hypothesis:

$$TR^d_{it} = b_1 + b_2 (Y^p_{it,2}) + b_3 (OP_{it,3}) + b_4 (TPR_{it,4})$$

$$-b_5 (ER_{it,5}) - b_6 (AR_{it,6}) + b_7 (DDR_{it,7})$$

where

- i = 1,2, . . ., N(number of countries in the particular group in the model)
- t = 1,2, . . ., T (number of years, depending on the decade being analyzed)
- TR^d = direct tax ratio (defined as total direct tax revenue divided by total tax revenue)
- Y^p = per capita GDP in U.S. dollars converted using market exchange rates
- OP = openness (defined as exports plus imports divided by GDP)
- TPR = transfer payment ratio (defined as government transfers divided by government expenditures)
- ER = ratio of expenditure on education
- AR = proportion of income generated in agriculture, forestry, and fisheries
- DDR = demand deposit ratio (defined as demand deposit divided by total money supply).

Openness was specifically included because of its relationship to direct taxes emphasized by Hinrichs who states:

> . . . personal income taxes may be based primarily on civil servants . . ., the army . . ., and/or employees of large mineral and/or export companies, especially foreign ones. Thus, the openness of the economy would normally affect the amount of personal income collected (1965, p. 556).

If this relationship was maintained, openness should have carried a positive sign in the models.

Multiple linear regression analysis was applied to test the relationships hypothesized in the model. The results obtained for different groups of countries at different points in time were tested using the Durbin-Watson Statistic. The test indicated that it was not possible to reject the hypothesis that auto-regression was present. The Durbin procedure then was used to correct for the possible autoregression. Table 5 summarizes the results obtained from the corrected multiple linear regression models.

The first regression equation reported in Table 5 shows results for 41 countries for the 10-year period using pooled cross-section, time series data. Regression 2 used the identical model for 46 countries for the 13-year period. The remainder of the regressions reported were estimated to determine if the specified relationships hold for the different groups of countries during the first and/or second decade.

INTERPRETING THE RESULTS

The results obtained from analyzing the 41 countries' data for the 1950-59 period did not provide an unequivocal answer to the hypothesis tested. Y^p (per capita GDP) assumed a positive sign and was significant at the 90% level of confidence. However, TPR, the only other significant variable in the model, did not carry the expected sign. Although the coefficients were not significant, neither did OP, AR, or DDR carry the expected sign. It was concluded that due to the sharp differences in direction of direct taxes at different stages of development during the first decade, a regression including all of the countries was not able to provide a satisfactory explanation of the variation in the direct tax ratio associated with the degree of economic development.

The analysis of the data from the second decade for the 46 countries provided an improved explanation for direct tax ratio changes. It was concluded that, during the second decade, the more developed the country, the more direct taxes were collected relative to other sources of taxation. This held only when the total group of developed and developing countries and/or underdeveloped countries were combined.

Underdeveloped countries (Group I)

When the data for both decades were used for the group of underdeveloped countries (Group I), it was strongly maintained that TR^d had been decreasing during the period. Variables ER, OP, and DDR had the expected sign to support the general hypothesis even though they were not statistically significant. The regression equation relating to Group I countries in the first decade was

© 1982 International Bureau of Fiscal Documentation – BULLETIN

less clear than that using both decades. Y^p carried a negative sign and was not significant. The same was true for AR, with a positive sign. Given the full model, it was concluded that TR^d dropped the first decade for the group of underdeveloped countries.

The results obtained from analyzing the data for underdeveloped countries during the second decade strongly indicate that TR^d had been decreasing for this group during the 1960-72 period. Per capita GDP (Y^p) carried a negative sign along with DDR. The latter was significant at the 80% level of confidence. OP and TPR, with positive signs, were not significant. Neither was ER with a positive sign.

Developing countries (Group II)

The results obtained from the regression analysis for Group II in both decades provided evidence that for the group of developing countries, the direct tax ratio is related to the degree of economic development. Y^p and AR and DDR carried the expected signs. Y^p was significant at the 90% level of confidence with AR being significant at the 95% level of confidence. ER carried a positive sign (contrary to our expectations) and was significant at the 90% level of confidence.

Analysis of the data for developing countries during the 1950-59 period revealed that the relative importance of direct taxes in total tax revenue decreased. Six of the 12 countries in the group relied on indirect sources of taxation more heavily during this period. These were the countries that shifted to the developed group (Group III) during the second decade. This is not contrary to the general result obtained from analyzing the developing countries during both decades since direct tax collection only became possible for this group of countries during the second decade.

Examination of the results for the group of developing countries for 1960-72 provided firm support for this position. Per capita GDP was significant at the 97.5% level of confidence and was positive. AR and DDR assumed expected signs and were significant at the 80% level of confidence. OP also carried the expected sign but was only significant at the 70% level of confidence.

Developed countries (Group III)

For the group of developed countries (Group III) TR^d did not increase as the economy developed. Analysis of the data from both decades for this group revealed that TR^d has been decreasing for the group of developed countries. Although Y^p carried a positive sign in this equation, it was not statistically significant. OP and TPR carried negative signs contrary to our hypothesis. ER and AR had negative signs but were not significant. DDR was significant at the 95% level of confidence but carried a positive sign contrary to our expectations.

When the data for the first decade were used, almost identical results emerged. While the F value was significant at approximately the 50% level of confidence, the model was not effective in explaining the direct tax ratio.

The analysis of the data for 1960-72 for the developed countries showed that direct taxes have been losing their relative importance in these countries. OP, TPR, ER and DDR carried signs contrary to those hypothesized. However, only OP and DDR were statistically significant.

THE "BEST" MODEL

Because the original model had many coefficients that were not statistically significant, a "best" model was analyzed which included only those variables significant at the 80% or higher levels of confidence (Table 6). The "best" model for the 41 countries for the period 1950-59 included only variables Y^p and TPR. Each of these variables was significant at the 90% confidence level with opposite signs. It again was concluded that the sharp differences in the direction of change in direct taxes at different stages of development during the first decade prevented the model from providing a satisfactory explanation of the variation in direct tax ratio associated with the degree of economic development.

For the second decade in the 46 countries, only per capita GDP and DDR remained in the "best" model with the expected sign. They were significant at the 80 and 97.5% level of confidence respectively. It was concluded that, for this decade, the more developed the country, the more direct taxes were collected relative to other sources of taxation.

Underdeveloped countries (Group I)

When data for both decades were used the "best" model included variables Y^p, TPR, and AR. Each of these variables were significant at the 97.5, 80, and 95% level of confidence respectively. The signs for these variables indicate that TR^d not only did not increase but decreased as the economy developed. This decrease was due to the reliance of countries on trade taxes. The decrease in TR^d did not result in a decrease in TR. What is shown was that the relative importance of direct taxes has been decreasing in these countries and the relative share of trade taxes in total tax revenue (and possibly other indirect taxes) has been increasing. Some of these countries were, in fact, using other indirect sources during the first decade and shifted to the second group in the second decade, a group where the stage of development permits direct tax collection to be practiced.

By way of comparison Chelliah analyzed the relationship between the share of direct taxes (TR^d) and per capita income for 50 countries for the period 1966-68. His results were as follows:

$$TR^d = \underset{(5.575)}{33.08} - \underset{(1.059)}{0.052}\ (Y^p) \text{ with an } R^2 = 0.005$$

for the countries with per capita income below U.S.$ 200 (the figures in parentheses are t-ratios) (1971, p. 314).

Had it been possible for these countries to collect direct taxes, they might have done so. Direct tax collection has been and still is practically impossible for countries at this stage of development. Invariably, attempts to shift

to direct taxes meet with serious administrative, political, and social obstacles.

The "best" model for the underdeveloped countries for the first decade includes OP with a positive sign, significant at the 80% level of confidence, together with TPR with a negative sign significant at the 95% level of confidence. The negative per capita TPR reinforced our preceding conclusions. The positive sign for OP during this period supports Hinrich's assertion that underdeveloped countries may collect income taxes on import/export companies.

The "best" model for the underdeveloped countries for the second decade included AR, and DDR with a positive and negative sign respectively. AR was significant at the 90% level of confidence and DDR at the 80% level. The signs of the "best" model variables suggest an actual decrease in TR^d as the economy develops. This sustains the conclusion that the group of underdeveloped countries has been decreasing its reliance on direct taxes. That means that the relative importance of direct taxes decreased for the group of underdeveloped countries during this stage of development.

Developing countries (Group II)

Based upon the "best" model for the second group for both decades, it was concluded that the direct tax ratio had increased in connection with their economic progress. The positive signs for ER were the result of its appearance in the model during the first decade. In fact, based upon results obtained, it was not until recent years (1960-72) that the group of developing countries started increasing their reliance on direct taxes and, as a result, increased the relative importance of this type of tax in the government revenue system.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

The "best" model for the developing countries for the periods 1960-72 introduced Y^p, AR, and DDR as the variables most closely associated with the direct tax ratio. They were significant at the 97.5, 80, and 90% level of confidence respectively. It was concluded that the hypothesis held strongly for the developing countries during the period. This indicates that developing countries can rely more and more on direct taxes as their economy develops. This supports our earlier conclusion that the reliance and employment of direct taxes becomes possible at this stage of economic development.

Developed countries (Group III)

The "best" model for the Group III developed countries included OP and DDR. It indicates that the relative importance of direct taxes has been decreasing in total tax revenue for developed countries.

The "best" model for the first decade for developed countries was not promising. The only variable which remained in the model was OP with a negative sign and significant at the 95% level of confidence. However, ER was also included and carried a negative sign significant at approximately 70% level of confidence.

The analysis of the second decade for the developing countries produced evidence that the development and use of taxes other than conventional direct taxes are responsible for this type of relationship between TR^d and the degree of economic development.

There is no doubt that the absolute amount of direct taxes collected in developed countries has been and is increasing. It is the variation in the collection of such taxes that results in such a "poor fit" for our models. Factors other than just the degree of development have affected direct tax collections in developed countries. In addition to those factors mentioned earlier, other factors affecting direct levies are the types of dominant business sector in the economy (partnership, proprietorship, or corporation), the type of government, and the size of public sector relative to the total economy. In the case of the latter, the larger the public sector the higher the amount of payroll taxes collected.

The results obtained from the analysis of data for developed countries invites the quotation of a statement by Chelliah.

> On an analogy with the course of evolution in the now developed countries, it is generally argued that with the growth of the economy and the rise in income the share of direct taxes, which could be levied more in accordance with the individual's ability to contribute, would begin to rise. Such a transformation of the tax system is yet to come (1971, p. 269).

CONCLUSIONS AND GENERALIZATIONS

The general hypothesis of this study was not rejected in total, but a wide range of exceptions were observed. The analytical results have led us to the following conclusions and generalizations.

1. Due to the sharp differences in the tax components of countries at different stages of development, the general study of all of the countries during the first decade did not provide a satisfactory explanation for the variations in direct tax ratio an its relation to the degree of economic development.
2. Use of the data in recent years (1960-72) for all the countries did support the hypothesis.
3. There is no hard evidence, based on the result obtained, that the group of underdeveloped countries has increased its relative reliance on direct taxes as their economy developed. However, based on the maintained hypothesis that the total tax ratio has been increasing, it was concluded that tax components have shifted towards a more intensive use of taxes other than direct taxes.

   The direct tax ratio decreased during the last two decades for this group of countries. It was concluded that the imposition and collection of direct taxes are practically impossible and encounter numerous administrative as well as political and social obstacles.
4. The group of developing countries in both decades did rely more and more on direct taxes as their economies developed. However, it was not until the second decade that these countries could experience a systematic increase in their direct tax ratio along with their economic progress.

   The results from the regression for the second decade support the above assertion. It is concluded that direct tax collection, and the increase in its relative importance compared to other types of taxes, becomes possible when a country is in its "developing" stage. However, reliance on indirect taxes remains desirable to increase tax revenue because a lag exists between the time that a country enters this stage of development and the time it can actually rely more heavily on direct taxes.
5. Direct taxes have been losing their relative importance in the budgets of the governments in developed countries.
6. The term "better tax system", which has always been associated with a higher relative reliance on direct taxes, is somewhat misleading. A "better tax system" with respect to an economic development objective would be the one that results in higher taxes as a proportion of GDP, implicitly assuming no disincentive in the private sector, and investment yields in the public sector at least equal to private investment. Consequently, it makes little difference from this perspective as to what type of tax sources, direct or indirect, are being used more intensively.

Zambia's 1982 Budget

by A.B.C. Emmanuel *

The Budget, as expected, was a belt-tightening one.[1] The worsening world economic conditions had and were having their adverse effects on the economy of Zambia, mainly because the demand for copper, which is the prime foreign exchange and revenue earner for Zambia, was dropping steadily. In addition, the copper consuming countries tended to hold smaller stocks of copper in order to reduce the costs of stock-holding. The average price of copper, which was 1,692 K per tonne in 1980, dropped to 1,554 K in 1981 representing a decline of 8.2%. Copper earnings declined from 884,000,000 K to 840,000,000 K, decline of 5%. The foreign exchange earnings from the mining sector fell from 1,200,000,000 K to 942,600,000 K. At the time, the demand for cobalt, the other revenue and foreign exchange earner, also fell badly leaving the mining companies a stock pile of about 8 months' production.

The mining industry, which is the mainstay of the country's economy, was thus afflicted by serious problems with the result that the industry's value added declined by 52.3% and the contribution of the mining sector to Gross Domestic Product declined from 16.2% in 1980 to 7.6% in 1981. In 1980, the mining companies contributed approximately 41.0 million K to Government revenue whereas in 1981 their contribution was virtually nil.

The manufacturing industry's contribution also fell during this year, mainly due to the lack of foreign exchange which had severe repercussions on those industries which are dependent on imported inputs. These difficulties were further increased by labour unrest and other factors which caused production to fall. The worsening financial position of the mining companies had their adverse effects on some of the manufacturing companies who relied a lot on the mines for their progress and prosperity. The industries depending on foreign inputs registered a drop ranging from 27% to 12%. Those who depended on local raw material did show a slight growth in the rate of production.

Against this gloomy background, there was, however, one ray of sunshine, which was in the agricultural sector. The performance in the agricultural sector was quite heartening and encouraging. The agricultural sector responded well to the call of His Excellency the President to boost the production of food in the country. This sector recorded an estimated growth rate of 9.8% in 1981. There was a significant increase in marketed maize of 3.5 million bags over the 1980 production, bringing in a total production of 7.7 million bags. In other fields of agricultural production, such as wheat, sunflowers, soya beans, etc., there were significant increases. There was thus a positive response by the farming community to the Government's agricultural policy which gave them various incentives.

One of the greatest problems facing the Government was the deteriorating balance of payments position. This position has been brought about by declining foreign earnings and worsened by the rising costs of imports, especially oil. The external payment arrears stood at 420,000,000 K. Exports amounted to 961,600,000 K in 1981 as compared to 1,027,000,000 K in 1980, a reduction of 6.4%.

In spite of the strict import controls, imports increased from 884,500,000 K in 1980 to 907,200,000 K in 1981. As a result of the critical shortage of foreign exchange, the rate of growth has been hindered, and it has provided exteremely difficult to build up foreign reserves and reduce the payment arrears.

1. The Budget proposals were enacted in the Income Tax Amendment Act No. 12 of 1982.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

"In the light of this grim scenario and bleak outlook, the immediate and vital lesson for the nation is clear", said the Hon. Minister of Finance as he presented the Budget. "The nation must brace itself for more sacrifices and hard work." The economy of the country had to be restructured so as to reallocate the scarce resources away from consumption toward production. Consumption had to be curbed by means of strict controls, which in turn would curb inflationary tendencies. It was essential to bring about a reduction in subsidies which were a heavy drain on the nation's financial resources. It was also essential to promote industrial production based on domestic resources and also expand agricultural and food production.

Keeping all this in mind, the Hon. Minister of Finance's main idea in his Budget proposals was to raise the additional revenue required through indirect taxation. The burden of direct taxation was fairly heavy on the few who paid taxes and hence by means of indirect taxes as a whole society would bear their share of the sacrifice which was necessary to enable the nation to recover from the crisis in which it finds itself.

Excise duties were raised on cigarettes, tobacco, liquor and petroleum products. Customs duties were also raised on various items.

As far as income tax on individuals was concerned, considering the high incidence of income tax in Zambia and the rising cost of living, the Hon. Ministry of Finance did not raise income tax but instead gave concessions in the form of increased personal allowances. He also gave a welcome relief to married women who had been making representations to the Government to reduce the tax burden borne by them. Under the system prevailing at the time, it was the husband who got the benefit of the married allowance of 1,700 K. Hereafter, he announced, the husband and wife could by election 6 months before the commencement of the charge year ask for the married allowance to be apportioned between them, specifying the amount in which the married allowance is to be divided.

Regarding tax on companies, the Budget introduced a new system of paying corporation income tax. According to the prevailing practice, companies paid provisional tax in two instalments, on 14 August and 14 December following the end of the tax year. Hereafter, under the new proposals in the Budget, all business will now have to estimate in advance what their taxable income will be for the current year and pay provisional income tax on that estimated amount in four instalments before the end of the tax year. In short, this means the payment of the 1981/82 and 1982/83 taxes before the end of March 1983.

This proposal that two years' income tax will have to be paid in one year raised objections from the entire business community, who pleaded that the business enterprises lacked the cash resources to pay two year's taxes in one year. Many of them, in view of the current foreign exchange shortages, did not get their full allocations of import quotas and were finding it difficult to run their businesses profitably. This new system, they said, would have grave consequences on the viability of many businesses and also seriously retard investment and expansion in the economy as a whole.

The Hon. Minister, after considering all the representations made to him, did not, however, alter his original proposal, but to alleviate the tax burden on the business enterprises, he extended the time limit for the payment of the taxes over a period of 1½ years. He also gave the Commissioner of Taxes the power to extend the time limit in case of hardships and also the power to waive the penalties for late payments of tax, considering each case on its own merits.

The undistributed profits tax, which was introduced in 1979 and amended in the 1980 and 1981 Budgets due to severe and widespread criticism, was repealed this year and replaced by a new regulation which went back to the old system of "deemed" distribution of dividends. Where the Commissioner of Taxes considers that a company, in order to avoid or reduce tax, has not declared a dividend or declared a dividend inadequately, he will "deem" a dividend to have been declared and such deemed dividend will be taxable in the hands of the shareholder. The business community preferred this "deemed" distribution regulation to the undistributed profits tax which was regarded as a penal provision. The new regulation removes the indiscriminate penalty for non-distribution and identifies those companies who do not declare dividends or plough back their profits into the business.

The agricultural sector was given further incentives in order to boost the agricultural output of the country. The rate of tax on farming income, which was reduced to 25% in 1981, was further reduced to 15%.

Accelerated depreciation on farming machinery implements and equipment at 50% of the cost of the assets on a straight line basis was also granted.

There were proposals to grant incentives to the industrial sector: these were not implemented as such in the Amendment Act, but the Hon. Minister of Finance hopes to implement some of these when changes are made in the Industrial Development Act. An effort is being made to encourage rural development with a view to reversing the existing rural/urban disparity as well as the deteriorating terms of trade between primary producers in the rural areas and the urban consumers. The poor rural areas will not be allowed to subsidise the urban areas and the Government hopes to achieve this by a sustained implementation of appropriate pricing and credit policies.

The Budget is a remedial one with a view to correcting the economic ills of the nation. The call is for economic revival and self-reliance. the principal message in the Budget is the "restructure of the economy, deliberate diversion of resources from non-productive to productive uses, thereby promoting the resumption of self sustaining economic growth while achieving progressive improvements in the balance of payments". It is hoped that the nation will respond to this call by the Hon. Minister of Finance who is hopeful that the nation will.

Recent Changes in the Philippine Taxation of Individuals*

By Corazon P. Paredes**

INTRODUCTION

Beginning calendar year 1982, a new individual income tax system is in force in the Philippines. The so-called modified gross income tax scheme became part of the Philippine National Internal Revenue Code of 1977 (Tax Code) when Batas Pambansa Blg. 135[1] was finally approved by the President on 18 December 1981. The new system constitutes a significant departure from the old system whereby individuals, irrespective of their types of income, were generally taxed on a net income basis. The following are the important changes introduced by the new law: (a) categorization of income; (b) modified gross taxation of compensation income; and (c) retention of itemized deductions with respect to business income.

The modified gross income tax scheme was designed to eliminate administrative problems connected with the old system. Accordingly, certain specific objectives were identified with the adoption of the new system. These are: (a) simplification of income tax administration; (b) minimization of discretion in the determination and allowance of deductions by the taxpayer and tax examiner; and (c) rationalization of the income tax treatment of different types of income.

The manner of taxation of gains derived by individuals, whether citizen or alien, as well as corporations, domestic or foreign, from the sale of shares of stock classified as capital assets have likewise been modified by Batas Pambansa Blg. 221 which was approved on 25 March 1982.

The following is a summary of the recent changes in the Philippine taxation of individuals.

II. REVISED TAXATION OF SALES OF SHARES OF STOCK

I. NEW MODIFIED GROSS INCOME TAX SYSTEM

A. Categories of income

1. Under the new system

Individual incomes are currently divided into three principal categories, namely, compensation income, business income, and passive income. Classification is based on the nature of the income derived and all three categories are meant to cover the entire range of individual incomes.

a. Compensation income

Briefly, compensation income covers all income arising from an employer-employee relationship, whether monetary or non-monetary. However, the Tax Code itself provides for a specific definition of the term "gross compensation income", which includes all income payments received as a result of an employer-employee relationship, such as salaries, wages, honoraria, bonuses, pensions, allowances for transportation, representation, entertainment, fees (including directors' fees) and other income of a similar nature, including compensation paid in kind.

The share of a partner from a general professional partnership for services is not considered as part of gross compensation income but as a partner's distributive share of ordinary business income.

* As of 31 July 1982.

** Tax Manager, SyCip, Gorres, Velayo & Co., Philippines.

1. Batas Pambansa may be loosely translated as "Parliamentary Act" in Pilipino while "Bilang/Blg." means "number".

© 1982 International Bureau of Fiscal Documentation – BULLETIN

b. Business income

Business income refers to income derived from engaging in a trade, business or profession as well as all other income derived from any source whatsoever not classified as compensation income or passive income. The Tax Code specifically uses the term "gross income" for this category of income which broadly includes gains, profits and income derived from professions, vocations, trades, businesses, commerce, sales, or from dealings in property, whether real or personal, or growing out of the ownership or use of property or any interest therein; and from interest, rents, dividends, securities, or the transactions of any business carried on for gain or profit, or gains, profits and income of whatever kind and in whatever from derived form any source.

c. Passive income

Passive income includes interest, dividends, royalties, prizes and other winnings which are subject to a final withholding tax.

2. Under the old system

Under the old global income tax system, there was only one general category of income. Thus, as defined, the term "gross income" included gains, profits and income derived from salaries, wages, or compensation for personal service of whatever kind and in whatever form paid, or from professions, vocations, trades, businesses, commerce, sales, or dealings in property, whether real or personal, derived from the ownership of or use of or interest in such property; also from interest, rents, dividends, securities, or the transactions of any business carried on for gain or profit, or gains, profits, and income derived from any source whatsoever. In effect, all items of income were lumped together.

As under present law, certain types of passive income like dividends and interest were also subjected to a final withholding tax. Other types of passive income, like royalties and prizes, were merely subjected to a creditable withholding tax. In other words, these types of income were consolidated with the other income of an individual and the tax thereon was computed accordingly. Any withholding tax paid could then be credited against the income tax as finally computed. Nevertheless, these special types of passive income were not recognized as falling under a separate category of income.

B. Exclusions from gross income

The following items are currently treated as exclusions from gross compensation income:

1. Actual, moral, exemplary, and nominal damages received pursuant to a final judgment or compromise agreement arising out of an employer-employee relationship.
2. Proceeds of life insurance policies paid upon the death of the insured.
3. Amounts received by the insured as return of premiums paid by him under life insurance, endowment or annuity contracts.
4. Value of property acquired by gift, bequest, devise, or descent.
5. Interest on government securities.
6. Amounts received through accident or health insurance or under the Labor Code of the Philippines, as compensation for personal injuries or sickness plus the amount of any damages received on account of such injuries or sickness.
7. Income exempt under treaty.
8. Retirement benefits, pensions, gratuities received under certain conditions.
9. Other miscellaneous items such as income received from investments in the Philippines or interest on deposits in Philippine banks by (a) foreign governments, (b) financing institutions owned, controlled, or enjoying refinancing from foreign governments, and (c) international or regional financing institutions established by governments.

The same items of exclusion above enumerated are also excludable under the category of business income. In addition, compensation income as well as passive income which have already been subjected to a final tax are also entitled to be excluded from the coverage of business income.

Under the old system, the same excludable items were recognized for determining gross income.

C. Allowance for deductions

Another highly significant change introduced by the modified gross income tax system is the restriction on deductions. Under current law, no other deduction is recognized for the purpose of arriving at one's taxable compensation income except for the so-called personal and additional exemptions. The usual deductions previously allowed to a taxpayer for computing his net taxable income are presently still allowed but only for the purpose of computing one's taxable *business* income. Aside from limiting the itemized deductions to the category of business income, such items must also be business-related in order to be deductible.

1. Under the new system

a. Personal and additional exemptions

Whether an individual is deriving purely compensation income or business income or both under current law, he is still entitled to the personal and additional exemptions. The rates of personal exemption that may be availed of by such individual depends upon his status as single or married person or head of a family. A single individual or a married person judicially declared as legally separated is entitled to claim a personal exemption equivalent to ₱ 3,000. A married person may deduct ₱ 6,000 while an individual who qualifies as head of a family is allowed ₱ 4,500 as personal exemption. Head of the family means an unmarried person with one or both parents, or with one or more brothers or sisters, or with one or more legitimate, recognized natural or adopted children living with and dependent upon him or her for their chief support where such brothers, sisters,

© 1982 International Bureau of Fiscal Documentation – BULLETIN

or children are not more than 21 years of age, unmarried, and not gainfully employed, or where such children are incapable of self-support because of mental or physical defect.

Additional exemptions equivalent to ₱ 2,000 may be further claimed by the taxpayer for each legitimate, recognized natural or adopted child wholly dependent upon and living with the taxpayer if such dependents are not more than 21 years of age, unmarried, and not gainfully employed or if they are incapable of self-support because of mental or physical defect. However, the Tax Code limits the number of dependents for which additional exemptions may be claimed. Such number must not exceed 4 dependents so that the maximum additional exemption is ₱ 8,000.

In view of the categorization of incomes, an individual who receives both compensation and business income is required to deduct first the amount of his personal and additional exemptions from his gross compensation. If there is any excess exemption, the same could then be deducted from his business income.

b. Itemized deductions

The availability of itemized deductions is presently restricted to the category of business income. Thus, for the purpose of arriving at net taxable income of taxpayers deriving business income, the following items may still be deducted:

1. Ordinary and necessary expenses paid or incurred during the taxable year in carrying on any trade or business.
   Entertainment, travel, and representation expenses associated with the taxpayer's trade, profession or business may be allowed as deduction subject to certain substantiation requirements.
2. Interest paid or accrued on indebtedness incurred within a taxable year in connection with the taxpayer's profession, trade or business.
3. Taxes paid or accrued within the taxable year in connection with the taxpayer's profession, trade or business, except: (a) income tax, (b) income, war profits, and excess profits taxes imposed by a foreign government (this deduction will be allowed for a taxpayer who does not wish to avail himself of the foreign tax credit provision); (c) estate and gift taxes; (d) taxes assessed against local benefits of a kind tending to increase the value of property assessed; and (e) electric energy consumption tax.
4. Losses actually sustained during the taxable year, not compensated for by insurance or otherwise and incurred in the exercise of the trade, profession or business or incurred in a transaction entered into for profit though not connected with the trade or business.
5. Bad debts which are actually ascertained to be worthless and charged off within the taxable year in connection with the exercise of the profession, trade or business.
6. Depreciation of property arising out of its use in the profession, business or trade, or out of its not being used.
7. Depletion of oil and gas wells and mines.
8. Charitable and other contributions actually paid or made within the taxable year to certain institutions which may be deductible in full or limited to an amount not in excess of 6% of the taxpayer's net income as computed before the deduction for charitable contributions, depending on the classification of the donee-institution.
9. Payments for pension trusts.

Medical care expenses and basic tuition fees which were deductible under the old system (subject to certain limits and conditions) are no longer deductible items.

c. Optional standard deduction

Except for non-resident alien taxpayers, an individual reporting business income may elect a standard deduction not exceding 10% of his gross income, instead of availing himself of the itemized deductions. His intention to elect the optional standard deduction must be signified in the income tax return.

2. Under the old system

At the time the modified gross income tax scheme was introduced, the same rates of personal and additional exemptions were allowed under the old law for individual taxpayers depending also upon their status. Therefore, no change has been introduced in this regard.

Since there was only one category of income under the global approach, itemized deductions were generaly allowed unless the taxpayer elected the standard deduction. Generally, the same items of deductions were available in case the taxpayer chose itemized deductions for reporting his income. However, certain items were not required to be business-related in order to qualify as deductions. Thus, interest, taxes and bad debts, though not connected with trade or business, were nevertheless deductible in arriving at net taxable income under the old system.

Previously, any individual taxpayer other than a non-resident alien could also elect to take the standard deduction, not exceeding 10% of his gross income, in lieu of the itemized deductions. As under current law, unless the taxpayer signified his intention to use the optional standard deduction in his return, he was considered to have availed himself of the itemized deductions.

If the gross income reported by the taxpayer in his return included that of his wife, a standard deduction of 10% of the gross income received by his wife, but not to exceed ₱ 500, was allowed as an additional deduction regardless of whether such taxpayer used the itemized deductions or the optional standard deduction. This standard deduction for working wife has been deleted under the current system.

D. Tax rates

1. Under the new system

a. Compensation income

The following tax rates are in effect under the modified gross income tax system.

The taxable compensation income (gross compensation

© 1982 International Bureau of Fiscal Documentation – BULLETIN

income less only personal and additional exemptions) received by a citizen or resident alien from world-wide sources is subject to the following rates:

Pesos	*Pesos + percentage of excess over lower amount*
Not over 2;500	0%
2,500 – 5,00	0 + 1%
5,000 – 10,000	25 + 3%
10,000 – 20,000	175 + 7%
20,000 – 40,000	875 + 11%
40,000 – 60,000	3,075 + 15%
60,000 – 100,000	6,075 + 19%
100,000 – 250,000	13,675 + 24%
250,000 – 500,000	49,675 + 29%
Over 500,000	122,175 + 35%

The tax rates imposed on compensation income are much lower as compared to the hold rates of 3% to 70% in force under the net income tax system. Previously, the 36% tax bracket was reached when one's net income exceeded ₱ 32,000. As a general rule, therefore, fixed income earners are favored under the gross income tax scheme because of the 50% reduction in the maximum tax rates and the increase in the taxable income base.

b. Business income

As a result of the categorization of incomes, the taxable net business income of a citizen or resident alien from world-wide sources is presently subject to a separate schedule of tax rates ranging from 5% on the first ₱ 10,000 to 60% on the excess over ₱ 500,000. The complete schedule of such tax rates is as follows:

Pesos	*Pesos + percentage on excess over lower amount*
Not over 10,000	5%
10,000 – 30,000	500 + 15%
30,000 – 150,000	3,500 + 30%
150,000 – 500,000	39,500 + 45%
Over 500,000	197,000 + 60%

There is only a slight reduction of the old maximum tax rate of 70% to 60% which is currently imposed under the new system, but the taxable income base has been increased.

c. Passive income

Passive income, consisting of dividends, interest, royalties, prizes and other winnings, is subject to the final withholding tax at varying rates. Dividends received by a citizen or resident alien from a domestic corporation and the share of an individual partner in a partnership which is treated as a corporation for tax purposes are subject to a 15% final withholding tax. Interest received by a citizen or resident alien on a savings deposit is subject to a 15% final withholding tax. Interest on time deposits and yields from deposit substitutes[2] and from trust funds and similar arrangements are subject to a 20% final withholding tax. However, if the aggregate amount of interest on a deposit account maintained by a depositor alone or with another in any one bank at any time during the taxable period does not exceed ₱ 1,000 a year or ₱ 250 per quarter, the same is exempt from tax. Royalties, prizes (except prizes amounting to ₱ 3,000 or less which should be taxed as business income) and other winnings received by a citizen or resident alien are subject to 15% final withholding tax.

2. Under the old system

Under the old system, only one schedule of tax rates was prescribed for items of income which came within the definition of the term "gross income". The rates ranged progressively from 3% on the first ₱ 2,000 of net taxable income to 70% on the excess over ₱ 500,000. However, dividends and interest from a savings deposit were subjected to the 15% final withholding tax. The same was true with respect to yields from deposit substitutes and interest from time deposits which likewise were subjected to the final withholding tax of 20%.

E. Classification of taxpayers

Individual taxpayers are generally divided into two classes, namely, citizens of the Philippines and aliens. Citizens of the Philippines can further be classified as residents or non-residents. Likewise, alien individuals may be classified as resident aliens or non-resident aliens. The same rules on classification of taxpayers recognized under the old law are currently being followed.

1. Citizens and aliens

Citizens and resident aliens are taxed on the basis of their world-wide income. The schedule of tax rates applicable will depend on the type of income earned by the taxpayer. However, in the case of non-resident citizens deriving income from sources outside the Philippines, a dollar schedule ranging from 1% to 3% based on the taxpayer's "adjusted gross income" is applied. Adjusted gross income means gross income from foreign sources less the total of personal exemptions allowed and the entire amount of foreign income tax paid by him.

Non-resident alien individuals are subject to tax only on the basis of their Philippine-source income. Non-resident aliens may further be classified into: (a) those engaged in trade or business in the Philippines; and (b) those not engaged in trade or business in the Philippines. A non-resident alien who comes to the Philippines and stays for an aggregate period of more than 180 days during any calendar year is deemed to be doing business in the Philippines. If his stay is 180 days or less, he is considered as not engaged in trade or business in the Philippines.

Non-resident aliens engaged in trade or business in the Philippines are generally subject to tax on their compensation and business incomes received from Philippine sources in the same way as resident citizens and resident aliens. However, dividends, shares in the net profits of a partnership (which is taxed like a corporation), interest,

2. As defined under the Tax Code, the term "deposit substitutes" means an alternative form of obtaining funds from the public, other than deposits, through the issuance, endorsement, or acceptance of debt instruments for the borrower's own account, for the purpose of relending or purchasing of receivables and other obligations. These include promissory notes, repurchase agreements, similar instruments with recourse authorized by the Central Bank of the Philippines for banks and non-bank financial intermediaries.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

royalties, prizes and other winnings (except prizes of ₱ 3,000 or less which shall be taxed as business income) are subject to a 30% final withholding tax.

On the other hand, interest, dividends, rents, salaries, wages, premiums, annuities, compensation, remuneration, emoluments, or other fixed or determinable annual or periodical or casual gains, profits, and income from Philippine sources received by non-resident aliens not engaged in trade or business in the Philippines are subject to a final withholding tax of 30%.

However, capital gains realized by non-resident aliens, whether or not engaged in trade or business in the Philippines from the sale of Philippine shares listed in the dollar or any acceptable foreign currency on a stock exchange are currently exempt from income tax.

2. Residents and non-residents

The principles for determining whether or not an alien is a resident or non-resident remain the same whether under the old or new system.[3]

An alien individual's residency or non-residency status depends on the nature and length of his stay in the Philippines. A mere floating intention, indefinite as to time, to return to another country is not sufficient to constitute one a transient. If he lives in the Philippines and has no definite intention as to his stay, he is a resident. One who comes to the Philippines for definite purpose which in its nature may be promptly accomplished is a transient. But if his purpose is of such nature that an extended stay is necessary for its accomplishment, and to that end he makes his home temporarily in the Philippines, he becomes a resident, though it may be his intention at all times to return to his domicile abroad when the purpose for which he came has been fulfilled or abandoned.[4]

F. Taxation of certain expatriates

As part of the incentives granted to certain businesses which help promote the Philippine economy, foreign employees hired by them are also entitled to preferential tax treatment vis-à-vis other expatriates.

Thus, alien individuals employed by regional or area headquarters established in the Philippines under Presidential Decree No. 218, offshore banking units established under Presidential Decree No. 1034 and service contractors or their subcontractors engaged in petroleum operations under Presidential Decree No. 87 are subject to a final tax of 15% based on their gross salaries including other emoluments.

G. Tax administration

1. Withholding system

The Philippine withholding tax system may be divided into four types, namely, withholding tax on wages, basic withholding tax at source, the "expanded withholding tax" and other special types of withholding. The growing use of the withholding tax as a mode of ensuring tax collection has been very apparent in recent tax laws. To further strengthen the system, a penalty is imposed upon the withholding agent if it fails to perform its obligations as such. Accordingly, any amount paid or payable by the withholding agent which is allowable as a deduction from gross income will be disallowed if it fails to deduct and withhold the tax in accordance with the law.

The withholding tax on wages is imposed on all forms of compensation arising from an employer-employee relationship, whether monetary or non-monetary. Specifically, the term "wages" is defined to include all remuneration for services performed by an employee for his employer unless specifically excepted under the law.[5] Thus, all amounts paid to an individual which fall within the category of compensation income will be subject to this type of withholding system.

Some relevant rules in this connection are: the basis upon which the remuneration is paid is immaterial in determining whether it constitutes wages. Thus, it may be paid on the basis of piecework, or a percentage of profits; and may be paid hourly, daily, weekly, monthly, or annually. Wages may also be paid in money or in some medium other than money, as, for example, stocks, bonds, or other forms of property. If services are paid for in a medium other than money, the fair market value of the thing taken in payment is the amount to be included as wages subject to withholding. Thus, as a general rule, pensions and retirement pay are considered wages subject to withholding. The same is true with respect to vacation allowances paid to an employee. However, amounts paid specifically - either as advances or reimbursements - for traveling or other bona fide ordinary and necessary expenses incurred or reasonably expected to be incurred in the business of the employer are not wages and are not subject to withholding. Traveling and other reimbursed expenses must be identified either by making a separate payment or by specifically indicating the separate amounts where both wages and expense allowances are combined in a single payment.

Ordinarily, facilities or privileges (such as entertainment, medical services, or "courtesy" discounts on purchases) furnished or offered by an employer to his employees generally are not also considered as wages subject to withholding if such facilities or privileges are of relatively small value or are offered or furnished by the employer merely as a means of promoting the health, goodwill, contentment, or efficiency of his employees.

The term "wages" includes remuneration for services performed by a citizen or resident of the Philippines, as employee of a non-resident alien individual, foreign partnership or foreign entity engaged in trade or business within the Philippines. Likewise, any person paying wages on behalf of a non-resident alien individual, foreign partnership, or foreign corporation not engaged in trade or business in the Philippines is constituted as the withholding agent.

---

3. See Gison and Salvador, "Philippine Taxation of Alien Individuals", 35, *Bulletin for international fiscal documentation* 5, p. 223 (1981).
4. Income Tax Regulations, Section 5.
5. Revenue Regulations No. 20-81, "Withholding Tax for Compensation Income Under the Gross Income Tax System".

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Compensation paid for services rendered in the Philippines irrespective of place of payment received by a non-resident alien not engaged in trade or business in the Philippines is subject to a final withholding tax of 30%. Every person who has the control, receipt, custody, disposal or payment of the income is constituted as the withholding agent.

2. Filing of returns and payment of tax

Citizens and resident aliens deriving purely compensation income must file their returns on or before 18 March of each year, covering income for the preceding taxable year. Individuals deriving business or professional income must file their returns on or before 15 April of each year. If the taxpayer derives both compensation and business incomes at the same time, the return covering both incomes must be filed on or before 15 April of each year.

II. REVISED TAXATION OF SALES OF SHARES OF STOCK

Gains of individuals, whether citizen or alien, or of corporations, domestic or foreign, from the sale of shares of stock classified as capital assets are currently subject to tax depending on whethert or not shares of stock are listed and traded on a local stock exchange. Previously, net capital gains from the sale, exchange, transfer or similar transactions intended to convey ownership of or title to any share of shares of stock were subjected to a final tax of 10%. However, if the shares of stock involved were that of a closed corporation, the tax rates were 10% on the first ₱ 50,000 of net capital gains and 20% on the excess.[6]

Under the present law, if the shares of stock sold or exchanged are listed and traded through the local exchange, a rate of 0.025% of the gross selling price is applicable. The stockbroker is constituted as withholding agent in this case.

On the other hand, if the shares of stock sold, exchanged or transferred are not traded through a local stock exchange, net capital gains derived therefrom are subject to a final tax of 10% on the first ₱ 100,000 and 20% on the excess. The seller must file the return and pay the tax on a per transaction basis, i.e. within 30 days following each sale or disposition of the shares of stock. An adjustment return is required to be filed after the close of the taxable year.

The net capital losses sustained during the taxable year are allowed as capital loss deductible in the same taxable year only. Moreover, the entire amount of capital gains and capital loss are considered without taking into account the period or duration during which the stocks were held by the seller up to disposition for purposes of computing net capital gains.

No sale, exchange, transfer or similar transaction intended to convey ownership of, or title to, any share of stock may be registered in the books of the corporation unless the receipt of payment of the tax is already filed with or recorded by the stock transfer agent or secretary of the corporation. The stock transfer agent or corporate secretary must also inform the Bureau of Internal Revenue in case of non-payment of the tax.

Residency Concept and Employment Income in Nigeria

By A.C. Ezejelue*

INTRODUCTION

Although something may have been written generally on "residence" for tax purposes in Nigeria, this narrow aspect of the concept as it applies to employment[1] income requires fairly detailed and isolated treatment. The emphasis will be on foreign nationals who are deemed to be resident in Nigeria for tax purposes in respect of their employment income. The relevant Nigerian tax law on this is often not well understood or is misconstrued by non-resident taxpayers.

Therefore this short article is an attempt to construe the relevant tax law on the matter, for the guidance of foreigners whose employment incomes are deemed to be liable to Nigerian tax. Any interpretations offered here are by no means conclusive; they are open to challenges, even by the author himself, in the light of any new facts.

RELEVANT SECTIONS OF THE RELEVANT ACT

The relevant law for the subject under consideration is contained in Sections 4 and 8 of our Income Tax Management Act (ITMA) 1961 (as amended).

The pertinent provisions of Section 4 are as follows:

> *Section 4(1).* The tax shall, subject to the provisions of the Act be payable for each year of assessment upon income accruing in, derived from, brought into, or received in, Nigeria in respect of –
>
> . . .
>
> (b) any salary, wages, fees, allowances or other gains or profits from an employment including gratuities, compensations, bonuses, premiums, benefits or other perquisites allowed, given, granted by any person to an employee.

And the following subsections of Section 8 are apposite for our purposes:

* The author is Professor of Accounting, School of Business Administration, Imo State University, Aba Campus, Imo State, Nigeria.

1. "Employment" includes any service rendered by any person in return for any gains or profits. See Sec. 4(2)(d) of Income Tax Management Act (ITMA) 1961 (as amended).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Section 8(1). The gains or profits from an employment shall be deemed to be derived from Nigeria if –

(a) the duties of the employment are wholly or partly performed in Nigeria, unless–
  (i) the duties are performed on behalf of an employer who is in a country other than Nigeria; and
  (ii) the employee is not in Nigeria for 183 days or more in a year of assessment; and
  (iii) the remuneration of the employee is liable to tax in that other country.
(b) the employer is in Nigeria unless the duties of the employment are wholly performed, and the remuneration paid, in a country other than Nigeria save during any temporary visit to or leave in Nigeria.

. . .

(3) The gains or profits from any employment exercised in Nigeria shall be deemed to be derived from Nigeria whether the gains or profits from such employment are received in Nigeria or not.

A MATTER OF CONSTRUCTING RELEVANT LAW

It seems that the spirit behind Section 8 of ITMA on the concept of "residency" is to give the Revenue authorities a wide scope of collecting as much tax as possible under Section 4 of ITMA while at the same time making allowance for what may appear to be the minimum acceptable practice elsewhere.

Section 4(1)(b) is very wide, and does not give any exclusionery conditions when read in isolation. However, apart from being subject to other provisions of the Act, Section 4 must be read in conjunction with Section 8 which introduces some qualifying and ameliorating provisions. At the same time, all subsections of Section 8 should be read together partly for possible interpretative purposes and partly for resolving any appartent conflicts.

Section 4(1)(b) tends to rope in all kinds of income whether accruing in, derived from, brought into, or received in,[2] Nigeria if considered in isolation. But Section 8 stipulates the conditions under which an income shall be deemed to be derived from Nigeria. The emphasis is on "derived from" because derivation in this context implies "obtained" or "acquired" or "got" via working or having worked in or for Nigeria.[3] This is to be distinguished from "brought into" or "received in" or (to some extent) "accruing in", which may not necessarily imply worked or working in or for Nigeria.

The first general condition[4] is that an income from employment shall be deemed to be derived from Nigeria (and therefore subject to Nigerian tax) if the duties of the employment are wholly or partly performed in Nigeria. Thereafter, it introduces some counter-conditions under which the general condition shall not hold, i.e. if:

(i) the duties are performed on behalf of an employer who is in a country other than Nigeria; *and*
(ii) the employee is not in Nigeria for 183 days or more in a year of assessment; *and*
(iii) the remuneration of the employee is liable to tax in that other country.[5]

It must be emphasized that the above three counter-conditions must operate together in order to exclude the operation of the general condition under Section 8(1)(a).

Therefore, if, for example, (i) and (iii) above are true but (ii) is not true, the general condition will be expected to apply.

Section 8(3) emphasizes that once the principle of derivation from Nigeria is associated with any employment income in accordance with the provisions of subsection (1), that income shall be subject to Nigerian income tax, notwithstanding that the income may not have been received in Nigeria.

There is no conflict between subsections (1) and (3) of Section 8. Rather, they tend to complement each other. A taxpayer who is subject to Nigerian income tax under subsection (1), i.e. the "derivation principle", cannot claim that he is exempt simply because the income is not received in Nigeria. Similarly, a taxpayer who is subject to Nigerian income tax by virtue of subsection (3), i.e. "concept of received in", cannot claim that he is exempt simply because the income is not derived from Nigeria.

Again, subsection (3) of Section 8 does not overrule its preceding subsection (1)(a). It merely re-inforces it, and brings out the independence of the "concept of received in" from the "principle of derived from". Subsection 3 explains that income from *employment exercised in Nigeria* shall be deemed to be derived from Nigeria. This is a restatement of subsection (1)(a) which emphasizes that income from employment shall be deemed to be derived from Nigeria if the *duties of the employment are wholly or partly performed* in Nigeria. If an employment is exercised in Nigeria under subsection (3) it is similar to saying that the duties of that employment are performed in Nigeria (wholly or partly) under subsection (1)(a).

"Received in" and "derived from" are under two different categories. They are not mutually exclusive. An income which may not qualify for Nigerian income tax because it is not deemed to be derived from Nigeria may qualify for Nigerian tax on the ground that it is "brought into" or "received in" Nigeria. This is the implication of taking up Sections 4(1)(b) and 8(3) together.

GENERAL HYPOTHETICAL ILLUSTRATION

A general hypothetical example may prove useful to illustrate all the foregoing theories.

Assume that a Dutchman, Mr. A, resident in the Netherlands – thus a non-resident of Nigeria – is sent by his Dutch firm (employer) to work temporarily in Nigeria. A receives a salary for the work performed in Nigeria. Is A liable to Nigerian tax?

The position will be that if A stays in Nigeria for 183 days or more, his income, whether or not it is received in Nigeria, will be subject to Nigerian tax. But if he stays for less than 183 days (in the aggregate) there is no doubt

---

2. For possible implications of the terms: "accruing in, derived from, brought into, or received in", see A.C. Ezejelue, "Taxation of Consultancy fees in Nigeria", 36 *Bulletin for International Fiscal Documentation* 8-9 (1982), pp. 421-424.
3. Id.
4. See Sec. 8(1)(a) ITMA.
5. Sec. 8(1)(a)(i-iii).

© 1982 International Bureau of Fiscal Documentation – BULLETIN

that his income will not attract Nigerian tax, provided also that the conditions under Section 8(1)(a)(i) and (iii) hold.

If we assume that A is not liable to Nigerian tax on the ground that his income is not deemed to be derived from Nigeria under Section 8(1)(a), what happens if A receives part of his salary in Nigeria to pay for living and other personal expenses? On the basis of the foregoing construction, this part of A's salary would have been received in Nigeria, and would therefore attract Nigerian income tax under Section 4(1)(b). An income may be liable to Nigerian tax simply because it is received in Nigeria notwithstanding that the income may not have been derived from Nigeria.

CONCLUSION

The issue of the determination of residence, generally, for tax purposes, in Nigeria is a very important one.[6] But it seems that the concept of residency as it affects employment income of non-residents is of greater importance because it tends to apply more to foreign nationals who are apt to misconstrue the position. Therefore, some efforts have been made in this article to highlight certain basic and vital issues. It is hoped that this will stimulate the interest of both academicians and practitioners.

6. For a detailed discussion of this, see A.C. Ezejelue, "Impact of residence on tax liability in Nigeria", 35 *Bulletin for International Fiscal Documentation* 12 (1981), pp. 547-554.

Tax Changes in Jamaica: The 1982-83 Budget

By H.W.T. Pepper

For the second year in succession the new Government in Jamaica has been able to introduce a Budget imposing no new taxes, partly because of increases in collection of tax arrears in the previous year.

Income taxes

Various changes in existing taxes have been announced although income taxes on companies and individuals have been deferred for future consideration.

Certain exemptions from income tax are, however, to be granted with effect from 1 January 1983. In the case of agriculture exemption is to be extended to all agricultural income derived from the growing of crops. (See below, "Agricultural income").

Exemption is also to be granted in respect of the employment income of all registered disabled individuals certified as substantially handicapped by injury, disease or congenital deformity where the handicap will be of indefinite duration.

Payroll contribution

A 3% levy on wages paid by employers is to be made with effect from 1 June 1982 to provide funds for H.E.A.R.T. (Human Employment and Resources Training) to train 16-to-20-year-olds who will be selected for training for periods up to 3 years.

Employers may deduct wages paid to the trainees from the H.E.A.R.T. contributions due from them, and wages and residual dues will be deductible from taxable profits.

In the second and third years instead of a deduction employers will receive tax credits of 75% of male trainees' wages (80% for female trainees' wages) a more generous allowance to encourage continuance of training programmes.

If the H.E.A.R.T. levy works as planned it will confer a net benefit, rather than a net liability, upon employers and so will rank as a kind of training subsidy rather than new taxation.

Property tax

As regards property tax, a re-valuation exercise is to be commenced in June 1982 and in due course small properties valued at $ 2,000 or less, which formerly paid a minimum tax of $ 5.00 are to exempted.

Other properties will be classified according to the type of land use and the rate structure will be adjusted so that there will be no material increase in the existing tax liability on properties.

Once the new values are established, an indexing system will be introduced so that in future values, and the tax yield, will rise with prices, creating buoyancy in the revenue from property tax.

Taxpayers whose properties are mortgaged will be afforded the facility of paying their property tax in monthly instalments to the mortgage institutions along with the monthly capital, interest, and insurance payments. The institutions will be required to pay over the tax to the collector quarterly, a system which will provide an "easy-payment plan" for taxpayers and also assist the Tax Collection Department.

Stamp duties

To cut down the amount of work involved both in the private sector and the Stamp Duty Office it is proposed to change the stamp duty on receipts from an ad valorem levy (which varies from 1 cent to 20 cents) to a flat rate levy of 3.5 cents per receipt. The levy was formerly paid by gumming postage stamps on receipts but will in future be paid by monthly composition payments.

Many other duties will also be paid by way of composition instead of by having thousands of individual documents embossed by stamping machines.

Vehicle and drivers' licences

To reduce administrative work the licensing system is to be computerised and driving licences will be issued for 3-year terms (at $ 24.00, i.e., 3 times the annual cost) instead of yearly. There will be an additional levy of $ 5.00 to cover the cost of a laminated plastic licence containing a photograph of the driver.

In the case of vehicle licences (called road tax in some countries) the fee will be payable annually without the option to pay quarterly. The owner of a vehicle will be able to retain the vehicle's licence plate throughout his life-time. When a vehicle is sold the old licence plate will be removed and a new one fixed in respect of the new owner.

Individuals' vehicle licence fees will be payable, and renewable on the first day of the month in which the individual was born, while other vehicles' licences will be renewable each 1st January.

Levies on imported vehicles

A major fiscal improvement arises from the rationalisation of initial duties and taxes on motor cars formerly subject to levies totalling 173% of c.i.f. value, with exemptions for self-drive car hire agencies and former residents of Jamaica returning to the country with a motor car.

The exemptions have now been abolished thus broadening the tax base, and the total taxation on cars not exceeding 2,000 c.c. engine capacity (petrol-driven) or 2,200 c.c. (diesel-driven) is now 75% of the c.i.f. value comprised of 45% customs duty and the remainder retail sales tax.

Cars of higher engine capacity will, however, continue to be taxed at the old rates.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Trucks, lorries, and other commercial vehicles used for agricultural purposes will continue to enjoy the exemption from all initial duties and taxes conferred in last year's Budget. Other commercial vehicles will continue to be exempted from all levies except the 45% customs duty on c.i.f. value.

Agricultural income

The considerable incentives to agriculture have been rationalised as far as the income tax exemption is concerned. Instead of specifying a period of tax holiday, a complete exemption is to be accorded, with effect from 1 January 1983, for profits from the growing of crops.

Losses incurred in exempt agricultural activities will not be available to be offset against other income and separate accounts are to be prepared for the exempt operations.

"Free trade" facilities

Jamaica's entitlement to export commodities to other countries which will accept the commodities as duty-free imports or within established quotas is likely to be extended from the CARICOM free trade area, the A.C.P. arrangements, the G.S.P. (Generalised System of Preference) agreements with Canada and the U.S.A., and other schemes by the inauguration of President Reagan's C.B.I. plan.

The C.B.I. (Caribbean Basin Initiative) arose partly from talks held by the Hon. Edward Seaga, M.P., P.C., Jamaica's Prime Minister and Minister of Finance, with President Reagan in 1981.

Basically the C.B.I. provides, for a period of 12 years, duty-free import facilities for Jamaica's (and many other Caribbean countries') exports to the U.S.A. of all goods except most textiles and garments. Textiles and garments will, however, receive favourable treatment falling short of duty-free entry. In addition the C.B.I. will give incentives to U.S. investment in the Caribbean to produce more goods for export and to finance imports of such goods by U.S. importers.

The C.B.I. scheme will come into effect when passed by the U.S. Congress.

Double taxation relief

Jamaica has double taxation treaties with the U.K. and the U.S.A., and also with Canada, Denmark, West Germany, Norway and Sweden. The treaty with Sweden is being updated and negotiations are under way for new treaties with other countries.

Erratum: Bulletin February 1982: page 52 (Section III), delete "New Zealand".

JAMAICA:

Budget 1982-83

Extracts from the Budget Speech pronnounced on 22 April 1982 by the Hon. Edward Seaga, Prime Minister and Minister of Finance and Planning.

Members of this Honourable House will recall that in the Budget Presentation of last year I indicated that among the priority objectives of my Government was the promotion of increased economic activity and towards that end tax administration and policy changes would be introduced on a phased basis.

. . .

Income tax relief

Where any person provides training and employment for one or more registered participants he will be permitted to deduct the amount of the remuneration paid to the participant from the amount of HEART Contributions[1] for which he is liable. The net HEART Contributions, if any, remaining after deduction of the participant's remuneration will be payable to the Collector of Taxes. The Net HEART Contributions and the participant's remuneration will be deductible expenses for purposes of income tax.

Where a person liable to HEART Contributions does not provide training and employment for registered participants the Gross Contributions will be payable to the Collector of Taxes and will be deductible for income tax purposes.

In order to induce continued employment of registered participants after the end of the first year of training, it is proposed that instead of treating the participant's remuneration as a deductible expense, the employer be given Tax Credits for the Second and Third years equivalent to a prescribed percentage of the participant's remuneration, which Credit would be a greater tax benefit than the effect of a deductible expense.

For the Second and Third years the prescribed percentage will be 75% and in recognition of the need to compensate for the higher rate of unemployment experienced by females in the Labour Force vis-a-vis males, the Tax Credits for the Second and Third years in respect of female participants will be 80%.

The grant of Tax Credits will be subject to certification by the HEART Fund that the participant performed satisfactorily during the relevant year and that the employer met all obligations.

Property taxation
Land revaluation programme 1982-83

In accordance with the provisions of Section 11 of the Land Valuation Act all parcels of land in Jamaica are now due for revaluation, but apart from this fact the significant changes in the level of property values during the past eight (8) years following the date of the last revaluation now render the early revaluation of land an urgent necessity in order to establish an equitable base for the taxation of property.

Government has therefore decided that the programme of revaluation will commence in May, 1982 and the whole exercise is expected to be completed by 31st January, 1983.

The main objectives of the revaluation programme are:

(i) To update the property tax base to reflect current market values.

(ii) To establish a system of land use classification and coding of each parcel of land to facilitate taxation based on the dominant land use categories, namely:
   (a) agricultural;
   (b) residential;
   (c) commercial;
   (d) industrial.
   Establishment of a land use classification will provide the basis for development of a more equitable tax structure, thereby obviating the necessity for time-consuming derating and relief procedures.

(iii) To create an inventory of agricultural properties of 50 acres and over. This size category covers 1.3 million acres or 46% of all farm land. Pilot studies have already been undertaken for the parish of St. Mary.

(v) To create an inventory of land owned by Government. The information derived from revaluation will be computerised and will include: location, area, title reference, use occupation and tenurial status, the nature of improvements and the unimproved values.

(v) To refine the existing fiscal cadastre especially in relation to enclosure maps and plans.

(vi) To code land in foreign ownership.

Tax liability after revaluation

Members should note two important aspects of the revaluation programme namely:

(i) The tax rates will be adjusted so that there should be no significant increases in the existing tax liability of property owners.

(ii) There will be no property tax on any parcel of land valued at $ 2,000 and under. Approximately 300,000 taxpayers across the island will benefit from this exemption.

Buoyancy of the property tax

On the defects of the present site value system of land taxation is its lack of buoyancy in the sense that Government derives no tax advantage from changes in the market values of land. This defect will be remedied by introducing a Land Value Indexing System concurrently with the establishment of the updated land values under the revaluation programme. This means that following the conclusion of the forthcoming revaluation exercise, there will be a continuous programme for monitoring and analysing property transactions in order to determine changes in the level of values in each land use category. The information derived under this Land Value Indexing System will:

(i) enable Government to review, as and when it deems necessary, the rate structure applicable to each use category; and

(ii) enable the Land Valuation Department:
   (a) to effect future revaluation exercises in a much shorter time period and at considerably reduced cost;
   (b) to improve the valuation roll maintenance operations by effecting on a regular basis changes relating to the ownership, use and subdivision of land.

. . .

Revision of the Stamp Duty Act

In continuation of the programme of revision of the provisions of taxing statutes to facilitate improvements in assessment and collection procedures, arrangements have been made for a comprehensive revision of the Stamp Duty Act which requires substantial updating in many respects having been enacted as long ago as July, 1937.

. . .

There are a number of stamp duties such as those on Life Insurance Policies and Bills of Lading which can be collected more efficiently by the method of composition. Government has, therefore, decided to facilitate the making of agreements in the future by amending the Act to empower the Stamp Commissioner to enter into agreements for the composition of stamp duties, as he thinks fit, but subject to the same terms and conditions as are applicable to the instruments now under composition arrangements.

. . .

Income tax concessions - income tax exemption: Agricultural Income

Members will recall that in the last Budget Presentation, I announced that the Agricultural Incentives Act would be amended in order to:

(i) Expand the range of agricultural crops in respect of which tax concessions were granted under the Act.

(ii) Extend the tax holiday period from 5 to 9 years on the basis of the amount of "value added" in the process of production.

. . .

Government is convinced that the initiatives for economic recovery, especially in the area of agriculture, can best be served by an exemption from income tax of the profits derived from agriculture, instead of the proposed amendments to the Agricultural Incentives Act. Initially, the exemption will be confined exclusively to the growing of agricultural crops.

. . .

Proposal for the integration of the system of collection for all items of revenue and statutory contributions

. . .

Government has, . . . decided that a more effective method of collection would be achieved if the Collection and Compliance Activities in relation to all items of Revenue and Statutory Contributions are centralized in a single Agency within the Collector General's Department adequately staffed with trained personnel and involving the establishment of an integrated Computer System.

This programme of development will be carried out on a phased basis as follows:

(i) The responsibility for the collection and enforcement of income tax in the Corporate Area will be transferred to the Collector General's Department. This will enable the Commissioner of Income Tax to concentrate on the primary functions of identifying and assessing the large number of taxpayers instead of dissipating the efforts of his organization in carrying out collection and compliance functions more appropriately executed by the Collector General's Department which is already provided with the nuclues for the centralized system of collection and compliance.

(ii) The collection of NHT contributions will be transferred from the Commercial Banks to the Collector General's Department.

(iii) The compliance activities in relation to NHT and NIS Contributions will be transferred to the Collector General's Department. This will facilitate compliance activities. This will mean the establishment in each Collectorate of a small Unit to carry out the compliance activities in relation to Income Tax, National Housing Trust and National Insurance Contributions.

BOTSWANA:

THE FINANCIAL ASSISTANCE PROGRAMME

By D.K. Uttum Corea*

Contents

I. Productive employment development fund
II. Classification, by scale, of projects recommended for financial assistance
III. Nature of assistance recommended for the various types of projects
IV. Other types of assistance
V. Linking industries
VI. Local reference
VII. Evaluation and monitoring
VIII. Production employment development fund policy proposals for amendment to income tax legislation
IX. Other main features of the proposed Income Tax Amendment Bill referred to in the Budget Speech

A "white paper" entitled "The financial assistance policy" was presented during the April 1982 sessions of the National Assembly of Botswana. The paper sets out a policy for the development of productive employment and deals with various proposals to provide financial assistance to certain new ventures and expansions of certain existing ventures to achieve this end.

This article is based on the proposals contained in the white paper and the report of an inter-ministerial working group. The income tax amendments, mentioned in the Budget Speech for 1982/83, which have yet to be detailed in an income tax amendment bill, are also discussed in the light of the white paper. This article should be regarded as providing guidelines only. The proposals are subject to introduction of related income tax legislation in the next sessions of the National Assembly, and the information contained herein is based on my interpretation of "the financial assistance policy" and proposals for amendment of the income tax act.

I. PRODUCTIVE EMPLOYMENT DEVELOPMENT FUND

Financial assistance is to be provided by way of specific grants to eligible projects from the above fund. P5 million is included as an appropriation in the 1982/83 budget towards the funds. This is considered to be an initial appropriation toward the fund.

II. CLASSIFICATION, BY SCALE, OF PROJECTS RECOMMENDED FOR FINANCIAL ASSISTANCE

(a) small scale projects: those involving an investment of up to P10,000;
(b) medium scale projects: those involving an investment between P10,000 and P750,000;
(c) large projects: those involving an investment of more than P750,000.

Access to funds for small projects will be limited to citizens and these are likely to be most important in the rural areas.

Assistance in respect of medium and large projects is intended to primarily favour citizen-owned businesses though it would appear that foreign-owned businesses will not be excluded from consideration, thereafter. In fact it is my opinion that medium and large scale projects will invariably require foreign collaboration and that the financial assistance policy will therefore apply to all eligible ventures.

III. NATURE OF ASSISTANCE RECOMMENDED FOR THE VARIOUS TYPES OF PROJECTS

Small scale projects:

(i) The proposed assistance is to be in the form of *grants* towards capital investment and working capital of small scale industries (e.g. hammer milling, bee-keeping, cement block manufacturing, black-smithing, etc.) which have reasonable expectation of being financially viable;
(ii) The grants are to be based on a percentage of total investment cost favouring owner-operated activity in rural areas. Preference is also given to female entrepreneurs;
(iii) The grants are to be limited to a maximum of P2000 per job to be created by the project.

Medium scale projects:

(i) In the case of *new manufacturing industries* the following *automatic grants* are recommended:
   1. *A five-year "step down" tax holiday* involving reimbursements to a business of 100% of its income tax liability in each of the first two years after commencement of production, and 75%, 50% and 25% in the third, fourth and fifth years, respectively;
   2. *A "step down" reinbursement* of *unskilled labour costs* of 80% in the first two years, and 60%, 40% and 20% in the third, fourth and fifth years respectively;
   3. *A training grant* in reimbursement of 50% of off-the-job training costs in the first five years of operation (in place of existing training allowances

* F.C.A. (Sri Lanka), Partner, Coopers and Lybrand, Botswana.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

for tax purposes. However, those businesses which are not eligible for training grants will retain their eligibility for training allowances for tax purposes).

Note: The grants in 2 and 3 above will be included in income for tax purposes but not the reimbursement of tax in 1 above.
Alternatively an entrepreneur contemplating investment in a new manufacturing industry may apply for substitution of the tax holiday described in 1 above with a *capital grant* and a *sales augmentation grant*, as described below, together with the automatic employment and training grants mentioned above.

(ii) In the case of all *other* expansions of existing *productive activities* and for all new investments in eligible sectors other than manufacturing the following assistance has been recommended after approval on a *case-by-case* examination basis:

(Productive activities: have been defined for the purpose of this policy to be activities for the production of goods which can either substitute for imported items or can be exported. These, however, exclude the cattle industry and large scale mining ventures. Effectively this limits the activities to manufacturing, medium and small scale mining and agriculture other than cattle.)

1. *Capital grants* of P1000 per job to be created in non-agricultural sectors and P500 per job to be created in agriculture.
   This grant is to be subject to the following limits:
   40% of capital investment in urban areas
   45% of capital investment in peri-urban areas
   50% of capital investment in non-urban areas
   60% of capital investment in rural area east
   70% of capital investment in rural area west;
2. *Sales augmentation grants* up to a maximum of 8% of sales revenue in each of the first two years, and 6%, 4% and 2% in years three, four and five respectively;
3. *A "step down" reimbursement of unskilled labour costs* – as detailed in the earlier section;
4. *A training grant* – as described in the earlier section.

Note: The case-by-case eligibility of the other productive activities will be evaluated by economic analysis so as to establish whether the project is in the overall economic interests of Botswana. The project would be expected to yield an economic return of at least 6% in real terms after adjustment for certain economic factors such as unskilled labour costs, import inputs, export credits, training costs, income tax and foreign investment in flows and out flows relating to the project. The economic analysis would cover a period of five years excluding any significant pre-production stage.

Large scale projects.

1. The same package of automatic assistance would apply to all *new* large scale *manufacturing* industries as in the case of similar medium scale projects.
2. A case-by-case evaluation would apply to all *other* expansions of existing *productive activities* and for all new investments in eligible sectors other than manufacturing as in the case of similar medium scale projects. A similar package of assistance is also envisaged.

Note: However, in view of the minimum size of the large scale projects the economic evaluation again based on 6% minimum yield will be over a period approximating the expected life of the initial investment generally up to a maximum of 20 years. Discounted Cash Flow (DCF) analysis would feature in the evaluation.

IV. OTHER TYPES OF ASSISTANCE

As a general rule the package of assistance will consist of those grants specified in the foregoing sections. However, some degree of flexibility is envisaged given the complex nature of some large scale projects. It is considered that for some projects protection under the terms of the Southern African Customs Union Agreement may be appropriate. Some other forms of direct and indirect assistance may be identified and requested by the potential investor.

V. LINKING INDUSTRIES

These have been described as industries which provide a marketing or collecting function for the productive sectors discussed above, e.g. Botswanacraft Marketing Co. The importance of such linking industries to the development of small scale industries has been recognised and such industries will qualify for grants after evaluation by standard methodology with some degree of flexibility given the unusual nature of such activities.

VI. LOCAL PREFERENCE

Local businesses tendering for Government contracts are currently given 12½% price preference over foreign suppliers of similar goods provided that the local product has at least 25% Botswana value added.

Businesses which are in receipt of financial assistance grants will not be eligible for local preference in Government and Parastatal procurement.

VII. EVALUATION AND MONITORING

Approval and monitoring of projects which are to be assisted by the Productive Employment Development Fund is to be carried out by:

- Local authorities - for small scale projects.
- Technical inter-ministerial committee (with later delegation to local authorities and line ministeries) - for medium scale projects.
- Committee at Permanent Secretary level – for large scale projects.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

In addition to prior analysis of projects for decision making there will be follow-up evaluation to ascertain the extent to which both the policy and individual projects approved under it are meeting their objectives.

VIII. PRODUCTION EMPLOYMENT DEVELOPMENT FUND POLICY PROPOSALS FOR AMENDMENT TO INCOME TAX LEGISLATION

It has been recommended that the existing lump sum capital allowances and investment allowances be replaced by straight line depreciation for all new and second-hand capital investment. This is in accordance with the budget which proposed a change in the system of capital allowances to make them neutral as between capital-intensive and labour-intensive industry.

The recommended rates of straight line depreciation are as follows:

Buildings:

(i) All buildings of industrial undertakings	15% initial allowance and the balance to be depreciated at 2½% per annum
(ii) Commercial buildings	2½% per annum;

It would appear that depreciation will not be allowed in respect of residential buildings.

Plant and machinery:

Short lived P & M (such as motor vehicles)	25% p.a.
Medium life P & M (6 - 7 years)	15% p.a.
Durable machinery	10% p.a.

I must stress, however, that any changes to income tax legislation are subject to an income tax amendment bill being presented in the National Assembly at its next sitting and debate thereon.

IX. OTHER MAIN FEATURES OF THE PROPOSED INCOME TAX AMENDMENT BILL REFERRED TO IN THE BUDGET SPEECH

(a) The extension of taxation of gains made on the transfer of certain business assets to all such assets. I interpret this as a proposed introduction of capital gains tax;
(b) A phased move to a system of current, quarterly income tax payments by the business sector;
(c) Correction of an error in the error in the provision for averaging of farming income;
(d) Revision of the provisions relating to secrecy with a view to facilitating the discovery and prevention of revenue frauds.

The detailed Income Tax Amendment Bill should be presented at the next sitting of the National Assembly.

Revised Double Taxation Convention between Australia and the United States of America *

I am pleased to be able to announce that a revised double taxation convention between Australia and the United States was signed today in Sydney. When it enters into force, this important new agreement will replace the one which has been in operation since 1953.

While the primary object of the new agreement is the avoidance of double taxation and the prevention of fiscal evasion, there are nonetheless a number of other important reasons for entering into the treaty. For example, it is an expression of accord between our Governments and reflects the close ties and goodwill that exist between our countries.

The Government has been aware of a number of shortcomings in the existing agreement, brought about largely by amendments over the years to the taxation laws of both countries and by changes in the commercial dealings. In overcoming these difficulties, the new agreement should be particularly welcomed by businessmen in both countries. Indeed, it is the Government's wish that the new agreement will not only facilitate, but will act as an incentive to, trade and investment between Australia and the United States.

The new agreement contains provisions for allocating taxing rights between the countries which are substantially similar to those obtained in Australia's other modern double taxation agreements. To the extent that the existing agreement accords with those principles of allocation, the new agreement will not result in any significant practical changes in the basis of taxing the income concerned.

For example, the taxation treatment of dividends is basically unchanged, and each country will continue to reduce its withholding tax on dividends paid to residents of the other to 15% of the gross dividend.

In somewhat similar vein, business profits which arise from the operation or maintenance of a branch that a resident of one country has in the other will continue to be taxed in the country where the branch is located. The agreement recognizes the Australian branch profits tax on branches here of U.S. and other foreign firms.

Because the new agreement, unlike the old, treats the Australian continental shelf as part of Australia for purposes of the treaty, Australia's ability to tax income of U.S. firms operating on our continental shelf is made secure.

Changes of significant practical importance which the

* Statement by the Australian Treasurer, the Hon. John Howard, M.P., 6 August 1982.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

new agreement will effect include those relating to the taxation of interest and royalties. Unlike Australia's (and other countries') modern agreements, the existing Australia/U.S. agreement does not contain provisions dealing with the taxation of interest. Nor, apart from rules under which copyright royalties are taxed only in the country of residence, are there existing provisions dealing with rights to tax royalties.

In line with modern practice the new agreement expressly recognizes the right of the country of source to tax interest and royalty income flowing to the other country but limits source country tax to 10% of the gross payment. As is customary, this limit will not apply to income effectively connected with a branch that the recipient has in the country of source. The country of residence of the recipient will also tax interest and royalties liable to tax of 10% in the country of source, but will allow a credit against its own tax for the tax paid to the country of source.

Other examples of income which may be taxed by the country of source include income from real property (including income from the exploitation of natural resources) or from the disposal of real property and most social security and government pensions.

Income from employment (including directors' fees) will be taxed in full in the country where the work is carried out, except that in specified circumstances income derived during visits of short duration to one of the countries will be taxed only by the country of residence of the particular employee.

Australia has, by the new agreement, bettered its ability to tax visiting U.S. entertainers. The new agreement provides for income derived by visiting public entertainers to be taxed in the country visited where the total income received by them in respect of their performances, including expenses, exceeds US$10,000 or its equivalent in Australian dollars. Under the existing agreement, entertainers are not taxed in the country visited unless their visit exceeds 183 days, or they are employed by a resident of the country visited or of a third country.

The new agreement provides that some types of income may be taxed only by the country of residence of the recipient. Items falling into this category include shipping and airline profits derived from international operations; pensions (other than social security and government pensions), annuities and other similar remuneration; and payments to students undertaking full-time education, made for their maintenance or education.

Unlike the existing agreement, the new treaty does not include provisions specifically covering taxation of the remuneration of professors and teachers of one country who are visiting the other. Under the new arrangements, this income will be dealt with in accordance with the general provisions covering income for services rendered.

There are also a number of changes of a more technical kind.

A special provision of the new agreement, aimed at attempted abuse of treaty provisions will limit, in specified circumstances, the benefits available under the agreement where companies are used in an attempt to exploit those benefits.

Yet other provisions of the agreement call for the allocation of income between a permanent establishment and its head office, and between associated enterprises, to be on the "arm's length" basis. In particular, Australia's right to apply its recently enacted anti-profit shifting provisions is specifically safeguarded.

Another new feature in the agreement is the inclusion of an article expressing each country's best intentions that, in enacting taxation measures, it will not treat citizens or residents of the other country, and enterprises or companies owned wholly or partly by them, in a less favourable way than it treats its own citizens or residents, enterprises or companies. This article will not affect the operation of existing provisions of the income tax law, or similar provisions enacted after signature of the convention, or provisions designed to prevent avoidance or evasion of taxes.

While the article will not be able to be called in aid by a taxpayer in an objection against a taxation assessment, it does provide for consultation between the Governments of both countries where any taxation measures are considered to infringe the principles of the particular article.

As is the case at present, the new agreement contains provisions outlining procedures to be followed where a taxpayer considers that his taxation is not in accordance with the agreement and for the relief of double taxation where, under the agreement, income may be taxed in both countries.

For example, Australia is to give credit – as it does now – for United States tax on dividends received by Australian individuals, Australian companies being effectively tax-free on dividends from the United States.

As is customary, the legislation giving the force of law to the agreement in Australia will provide for the credit method of relief to apply to interest and royalties derived by Australian residents where the United States tax on the income is limited by the terms of the agreement to 10%. Other non-dividend income that Australian residents derive from the United States will continue to be exempt from Australian tax if taxed in the United States.

The exchange of information provisions of the new agreement represent yet another area of change. This valuable aid to the taxation administrations of the two countries now will extend to information appropriate in the general enforcement of each country's income tax laws.

The new agreement will enter into force upon exchange of instruments of ratification, which can only occur after the Australian parliament and the U.S. Senate have approved the agreement. Once the agreement has been ratified, the new arrangements covering income flows between the United States and Australia will have effect with respect to dividends, interest and royalties derived on or after the first day of the second month following the date of entry into force and, in relation to other forms of income, for taxation years commencing on or after the first day of the second month following the date of entry into force.

Copies of the agreement will be made available to interested persons at Taxation Offices in the capital cities.

UNITED STATES:

Overview of Federal Excise Taxes

INTRODUCTION

This pamphlet, prepared by the staff of the Joint Committee on Taxation, provides a summary of present Federal excise taxes. It also shows recent historical trends in Federal excise tax collections and projected excise tax revenues. The pamphlet is intended to provide summary information on Federal excise taxes for Members of the House Committee on Ways and Means, the Senate Committee on Finance, and other Members of Congress.

Part I of the pamphlet is an overview of Federal excise taxes, with a brief discussion of the types of Federal excises and how some of the excises are earmarked for certain expenditure purposes. Part II is a summary of present Federal excise taxes by category: organized into 13 categories, plus a category of miscellaneous excises. The summary of each excise tax category indicates whether the revenues from the tax go into the general fund or into a trust fund or other special fund. Part III presents data on recent trends in Federal excise tax revenues for selected fiscal years, 1970-1981, and estimated revenues for fiscal years 1982 and 1983 under present law.

A forthcoming staff pamphlet will provide additional background information regarding Federal excise taxes, including an historical survey of major Federal excise tax changes, a more detailed description of present law excise taxes and the applicable trust funds, and legislative history of the specific excise taxes.

I. OVERVIEW OF FEDERAL EXCISE TAXES

Types of Federal excise taxes

The Internal Revenue Code of 1954, as amended, provides for more than 50 different excise taxes (Code subtitles D and E). In general, these are taxes imposed on the manufacture, sale or use of a particular commodity or service. Occupational taxes and penalty taxes[1] imposed on certain other activities (e.g., certain prohibited transactions of pension plans and self-dealing transactions of private foundations) are also provided as excise taxes.

Where an excise tax applies to a manufacture, sale or use, the rate of tax is a prescribed dollar amount per commodity unit (e.g., 4 cents per gallon of gasoline), a prescribed percentage of the selling price, or a variant of these basic structures. A partial listing of commodities or services to which an excise tax applies includes certain diesel fuel, truck bodies and parts, gas guzzling automobiles, tires, inner tubes, gasoline, lubricating oils, coal, fishing equipment, bows and arrows, firearms and ammunition, telephone service, airline passenger tickets, wagers, certain chemicals, crude oil, distilled spirits, wines, beers, cigars, and cigarettes.

Where an excise tax is an occupational tax, the tax is imposed as an annual amount (e.g., $123 per year for wholesale dealing in beer). Such taxes apply to certain occupations involving wagers, alcoholic beverages, and firearms.

Excise tax revenues

In fiscal year 1980, Federal excise tax revenues (excluding the windfall profit tax) amounted to $18.37 billion. Eighty percent of this amount was collected from the six excise taxes imposed on gasoline, distilled spirits, cigarettes, airline passenger tickets, beer, and telephone service. Excise tax revenues for fiscal year 1980 including the windfall profit tax were $24.33 billion.

The relative importance of excise taxes (other than the windfall profit tax) to the Federal budget has diminished over the past two decades. In fiscal year 1960, excise tax collections accounted for 13 percent of net budget receipts. By fiscal year 1970 this figure had declined to 8 percent, and by 1980, to 4 percent. This trend has been influenced by the repeal of numerous excise taxes in 1965: constant, per-unit tax rates or reduced tax rates for many other excise taxes; and the relative growth of payroll and individual income tax revenues over the period.

State governments have relied on excise taxes more heavily than the Federal Government. In 1980, State government revenues from excise taxes on selected products (principally gasoline, tobacco products, alcoholic beverages, insurance premiums, and public utility services) and general sales amounted to $68.86 billion. These collections accounted for 32 percent of the own-source revenue of State governments.

Local governments collected $12.07 billion, or 8 percent of their own-source revenue, from excise taxes on selected products and general sales in 1980.

Transfer of revenue to trust funds

In some cases, excise tax revenues are transferred to a trust fund in order to finance specified trust fund expenditures. The general intent of such trust fund excise taxes is to place the excise tax burden on persons who are most likely to benefit from such expenditures or on persons whose activities may have necessitated the expenditures.

Trust funds currently financed (in whole or in part) by certain excise tax revenues are the Black Lung Disability Trust Fund, the Hazardous Substance Response Trust Fund, the Highway Trust Fund, the Inland Waterway Trust Fund, the Land and Water Conservation Fund, and the National Recreational Boating Safety and Facilities Improvement Fund. Present law also provides for the future funding of the Deep Seabed Revenue Sharing Trust Fund and the Post-Closure Liability Trust Fund with certain excise tax revenues. Excise tax collections funded the Airport and Airway Trust Fund from July 1, 1970, through September 30, 1980.

1. The various penalty excise taxes (chapters 41-44 of the Code) make up 16 of the total excise taxes.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

II. SUMMARY OF PRESENT FEDERAL EXCISE TAXES

A. Alcohol Excise Taxes

Overview

Under present law, excise taxes are levied on the production or importation of three types of alcoholic beverages: distilled spirits, wine, and beer. Also, an occupational tax is imposed on the persons involved with the production or marketing of alcoholic beverages.

Revenues collected from the alcohol excise taxes, most of which are from the tax on distilled spirits, go into the general fund of the Treasury.

Tax rates

Tables I and II are a summary of the excise tax rates imposed on alcoholic occupational taxes.

B. Tobacco Excise Taxes

Overview

Excise taxes are imposed on cigars, cigarettes, and cigarette papers and tubes manufactured in or imported into the United States.

Revenues collected from these tobacco excise taxes, most of which are collected from the tax on small cigarettes, go into the general fund of the Treasury.

Tax rates

Table III is a summary of the excise tax rates imposed on tobacco products.

C. Highway Trust Fund Excise Taxes

Overview

Excise taxes are imposed on certain motor fuels, lubricating oil, trucks and truck trailers, truck parts, tires and tubes, tread rubber, and the use of heavy duty highway vehicles. In general, exemptions from these taxes are provided for nonhighway use.

Under present law, revenues from these highway-related excise taxes are deposited into the Highway Trust Fund through September 30, 1984, after which time these taxes are scheduled (unless otherwise extended) to decline (generally to pre-Trust Fund rates) or to expire.

Tax rates

Table IV is a summary of present highway-related excise tax rates.

D. Aviation Excise Taxes

Overview

The Airport and Airway Revenue Act of 1970 imposed or increased the aviation excise taxes

Table I – Alcohol Beverage Taxes

Item	Tax rate
Distilled spirits	$10.50 per proof gallon.
Beer	$9.00 per barrel generally.[1]
Still wines:	
Up to 14% alcohol	17 cents per wine gallon.
14 to 21 percent alcohol	67 cents per wine gallon.
21 to 24 percent alcohol[2]	$2.25 per wine gallon.
Champagne and sparkling wines	$3.40 per wine gallon.
Artificially carbonated wines	$2.40 per wine gallon.

1. $7 per barrel for certain small brewers.
2. Wines containing more than 24 percent alcohol are taxed as distilled spirits.

Table II – Alcohol Occupational Taxes

Item	Tax rate
Brewers	$110 a year: $55 for less than 500 barrels a year.
Still manufacturers	$55 a year, plus $22 per still.
Wholesale dealers:	
Liquors and wines	$255 a year.
Beer	$123 a year.
Retail dealers:	
Liquors and wines	$54 a year.
Beer	$24 a year.

Table III – Tobacco Excise Taxes

Item	Tax rate
Cigars:	
Small cigars	75 cents per thousand.
Large cigars	8½ percent of wholesale price, up to $20 per thousand.
Cigarettes:	
Small cigarettes	$4 per thousand (8 cents per pack).
Large cigarettes	$8.40 per thousand.
Cigarette papers	½ cent per 50 papers.
Cigarette tubes	1 cent per 50 tubes.

Table IV – Current Highway User Excise Taxes and Scheduled Rates of Tax under Present Law

	Rate of tax, present law	
Tax	Before Oct. 1, 1984[1]	After Sept. 30, 1984[2]
Petroleum products:		
Gasoline	4 cents/gallon	1.5 cents/gallon.
Diesel fuel	4 cents/gallon	1.5 cents/gallon.
Special motor fuels	4 cents/gallon	1.5 cents/gallon.
Lubricating oil	6 cents/gallon	6 cents/gallon.
Trucks and truck parts:		
Trucks and trailers	10 percent of manufacturer's sale price	5 percent of manufacturer's sale price.
Parts and accessories	8 percent of manufacturer's sale price	5 percent of manufacturer's sale price.
Tires, tubes and tread rubber:		
Tires for highway vehicles	9.75 cents/pound	4.875 cents/pound.
Laminated tires	1 cent/pound	1 cent/pound.
Other tires	4.875 cents/pound	4.875 cents/pound.
Inner tubes	10 cents/pound	9 cents/pound.
Tread rubber	5 cents/pound	No tax.
Use tax on heavy vehicles	$3 per 1,000 pounds per year, if more than 26,000 pounds.	No tax.

1. Revenues are deposited into the Highway Trust Fund.
2. Revenues would be deposited into the general fund of the Treasury, unless the Trust Fund is extended.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

for a 10-year trust fund period, 1970-1980. The Act also established the Airport and Airway Trust Fund for deposit of the aviation-related excise taxes. On October 1, 1980, many of the aviation excise taxes expired or were reduced, and the deposit of the aviation tax revenues into the Trust Fund was terminated at that time.

Currently, there is a 5-percent excise tax on domestic air transportation of persons, the revenues from which go into the general fund of the Treasury. There are also taxes applicable to gasoline used by noncommercial aviation and taxes on aircraft tires and tubes; these revenues currently go into the Highway Trust Fund.

Tax rates

Table V shows the present law aviation excise tax rates and the prior law Trust Fund tax rates.

E. Environmental Excise Taxes

1. Taxes for Hazardous Substance Response Trust Fund

Overview

Under present law, excise taxes are imposed on crude oil and certain chemicals, and the revenues from these taxes are deposited into the Hazardous Substance Response Trust Fund. These provisions were enacted in the Comprehensive Environmental Response, Compensation, and Liability Act of 1980.

The crude oil tax of 0.79 cent per barrel is imposed on the receipt of crude oil at a U.S. refinery, the import of crude oil and petroleum products, and the use or export of domestically produced crude oil (if the tax has not already been paid).

The tax on chemicals is imposed on the sale or use of 42 specified organic and inorganic substances if they are produced in or imported into the United States. The taxable chemicals generally are chemicals that are hazardous or chemicals the use of which may create hazardous products or wastes. The rates vary from 22 cents per ton to $4.87 per ton. (See table, following.)

The taxes generally will terminate on September 30, 1985. However, the taxes will be suspended during calendar years 1984 or 1985, if, on September 30, 1983, or 1984, respectively, the unobligated trust fund balance exceeds $900 million, and the unobligated balance on the following September 30 will exceed $500 million, even if these excise taxes are suspended for the calendar year in question. Further, the authority to collect taxes will terminate when cumulative receipts from these taxes reach $1.38 billion.

Tax rates on chemicals

The excise tax rates on certain chemicals are as shown in the following table.

Excise Tax Rates on Certain Chemicals

Chemical	Tax per ton
Acetylene	$4.87
Benzene	4.87
Butane	4.87
Butylene	4.87
Butadiene	4.87
Ethylene	4.87
Methane	3.44
Napthalene	4.87
Propylene	4.87
Toluene	4.87
Xylene	4.87
Ammonia	2.64
Antimony	4.45
Antimony trioxide	3.75
Arsenic	4.45
Arsenic trioxide	3.41
Barium sulfide	2.30
Bromine	4.45
Cadmium	4.45
Chlorine	2.70
Chromium	4.45
Chromite	1.52
Potassium dichromate	1.69
Sodium dichromate	1.87
Cobalt	4.45
Cupric sulfate	1.87
Cupric oxide	3.59
Cuprous oxide	3.97
Hydrochloric acid	.29
Hydrogen fluoride	4.23
Lead oxide	4.14
Mercury	4.45
Nickel	4.45
Phosphorus	4.45
Stannous chloride	2.85
Stannic chloride	2.12
Zinc chloride	2.22
Zinc sulfate	1.90
Potassium hydroxide	.22
Sodium hydroxide	.28
Sulfuric acid	.26
Nitric acid	.24

Table V – Aviation Excise Taxes under Present and Prior Law

Tax	Present rate[1]	Prior Trust Fund rate (July 1, 1970-Sept. 30, 1980)
Air passenger ticket tax	5 percent	8 percent.
Air freight	No tax	5 percent.
International departure tax	No tax	$3 per person.
Fuels tax for noncommercial (general) aviation:		
Gasoline	4 cents/gallon	7 cents/gallon.
Nongasoline	No tax	7 cents/gallon.
Aircraft use tax (annual)	No tax	$25 per plane, plus weight tax.[2]
Aircraft tires tax	4.875 cents/pound	5 cents/pound.
Aircraft tubes tax	10 cents/pound	10 cents/pound.

1. Under legislation reported by the House Committee on Ways and Means (H.R. 4800, H.R. Rep. No. 97-510), the following aviation excise taxes and rates would apply for the period, July 1, 1982 to December 31, 1983 (and the revenues would go into the Airport and Airway Trust Fund for the same period):

Air passenger ticket tax	5 percent.
Air freight waybill tax	5 percent.
International departure tax	$5 per person.
Fuels tax for noncommercial aviation - (gasoline and nongasoline)	12 cents/gallon.
Aircraft tires tax	4.875 cents/pound.
Aircraft tubes tax	10 cents/pound.

2. 3½ cents per pound for turbine-powered (jet) aircraft and 2 cents per pound for nonturbine-powered aircraft for each pound in excess of 2,500 pounds of "maximum certificated takeoff weight."

2. Tax for Post-Closure Liability Trust Fund

Effective after September 30, 1983, an excise tax of $2.13 per dry weight ton will be imposed on hazardous waste which is received at a qualified hazardous waste disposal facility and which will remain at the facility after its closure. These tax receipts are to be deposited into the Post-Closure Liability Trust Fund. These provisions were enacted in the Comprehensive Environmental Response, Compensation, and Liability Act of 1980.

Authority to collect the tax will be suspended for any calendar year after 1984, if the unobligated balance in the Trust Fund exceeds $200 million on the preceding September 30. Further, authority to collect the tax will terminate when cumulative receipts from the crude oil and chemical excise taxes described in the previous section reach $1.38 billion.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

F. Black Lung Trust Fund Excise Taxes

Overview

Present law imposes a manufacturers excise tax on domestically mined coal (other than lignite) which is sold or used by the producer of the coal. Amounts equal to the revenues collected from this tax are automatically appropriated to the Black Lung Disability Trust Fund.[2] The coal excise tax was enacted in the Black Lung Benefits Revenue Act of 1977, and increased in the Black Lung Benefits Revenue Act of 1981.

Tax rates

The rate of tax is the lesser of (1) $1 per ton for coal from underground mines and 50 cents per ton for coal from surface mines or (2) 4 percent of the price for which the coal is sold. Present law provides that the rate of tax is to be reduced to the pre-1982 tax rates on January 1, 1996, or, if earlier, on the first January 1 after 1981 as of which there is no balance of repayable advances made to the trust fund from the general fund of the Treasury and no unpaid interest on such advances. This reduced tax rate will be the lesser of (1) 50 cents per ton for coal from underground mines and 25 cents per ton for coal from surface mines or (2) 2 percent of the price for which the coal is sold.

G. Gas Guzzler Tax

Overview

Present law imposes an excise tax on passenger automobiles that fail to meet prescribed fuel efficiency standards. The tax was enacted as part of the Energy Tax Act of 1978, applicable to 1980 and later model year automobiles. The tax is imposed at annually increasing rates through model year 1986. (See Table VI.) Revenues from the gas guzzler tax go into the general fund of the Treasury.

The tax does not apply to certain emergency vehicles or automobiles classified as nonpassenger automobiles under rules precribed by the Secretary of Transportation. Small manufacturers of automobiles (those who produce fewer than 10,000 vehicles a year) may apply to the Secretary of Treasury for special treatment for a model year, if it is not possible for the manufacturer to meet the applicable tax-free fuel economy standards with respect to some or all of its models for that year.

Tax rates

Table VI shows the gas guzzler tax for the applicable fuel economy standards in each model year for model years 1982-1986.

Table VI – Rate of Gas Guzzler Tax by Model Year

Model year	Fuel economy rating (in miles per gallon)	Tax
1982	At least 18.5	0
	At least 17.5 but less than 18.5	$200
	At least 16.5 but less than 17.5	350
	At least 15.5 but less than 16.5	450
	At least 14.5 but less than 15.5	600
	At least 13.5 but less than 14.5	750
	At least 12.5 but less than 13.5	950
	Less than 12.5	1,200
1983	At least 19	0
	At least 18 but less than 19	350
	At least 17 but less than 18	550
	At least 16 but less than 17	650
	At least 15 but less than 16	800
	At least 14 but less than 15	1,000
	At least 13 but less than 14	1,250
	Less than 13	1,550
1984	At least 19.5	0
	At least 18.5 but less than 19.5	450
	At least 17.5 but less than 18.5	600
	At least 16.5 but less than 17.5	750
	At least 15.5 but less than 16.5	950
	At least 14.5 but less than 15.5	1,150
	At least 13.5 but less than 14.5	1,450
	At least 12.5 but less than 13.5	1,750
	Less than 12.5	2,150
1985	At least 21	0
	At least 20 but less than 21	500
	At least 19 but less than 20	600

	At least 15 but less than 16	1,500
	At least 14 but less than 15	1,800
	At least 13 but less than 14	2,200
	Less than 13	2,650
1986 and thereafter	At least 22.5	0
	At least 21.5 but less than 22.5	500
	At least 20.5 but less than 21.5	650
	At least 19.5 but less than 20.5	850
	At least 18.5 but less than 19.5	1,050
	At least 17.5 but less than 18.5	1,300
	At least 16.5 but less than 17.5	1,500
	At least 15.5 but less than 16.5	1,850
	At least 14.5 but less than 15.5	2,250
	At least 13.5 but less than 14.5	2,700
	At least 12.5 but less than 13.5	3,200
	Less than 12.5	3,850

H. Crude Oil Windfall Profit Tax

Overview

The windfall profit tax is a temporary excise tax on the removal of domestically produced taxable crude oil from the premises on which it was produced. All domestically produced taxable crude oil is classified in one of three tax tiers. The method of determining the tax is essentially the same for all tiers: the tax is equal to the taxable windfall profit multiplied by the applicable tax rate. The taxable windfall profit is generally equal to the selling price of the oil minus an adjusted price and an adjustment for State severance taxes. The windfall profit on any barrel of crude oil cannot, however; exceed 90 percent of the net in-

2. Misuse of a black lung benefit trust due to self-dealing (sec. 4951), expenditures for an improper purpose (sec. 4952) or excessive contributions to a trust (sec. 4953) by the producer triggers certain penalty excise taxes. Amounts equal to the revenue collected under these penalty taxes, which historically have been very small, are also automatically appropriated to the Black Lung Disability Trust Fund.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

come attributable to that barrel. The applicable tax rate differs among the various tiers, as does the adjusted base price. All base prices are adjusted for inflation. Certain kinds of producers are either exempt from the tax, or are eligible for reduced rates of tax on all or part of their production. The tax was enacted in the Crude Oil Windfall Tax Act of 1980.

Oil subject to tax and rates of tax

Tier one oil generally is all oil which whould have been lower or upper tier oil had previous price controls been continued, and any other oil not included in tiers two or three. Tier two oil is all oil which qualifies as stripper oil or which is attributable to production from a Petroleum Reserve.[3] Tier three oil is newly discovered oil, heavy oil, and incremental tertiary oil.

The tax rate applied to the windfall profit is 70 percent for tier one oil, 60 percent for tier two oil, and 30 percent for tier three oil. Newly discovered oil is subject to a reduced windfall profit rate. This rate which is currently 27.5%, will be reduced to 15 percent by 1986. Independent producers are allowed reduced rates on up to 1,000 barrels a day of their combined production of tier one and tier two oil from working interests. For tier one oil, the reduced rate is 50 percent, and for tier two oil the reduced rate is 30 percent.

Exemptions. – State and local governments, certain qualifying charitable medical facilities, educational institutions, and certain qualifying child care facilities, and Indian tribes and Indians over whom the United States exercises trust responsibilities are exempt from the tax. There also are exemptions for new oil produced in most of Alaska, for front-end tertiary oil, for independent stripper oil, and for a certain amount of royalty owners' production.

Phaseout of tax. — The windfall profit tax phases out over a 33-month period beginning after December 31, 1987, or when cumulative revenues raised by the tax reach $227.3 billion, whichever is later. However, the phaseout will begin no later than January, 1991.

I. Inland Waterways Fuel Tax

Overview

Present law imposes a retailers excise tax on diesel and other liquid fuels used by commercial cargo vessels on 26 specified inland or intracoastal waterways of the United States. Included among the 26 waterways are the Mississippi River upstream from Baton Rouge, the Mississippi's tributaries, and the Gulf and Atlantic Intracoastal Waterways. The revenues from this tax are deposited into the Inland Waterways Trust Fund. The tax was enacted in the Inland Waterways Revenue Act of 1978.

The tax does not apply to fuel used by deep-draft ocean-going vessels, recreational vessels, or noncargo vessels such as passenger vessels and fishing boats. In addition, fuel used by tugs in moving LASH and SEABEE ocean-going barges carrying international cargoes is exempt.

Tax rates

The present tax rate is 6 cents per gallon. That rate was first effective on October 1, 1981. On October 1, 1983, the rate is scheduled to increase to 8 cents per gallon. On October 1, 1985, the tax will increase to 10 cents per gallon.

J. Land and Water Conservation Fund Taxes; National Recreational Boating Safety and Facilities Improvement Fund

1. Land and Water Conservation Fund

Present law provides for the transfer of certain tax and other government receipts to the Land and Water Conservation Fund. There are no separate taxes imposed specifically for this purpose. The amounts transferred to the fund are:

(1) An amount equal to the 4-cents-per-gallon tax on gasoline and special fuels derived from such fuels used in motorboats (except for certain amounts transferred to the National Recreational Boating Safety and Facilities Improvement Fund, described below, for fiscal years 1981-1983);[4]

(2) Generally, proceeds received from any disposal of surplus real property and related personal property under the Federal Property and Administrative Services Act of 1949, as amended;

(3) Certain miscellaneous receipts under the Outer Continental Shelf Lands Act; and

(4) Revenues from Federal recreation fee collections (since January 1, 1981).

2. National Recreational Boating Safety and Facilities Improvement Fund (Boating Safety Fund)

The Secretary of the Treasury is authorized to pay into the Boating Safety Fund amounts equivalent to the motorboat fuel taxes on gasoline and special motor fuels (4 cents per gallon) received on or after October 1, 1980, and before October 1, 1983. The aggregate amount transferred to the Fund during any fiscal year is not to exceed $20 million, and no amount is to be transferred if such transfer would result in increasing the amount in the Fund to a sum in excess of $20 million. Any amount received in the Highway Trust Fund which is attributable to motorboat fuel taxes and which is not transferred from the Highway Trust Fund under these provisions is to be transferred into the Land and Water Conservation Fund provided for in Title I of the Land and Water Conservation Fund Act of 1965.

K. Sporting Goods and Firearms Excise Taxes

Overview

1. Excise taxes on sporting goods and regular firearms

Under present law, there are excise taxes imposed on the sale by a manufacturer, producer, or importer of certain fishing equipment, bows and arrows, pistols or revolvers and other regular firearms, and ammunition (shells and cartridges). Revenues attributable to these taxes are distributed in grant programs to States for certain fish and wildlife restoration and development projects.

Tax rates

Table VII is a summary of the excise tax rates on sporting goods and regular firearms.

Table VII – Excise Taxes on Sporting Goods and Regular Firearms

Item	Tax rate
Fishing equipment (rods, creels, reels, and artificial lures, bait and flies)	10 percent.
Bows and arrows (and accessories)	11 percent.
Pistols and revolvers	10 percent.
Firearms (other than pistols and revolvers)	11 percent.
Ammunition (shells and cartridges)	11 percent

3. The reference continued in the Crude Oil Windfall Profit Tax Act of 1980 should have been to a "Naval" Petroleum Reserve. This reference is proposed to be corrected in the Technical Corrections Act of 1982 (H.R. 6056), which has been ordered reported by the House Committee on Ways and Means.

4. See also summary of the excise taxes on gasoline and special fuels included in section C. on the Highway Trust Fund Excise Taxes.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

2. Excise taxes on non-regular firearms

Overview

There are also special excise taxes imposed to regulate machine guns, destructive devices (e.g., bombs, grenades, mines, etc.) and certain other firearms (e.g., shotguns or rifles under a certain length). These consist of occupational taxes (annually), transfer taxes, and a "making" (producing) tax.

Tax rates

Table VIII is a summary of excise taxes on non-regular firearms.

Table VIII – Excise Taxes on Non-Regular Firearms

Item	Tax rate
Occupational taxes:[1]	
Importers	$500 per year
Manufacturers	$500 per year
Dealers	$200 per year
Transfer taxes:	
Generally	$200 per transfer
Certain concealable weapons (sec. 5845(e))	$5 per transfer
Making tax	$200 per firearm

1. An importer, manufacturer, or dealer in certain concealable weapons only are taxed (under sec. 5845(e)) as follows: $25 per year per place of business for importers and manufacturers; and $10 per year per place of business for dealers.

L. Communications (Telephone) Excise Tax

Present law imposes a 1-percent excise tax on amounts paid for local telephone service, toll telephone service and teletypewriter exchange service. Revenues from the tax go into the general fund of the Treasury.

Exemptions from the tax are provided for communications services furnished to news services (except local telephone service to news services is not exempt), international organizations, the American National Red Cross, servicemen in combat zones, nonprofit hospitals and educational organizations , and State and local governments. Other exemptions include amounts paid for installation charges and for certain calls from coin-operated telephones.

This excise tax is scheduled to terminate, effective with respect to amounts paid pursuant to bills first rendered on or after January 1, 1985.

M. Wagering Excise Taxes[5]

Under the present law, a two-percent excise tax is imposed on the amount of certain wagers. For this purpose, a wager means (1) a wager placed with a person who is in the business of accepting wagers on the outcome of a sporting event or contest, (2) a wager with respect to a sporting event or contest placed in a wagering pool conducted for profit, and (3) a wager placed in a lottery conducted for profit (including the numbers and similar types of wagering). However, this excise tax is not imposed on (1) wagers placed with a parimutuel wagering enterprise licensed under State law, (2) wagers placed in coin-operated gaming devices, such as slot machines, and (3) State-conducted wagering, such as sweepstakes and lotteries. Under present law, the two-percent excise tax is imposed on so-called off-track betting authorized by State law.

In addition, an occupational tax of $500 per year is imposed on each person who is liable for the two-percent excise tax on wagers and on each person who is engaged in receiving wagers for or on behalf of such person.

N. Miscellaneous Excise Taxes

Overview

There are several miscellaneous excise taxes under present law, including penalty excises on certain transactions or activities of certain tax-exempt organizations or other trusts, an excise tax on net investment income of private foundations, a deep seabed excise tax on certain minerals, and an excise tax on foreign insurance policies.

Specific miscellaneous excise taxes

1. Penalty excise taxes. – A number of penalty excise taxes are imposed on certain organizations or trusts if they engage in certain transactions or activities, or if they fail to take particular required actions. These excise tax sanctions (at varying rates) are imposed on certain lobbying activities of public charities, certain private foundation activities, and on black lung benefit trusts, qualified pension, etc. plans, and real estate investment trusts. Revenues from these penalty excise taxes go into the general fund of the Treasury.

2. Excise tax on private foundation net investment income. – There is a 2-percent excise tax imposed on a private foundation's net investment income. A foreign organization which is a private foundation is subject to a 4-percent excise tax on gross investment income derived from sources within the United States. Revenues from this tax go into the general fund of the Treasury.

3. Deep seabed excise tax. – An excise tax is imposed on the removal from the deep seabed of certain hard mineral resources pursuant to a deep seabed permit issued under the Deep Seabed Hard Mineral Resources Act of 1980. Hard mineral resources are mineral nodules lying on or just below the surface of the deep seabeds, which contain one or more specified minerals (manganese, nickel, cobalt, or copper).

The tax is equal to 3.25 percent of 20 percent (or 0.65 percent) of the fair market value of the commercially recoverable minerals removed. Revenues will go into the Deep Seabed Revenue Sharing Trust Fund. (No revenues are currently expected to be received prior to 1988.)

This excise tax will terminate on the earlier of the date on which an international deep seabed treaty takes effect with respect to the United States, or 10 years after the date of enactment of the Tax Act (June 28, 1980).

4. Excise tax on foreign insurance policies. – An excise tax is imposed on certain policies issued by any foreign insurer or reinsurer to or for a U.S. corporation, partnership or individual with respect to risks wholly or partly within the United States, or to or for any foreign personel engaged in business within the United States with respect to risks within the United States.

The tax is imposed at the rate of: (1) 4 cents per dollar of premiums paid on the policy of casualty insurance or the indemnity bond; (2) 1 cent per dollar of premiums paid on a policy of life, sickness, or accident insurance, or annuity contract (unless the insurer is subject to tax under Code section 819); and (3) 1 cent per dollar of premiums paid on the policy of reinsurance covering any of the contracts taxable under (1) or (2) above. Revenues from the tax are deposited in the general fund of the Treasury.

5. There is a Senate amendment to H.R. 4717, currently pending in a House-Senate conference committee, which would reduce the two-percent tax to 0.25 percent for wagers authorized by State law. Also, the $500 occupational tax would be reduced to $50 in the case of persons authorized by State and local law to accept wagers in a wagering business authorized by State law. Otherwise, the present two-percent and $500 taxes would continue to apply.

Total Excise Taxes	15,705	16,551	24,329	40,839	42,859	40,640

Note: Details may not add to totals because of rounding.

1. The rectification tax was repealed in the Trade Agreements Act of 1979.
2. $500,000 or less.
3. The excise tax on passenger automobiles was repealed in the Revenue Act of 1971.
4. The excise tax on sugar expired in 1975.
5. The tax on coin-operated gaming devices was repealed in the Revenue Act of 1978.
6. The interest equalization tax expired in 1974.
7. The aviation excise taxes going into the Airport and Airway Trust Fund (July 1, 1970 through September 30, 1980) either expired or were reduced on October 1, 1980. The revenues from the current 5-percent air passenger ticket tax now go into the general fund; and the revenues from the 4-cents a gallon tax on general aviation gasoline and taxes on aircraft tires and tubes now go into the Highway Trust Fund. (The figures for 1982 and 1983 do not include the revenue effects of proposed legislation affecting the aviation excise taxes; neither Administration proposal nor H.R. 4800 as reported by the House Committee on Ways and Means.)
8. The tax on buses was repealed in the Energy Tax Act of 1978.

BANGLADESH:

Budget 1982-83

Extracts from the Budget Speech pronounced by Mr. A.M.A. Muhith, Minister of Finance and Planning, on 30 June 1982.

A detailed discussion of the Bangladesh tax system appears in the International Bureau of Fiscal Documentation's publication: TAXES AND INVESTMENT IN ASIA AND THE PACIFIC.

. . .

Now I would present the policy and decisions regarding fiscal measures for the coming financial year. The role of foreign aid in the development of the economy is undoubtedly very important, but for bringing about economic transformation of an economy, the overall fiscal policy of the Government is a fundamental element. For increasing the investment for productive purposes with reduced dependence on foreign aid, increased mobilisation of internal resources is necessary. But it is to be borne in mind that we have a very limited number of people having surplus income and the vast majority of the people can hardly make their both ends meet and languish in miseries.

2. The following basic principles have been adopted in formulating proposals for the fiscal measures of the Government:

- To provide relief for the poor people as far as possible from the burden of taxes.
- To help the domestic industry to expand and augment production and introduce measures in conformity with this policy.
- To bring about rationality and equity in the tax administration.
- To simplify the method of tax collection making it comprehensible to the common taxpayers.
- To reduce the area of discretion with a view to ensuring logical and rational approach thereby saving the taxpayers from avoidable harassment.
- Multiplicity of taxation points to be reduced. Customs duty and sales tax should be realised at import point, excise duty should be realised at production premises and similarly all direct taxes should be realised at one point.
- Tax policy should be geared up as a tool for accelerated mobilisation of internal resources.
- All surplus and taxable income should be brought under tax net. While there is a necessity of effective and equitable tax administration, there should be inducements for increasing the willingness on the part of the taxpayers to pay taxes.

3. For formulating a correct and balanced fiscal policy, I have received suggestions and advice from different sections of the society. Chief Martial Law Administrator, his Ministers and other advisors have also offered guidelines and suggestions. In many cases, in harmonisation of different objectives the ideal solutions could not be achieved. Formulation of a fiscal policy is not a matter of few months, it requires continuous study and exercise throughout the whole year. We have decided to utilise the newly formed Consultative Committee for Mobilisation of Internal Resources more fruitfully in future. For simplification of the principles and procedures adopted or applied in realising tax, considerable time is required. My effort was to make a beginning of the process of simplification and rationalisation and to widen the process in those areas where the work of simplification has already initiated.

4. We believe that, for changing the lot of the people, establishment of new industries and increase of industrial production side by side with increase in agricultural produces is a must. In order to simplify the process to achieve this goal, decisions have been taken for rationalisation and simplification involving major changes in customs duties. In taking these decisions, the rate of augmentation of internal resources, ability to pay tax by the people, overall need of the country, stabilisation of the price level and steady flow of commodities have been taken into account.

CUSTOMS DUTY

5. In order to eliminate the existing stagnation in the field of production of the domestic industries and to transform it into a viable, productive and income generating sector by utilising the idle capacity, the duty on many imported raw materials have been reduced quite substantially. In the cases of those commodities where domestic production is not adequate to meet the requirement of the economy, the duty rates on such imported finished goods have been adjusted reasonably. These measures, it is hoped, will protect the interest of the domestic industry on the one hand and ensure adequate availability of goods within the country on the other. I believe that the industrialist of the country will take full advantage of these facilities and make an all-out effort to augment the domestic production of these articles. The increase in production will have a favourable effect on the efficiency of the production method bringing about reduction in the cost of production and increase in profit. The policy of protecting the interest of the domestic industry has not been kept confined in the sphere of customs alone, but has also been equally applied in the field of excise and the price control. The facilities thus given are quite substantial and the nation expects that the industrialists of the country will take full advantage of this policy not only to advance their own interest but also extend the benefit to the vast masses of the country. Government shall expect from the producers of the essential commodities to fix the retail price of their products and notify those to the general public:

(1) In consideration of the fact that thermoplastic moulding compound is a raw material for a wide range of industries and extensive use thereof is capable of having a salutory effect on the economic development of the country, the duty on the item is reduced to 40% from the existing 75%. Duty on shoe and cable grade PVC however has not been changed in view of their domestic production. On the same ground duty on urea formaldehyde adhesive has been raised to 100%.

(2) In order to help domestic industry produce more at a reasonable cost, the duty on bright, medium and high carbon steel wire and wire rods have been reduced to 40% from the existing 60%. On the other hand, duty on pipes, tubes, nuts, bolts, screw, rivet, welding electrodes, etc. have been enhanced from 35% and 100% to 50% and 150% respectively.

(3) In order to protect the interest of the domestic producers, the duty on sanitary wares of iron and steel has been raised to 150% from the existing 100%.

(4) The existing duty differential between the imports of CKD and finished trucks and buses being not adequate, the duty on built-up trucks and buses has been raised to 50% from the existing 35%. However, in order to ease problems of transportation in the urban area duty on mini-buses has been reduced to 20%.

(5) In order to save the domestic industry engaged in production of pumps from the uneven competition with the imported goods, duty on pumps have been raised and unified at 50%.

(6) With a view to encouraging the domestic assemblers, duty on CKD refrigerators and deep-freezers is reduced to 75% from existing 100% and that on built-up sound recorders and reproducers has been raised to 100% keeping the duty rate on CKD imports of the same at 75%.

(7) There is a sizeable capacity within the country for production of milk and milk products which remains under-utilized because of the uneven competition with the imported goods. In order to provide advantage to the local dairy products, duty on aluminium foil and polythene film is reduced to 10% from the existing 50% and 100% on certain conditions. Further, duty on imported liquid and semi-liquid milk is raised to 20% from the existing 10% and that on cheese and butter to 40% from the existing 25%.

(8) For the benefit of the domestic film industry, the duty on the imported exposed cinematographic film has been raised and fixed at Taka 5.00 per metre.

(9) With the commencement of domestic production of the items, duty on acetyle salicylic acid B.P. and piperazine citrate has been raised to 50% from the existing 10%. This will be applicable to the imports of pharmaceutical industries also.

(10) To help attain self-sufficiency in its domestic production the duty on mosquito coil and napthalene ball has been raised to 50% and 75%, respectively.

(11) It is in the interest of the economy of the country to take necessary measures to protect the interest of the domestic textile industry. In order to achieve this objective, duty on wool and synthetic tops and nylon chips has been reduced to 20% from the existing 75%, on the other hand duty on imported cotton yarn has been

© 1982 International Bureau of Fiscal Documentation – BULLETIN

reduced to an unified rate of 20% from the existing 25% and 35%. In order to help domestic spinning industry to reduce its cost of production, the total incidence of duty and sales tax on raw cotton has been reduced and fixed at 10% customs duty with no sales tax.

(12) Measures have also been taken to help the ailing cycle industry of the country by way of increasing the duty on imported built-up bicycle to 75% from the existing 50% and rationalising the duty on the components and parts of bicycle by fixing it at 20% in lieu of the existing 15% and 50%. Duty on writing and duplicating ink has also been enhanced to 155%.

(13) In order to boost up the production of tar obtained from petroleum it is necessary to refix the duty on the imported coal tar. As such the duty on the later has been raised to 50% from the existing 25%.

(14) Encouragement of assembling of cassettes domestically is necessary for saving foreign exchange spent on account of import of cassettes. To help this industry, duty on parts and components of cassettes has been reduced and fixed at 50%.

(15) In order to encourage domestic production of pesticide and insecticide in a greater scale, duty on the raw and packing materials of the industry engaged in its production has been fully exempted in case of raw materials and reduced to 20% in case of packing materials.

(16) Pulp is the basic raw material of the domestic paper mills, for safeguarding the interest of which, duty on the item is reduced to 10% from the existing 15%. Similarly, the duty on the imported finished spectacle frames has been enhanced to 100% from the existing 75%.

(17) With a view to protecting the interest of the steel mill, the customs duty on imported billets has been raised to 50% from the existing 40%.

(18) Duty on copra, which is a raw material for production of coconut oil is reduced to 10% from the existing 40%.

(19) Duty on finished medicines and allied goods has been raised to 20% from the existing 10% in view of their local production.

6. It is the declared policy of the Government to simplify, rationalise and modernise the tariff structure. In order to achieve this objective, a number of steps have been taken in this year's budget. I believe that these steps would go a long way in alleviating many anomalies, disputes, misunderstandings paving the way for introduction of a smooth, simple and understandable customs administration:

(1) At present there are more than 23 rates of customs duties which have now been reduced to 12. There, however, remain a few exceptions which could not be removed because of revenue consideration or protection to domestic industry. In due course, further simplification will be considered.

(2) Vegetable oils excepting palm karnel, coconut and crude degummed soyabean oil which attracted the duty rate of 25% have now been subjected to duty @ 40%. Duty on coconut and crude degummed soyabeen oil has been reduced to 20% while that on palm karnel oil has been enhanced to 50%. Duty on Horlics and Ovaltine has been rationalised to the rate of 40% from the existing 5%.

(3) Medical, surgery and hospital equipments attracting duty rates of 10%, 15% and 25% have now been subjected to a unified duty rate of 20%.

(4) Fabrics in which the total content of cotton is 85% or more at present attract different rates of duties of 30%, 75%, 125% and 150% depending on various factors. These rates have now been unified at 75%.

(5) The ship-builders in the nationalised sector enjoy a conditional duty free facility which has been abolished bringing them at par with the ship-builders in the private sector. Now they will have to pay the duty on their imports and on production of proof of the use of their imported materials in the building of ship, shall get refund of duty paid in excess of 20%. M.S. plate, however, shall not be entitled to this refund facility.

(6) The duty on man-made fibre has been rationalised and up-dated at Taka 2.20 per kg. from the existing Tk. 1.00 per lb and 150%.

(7) Duty on essential oils and its mixtures has been made uniform at 200% from the existing 125%, 150% and 200% depending on its tariff classification.

(8) The duty rates of factory ships and trawlers have been rationalised and made uniform at 2½% from existing 15% and 2½% respectively.

(9) The tariff values on coloured and black and white television and refrigerator and deep-freezer have been enhanced and up-dated at Taka 500.00, Taka 200.00 per inch and Taka 500.00 per cft. respectively.

(10) The duty on scraps of iron and steel, rerollable scraps and ship for breaking purpose have been enhanced and unified at 20% from the existing 12½% and 17½%.

(11) The conversion rate between the foreign currency and Bangladesh currency often gives rise to the necessity for raising demand subsequent to the clearance of the goods because of the non-availability of day-to-day exchange rate by the customs authority. With a view to removing this nagging problem, necessary amendment in law has been made enabling the customs authority to accept the average monthly exchange rate of the preceding month. Certain other amendments in law have also been made to rationalise and modernise certain provisions of law.

(12) From now on, in case of the machinery imported for the initial installation of an industry, the transaction value will be accepted by the customs authority for assessment purpose. It is hoped that this measure will remove lot of dispute and misunderstanding.

7. The wide imbalance in the export earnings and import bills of the country is one of the biggest problems faced by us. All possible efforts should be made to reduce the import by increasing the industrial capacity to produce more within the country, by restricting the import of non-essential articles. The steps that have been taken in this regard are aimed at achieving this objective. The efforts that have been initiated in the Export Policy have been stated in details by the Minister of Commerce and Industry a few days back. I would like to mention only about three steps taken in the budget to boost up the export. Total exemption of duty has been accorded on the exports of tea and raw jute. In order to give a boost to the export of finished leather, a system has been devised under which the exporter of the finished leather who has been able to raise his export by 20% over that of the previous year will be entitled to export wet blue leather also at a special concessionary rate of 2½%. Further, with a view to augmenting export of frozen fish, duty on imported factory ships has been reduced to 2½% from the existing 15%.

8. While the need for mobilization of domestic resources remains paramount, duty on many non-essential goods are comparatively quite low. In consideration of greater national need for mobilization of domestic resources, duties on these articles have been raised:

(1) Duty on petrol motor-car having engine capacity of over 850 c.c. but not over 1000 c.c. has been raised to 100% from 75% duty on petrol motor-cars up to 1300 c.c. has been raised to 150% from existing 125%. Motor-cars having engine capacity over 1300 c.c. will now be dutied @ 300%. The luxury cars having air-conditioners and other luxury gadgets will continue to attract higher rates of duty.

(2) For the benefit of thousands of villagers producing betelnuts, the duty on this item has been increased to Taka 20.00 per kg. from the existing Taka 11.00 per kg. The duty on plants and parts of trees required for pharmacy has been fixed at 10% withdrawing the existing full exemption. Duties on fishing hooks, grease and lubricating oil have also been enhanced respectively from existing 30% and 20% to 100% and 40%. In view of the ban imposed on the import of dry-cell batteries, the tariff value fixed earlier on the item has been withdrawn.

(3) Duty on cigarette paper has been raised to 150% from the existing 100% but at the same time the sales tax on the item has been reduced to 10% from the existing 20%.

(4) Last year in order to meet the deficit in the budget, development surcharge @ 1% was imposed on all dutiable imports. This year also similar necessity exists for which this rate of surcharge has been enhanced to 2%. This measure is likely to yield an additional revenue of Taka 30 crores.

9. The fiscal measures which have been discussed above are likely to yield a gross revenue of Taka 62.83 crores and would entail a revenue loss of Taka 21.8 crores giving net revenue gain of Taka 41.75 crores in customs duty.

SALES TAX

10. Sales tax law has been completely recast. The new Ordinance will invest the Customs Department with the administration of sales tax in its entirety. From the coming financial year, sales tax will exclusively be levied on the imported goods and there will be only two

© 1982 International Bureau of Fiscal Documentation – BULLETIN

rates of sales tax, i.e. 20% and 10%. In the present budget substantial exemptions and reductions of sales tax have been accorded as a result of which the revenue loss of the exchequer on this account will be Taka 36 crores. On the other hand, sales tax have been imposed on certain items of raw materials which enjoy exemption from excise duty. Besides, as a consequence of the decisions taken in respect of customs duty, the collection of sales tax on certain items will also increase. The total gain in sales tax as a result of the aforesaid measures has been estimated at Taka 44 crores bringing the net gain on this account at Taka 8 crores.

EXCISE DUTY

11. I would like to draw your attention to a few of the steps that we have taken with regard to excise duties. A number of changes has been made in the rates of duties and their underlying principles are as follows:

In the first place, to stop harassment of small traders and producers excise duty has been withdrawn from autogarages, wooden furniture, services rendered by decorators and caterers, tanned leather and leather products (except footwear), syrups, squashes and fruit juices, banking services excepting cheques, bottling of unscented cocoanut oil, ultramarine blue and dyes. To encourage cottage industries the range of excise duty exemption has been widened. The ceiling of capital has been raised from Taka 10,000 to Taka 50,000 for such cottage industries. For purposes of income tax assessment the same definition will be applicable.

Secondly, for administrative efficiency excise duty has been withdrawn in some cases, and in some other cases, duties have been merged. For example, duty has been withdrawn on cellophane, plastic and resin materials excepting four items. These four items are: PVC pipes, Rexin cloth, insulation boards and telephone sets on which duty @ 30% and ad val. has been retained. In case of rubber products duty has been retained @ 30% ad val. on three items rubber belt, pipes and foam, and duty has been withdrawn from the rest of the items. On glass and glasswares three rates have been fixed: 30% for glass sheet, 5% for amber glass bottles and 10% for others by replacing the different rates of duty (5%, 10%, 20% and 30%). The existing exemptions will, however, continue. The other aim of allowing such concessions is to help boosting of production. Duty rates on metal containers used in production process have been merged and reduced to 10% ad val.

Thirdly, duty has been exempted or reduced on some items for the convenience of the people, specially the lower income group. Duty on paper has been reduced from 15% to 10% ad val. and on motor-cycle from 7½% to 5% ad val. Duty is also withdrawn from bitumen emulsion and Alkatra made out of local bitumen.

Fourthly, after complete abolition of sales tax on local produced or manufactured goods, arrangements have been made to maintain Government revenue through excise duties. Cutlery, stainless steel crockeries, steel pine, G.I. pipe, asbestos pipe, sheet and other asbestos products, oxygen and other gases, sodium silicate and glycerine will now be subjected only to excise duty at the rate of 20% ad val. The other four items, viz., mechanically propelled four-wheeled vehicles, tarpaulin, steel billets and steel ingots will be subjected to excise duty at the rate of 10% ad valorem.

Fifthly, as I have aready stated all sales tax will be collected at the import stage. Some raw materials are now exempted from payment of sales tax. With the change in this condition excise duty has been reduced to lighten the burden of tax:

(a) Excise duty on vanaspati ghee and edible oil payable respectively, at the rate of Taka 50 and Taka 5 per cwt. is completely withdrawn.
(b) Duty on paints, pigments and varnishes has been reduced from 30% of the retail price to 20% of the retail price.
(c) Duty on mechanically manufactured soap has been reduced from the existing 20% and 10% to 5% of the retail price, and that on non-mechanically produced soap payable at the rates of 20% and Taka 20 per maund has been fully exempted. Duty on detergents has been reduced from 20% to 10% of the retail price, and that on jute batching emulsifier has been fixed at 5% of the retail price.
(d) Duty on electric bulbs has been reduced from Taka 12, 15 and Tk. 36 per dozen to Tk. 6, Tk. 7.80 and Tk. 18 per dozen respectively. Similarly, duty on fluorescent tubes has been reduced from Tk. 10.75, Tk. 8, Tk. 8.50 and Tk. 5.50 per tube to Tk. 5.50, Tk. 4, Tk. 4.25 and Tk. 2.725 per tube respectively.
(e) The existing duty of Tk. 9, Tk. 7.20 and Tk. 6 per dozen of primary cells and batteries has been reduced to Tk. 4.80, Tk. 3.60 and Tk. 3 per dozen respectively.
(f) Various rates of excise duty on man-made fibres and yarn have been totally withdrawn and this item has been made fully exempted from excise duty.
(g) Duty on perfumery, cosmetics and toilet preparations has been reduced from the existing 35% and 25% to 20% of the retail price, and in some cases it has been reduced from 25% to 10% of the retail price.

Sixthly, steps have been taken to simplify procedure in certain respects. For example, the duty and licence fee which used to be collected on narcotics and liquors has now been merged into duty. The excise duty and Development Surcharge on petroleum products have been merged. Duty on diesel oil, kerosene and furnace oil has been raised by five poisha per gallon. In place of the existing four rates of 2½%, 5%, 10% and 15% on hotels and restaurants, two rates of 10% and 20% have been fixed. The exemption ceiling of duty in case of hotels and restaurants has been made realistic. If the rent per room per day exceeds Tk. 50 in place of Tk. 10 and if the gross sale exceeds Tk. 50,000 per month in case of hotels and restaurants respectively, they will be assessable to duty.

12. Some steps have been taken to increase revenue:

(i) Existing excise duty of Tk. 1 per lb. on tea has been refixed at Tk. 3 per kg. Additional duty of 10% and 15% which is leviable on relatively costlier packet tea will, however, continue.
(ii) Duty-rate on sugar has been fixed at 10% ad val. in place of the existing Tk. 70 cwt.
(iii) Duty-rate on matches has been fixed at Tk. 3 in place of the existing Tk. 2 per gross.
(iv) In case of gold jewellery the capacity duty rates haves been refixed in place of–
(a) Tk. 15,000 + Tk. 1,000 for every 100 tolas or fraction thereof at Tk. 24,000 + Tk. 1,000.
(b) Tk. 15,000 at Tk. 24,000.
(c) Tk. 10,000 at Tk. 15,000.
(d) Tk. 6,000 at Tk. 9,000.
(e) Tk. 3,000 at Tk. 4,500.
(f) Tk. 1,000 at Tk. 1,500.
(g) Tk. 500 at Tk. 700.

Similarly, in case of bullion dealers the rates have been refixed in place of:

(a) Tk. 15,000 + Tk. 2,000 at Tk. 25,000 + Tk. 2,000.
(b) T. 15,000 at Tk. 22,500.
(c) Tk. 10,000 at Tk. 15,000.
(d) Tk. 6,000 at Tk. 9,000.
(e) Tk. 4,000 at Tk. 6,000.
(f) Tk. 2,000 at Tk. 3,000.

(v) At present natural gas is used in a few cities and industries. Gas users are getting a lot of advantages in respect of price in comparison to those to whom gas is not available. As such duty on gas has been raised from Tk. 14.00 to Tk. 17.50 only per one thousand cft., and for power generation and fertilizer production the rate has been refixed at Tk. 9.00 in place of Tk. 6.00 per 1000 cft.
(vi) Pharmaceutical industry has reached a stage where the question of its remaining untaxed no longer seems justified. Excise duty has been imposed on allopathic medicine (except vaccines and contraceptives) at the rate of 5% on the retail price.
(vii) Duty has been imposed on insecticide, pesticide, germicide and antiseptic other than those used for agricultural purposes at the rate of 5% of the retail price.
(viii) Glucose, dextrose and starch are being produced in the country on a large scale and these industries have become quite profitable. It has therefore been decided to impose excise duty at the rate of 10% ad val. on these products.
(ix) Welding electrodes used mainly in industries, are being produced in the country on quite a large scale and its remaining out of tax net does not appear to be reasonable. Excise duty at the rate of 20% ad val. has therefore been imposed on welding electrodes.
(x) Chinawares and porcelainwares are paying excise duty at the rate of 30% ad val. at present. But glazed claywares, similar in appearance and use to chinaware and porcelainware, are offering a good enough competition to China and porcelain products. But there is not duty on this item. As such, excise duty at the rate of 30% ad val. is imposed on glazed potteries.
(xi) A regulatory duty on comparatively higher quality cigarettes is imposed at the rate of 5% of the retail price if such price exceeds Taka two and poisah eighty per packet of ten sticks of cigarettes.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

(xii) Duty on foreign liquor, country liquor, mritasanjibani sura, ganja, bhang and opium has been enhanced slightly over the present rate. The rate of duty on rectified spirit has also been enhanced slightly. But the concessionary duty rate on rectified spirit, used in homeopathic and allopathic medicines, has been retained. At the same time, steps have been taken to stop the tendency on large-scale misuse of this concessionary rate.

13. Sales tax has been exempted fully on the following items, viz.:
(a) Brass and copper sheet and zinc sheet, (b) table lamp, (c) wall-clock and time piece, (d) musical instruments, (e) chocolates, toffees and lozenges, (f) sweet-meats, (g) slacked and unslacked lime, (h) brass and copper handicrafts, (i) industrial chemicals, (j) ice-cream, (k) decorated brass and copper light fittings, (l) tea trolleys, (m) torch-light, torch-light case, and hook rings, (n) printing ink, (o) R.C.C. pipe, (p) conduit pipe, (q) electrical fittings.

14. There is some talk on entertainment tax. It is said that the arrangement is really old-fashioned and there is no correlation between the duty-rates and reality. It is possible to fix entertainment tax on the capacity of cinema halls. We want to have discussions with the cinema hall owners and the film exhibitors. Under these circumstances, no change in the rates of duty on entertainments has been considered.

15. An amount of nearly Tk. 22 crores will be collected less on account of exemption and reduction in the rates of excise duty. Of course, for new impositions and few enhancements of the rates of duty, nearly Tk. 45 crores will be collected. As a result, there will be a net increase in revenue of Taka twenty three crores approximately.

INCOME-TAX AND OTHER DIRECT TAXES

16. At present there are only two lakh eighty thousand assessees in our country. The direct taxes constitute only a small portion of the total revenue earnings. The corporate sector contributes nearly 75% of the income-tax.

The income-tax laws are complex and the Act itself is outdated. The procedure of determining income is complicated. The system of tax collection is not particularly streamlined. The improvement of the system will be both difficult and time consuming:

- We hope to re-write the Act in the near future and public opinion in this regard will be solicited.
- Last year, attempts were made to bring new assessees into the tax-fold through the introduction of self-assessment scheme and reduction in the rate of tax.
- The same effort will continue this year also. Proposals have been taken for the simplification of the method of calculation of tax.
- A number of measures have also been taken to encourage investment.
- The Estate Duty Act has been repealed.
- The responsibility of collection of income-tax, gift-tax and wealth-tax will be entrusted to the same authority.
- Stamp duty leviable on the transactions in the shares market has been exempted.
- Rates or scope of gift-tax, wealth-tax and urban immovable property tax have been substantially reduced.
- Efforts to merge urban immovable property tax with other prevalent rates will be taken up in the near future.

17. In order to reduce the burden of tax the following measures have been adopted:

(1) In the context of inflationary situation, the maximum exemption limit of income seems to be low. It is, therefore, decided to enhance the present limit from Tk. 15,000 to Tk. 20,000 to alleviate the hardship of the lower income group.
(2) In order to reduce the burden of tax the personal taxation rates have been substantially scaled down. As a result, an individual having income of Tk. 50,000 will now pay tax of Tk. 2,750 only as against Tk. 4,000 payable under the existing rate provided the benefit of maximum investment is allowed in both the cases. But without any investment allowance the tax on the same income will be Tk. 8,500 and Tk. 6,750 under the old rates and new rates respectively. The tax rates in the case of registered firms have also been reduced. The maximum rebate of tax on export sales has been enhanced.
(3) In order to remove the difficulties of the small investors, the restrictive provision regarding the initial allowance of Tk. 5,000 and 60% on the balance of investment has been withdrawn.
(4) Considering the increase in the cost of conveyance, the rates of conveyance allowance in the case of salaried persons have been raised from Tk. 1,800 to Th. 2,400, Tk. 2,400 to Tk. 3,200 and Tk. 4,200 to Tk. 6,000.
(5) The rate of tax on capital gains arising from the sale of assets after 2 years but within 5 years of acquisition and after five years of acquisition have been reduced from the existing 35% and 30% to 25% and 20% respectively. Besides, the rate of tax on capital gains arising after 15 years of acquisition of the asset has been fixed at 15%. It has also been decided to withdraw the provision of exempting of capital gains from sale of assets acquired before the 14th August 1947.
(6) Gratuity has been totally exempted from the payment of tax in line with the exemptions already granted to pensions.
(7) A new provision has been made in the Act for exemption on payments made to Zakat Fund and contributions made to the Charitable Fund established under the Zakat Fund Ordinance, 1982.
(8) By the Finance Act, 1980, a provision was made for obtaining licence on payment of Tk. 100 by all persons carrying on business, profession or vocation from a premise, whether their income is below or above the exemption limit. This provision has been withdrawn for the benefit of traders and professionals with income below the exemption limit.

18. The following measures have been taken with a view to facilitate investment:
(1) In the interest of the country's industrialisation the capital gains arising out of sale proceeds of land and buildings have been exempted from payment of tax provided these are invested in the setting up of new industrial undertakings.
(2) Royalty and technical know-how fee have also been exempted from payment of tax in order to encourage industrialisation.
(3) The conditions required to be fulfilled for the admissibility of bonus as an expenditure have been waived in the case of festival bonus.
(4) The provision of accelerated depreciation introduced by the Finance Ordinance, 1977 which expires on the 30th June, 1982 is extended for another five years in the interest of industrialisation.
(5) For the purpose of exemption of cottage industry the maximum investment limit has been raised from Tk. 10,000 to Tk. 50,000.

19. The measures taken for the rationalisation and simplification of assessment procedure are as follows:
(1) In order to simplify the assessment procedure earned income relief, children education allowance and personal allowance have been withdrawn. However, the consequential loss has been made good through adequate reduction in the tax rates.
(2) To widen the scope of self-assessment, the present maximum limit of Tk. 25,000 has been raised to Tk. 50,000. The salaried directors of limited companies have also been made eligible for self-assessment.
(3) the provision of presumptive assessment introduced by the Finance Act, 1980 has failed to achieve the desired result. It has also become redundant after the reintroduction of self-assessment scheme. Hence, the provision of presumptive assessment has been withdrawn.
(4) In order to alleviate the hardship of the lower income group the present limit of income for advance payment of tax has been raised from Tk. 25,000 to Tk. 50,000.
(5) In order to exclude the lower income group from the requirement of filing a statement of assets and liabilities along with the return of income, the present limit of income for this purpose has been raised from Tk. 25,000 to Tk. 50,000.
(6) The rate of interest payable by the Government on the excess payment of advance tax has been raised from 10% to 13½% per annum.
(7) In view of the rising prices of real estate the present requirement for obtaining clearance certificate where sale value exceeds Tk. 50,000 has been raised to Tk. 100,000.
(8) The restrictive provision regarding the date of commencement of construction for the purpose of exemption of newly constructed residential building has been withdrawn.
(9) In order to simplify the calculation of annual value of self-occupied property, a suitable amendment has been made in the Act.
(10) In future income from bus, truck and launch will be computed on the basis of capacity of each transport. This will remove a lot of misunderstanding.
(11) A new system will be evolved for realisation of taxes from the travel agencies.

© 1982 International Bureau of Fiscal Documentation – BULLETIN

Airlines having business transaction with the travel agencies will be made responsible for deduction of tax at source at the time of making payments to such agencies.

(12) The Income-tax Appellate Tribunal will hear appeals in the concerned districts where necessary.

GIFT TAX

20. As regards gift tax, the following measures have been taken:

(1) In order to rationalise the present provisions of tax free gifts to father, mother, real sons and daughters up to Tk. 300,000 and to spouse up to Tk. 100,000 it has been decided to merge these two exemptions into one. The maximum limit has been fixed at Tk. 400,000.

(2) Considering the rising cost of living, it has been decided to raise the exemption limit of gift from Tk. 20,000 to Tk. 25,000 per year.

(3) In order to simplify the existing rate structure, it has been decided to reduce the number of slabs from 6 to 4. The rate of tax on each slab has also been modified.

WEALTH TAX

21. The following measures have been taken with a view to reducing the burden of wealth-tax:

(1) The present exemption limit in the case of self-occupied residential house has been raised from Tk. 1,500,000 to Tk. 2,500,000 in view of the present inflationary situation and to alleviate the hardships of the persons of limited means.

(2) Under the present provisions the aggregate of income-tax and wealth tax can not exceed 60% of the total income of an assessee, only if his taxable income exceeds Tk. 150,000. This restrictive provision is unnecessary and hence withdrawn.

ADVERTISEMENT TAX

22. At present employment and tender notices published in daily newspapers are exempt from advertisement tax. It has been decided to extend this exemption so as to include any notice connected with employment and also advertisements made by the educational institutions such as notice of admission, notices of commencement of examinations, academic sessions etc.

URBAN IMMOVABLE PROPERTY TAX ACT

23. At present holdings with annual value not exceeding Taka 6,000 are exempt from urban immovable property tax. In order to give some relief to the owners of small holdings the ceiling of exemption has been raised to Tk. 18,000 for holdings within the Dacca Metropolitan area and to Tk. 12,000 for holdings in all other areas. Moreover in order to reduce the tax burden on the owners of holdings the rate of tax has been reduced in the case of holdings not being self-occupied from 4% to 3% of annual value and in case of self-occupied holdings from 2% to 1½% of the annual value.

24. The reduction in the burden of tax and the simplification of the collection procedure have been made with the hope that these will motivate larger number of taxpayer to pay their taxes. These are also expected to curb the tendency and the scope of evasion of tax and also to augment the revenue collection. The provision of declaration of untaxed income is also expected to yield additional revenue. It is, therefore, estimated that the total collection of revenue only from income-tax will amount to Tk. 300 crores.

STAMP DUTY

25. At present the rate of share of transfer fee under Stamp Duty Act, 1899 is 1.5% on the value of the shares. This transfer fee acts as a deterrent to the transactions of shares in the Stock Exchange. It is decided to remit the duty chargeable under the said Act on the shares of Public Limited Companies listed in the Stock Exchange with effect from 1-7-82. A separate order will be issued in this respect.

MOTOR VEHICLE TAX

26. The existing rates of motor vehicle taxes and fees are very low. Tolls are collected from a very few bridges. Hence it has been decided to enhance the rates of tax on motor vehicles and to abolish the system of collection of toll from bridges. An additional collection under this head is estimated to be Tk. 2.25 crores.

FOREIGN TRAVEL TAX

27. In order to remove the burden of the wage-earners, it has been decided to exempt return tickets purchased abroad in foreign currency from payment of foreign travel tax.

LAND DEVELOPMENT TAX

28. The provision of tax collection introduced by the Land Development Tax Ordinance, 1976 is unrealistic. Agricultural development has been the mainstay of our economy during the last decade. The present pace of development leaves scope for further improvement and requires increased investment in the agricultural sector. Land is our main asset. Unless we can tap adequate revenue from this sector it would not be possible to generate enough savings for further investment. Agriculture contributes nearly 56% of our Gross Domestic Product. It would not be possible to accelerate development process unless savings are generated from this sector. Most of the landed properties are controlled by a limited number of people. Farmers having four to six bighas of land are considered to be self sufficient, while those having land exceeding fifteen bighas are considered to be surplus farmers and fairly rich. But a person owning lands upto 25 bighas is required to pay land development tax at Tk. 1 only per bigha. This state of affairs needs a radical change. The rate of tax on land should be progressive and the landowners should pay tax at an increased rate. The best way is to impose tax on the basis of productivity of land. But this cannot be done because of the dearth of necessary documents and administrative machinery.

29. We have long been talking about raising the rate of land development tax. We also believe that this will ensure efficiency in the use of land. We have, therefore, decided to increase the rate of land development tax with effect from 1-7-82. Measures have been taken to realise more revenue from both urban and rural lands. The revenue yield from urban land will be about Tk. 13 crores. There will be three rates of tax: one for Dacca, Chittagong and Khulna, another for the District towns and yet another for the rest of the towns. The rate of tax will also be different for residential and commercial lands. Different slabs have been prescribed for agricultural land namely, upto 6 bighas, then 6 to 15, in excess of 15 to 30, in excess of 30 to 45, in excess of 45 to 75 and exceeding that quantum of land being highest slab. The rate of tax has been made progressive. The tax on 15 bighas, 30 bighas, 45 bighas, 75 bighas and 100 bighas of land will be Tk. 51, Tk. 231, Tk. 531, Tk. 1,421 and Tk. 2,641 respectively. This new rate is expected to yield Tk. 49 crores. Revenue collection from land development tax would be around Tk. 45 crores. The introduction of this new meaure will usher in a new horizon which, I am sure, would lead to gradual development in the agriculture sector and increased savings therefrom.

TURNOVER TAX

30. People frequently talk about value-added tax. This tax is very reasonable and progressive. But its administration is rather complex. Particularly in our socio-economic context, it is difficult to introduce the system of value-added tax. Hence, we have introduced a new tax called the Turnover Tax. The application of this tax will be easy and, to begin with, it will cover a limited number of goods and services. It will be realised from specified big establishments. And it will extend to both manufactured goods and sales of goods. It will be imposed on such goods and services which are exempt from excise duty. This tax is leviable only on those individuals or establishments who are income-tax assessees or where the capital investment exceeds Taka 1 lakh. After the initial experiment, this tax will be levied on the basis of capacity. We want to impose this tax initially on four types of establishments, namely: workshops, sweetmeat, manufacturers and dealers, printing industries and dock-yards. To start with, this tax will be limited to establishments in the big towns. We hope to get a total revenue of Taka 5 crores from this source. I believe that in the near future, this tax will emerge as a popular tax resource and all the manufacturing and selling concerns of the country will contribute to increase the domestic savings, through this tax.

31. In determination of the size of the Annual Development Programme we have adopted a very conservative approach this year. This is due to severe strain on our balance of payments position. Restraint has also been exercised in non-development expenditure. Attention has been given to estimation of non-tax receipts on an objective and rational basis. Care has been taken in projection of foreign aid disbursement. Our taxation system is such that its quantum is substantially dependent on external aid and foreign exchange earnings. In spite of these constraints we have estimated tax receipt of Taka 117 crores from new measures out of which about 50 crores are expected from imports on account of customs duty and sales tax.
