decision, that the amount received, to the extent of the difference between the redemption amount and the acquisition price or issue price of the redeemed stock, should be subject to the more advantageous tax regime of capital gains; that is, for individuals the reduced tax rate of 18.1 percent and for corporations[5] the reduced tax rate of 18 percent for long-term capital gains.[6]

When the redemption involves a foreign party, the tax consequences should be as follows. Assuming that the redeemed shareholder is a resident of the United States, the qualification of the amount received in redemption as a capital gain results in no tax being levied in France since under Article 12 of the France/US tax treaty (as most tax treaties signed with France), such capital gain (other than capital gain on real property) is taxable only in the United States, the state of residence of the shareholder.

Assuming that the redeeming corporation is a US corporation, the capital gain is taxable only in France. However, this supposes that both states give to such transaction the same qualification under their domestic law. In the event that the United States treats the amount received by the French shareholder as a dividend, the tax treaty does not provide a solution to such conflicting qualification and hence, US withholding tax at the treaty rate would be levied. On the other hand, France may not grant the corresponding tax credit since, on its side, the amount received is a capital gain taxable in France only. Finally, although this case involved a redemption, it could also affect the tax treatment of parties involved in a complete liquidation.

III. FINANCIAL INSTRUMENTS

More than any other area of law, the tax treatment of financial instruments has been remodelled over the past years and at the beginning of 1993 to a point where their financial reality is finally taken into account. Notions that have been in effect under US tax law for some time are being progressively introduced into French tax law.

A. *Mutual funds*

Such is the case of the mark-to-market rule. The Technical Correction Law of 1991 had extended its application to interest-rate and currency swap agreements concluded, under certain conditions, by credit institutions and brokerage firms. The Finance Law for 1993 further extends application of the mark-to-market rule to securities held in mutual funds ("OPCVM", that is, "Organisme de Placement Collectif de Valeurs Mobilières"). More specifically, effective for fiscal years ending on or after 1 November 1992, the mark-to-market rule (i.e. annual taxation) applies to securities held directly or indirectly in French or foreign mutual funds by corporations subject to corporation tax. Thus, securities held indirectly through a foreign person are subject to these new rules. There is indirect participation when the French corporation holds, directly or indirectly, the stock of a foreign person[7] which in turn owns the stock of the mutual fund but only if (i) at least 50 percent of the assets, in terms of value, of the foreign person consists of the securities held in the mutual fund, or (ii) its primary activity is administering these securities for its own account. There is no other indication as to what type of indirect participation can be taken into account for purposes of this test but it is arguable that, since the test is in terms of assets, mere voting stock without financial rights should not be taken into account. Securities held in French or foreign mutual funds that "invest essentially in shares" and "mutual funds at risk" are, under certain conditions, excluded from the scope of the mark-to-market rule.

Under the mark-to-market rule, the liquidation value of the securities held in these mutual funds has to be determined at the close of every fiscal year. The difference between the liquidation value at the beginning of the fiscal year and the liquidation value at the end of the fiscal year is taxed in proportion to the participation of the French corporation at the standard corporation tax rate.[8]

B. *Tax regime of reimbursement premium*

The rule of annual taxation has also been introduced progressively in the tax treatment of reimbursement premium.

The tax regime of the beneficiary of the reimbursement premium has been modified to such extent, over the past years, that the applicable tax treatment depends on the date the debt was issued. The last modification is contained in the Finance Law for 1993 and codified under new Section 238 septies E of the French Tax Code.

Section 238 septies E is effective for debts issued, or for rights arising from the stripping of debt instruments, on or after 1 January 1993. The list of debts concerned by this new rule is over-inclusive.[9] In addition, it applies to every person except individuals, provided that the corresponding debt instrument is not accounted for as a business asset.

Reimbursement premium is generally defined, for purposes of that section, as the difference between the sums or consideration, regardless of their nature, that will be received upon reimbursement and the sums or consideration that are paid at the time of issuance or acquisition of the debt instrument. Excluded interests are more strictly defined and, hence, capitalized interests are now part of the reimbursement premium.

Section 238 septies E applies to reimbursement premium that meets the two following conditions:

5. On the other hand, this decision may not apply in the case of a parent corporation entitled to the parent-subsidiary regime of Sec. 145 of the French Tax Code. Indeed, in a preceding decision involving the redemption of the stock of a French parent company the Conseil d'Etat held that the amount distributed (i.e. the difference between the redemption amount and the acquisition price) remained subject to the parent-subsidiary regime of dividend exemption (CE 18 March 1992, No. 94061, "Péchiney").
6. See *supra* note 1.
7. The term "foreign person" is broadly defined for that purpose since it can be, *inter alia*, a foreign individual with whom the French corporation has deposited funds, a trust or other association. On the other hand, it is not clear whether the term applies to a foreign establishment or a branch.
8. For the first fiscal year ending on or after 1 November 1992, however, it is provided that this difference is to be determined on the basis of the liquidation value as of 1 July 1992, unless the liquidation value after that date has varied in an opposite direction to the difference determined before that date. In this latter case, the difference is determined on the basis of the entire fiscal year.
9. Its scope has been further extended to debt instruments or debt instruments providing for capitalization which are non-negotiable.

© 1993 International Bureau of Fiscal Documentation

- it must exceed 10 percent of the acquisition price of the debt instrument or of the right; and
- it must relate either to a debt instrument whose average issue price does not exceed 90 percent of its reimbursement value, or to a right arising from the stripping of the debt.[10]

In such case, the holder of the debt instrument or of the right is taxed annually on an accrued fraction of the premium (and on the contractual interest, if any).

The principal interest of this new section is the manner this fraction is determined. Indeed, it is determined by applying to the acquisition price the effective interest rate at the time of acquisition of the debt. For the following years, the acquisition price is then grossed up by the fraction of the premium already taxed and of the interest capitalized on the anniversary date of the debt instrument or of the right. As a result, the present value of the debt instrument is now annually taken into account in the taxable fraction. Thus, the annual taxable amount is not linear but progressively increases over the entire term of the debt.

The 1993 Finance Law sets forth some rules for the deductibility of the reimbursement premium and, thereby, achieves some symmetry between taxation and deductibility. Indeed, under new Section 39-1º ter of the French Tax Code, the deductible amount of the premium is also determined on the basis of an annual fraction computed in the same manner as for the taxation of the holder of the debt instrument.

The definition of reimbursement premium for deductibility purposes is, however, more vague than its counterpart for taxation purposes and may lead to a more extensive application of the rules of Section 39-1º ter.[11] In this sense, Section 39-1º ter does not use the terms "reimbursement premium", presumably to avoid any confusion with the definition of reimbursement premium for purposes of its taxation. The annual amount of the deductible fraction should otherwise be determined in the same manner as described above. Thus, its amount increases progressively over the term of the debt rather than being deductible on a straight-line basis.

C. *Transfer of assets outside France*

The Technical Correction Law for 1992 contains a provision that was part of a failed project to introduce a comprehensive regime of trusts under French domestic law. Under this new provision, French corporations which transfer assets (cash, securities, debts etc.) to a third party outside France, either to be administered for the profit of the French corporation or to undertake an existing or future obligation, are taxed on the resulting investment income.

The provision is not intended to apply, however, to transactions such as loans, service arrangements or contributions of assets.[12] In practice, two financial transactions, defeasance and repackaged TSDI ("Titres Subordonnés à Durée Indéterminée"), seem to be particularly affected by this provision. Indeed, in a defeasance transaction, the corporation transfers some assets to a third party for purposes of assuming the payment of the principal and interests on a debt incurred by the transferring corporation. Repackaged TSDIs involve the issuance of so-called "perpetual bonds" where part of the issuance price is immediately transferred to a foreign tax-exempt vehicle, which repays the principal of the bond at the end of a 15-year period using zero coupons that mature free of tax.

If the transfer satisfies the above criteria, the transferring corporation must include in its taxable income the income derived from the administration or disposition of the transferred assets or of the assets acquired in replacement. The transferring corporation is, however, entitled to deduct the foreign taxes from the French corporation tax provided that these foreign taxes are similar to the French corporation tax. Thus, foreign withholding taxes, if any, imposed on such income are not, in principle, creditable.

The transferring corporation must determine its investment income from such transfers separately. The resulting income is taxed in the same basket as the transferring corporation's other income, however, and thus can be used to offset net operating losses.

Finally, specific recordkeeping obligations and penalties are provided.

These rules are effective for fiscal years starting on or after 1 January 1992, regardless of the date of the transfer. Thus, they may apply to transfers that have already been made.

IV. UPDATE ON THE FRANCE/US TAX TREATY

The last modifications to the France/US income tax treaty and to the estate and gift tax treaty were made in 1988 and 1980, respectively. Since 1988, however, these two treaties have been the centre of renegotiation between the two parties to take account of the 1986 US Tax Reform Act. It now appears that a document should be definitely be adopted sometime in 1993.

With respect to the income tax treaty, it should bring modifications, among others, to the "Limitation on Benefits" provision, and includes within its scope pension funds and real estate mortgage investment conduits ("REMICS"). With respect to the estate and gift tax treaty, a provision allowing the marital deduction to a non-US surviving or donee spouse remains an issue.

---

10. If one of these conditions is not satisfied, the reimbursement premium will be taxed fully at maturity.
11. Sec. 39-1º ter provides that "with respect to debts issued on or after 1 January 1993 the fraction, accrued during the fiscal year, of the remuneration which equals the difference between the sums or consideration to be reimbursed, other than interests, and the sums or consideration received upon issuance, when this remuneration exceeds 10% of the sums initially at the disposal of the borrower" can be deducted from the gross income of the borrower.
12. Transfers resulting from insurance contracts or from agency contracts are also excluded.

I. IMPLEMENTATION OF THE PARENT-SUBSIDIARY DIRECTIVE INTO DUTCH TAX LAW

A. *General*

On 3 October 1991 the bill for the implementation of the parent-subsidiary directive (the "directive") was submitted to the Dutch Parliament. The law was passed in September 1992, almost a year later, the delay of almost a year being due to extensive technical discussions in both Chambers of Parliament. The Under-Secretary of Finance instructed the tax inspectors to apply the proposed legislation between 1 January and 8 September 1992 (being the date of approval by the Senate) in order to comply with the directive as of January 1992. The main characteristics of the implementation of the directive are discussed below.

B. *Participation exemption*

1. Before implementation

In general, four requirements must be met for the exemption to apply to a participation in a non-resident company:

- The participation must amount to at least 5 percent of the nominal paid up capital of the subsidiary company. Under very specific circumstances, a smaller participation may also qualify.
- The shares may not be held as inventory. This requirement is intended to deny application of the participation exemption in situations in which the ownership of shares is motivated not so much by a desire to participate in an enterprise owned by a company, but as a financial services business. This requirement is specifically designed to deny Dutch banks the benefit of the exemption for the profits (the discount and mark-up) which they earn on trading in "cash" companies. The Under-Secretary of Finance has indicated that this requirement

Mr Sleurink graduated from Leiden University in 1980 with a degree in Civil Law (with honours). He completed a post-graduate course in Tax Law at Leiden University in 1982. From 1982 to 1986 he was an (associate) Tax Inspector with the Dutch Revenue Service, Corporate Income Tax Division. In 1986 he joined the Amsterdam office of Loyens & Volkmaars and became the Managing Partner of the New York office in 1990.

Mr Sleurink has written extensively on matters of both domestic and international tax law and is a regular speaker at various seminars on topics of international tax law.

© 1993 International Bureau of Fiscal Documentation

would apply only if a company does not have assets other than mere liquidities and/or portfolio investments.
- The non-resident company must be subject to a tax imposed, at the federal level, on its profits by any sovereign state in which the company is resident.
- The participation may not be held as a portfolio investment. Generally, this means that the Dutch entity must have a business interest for the investment in the foreign subsidiary. The Under-Secretary of Finance indicated in a 1974 Resolution that shares are not held as a portfolio investment if:
  - the foreign subsidiary is itself not a passive investment company; and
  - the holding company performs an "essential function" to the group as a holding company. This is the case if either the holding company is involved in the management, policy making, etc. of the subsidiary, or if there is a connection between the business activities of the foreign subsidiary and the ultimate parent shareholder.

2. After implementation

The amendments made to the provisions of the participation exemption due to implementation of the parent-subsidiary directive are relatively small. Generally speaking, the existing participation exemption is in line with the directive. The amendments made to the participation exemption as a result of the directive follow.

The non-portfolio investment test has been abolished but only in situations which are directly covered by the directive, i.e. 25 percent or more EC resident subsidiary companies. Moreover, a "portfolio subsidiary" may not be subject to a "special tax regime". Although the directive only addresses distributions of profits, the abolition by the Netherlands of the non-portfolio investment test (in situations covered by the directive) has been extended to capital gains.

In addition to the 5 percent minimum participation requirement a 25 percent voting power test has been introduced in case the participation is less than 5 percent of the share capital of the subsidiary. This extension of the participation exemption applies only to subsidiaries resident in the United Kingdom, Ireland and, temporarily, in Germany. The Dutch treaties with the United Kingdom and Ireland apply the voting rights criterion for the reduced (5 percent) withholding tax rate on dividends. These treaties are seen by the Netherlands as referred to in Article 3, paragraph 2 of the directive. With regards to Germany, application of the voting rights criterion is under discussion because the tax treaty with Germany applies a voting "stock" rather than a voting "rights" criterion.

3. Specific issues

(a) *Anti-abuse provisions in Dutch participation exemption legislation*

In 1990, additional provisions were introduced to the Dutch Corporate Income Tax Act ("CITA") limiting application of the participation exemption in areas where tax strategies had been developed that caused unintended tax advantages for taxpayers. As a result of these provisions, the participation exemption requires the recognition of taxable income upon certain transfers of parent-subsidiary loans with respect to which a parent corporation has previously taken a bad debt deduction. Additionally, the participation exemption does not apply to certain income from an (otherwise qualifying) participation if the enterprise of such participation has previously been conducted in the form of a permanent establishment (PE) and losses of such PE have decreased Dutch taxable income. Finally, the possibility to deduct losses from the liquidation of a participation has been limited under the amended participation exemption, especially if the shareholder's interest in the foreign company is less than 25 percent, the participation is continued by the taxpayer or a party related to it, or a possibility to compensate losses from the enterprise of the participation exists after the liquidation. In situations covered by the directive, these anti-abuse provisions will continue to be applied by the Dutch authorities on the basis of Article 1, paragraph 2 of the directive. This paragraph is also the basis for the continued exclusion from the participation exemption for benefits derived from shares held as "inventory".

A question arises about the "special tax regime test" that has been introduced with respect to EC subsidiaries that do not meet the non-portfolio investment test. According to the legislative history of the act, a "special tax regime" is a regime employing a reduced rate of profit tax and also a regime under which the subsidiary company computes its taxable income using a special, favourable method (e.g. in cost plus systems). The directive requires only that a subsidiary must be subject to tax on its profits as mentioned in the directive, without an option of being exempt. The directive does not seem to allow any further condition of a substantive nature, such as conditions regarding a minimum tax rate or a certain tax regime. The "special tax regime test" therefore seems available for successful challenge.

(b) *Minimum holding period*

Until April 1990, the participation exemption provision required that a parent company should own a participation as of the beginning of its taxable year. This requirement, which was originally intended to prevent certain dividend stripping transactions involving participations, had lost its purpose and was deleted when several other above-mentioned anti-abuse amendments were implemented. Although the directive permits member states to introduce a maximum holding period of two years, the Netherlands has not made use of this possibility to reintroduce a minimum holding period for the participation exemption. For the minimum holding period required for the exemption of dividend withholding tax see below.

(c) *Tax haven and CFC legislation*

The Netherlands does not apply tax haven or CFC legislation.[1] The Ministry of Finance is studying the introduction of

1. However, if a Dutch corporation has an interest of at least 25 percent in a non-resident corporation, the assets of which consist at least for 90 percent of portfolio investments, the Netherlands corporation will be taxed annually, in its proportionate share of the increase in the net asset value of his participation, regardless of whether any profits have been distributed. Obviously, if this foreign subsidiary is a qualifying resident of an EC member state, the participation exemption will, in most cases, exempt this deemed benefit derived from the foreign corporation from the Netherlands corporation tax.

© 1993 International Bureau of Fiscal Documentation

anti-tax haven legislation in the Netherlands, but it is unlikely that such legislation will be introduced in the foreseeable future.

(d) *Compartmentalization*

Under discussion is the application of the "compartmentalization doctrine" on distributions of profits that fall within the scope of the directive. This doctrine prescribes that benefits derived from a participation be allocated, whenever appropriate, between periods in which the participation exemption did and did not apply, and then be taxed accordingly. Application of this doctrine means that profits realized before 1992 and distributed after this year would not be exempt. The Under-Secretary of Finance has indicated that this doctrine will be applied with respect to capital gains on shares even if, as a result of the implementation of the directive, the participation exemption applies.

Costs relating to a participation, such as financing and management costs, continue to be non-deductible for Dutch corporate tax purposes unless it is demonstrated that these costs are indirectly subservient to the realization of profits taxable in the Netherlands. Currency gains and losses on loans taken up by the parent company to finance the acquisition (or increase of capital) of the participation are fully taxed in the Netherlands.

C. *Exemption of dividend withholding tax*

Under the Dividend Tax Act 1965 ("DTA") all payments of dividends, payments on profit certificates and certain other payments such as interest on participating bonds, are subject to Dutch dividend withholding tax at a rate of 25 percent.

Tax treaties concluded by the Netherlands reduce the 25 percent rate. The Netherlands has tax treaties in force with all EC member states except Portugal. In several Dutch treaties a zero percent rate is applied for corporate shareholdings owning 25 percent or more of the shares of a Dutch company. Such rate is included (under certain conditions) in the treaties with Czechoslovakia, Denmark, Finland, Ireland, Italy, Malaysia, Norway, Poland, Singapore, Sweden, Switzerland and Venezuela. Due to the implementation of the directive a full exemption of dividend withholding tax will also be applied on dividend payments to parent companies resident in EC member states.

Article 4A DTA provides an exemption of dividend withholding tax in directive situations.

Full exemption of dividend withholding tax is granted if the following requirements are met:

- the parent company and the subsidiary company are organized as one of the entities mentioned in the annex to the directive;
- the parent company is resident in a different member state; the criterion is whether, according to the fiscal laws of a member state, the company is resident there; furthermore, the EC parent and the Dutch subsidiary are not considered as having a (dual) residence outside the EC under a tax treaty between a member state and a non-EC country;
- the parent company and the subsidiary company are subject to tax in the respective country of residence without being exempt or having the option of being exempt of a tax on its profits as mentioned in Article 2C of the directive;
- an anti-abuse provision in the tax treaty between the Netherlands and the country of residence of the parent company does not prevent the parent company from claiming a reduction of tax on dividends;
- the parent company has owned shares representing 25 percent or more of the subsidiary's nominal share capital at the time the profits are made available by the subsidiary, for an uninterrupted period of one year. During this one year period, the exemption can nevertheless be applied if the Dutch subsidiary provides the Collector of Taxes with sufficient collateral (e.g. a bank guarantee) for the amount of the tax that would otherwise be due. If, during this one year period, the parent company's interest in the Dutch subsidiary falls below 25 percent, the dividend withholding tax becomes due. The Collector of Taxes can decide whether the security offered by the Dutch subsidiary is sufficient. Costs involved in providing this security to the Collector are for the account of the Dutch subsidiary.

If the parent company is a resident of a member state with which the Netherlands has concluded a tax treaty that contains a voting power test for the reduction of the dividend withholding tax, the criterion for full exemption of DTA is 25 percent or more of the voting power (regardless of whether the shares are owned by the parent company) in the Dutch subsidiary, rather than 25 percent or more of its nominal share capital. The voting power criterion apples in any case to the United Kingdom and Ireland. The Under-Secretary has declared that he is not certain whether the treaties with Germany and the new treaty with Italy (which is not yet in force) qualify in this respect. Pending discussions with both countries, he has agreed that, if the parent company is resident in Germany, either of the criteria may be applied. After the Italy treaty comes into force, this will also be the case with parent companies resident in Italy.

- the Dutch subsidiary notifies the Dutch tax authorities of the payment within one month after the dividend is made available, provides data on the parent company and confirms that the parent company fulfils the above criteria. (While it is not absolutely certain that this notification is mandatory, it is highly recommended to avoid problems.)

If any of these conditions have not been fulfilled, the normal rules in the applicable tax treaty apply.

D. *Tax planning opportunities*

Regarding Dutch parent companies, the most important result of implementing the directive into domestic law is that the participation exemption will be available in specific situations where the shares in an EC subsidiary are held as a portfolio investment as well as in situations where the shareholding is less than 5 percent of the subsidiary's capital, but represents 25 percent or more of the voting rights.

© 1993 International Bureau of Fiscal Documentation

Additionally, the group may be applying a debt-to-equity ratio in excess of 85/15 at the level of its Dutch holding, which is the maximum ratio stipulated in a participation exemption ruling. As a consequence of the directive, the necessity to obtain advance tax rulings from Dutch tax authorities to ascertain whether the participation exemption will apply will be reduced. However, an advance ruling may continue to be recommended with respect to non-EC participations. Generally, however, the participation exemption will remain unchanged. Existing Dutch provisions go beyond the minimum requirements of the directive, especially in that capital gains are also included in the participation exemption and a 5 percent shareholding (instead of 25 percent) may be sufficient to benefit from this exemption. The Netherlands therefore remains a good location for a holding company for both EC-based and non-EC based groups.

II. IMPLEMENTATION OF THE MERGERS DIRECTIVE INTO DUTCH TAX LAW

A. *Introduction*

The merger directive was implemented in Netherlands tax law by the law of 25 September 1992, with retroactive effect to 1 January 1992.

B. *Pre-directive Dutch law*

The law already provided exemptions for domestic share mergers and transfers of assets and liabilities. In this respect, a distinction should be made between non-entrepreneurial individuals on the one hand, and entrepreneurs/individuals and corporate taxpayers on the other hand.

1. Individual shareholders

Capital gains realized by individuals on shares in a company are in principle not subject to income tax. However, Netherlands resident individuals owning a "substantial interest" in a corporation are taxed on the capital gains that they realize on the alienation of their shares of such company. A substantial interest is present if the taxpayer owns or owned during the five years preceding the alienation, directly or indirectly, alone or together with family members in the first or second degree, at least one-third of the nominal paid up share capital of a company, and alone or together with the spouse, at least 7 percent of the nominal paid up share capital. Specific provisions address situations whereby special classes of shares are created to avoid the application of the substantial interest rules. Also, non-residents owning a substantial interest in a Netherlands resident company are subject to Dutch income tax on any capital gain realized (note, however, that tax treaties often prevent the Netherlands from taxing capital gains on shares in the hands of non-residents).

The 1964 Income Tax Act ("ITA") provides for an exemption if the shares forming part of a substantial interest are alienated in the course of a qualifying share merger.

2. Entrepreneurs and corporate taxpayers

Corporate taxpayers and individuals holding shares as part of their enterprise are, in principle, subject to tax on capital gains realized from the alienation of shares. However, it is possible for these categories of taxpayers to obtain an exemption or a rollover of the capital gain realized in connection with an alienation of shares, either on the basis of the participation exemption (corporate taxpayers) or on the basis of the replacement reserve or rollover provisions. Finally, it is possible under certain conditions to contribute a full enterprise, or an independent part of an enterprise, to a company in exchange for shares free of (corporate) income tax.

C. *Implementation of the provisions of the mergers directive*

1. Exchange of shares

ITA Article 40 provided for a rollover of the capital gain realized by an individual taxpayer who contributes shares that are part of a substantial interest to a Netherlands resident company in exchange for shares of the latter company. As a result of the implementation of the directive, Article 40 is replaced by Article 14B, which provides a new definition of the transactions that qualify as an exchange of shares for tax purposes. In fact, the scope of the current share exchange facility is extended to cover the situations prescribed in the directive. Furthermore, the range of taxpayers that can make use of the exchange of shares facility has been extended. Apart from individual taxpayers, corporate taxpayers (and individual taxpayers for which the shares are allocated to an enterprise) can also request application of the new exchange of share facility.

Article 14B distinguishes between three types of exchanges of shares (hereinafter "share merger"):

(a) the share merger whereby a company of one member state acquires shares in the capital of a company resident in another member state such that it obtains a majority of voting power in the latter company in exchange for shares in its own capital;
(b) a similar share merger involving two companies that are both resident in the Netherlands;
(c) a share merger whereby a Netherlands resident company acquires shares in the capital of a company resident *outside* the EC such that it obtains at least 90 percent of the voting power in the latter company, in exchange for shares.

Only the share merger mentioned under (a) is prescribed by the directive. The directive definition of a qualifying share merger does not include (i) a share merger between two companies resident in the same member state, (ii) nor does it provide for a share merger between a company resident in a member state and a company resident outside the EC. A company resident in a member state that is involved in a share merger as described under (a) above should meet the conditions set forth in Article 3 of the directive regarding the legal form of the company, the "residence for tax purposes" and the "subject to tax" tests. These conditions of the directive have been taken over literally in ITA Article 14B, paragraph 2. In the course of a share merger a cash payment (or a payment in kind) of not more than 10 percent of the nominal value of the shares issued in exchange can be granted. Tax-

© 1993 International Bureau of Fiscal Documentation

payers may ask the competent tax inspector to confirm, in advance, that a transaction qualifies under the law as a share merger. This request is optional and does not constitute a condition for applicability of the share merger facility.

The Proposal introduces the new voting right criterion prescribed by the directive for the determination of whether a transaction qualifies as a share merger. Preferential and priority shares must be taken into account as ordinary shares for this purpose. (Structural) voting agreements must also be taken into account for the determination of whether or not a company acquired a majority of the voting rights of another company.

One of the conditions that is imposed on the share merger is that the enterprises of the companies involved in the share merger should carry on material enterprises and that these enterprises must be structurally united both financially and economically. The introduction of this condition, which cannot be found in the directive, is defended on the basis of the anti-abuse provision of the directive (Article 11). If this condition is not met (which will be often the case), it is possible to request a dispensation from the tax inspector. According to the Commentary to the Proposal, dispensation can only be refused if the share merger is used for "constructions" that are aimed at tax fraud or tax avoidance. An unfavourable decision of the tax inspector on a request for dispensation can be appealed. Special rules apply for share mergers involving a Netherlands resident company with a "fiscal investment institution status". A "fiscal investment institution", which is not considered to carry on a material enterprise, can under certain circumstances be a party to a qualifying share merger.

Exemptions obtained by individual shareholders in the course of a share merger, whereby the shares of a Netherlands resident company are exchanged for shares in a company resident in another member state, are withdrawn if the individual shareholder emigrates within five years after the share merger took place. An automatic extension of payment of the tax thus payable will be granted for as long as the shareholder does not alienate the shares that he received in exchange. The shareholder's liability for the tax will be discharged if he still owns the shares five years after the share merger. A non-resident shareholder with a substantial interest in a Dutch company cannot make use of the share merger facility if his shares are exchanged in the course of a share merger for shares of a company of another member state. Since the Dutch legislature understands that this denial of the share merger facility is not in conformity with the directive, the tax payable on the capital gain realized is not collected (extension of payment) provided the non-resident shareholder owns the shares that he received in exchange for a period of at least five years after the date of the share merger.

2. Transfer of assets and liabilities (business merger)

Article 14 of the 1969 Corporate Income Tax Act ("CITA") provides for a rollover of the profit realized by a corporate taxpayer from the contribution of an entire enterprise or an independent part of an enterprise to another company in exchange for shares. The directive has caused an amendment of the rules of this provision to facilitate transfer of assets as provided therein.

According to the Commentary to the amendments, the range of taxpayers that can make use of the existing facility of CITA Article 14 is already broad enough to include the situations covered by the directive. Under current law, a Dutch company contributing an enterprise or an independent part of an enterprise to a foreign company may already benefit from the rollover provision so long as the foreign receiving company maintains a Dutch PE to which the assets and liabilities contributed are allocated. Please note that the facility of CITA Article 14 is not limited to contributions made to companies resident in other member states. Contributions to companies resident outside the EC can benefit from the rollover provision as well.

Under CITA Article 14, paragraph 1 profit realized as a result of the transfer of an enterprise or an independent part of an enterprise is tax exempt as long as the claim of the tax authorities on such profit is preserved. If, in the case of assets transferred by a Dutch company to a foreign resident company, all assets transferred cannot be allocated to a Dutch PE, it is possible that the rollover provision will only be applied to the assets and liabilities that are allocated to a Dutch PE. Fiscal reserves and the repayment obligation for investment premiums can also be rolled over.

According to CITA Article 14, the transaction should consist of the contribution of "an enterprise or an independent part of an enterprise" in exchange for shares of the company to which the contribution has been made. According to the legislative history, the meaning of the requirement coincides materially with the phrase "all or one or more branches of activity" used in the directive.

Application of Article 14 is subject to various additional conditions.

3. Contribution of PE

Article 10 of the directive forbids the member state of the transferring company from taxing the profit realized on the contribution of the assets and liabilities that belong to a PE in another member state. However, the member state of the transferring company can reintegrate the PE's losses deducted in the past from that company's worldwide profit.

If a Netherlands resident company contributes a PE resident in another member state to a company resident in the other member state or in a third member state, CITA Article 14 (business merger) does not apply since the occasion of the transfer of the PE presents the last opportunity for the Netherlands to tax the (hidden) reserves of the PE. In the Parliamentary proceedings, the Under-Secretary of Finance noted that in his view the incorporation of a foreign PE of a Netherlands resident company is not covered by Article 10 of the directive. However, he stated that this issue lacks importance since the Netherlands will apply a facility for the avoidance of double taxation to the profits realized on the transfer of the PE to a local company, either on the basis of a tax treaty or on the basis of unilateral rules for the avoidance of double taxation. The exemption requirements set forth in Article 10 of

© 1993 International Bureau of Fiscal Documentation

the directive are considered fulfilled by this provision for the relief from double taxation. Under certain circumstances, however, the method of calculation of the relief for double taxation will not result in the exemption of all of the profit that is realized on the transfer of the assets and liabilities that belong to the PE. This is especially the case where assets have been transferred from the company's Dutch head office to the foreign PE.

The recapture of PE losses deducted from the worldwide profit of the transferring company permitted under Article 10, paragraph 2 of the directive is not taken up in the amendments. Corporate income tax law already contains a provision that brings about the same material result through a partial denial of the application of the participation exemption to a participation in the company to which the assets and liabilities of a PE have been contributed. The benefits of the participation exemption are withheld in proportion to the amount of PE losses that have been deducted against the worldwide profit of the transferring company in the past.

4. Intra-community legal mergers and divisions

In view of the absence of legislation regarding legal mergers or divisions between companies resident in different member states, the Proposal contains only a framework provision dealing with the tax consequences of such legal mergers and divisions. This provision states that the competent tax authorities can, under certain conditions, exempt the profit realized from an intra-Community legal merger and/or divisions from income and corporate income tax.

5. Anti-abuse provisions

Many of the conditions imposed on the application of the share merger or the transfer of assets facilities are motivated by the general anti-abuse provision of the directive (Article 11, paragraph 1) allowing member states to refuse application of the provisions of the directive if the main goal or one of the main goals of the transaction is tax fraud or tax evasion. These "anti-abuse conditions" can be summarized as follows:

- material enterprise condition;
- denial of share merger facility to emigrating shareholders and non-resident shareholders;
- refusal of business merger facility, if the acquiring company has tax losses, and the transferring and acquiring companies do not apply the same rules regarding the determination of taxable profit;
- three-year holding period for the shares received in exchange for the transfer of assets and liabilities; and
- exclusion of fiscal investment institutions that do not possess a special licence from the directive's tax facilities.

The question of whether or not these provisions exceed the scope of the general anti-abuse provision of the directive remains unanswered. Note, however, that under additional conditions to be imposed by the tax inspector, dispensation can be granted for most of these requirements.

6. Tax planning opportunities

The implementation of the mergers directive into Dutch law will increase the possibilities of groups to reorganize their EC companies free of tax, in order to achieve a more tax efficient group structure. The facilities provided for in the implementing legislation can be used, for example, to create a Dutch (sub)holding company.

III. PROPOSED INTEREST AND ROYALTY DIRECTIVE

A. *General*

The proposed interest and royalty directive does not have a great impact on Dutch taxation because the Netherlands does not impose a withholding tax on interest and royalty payments. Foreign corporations are, however, in a small number of cases liable to Netherlands corporate income tax as non-residents for cross-border interest and royalty payments.

B. *Corporate income tax on interest and royalties*

1. Profit-sharing interest and royalty payments

Non-resident corporations that do not carry on an enterprise and that have a substantial interest in a Dutch company are liable for corporate income tax in the Netherlands if the Dutch company pays interest to this non-resident corporation. A substantial interest is present if the foreign corporation owns or owned during the last five years directly or indirectly at least one-third of the nominal paid up share capital of the Dutch company. In the tax treaties with the United Kingdom, Italy, Ireland, Germany and Denmark the Netherlands is not allowed to levy this tax. In my opinion the scope of the interest and royalty directive should be extended to corporate income taxes in these cases, since the scope of the directive should not be limited to withholding taxes.

2. Payments received by a non-EC PE

If a non-EC PE receives interest payments between EC member state companies, these payments should fall within the scope of the directive if these payments are normally taxed in the non-EC-country. Since the Netherlands does not levy a withholding tax on interest and royalty payments, such a scope would not have an impact on Dutch taxation.

IV. PROPOSED DIRECTIVE ON LOSSES OF PES AND SUBSIDIARIES

A. *General*

If the "Proposal for a Council directive concerning arrangements for the taking into account by enterprises of the losses of their PEs and subsidiaries situated in other member states" (hereinafter "directive") is adopted, the Netherlands will have to make some major changes in its domestic legislation in order to allow losses of foreign subsidiaries to be taken into account in accordance with the provisions of the directive. With respect to PEs, it can be expected that the Netherlands will select the "method of deducting losses and reincorporating subsequent profits" set forth in Article 7 of the directive (hereinafter "reincorporation method"). In that case, the directive will have relatively little impact on Dutch tax law.

© 1993 International Bureau of Fiscal Documentation

B. *The meaning of the term "enterprise" under Dutch tax law*

It appears that an individual or corporate taxpayer must carry on an enterprise in order to fall within the provisions of the directive. The term "enterprise" is not defined in the directive. It can therefore be expected that the Netherlands will take the position that the term "enterprise" as used in the directive must be interpreted according to Dutch tax law. The term "enterprise" is not defined in Dutch statutes or regulations. Consequently, it is left to the Dutch courts to define the term. A general definition which can be derived from case law reads as follows: "An organization of capital and labour aimed at participating in the social production process with the purpose of generating profits." Furthermore, there should be a reasonable expectation that profits will arise. Independent professional services normally constitute an enterprise. Passive investment activities do not constitute an enterprise. Such activities may be defined as activities of a passive nature performed with respect to portfolio investments with the purpose of obtaining revenue or gain which can be expected not to exceed the return on normally managed portfolio investments.

C. *The taking into account of losses of PEs*

As mentioned above, it can be expected that the Netherlands will choose the reincorporation method if the directive is adopted. This method is to a large extent similar to the method of (proportional) tax exemption (hereinafter "exemption method") applied in the Netherlands with respect to the results of foreign PEs. The exemption method is applied on the basis of the tax treaties concluded by the Netherlands, or its domestic arrangement for the avoidance of double taxation. The Netherlands has concluded tax treaties with all countries of the EC except Portugal. Pursuant to the exemption method, the results (positive or negative) of foreign PEs form part of the worldwide income of a resident taxpayer. If the activities carried on through foreign PEs result in profits, a reduction of the Dutch taxation which relates to the profits of such PEs is granted (hereinafter "foreign profits"). However, it is stipulated that foreign losses reduce the amount of foreign profits to be exempted in the eight years following the year in which the foreign loss became deductible. It can be argued that this eight-year period is in conflict with the "incorporation rule" contained in Article 7(1)(b) of the directive pursuant to which foreign profits are to be included in the taxable results of the head office to the extent of losses previously (without limitation) deducted. The above-mentioned eight-year period is in line with domestic arrangements for the carry-over of losses. The Commission has "linked" the adoption of the directive to its 1984 proposal pursuant to which a loss can be offset against the profits of the three preceding years and/or against subsequent profits (without limitation). This is in the interest of Dutch taxpayers. The 1984 proposal improves the position of Dutch taxpayers, whereas an unlimited incorporation period on the basis of the directive will have a negative impact on the position of Dutch taxpayers.

The meaning of the term "PE" in the different tax treaties concluded by the Netherlands and in domestic tax law is normally in line with the meaning of this term in the 1977 OECD model treaty. The explanatory memorandum to the directive mentions that the definition of a "PE" in the directive is modelled on that of Article 5 of the OECD model treaty. However, no provisions are included in the directive with respect to permanent representatives, construction projects, the maintenance of a fixed place for the purpose of carrying on preparatory or auxiliary activities, etc. The exact meaning of the term "PE" in the context of the directive is therefore unclear.

The profits of a PE are determined in accordance with the rules of Dutch law unless a treaty provides otherwise. It seems inconceivable that the Netherlands would accept the rule contained in Article 7(2) of the directive pursuant to which the losses and subsequent profits of PEs must be determined "in accordance with the rules of law of the member state in which the PE is situated".

If a resident taxpayer has several PEs through which both profits and losses are derived, the effect of the exemption method will depend on whether the "per country" or "overall" method is applied. In the first case, foreign losses are deducted from taxable income, regardless of any other foreign income. In the second case, foreign losses are first compensated with exempt foreign profits. An effective tax deduction is only allowed to the extent foreign losses exceed foreign profits. Pursuant to tax treaties concluded with EC countries, the per country method should be applied with respect to Italy (1957 treaty), Denmark, Germany, Luxembourg, Ireland, Belgium, Spain and France. The tax treaties with Italy (1990 treaty), the United Kingdom and Greece provide for the overall method. Pursuant to domestic tax law, the overall method should be applied to Greece. It follows from the above that from a Dutch perspective it is very important that the directive explicitly state that the results of PEs must be determined on a per country basis.

Dutch tax law contains no provisions regarding "automatic reincorporation" as described in Article 8 of the directive. If these provisions are written into domestic tax law, they would have a substantial negative impact on the position of Dutch taxpayers.

Losses of foreign enterprises are normally allocated to the individual or legal entity carrying on the relevant enterprise. This is not the case if an entity is regarded as tax transparent (e.g. certain partnerships), or if a fiscal unity is formed for corporate income tax purposes (pursuant to CITA Article 15, a fiscal unity can be formed between a Dutch parent company and its Dutch subsidiary). After the formation of a fiscal unity, all assets and liabilities (including those attributable to a PE) and all profits and losses (including those derived through a PE) are directly allocated to the parent company. A fiscal unity can only be formed between corporate taxpayers incorporated under Dutch law.

It can be expected that the Netherlands will not change the allocation rules set forth above if the directive is adopted.

D. *The taking into account of losses of subsidiaries*

Under Dutch tax law, an individual or corporate entity cannot directly take into account any losses incurred by a company

© 1993 International Bureau of Fiscal Documentation

in which it has a shareholding of 75 percent or more. In some instances, however, a structural decrease in value of a subsidiary can lead to a revaluation of the shareholding which is tax deductible. For corporate income tax purposes, however, such revaluations can normally not be taken into account by virtue of the participation exemption rules. Pursuant to these rules, income or capital gains derived from qualifying participations are not taken into account when determining the taxable profit of a Dutch parent company. As an exception to these participation exemption rules, losses arising in connection with the liquidation of a subsidiary are tax deductible if certain (strict) conditions are fulfilled.

An exception to the general rule that losses of foreign subsidiaries cannot be taken into account by a Dutch parent company applies if a fiscal unity is formed between a Dutch parent company and its 100 percent Dutch subsidiary which is effectively managed from a foreign country. Under the fiscal unity regime, all assets and liabilities and all profits and losses of such a dual resident subsidiary are allocated directly to its Dutch parent company. As mentioned above, a fiscal unity can only be formed between corporate taxpayers incorporated under Dutch law. The above tax treatment can therefore only apply if the foreign subsidiary is incorporated under Dutch law.

1. Impact of the directive on Dutch tax law

The Netherlands would have to make some major changes to its domestic legislation in order to allow losses of foreign subsidiaries to be taken into account in accordance with the provisions of the directive. The proposed "one way" offset of losses will, however, not be very advantageous for the Dutch business community. In comparison with countries such as, e.g. Germany and France, the consumer market in the Netherlands is relatively small. Consequently, the taxable base of a Dutch parent company may not be sufficient to absorb foreign losses.

2. Alternatives

From a Dutch tax point of view, it would be best to have a European consolidation system. Such a system would, however, require far-reaching harmonization which for the moment is not likely to occur. An alternative might be a system in which losses are treated as transferable assets (the UK system). Another alternative may be a variant to the UK system whereby, pursuant to an international pooling arrangement, losses made within a European group are allocated to profitable companies within the group (in proportion to the profits made).[2]

V. INFORMATION NOTE ON THE FISCAL CLIMATE IN THE NETHERLANDS

A. *General*

On 6 October 1992, the Dutch Under-Secretary of Finance sent an information note to Parliament on the fiscal climate for enterprises in the Netherlands. The purpose of this note was to contribute to the present discussion on the possibilities of attracting foreign investment to the Netherlands and on the fiscal changes that could take place following this discussion. The following summarizes the note.

B. *Object*

The Netherlands has traditionally taken a leading position in establishing itself as a residence country. Current international developments require that the Netherlands should focus on lasting investments in respect of its international tax policy. Short-term fiscal measures do not fit into this policy. Measures have to be taken to increase the fiscal attractiveness of the Netherlands as a residence country. The object of eligible fiscal measures is to attract real investments that bring long-term employment and increase welfare, while maintaining the established stable fiscal climate. The Under-Secretary expects to present concrete changes in the near future – possibly this year.

C. *Eligible fiscal measures*

The Under-Secretary of Finance announced the following eligible fiscal measures.

1. Fiscal incentives to stimulate economically weak areas in the Netherlands

The purpose of this measure is to increase the rate of return on investments in these areas, which makes them more attractive for investors. Considered changes in these specific areas include accelerated depreciation allowances and a lower (or even a zero) corporate income tax rate.

One of the Under-Secretary's remarks is that it is doubtful whether such fiscal incentives are useful in improving the Dutch fiscal climate. Temporary fiscal accommodation will generally only attract enterprises seeking a fiscal profit, leaving when a more profitable situation occurs somewhere else. Further investigation on this point will follow.

2. Fiscal allowance provisions on the transfer of goodwill and know-how to a PE in the Netherlands

Such provision does exist for the transfer of these intangibles by a foreign parent to a Dutch subsidiary. There are no provisions for the transfer by a foreign head office to its PE in the Netherlands. At first glance, such a provision will increase depreciation allowances and as a consequence a lower corporate income tax will result, but there are some considerable disadvantages. Therefore, the Under-Secretary will not consider such measures as important business partners, such as the United States, Japan and the United Kingdom, use the credit method to grant relief for the profit of a PE. The unilateral implementation of an additional depreciation possibility will only shift the tax burden (instead of reducing it) from the Netherlands to the country where the head office is established.

3. Specific accelerated depreciation on fixed assets

The effect that such depreciation on certain specific investment categories or on fixed assets with a short life has on

[2] See "Loss compensation within the European Community", *Intertax* (October 1990).

© 1993 International Bureau of Fiscal Documentation

employment and investment will be examined. Specifically, such an incentive is considered for short life assets, such as fixed assets with a useful life of less than five years (e.g. computers, software and intangible assets).

4. *Change in the fiscal treatment of currency translation results*

The question has been raised whether the possibility should be created for a foreign parent with a Dutch subsidiary to calculate the result of the subsidiary in a functional currency. Another question is whether exchange results realized on loans the interest of which is not deductible should be excluded from corporation tax. In the current situation, the positive exchange results on these loans are included, whereas the exchange results on the participation itself are exempted.

5. The scope of the EC parent-subsidiary directive will be extended

A broader application of the parent-subsidiary directive will be aimed for in negotiating tax treaties. The scope of two criteria, i.e. the legal form of the company (NV/BV) and the 25 percent criterion, will be studied. Further, legislation to lower the threshold percentage of participation in order to expand the waiver of withholding tax (on the basis of reciprocity) might be proposed.

6. Extension of fiscal compensation of losses and introduction of unlimited carry-forward of losses

Even though the Netherlands already has a broad system of compensation of losses, the extension of loss carry-forward could be examined, possibly an indefinite carry-forward. However, a "trade" in losses should not be the result of the change. The possibility of transferring losses within a group which does not form a fiscal unity is also being examined.

7. Implementation of the per-country method for losses of a foreign PE

The present policy is aimed at using the overall method in tax treaties. Because the per-country method, i.e. no set-off of profits and losses from PEs from different countries, could be more profitable due to a resulting higher exemption credit, a change in policy could be considered.

8. A provision to take into account non-creditable withholding tax on participation dividends

Under the participation exemption, Dutch corporations are exempt from Dutch corporate income with respect to dividends received and capital gains (including currency exchange gains) realized on the alienation of a qualifying shareholding. The exemption applies not only to domestic but also to foreign subsidiaries. In the latter situation, foreign dividend withholding tax cannot be credited against Dutch corporate income tax. This is considered an undesirable burden, especially if one would add the fact that the Netherlands imposes a withholding tax on further distribution of such income.

The Under-Secretary wants to examine whether this problem could be reduced by allowing the taxpayer to (partly) credit the foreign-source tax against the Dutch dividend withholding tax.

9. A permanent office for potential foreign investors will be added to the Dutch Revenue Department

Because an entrepreneur requires the cooperation of the Revenue Department in setting up his business, it is important that the Department is well organized and properly functioning. Measures will be taken to ensure that the advance ruling team of the Large Enterprise Department of the Rotterdam Tax District Office will be able to deal faster with advance ruling requests, specifically in situations that deal with real Dutch economic interests.

10. In the announced proposals on the 35 percent resolution, the deemed foreign tax liability, awaiting further determination, will be maintained

This means that foreign-source income from net wealth of temporarily resident foreign employees will not be subject to Dutch income tax. A regulation is being studied which will take into consideration only those items that are being transferred to the Netherlands (remittance base).

D. *Continuing international tax policy aspects*

The Dutch capital duty (1 percent) can be a heavy burden in setting up new corporations, but abolition is not being considered for budgetary reasons. On the part of the corporate income tax rate and tax base, the Netherlands runs a fairly middle course compared to the surrounding countries. In view of the future common EC tax policy, no significant changes are being considered. The "classical system", which causes profits to be subject to double taxation, once at the corporate level and once at the shareholder level when distributed, will remain unchanged.

Dutch tax treaty policy is aimed at reducing the withholding tax on dividends to zero percent in case of a qualifying shareholding. The reason for this strong position relates to the above-mentioned participation exemption system, which currently prescribes a disallowance for crediting the foreign dividend withholding tax. The Under-Secretary wants to maintain this position in treaty negotiations, but agrees not to be too rigid on this point.

The current method used in the Netherlands to avoid international double taxation is the exemption method. The exemption method remains basically unchanged, although certain elements of this method may be sharpened (see above).

VI. THE 35 PERCENT CONCESSION PER 1 SEPTEMBER 1992

A. *General*

The 35 percent concession is a tax facility for non-Dutch employees temporarily employed in the Netherlands, based

© 1993 International Bureau of Fiscal Documentation

on the directive of the State Secretary of Finance dated 4 June 1992. The facility allows an employer to provide the employee with a non-taxable compensation for special expenses with which the non-Dutch employee is deemed to incur in connection with his employment in the Netherlands.

B. *Conditions*

The 35 percent compensation facility is applicable in respect of employees coming to the Netherlands as of 1 September 1992 or those employees who qualify for the facility under the transitional regulations of the directive of 4 June 1992.

The concession is only available for employees.

The employment must be a real employment (no "deemed" employment such as employment through an employment agency). In addition, artists, sportsmen, members of a supervisory board, etc. are excluded.

The employee must come from outside the Netherlands, although an employee having Dutch nationality qualifies if he lived outside the Netherlands for more than eight years (see below).

The employee must reside or sojourn in the Netherlands and work in this country.

The employee must stay in the Netherlands on a temporary basis. "Temporary" is not defined, so in principle the period of sojourn in the Netherlands could exceed 96 months.

There must be a (Netherlands-established) withholding entity (company deducting from the salary and contributing wage withholding tax and national insurance contributions on a monthly basis on behalf of the employee.) If there is no withholding entity, the non-Dutch employer should be appointed as such.

The non-Dutch employee should be assigned or recruited by the Dutch employer because he has a specific expertise which is not available or is scarcely available on the Dutch labour market. In this respect, education, experience, qualification of the function and the net remuneration also play an important role.

The 35 percent concession can only be applied after the Revenue has, at the request of both employer and employee, granted approval. If a withholding entity must be appointed, the request for the 35 percent concession must be filed within four months after the start of the employment in the Netherlands.

The tax-free compensation (maximum 35 percent) of the basis for computation mentioned in paragraph 3.5 of the directive of 4 June 1992 must be granted separately (in the employment agreement or in an appendix thereto), and paid together with the salary. The Revenue attaches great importance to the simultaneous payment of both the salary and the 35 percent compensation!

In principle, the 35 percent concession is available for a period of 96 months from the start of the employment in the Netherlands. However, before the expiration of 48 months, an interim review must be initiated by both employer and employee.

The Dutch employer must demonstrate that the non-Dutch employee has to extend his stay in the Netherlands as a consequence of the permanent shortage of specific expertise on the Dutch labour market.

The period of 96 months is reduced by periods of earlier sojourn or employment in the Netherlands. However, if the date of departure from the Netherlands at the time is eight years or more before the start of the new employment in the Netherlands, the 96 month period will not be reduced.

The 35 percent concession is not available when the 35 percent deduction in accordance with the "Wet faciliteit voor de zeevaart" (facility for seafaring employees) applies. However, the "Nedeco-regeling" (35 percent deduction for expatriates assigned to specific areas of the world) is available (only for those employees under the 35 percent concession having the status of a resident taxpayer).

If the non-resident employee benefiting from the 35 percent concession starts to work for a new employer in the Netherlands, he can again qualify for the 35 percent concession (if, of course, the further requirements are satisfied) for the remaining months of the maximum period of 48 or 96 months. Both the new employer and the employee have to file a request in this respect.

C. *Decisive circumstances*

The circumstances at the start of the employment in the Netherlands are decisive with respect to the question whether the employee qualifies for the 35 percent concession. If the employee would satisfy the conditions at a later point in time, the circumstances at that later point in time will be decisive. In that situation, the period of 96 months will be reduced by the months during which the employee has already been in the Netherlands.

D. *Special situations*

If the benefits of the 4 June 1992 directive would be more beneficial, employees benefiting from the 35 percent concession under earlier directives may at any time choose that facility for the remaining months of the 96 months if all prerequisites of the 4 June 1992 directive are satisfied.

When the maximum period of 60 months under earlier directives has expired, employees benefiting from the 35 percent concession under such directives may apply for the benefits under the 4 June 1992 directive (for a period of 36 months). Where the maximum 60-month period has expired before 1 September 1992, employees who have benefited from the 35 percent concession under earlier directives but who are still in the Netherlands, may again apply for the 35 percent concession under the 4 June 1992 directive for the remaining months of the maximum 96-month period, counted as from the date of arrival in the Netherlands.

Employees who did not qualify for the 35 percent concession under earlier directives because the conditions of those direc-

© 1993 International Bureau of Fiscal Documentation

tives were not satisfied may apply for the 35 percent concession as of 1 September 1992 for the remaining months of the maximum period if the conditions of the 4 June 1992 directive are fulfilled.

In all of the above situations, the conditions of the 4 June 1992 directive must be satisfied. The circumstances at the time of arrival in the Netherlands are decisive. It is not yet clear how "temporary" will be interpreted in these situations.

E. *Determination of taxable employment income*

Taxable employment income is determined in accordance with the legal rules in the Wage Tax Act 1964. In addition to the tax-free 35 percent compensation, the employer can also provide other tax-free allowances, and the employee can deduct in his income tax return certain professional expenses.

F. *Exempt 35 percent compensation*

The non-taxable 35 percent compensation is determined, taking into account the basis for calculation set forth in paragraphs 3-5 of the directive. If the employee claims in his income tax return a deduction for the avoidance of double taxation in respect of employment income earned outside the Netherlands, a tax-free 35 percent compensation is not permitted in respect of this foreign income.

Under all circumstances, the exempt 35 percent compensation must be paid together with the salary. Monthly salary statements have to demonstrate this payment. Until the tax authorities have granted approval of the concession, the full compensation must be taxed. A recalculation can be made when the concession is granted.

G. *School fees*

In addition to the non-taxable 35 percent compensation, the employer can reimburse school fees for children at international schools for primary and secondary education, both in and outside the Netherlands, without any tax consequences. In this respect, school fees are the amounts for education (not for boarding) and transport invoiced by the school.

Contrary to earlier directives, if the employer does not reimburse the school fees it is not possible for the employee to deduct the expenses in his income tax return.

H. *Pensionable base*

It is not presently clear whether the split between salary and exempt 35 percent compensation would have negative consequences for the pensionable base.

I. *35 percent concession and employee insurance contributions*

For the time being, most of the industrial boards do not accept that the 35 percent concession is applied in respect of the salary on which the employee insurance contributions (ZW, WW, WAO, ZFW) are calculated. This item is still under discussion. If the 35 percent concession would be applied in this respect, it could have an impact on the level of possible benefits.

J. *Resident tax liability or non-resident tax liability?*

The directive of 4 June 1992 provides that an employee who, on the basis of circumstances, is regarded as a (tax) resident of the Netherlands, is qualified as a resident taxpayer. In such a case, the employee's tax liability is unlimited, i.e. he is liable for Dutch tax on his worldwide income and worldwide net wealth. Income other than income from employment is subject to tax in the Netherlands. However, the employee may also deduct certain expenses (e.g. alimony paid to an ex-spouse or the negative income from non-Dutch real estate, interest paid on loans, contributions to Dutch charities, etc.).

K. *Employee qualified as a non-resident of the Netherlands has status of non-resident taxpayer*

The directive of 28 August 1992, a supplement to the 4 June directive, provides that when filing the request for the 35 percent concession an employee who is tax resident in the Netherlands may request to be qualified as a deemed non-resident taxpayer for a period of 48 months. This implies that the employee's tax liability would be limited. In general, only the employment income earned in the Netherlands and (positive or negative) income from Dutch real estate will be taken into account.

A non-Dutch employee who is qualified as a deemed non-resident taxpayer is nevertheless regarded as a resident taxpayer in respect of the following:

- for purposes of determining the personal allowance (tax group): the employee is entitled to the basic personal allowance and additional allowances;
- for purposes of allocating non-personal income: such income is allocated to the partner having the highest personally earned employment income, unless, if this would be more beneficial, the employee requests allocation as a non-resident taxpayer (the same allocation rules apply for net wealth tax purposes); and
- for purposes of determining taxable employment income (income earned outside the Netherlands is also subject to Dutch taxation).

When choosing the tax status (resident or non-resident taxpayer) the personal circumstances of the employee are decisive. Also, the choice made when filing the 35 percent concession request is final for the first 48 months. After 48 months, the circumstances determine whether during the last 48 months the employee was a resident or non-resident taxpayer.

A resident employee who wishes to be qualified as a deemed non-resident taxpayer cannot apply for the "90 percent concession", a concession providing certain facilities to non-resident taxpayers; such concession is in principle only available to resident taxpayers. A "real" non-resident taxpayer can invoke this 90 percent concession, and he can split off from his Dutch taxable income the salary earned in respect of activities performed outside the Netherlands on the basis of the number of days he worked outside the Netherlands. Such

© 1993 International Bureau of Fiscal Documentation

a "salary split" is not available for (statutory) managing directors of a Dutch company.

An employee benefiting per 1 September 1992 from the 35 percent concession under earlier directives may, if he prefers the new 35 percent regulations, request to continue his status as a deemed non-resident taxpayer. The same applies for an employee who has his "old" 35 percent concession extended after expiration of the 60 month period.

L. *Tax rates*

In principle the general personal allowances, tax brackets and tax rates apply in respect of taxpayers benefiting from the 35 percent concession. However, there is a special rule for taxpayers who are exempt from Dutch social security. In general, 13 percent tax and 25.55 percent national insurance contributions are levied on the first tax bracket (Dfl. 42,966 in 1992). In view of the fact that the national insurance contributions are not due, the employee would have to pay 13 percent tax. However, the latter only applies to residents of the Netherlands. The "real" non-resident taxpayers have to pay 25 percent tax on the first bracket.

VII. MISCELLANEOUS

A. *Supreme Court ruling on different withholding tax in case of dual resident company*

On 2 September 1992, the Dutch Supreme Court issued an important ruling regarding the applicability of Dutch withholding tax in case of distributions of a dual resident company (hereinafter referred to as "DRC").

The corporation, incorporated under the laws of the Netherlands, was effectively managed and controlled in Ireland. The corporation ("BV") made a dividend payment to its sole US corporate shareholder, without any withholding, whereupon the Dutch tax inspector issued a Dutch dividend tax assessment at the rate of five percent based on Article VII, paragraph 1 of the Dutch-US tax treaty. The Revenue based this assessment on Article 1, paragraph 3 of the 1965 Dividend Tax Act, whereunder all corporations incorporated under the laws of the Netherlands are deemed to be subject to 25 percent dividend withholding tax, subject to relief under a tax treaty.

One of the key issues in the case was whether Article 8, paragraph 9 of the Dutch-Irish tax treaty, which is substantially similar to Article 10, paragraph 5 of the 1963 OECD model convention, would prevent the Netherlands from levying a withholding tax since BV is considered a resident of Ireland for purposes of the Dutch-Irish treaty.

The Lower Court at the Hague did not apply Article 8, paragraph 9 of the Dutch-Irish treaty holding that this provision only covered cases where an Irish company derives profit or income from the Netherlands. In the case at issue, BV carried on no activities at all in the Netherlands and it did not receive any Dutch source income. The Supreme Court, however, overruled this decision, relying heavily on the OECD Commentary to Article 10, paragraph 5 of the 1963 OECD model convention. The Supreme Court concluded that regardless of whether the DRC was deriving any Dutch profits and/or income, Article 8, paragraph 9 of the Dutch-Irish tax treaty denied the Netherlands the right to levy a withholding tax on a distribution of profits by the DRC to its US shareholder. The Court focused on the final words of this paragraph, "even if the dividends or the undistributed profits consist wholly or partly on income arising in such other State [i.e. the Netherlands]."

Based on this Supreme Court ruling, shareholders may start to seek avoidance of Dutch dividend withholding tax by transferring the effective management of a Dutch corporation to a country that has a tax treaty with the Netherlands that contains a provision similar to Article 10, paragraph 5 of the 1963 or 1979 OECD model convention. In the Supreme Court case, BV had never conducted business in the Netherlands. It is not inconceivable that if a Dutch company has been conducting business in the Netherlands and has accumulated retained earnings during that period, a distribution immediately upon transfer of the effective management to a third country will be challenged under abuse of law.

It is likely that this Supreme Court decision may also urge the Dutch government to introduce an exit tax provision in the Dutch Dividends Tax Act under which a Dutch corporation would become liable to dividend tax on all retained earnings at the time plus any possible unrealized gains.

B. *Revision of the internal reorganization exemption regarding Dutch capital duty*

The Netherlands is one of the remaining EC member states that levies a non-recurring 1 percent capital duty on any capital contribution to a Dutch corporation regardless of the form and nature of the contribution. This capital duty is generally considered a substantial constraint for structuring, e.g., a Dutch holding corporation. However, in many cases multinational groups could reduce the effective capital duty burden substantially by relying on the merger exemption and/or internal reorganization exemption. The merger exemption in general terms applies when a Dutch corporation receives at least 75 percent of the stock of another corporation resident in an EC member state, regardless of the residency of the contributing corporation.

The internal reorganization exemption was applied, for example, in the case where an EC resident corporation contributed to a Dutch corporation 100 percent of the stock of another corporation whereby it was irrelevant whether the transferred corporation was resident in an EC member state. The exemption was applied since the Dutch Supreme Court ruled in 1981 that a 100 percent subsidiary corporation could be considered an "independent part of an enterprise", the expression used by the Netherlands to implement the "branch of activities" as referred to in Article 7, paragraph 1, subparagraph b of the EC directive of 7 July 1969.

I. INBOUND INVESTMENT

A. *Implementation of the parent-subsidiary directive*

Since 1 January 1992 dividends distributed by a German resident corporation to a qualified EC parent company have been subject to withholding at a rate of 5 percent of the gross dividend. Effective 1 July 1996 dividends distributed by a German resident corporation to a qualified EC parent company will not be subject to German withholding tax.

Both rules apply also to the refund of corporate income tax which the German distributing company has to pay upon distribution of pre-1977 profits (so-called EK 03) and of profits from foreign sources exempt from German tax under a tax treaty, such as foreign source income from a permanent establishment (PE), from the letting and leasing or the alienation of foreign-situs real (immovable) property, or direct investment dividends (so-called EK 01).

A *qualified EC parent* is a company that is listed in Article 2 of the parent-subsidiary directive; has neither statutory seat nor place of effective management in Germany; and can show that it has held a qualified interest in the German distributing company continuously over the 12-month period preceding the distribution.

A *qualified interest* is defined as a
- 25 percent or more interest in the stated capital of the German company; or
- 10 percent or more interest in the stated capital of the German company if
  - the parent's residence country exempts from its tax dividends received by the parent company from the German distributing company; or
  - the residence country gives a credit for the German withholding tax; and
  - exempts from its withholding tax dividends paid by a resident affiliate to the German parent; and
  - each of these requirements is met provided there is a 10 percent or more interest in the other company ("reciprocity requirement").

The lower rates apply, on application, at source so that the refund procedure is no longer required. Up-front relief is also granted if the lower withholding rate applies on the basis of a tax treaty (i.e. also *vis-à-vis* parent companies outside the EC holding a 10 percent or more interest in the German distributing company).

It is currently unclear whether the zero percent withholding rate applicable *vis-à-vis* EC parent companies after 30 June 1996 will also be extended to important non-EC trading partners of Germany such as the United States. A complete waiver of the German withholding tax would require reciprocal measures by the treaty partner unless the German split-rate system is substantially altered by then (discussed in III). This requirement should not come as a surprise to the US treaty negotiators as similar negotiating positions have been known to exist on the part of the Mexican and USSR negotiators. Also, until early 1987 the US delegation's position *vis-à-vis* Germany was that Germany should waive its withholding tax completely to compensate US parents for the fact that the German corporate income tax is not generally refunded to non-resident shareholders.

B. *Implementation of the mergers directive; effect on tax-neutral rearrangements of participations within a European group*

Effective 1 January 1992 contributions in exchange for new shares issued by the receiving company qualify for rollover relief also in the cross-border EC context.

© 1993 International Bureau of Fiscal Documentation

1. Share-for-share exchanges

Tax neutrality of a share-for-share exchange no longer requires a 100 percent shareholding. Majority voting rights of the receiving company on the basis of existing and transferred shares are now sufficient.

Payment of "boot" by the receiving company to the transferor is admissible if the "boot" does not exceed 10 percent of the nominal value of the transferred shares.

The tax-neutrality is lost if the receiving company disposes of the transferred shares within seven years of the exchange unless the shares are contributed, without basis step-up, in a further share-for-share exchange with another EC company.

2. Business-for-share exchanges

The transfer must involve an entire business or an independent business division viable on its own if separated from the remaining business ("*Teilbetrieb*"; stand-alone business division).

Business-for-share contributions are now tax-favoured not only if the transfer is made by a German resident to another German resident but also if:

- a German resident corporation contributes a business or a stand-alone business division to a German PE of an EC corporation in exchange for new shares of such corporation; or
- a non-resident EC corporation contributes its German PE to a German resident or a non-resident EC corporation; or
- a German resident corporation contributes its non-German EC PE to another corporation.

The tax neutrality is lost if the non-resident EC company disposes of the shares received in exchange for the contribution of the German PE within seven years of the transfer unless the shares are contributed without basis step-up to another EC company.

C. *Fiscal unity: legislative changes in reaction to civil court decision*

German corporate income tax law does not provide for the filing of consolidated returns. Instead the notion of *Organschaft* has the effect of group relief. This "fiscal unity" concept requires financial, economic and organizational integration of a subordinated corporation into a dominating business enterprise and the conclusion of a profit and loss absorption agreement. In practice fiscal unity is normally brought about by the conclusion of a profit and loss absorption agreement between the dominant business enterprise and the subordinated corporation; and a domination agreement between the two parties.

The highest German civil court (BGH) ruled that a valid profit and loss absorption agreement between a dominant business enterprise and a limited liability company (GmbH) requires that

- the agreement be entered into the commercial register of the subordinated entity corporation;
- the shareholders of the dominant business enterprise consent to the agreement by a 75 percent majority of votes cast. If the dominant entity is a stock corporation (AG), a general shareholders' meeting is necessary. The shareholders' resolution need not be notarized;
- the shareholders of the subordinated corporation consent to the agreement. It remains unclear whether a qualified majority is also required here. The shareholders' resolution must be notarized.

The Corporate Income Tax Act used to provide that the profit and loss absorption agreement had to become effective by the end of the first year for which fiscal unity was to apply. The formal requirements established by the BGH normally make it impossible to complete all elements necessary within such time frame. Accordingly, the tax rules were relaxed effective for the assessment period 1991, so that the profit and loss absorption agreement need only become effective by the end of the subordinated entity's fiscal year which follows the fiscal year for which fiscal unity is first to apply.

D. *Administrative Circular on tax-neutral split-ups and spin-offs; effect on tax-neutral rearrangements of participations in general*

1. General

As opposed to mergers and certain types of reorganizations, German statutory law does not currently contain any provisions that specifically address the split-up or the spin-off of a business division from a corporation. This is true both for commercial and fiscal law purposes. In connection with the implementation of the EC directive on the taxation of cross-border mergers the German government has begun work on draft legislation that would create the tools, under commercial law, required to provide for tax-neutral split-ups and spin-offs both in the domestic and the international context. However, this draft legislation has not been finalized. It therefore remains unclear whether a formal proposal of the relevant fiscal legislation can be expected soon.

In the interim, the German Ministry of Finance (BMF) on 9 January 1992 issued a Circular (comparable to Treasury Regulations in the United States, except for their non-binding character on taxpayers and courts) that summarizes the criteria for split-ups and spin-offs.[1]

The Circular does not improve the situation under commercial law. A split-up or spin-off cannot be achieved in one unified act whereby the new corporation assumes the juridical position of the corporation being reorganized. Instead a series of individual, but interdependent steps is still required until the commercial law has been amended as envisaged. The Circular does, however, summarize the criteria that will allow the taxpayer to treat the entire arrangement as a tax-neutral reorganization for (corporate) income and capital gains tax purposes. As the Circular is relatively new, the tax administrations of the *Länder* have agreed that taxpayers wishing to

1. The BMF is basically a policy-making body on the level of the Federal Government (much like the US Treasury Department) that coordinates, but does not interfere directly with, the application and practical implementation of the tax laws by the Federal States (*Länder*).

© 1993 International Bureau of Fiscal Documentation

avail themselves of the tax neutrality should come in for an advance ruling. Any substantial departure from the standards of the Circular will first have to be discussed between the *Länder* officials and is bound to slow down the ruling process.

The Circular does not provide for the tax neutrality of split-ups and spin-offs for transfer tax purposes. After the elimination of capital transfer and stock exchange turnover taxes the taxpayers involved therefore remain exposed to some level of real property transfer tax.

2. Highlights of Circular

The Circular describes the individual steps involved in a split-up/spin-off, i.e.:

- the business-for-share contribution by the distributing corporation to a newly established subsidiary ("NewCo") of the distributing corporation; this step is tax-neutral under existing law;
- the transfer of the NewCo shares to the shareholders of the distributing corporation; under existing law this step amounts to a taxable dividend-in-kind unless it is accompanied by the next step;
- the surrender of shares which the receiving shareholders have in the distributing corporation; under existing law this step generally amounts to a taxable exchange unless certain like-kind criteria are met which the tax courts have developed in their jurisprudence.

The Circular allows these individual steps to be treated as one unified tax-neutral measure if the reorganization has a valid business purpose, i.e. serves to continue the existing entrepreneurial activities in a new juridical form.

3. Particular points

The contribution by the distributing corporation to NewCo must involve an entire business, a separate, independently viable business division (stand-alone business division) or 100 percent of the shares in another corporation. The transfer of a stand-alone business division generally requires the transfer of land and buildings essential for the operation of the transferred or business division.

The transfer must be at book value.

Both the distributing and the controlled corporation must be German residents; the shareholders of the distributing corporation can be non-residents.

NewCo must be an entity newly established for purposes of the reorganization; it cannot be a pre-existing entity.

The shares in the distributing corporation and in NewCo must not be sold outside the group within the five years following the reorganization.

The existing group of shareholders must not be changed; however, identity in shareholdings *vis-à-vis* an individual corporation before and after the reorganization is not required.

Unrealized gain as represented by the transferred business and by the shares in the distributing corporation must remain subject to German taxability after the reorganization to the same extent as it was before.

Workers' co-determination rights must not be negatively affected by the reorganization (e.g. the spun-off entity must still have 2,000 employed personnel if the distributing corporation was above that threshold for parity representation in its supervisory board).

It appears that the tax administration is currently entertaining a rather narrow interpretation of these principles. They are obviously concerned that too generous a treatment would result in the demerger of large groups in preparation of a tax-efficient sale of the constituent parts in such a way that the German fisc does not participate in gain accrued prior to the spin-off. This approach can cause difficulties, e.g. in situations involving a Section 355 IRC spin-off where the shares in NewCo are to be distributed to group entities not forming part of the group of direct shareholders of the German corporation being split-up. Such reorganizations should therefore be planned with great care, particularly in cases involving the spin-off of a worldwide business.

E. *Introduction of a withholding tax on interest; effect on non-resident payees; effect on non-resident issuers of debt with German paying agents*

Non-resident bondholders are generally not affected by the new 30 percent interest withholding tax if they derive foreign or German-source interest income from debt securities held in a custodial account with a German or non-German bank.

Non-resident "coupon clippers" are affected by the interest withholding tax at a rate of 35 percent if they present their interest coupons for cash payment to a German disbursing entity, i.e. a financial institution resident in Germany; a German branch of a foreign financial institution; or to the obligor itself, for payment outside a custodial account. An exemption under a tax treaty can only be invoked through the refund procedure.

Non-residents are further affected if their foreign or German-source interest income, payable by a German disbursing entity, is effectively connected with a German PE or German immovable property. In that case tax is withheld at a rate of 30 percent and credited against the tax on the net income of the PE or from the letting and leasing of the immovable property.

It should be noted that the paying agent within the terms of an agency contract between the issuer of debt and a financial institution is not necessarily identical with the disbursing entity. Generally, only the "retail bank" holding the debt security in custody on behalf of the ultimate investor pays out the interest and has to withhold tax thereon if the investor is a German resident. The paying agent does not generally assume the function of "retail bank", but pays interest on behalf of the debt issuer to those financial institutions that present interest coupons or the debt obligation itself on behalf of their customers upon maturity.

F. *Proposals for thin capitalization rules*[2]

The German Parliament is currently considering a bill for the introduction of thin capitalization rules after a 1987 Ministry of Finance Circular providing for a 9:1 debt/equity ratio (where debt includes third-party and shareholder loans) was invalidated by a February 1992 BFH decision and subsequently withdrawn by the MoF. The bill amounts to a re-introduction of similar proposals that were thoroughly rejected by the business community in committee hearings in 1988.

The present version of the bill (as of 21 June 1993) would recharacterize as constructive dividend distributions any consideration payable by a German resident corporation to a shareholder not entitled to the corporate imputation credit holding a 25 percent or more interest in the stated capital of the corporation, where such consideration pertains to

- any debt instrument providing for consideration in terms other than a fixed percentage of the loan principal (such as profit participating rights or loans or other "hybrid instruments") where the loan capital extended by the shareholder exceeds 50 percent of that portion of the corporation's equity that corresponds to the shareholder's interest in the corporation's stated capital (1:2 debt/equity ratio);
- any other indebtedness, where the loan exceeds a debt/equity ratio of 3:1, *unless* an unrelated party would have extended such loan capital at the same terms and conditions or the loan serves to finance transactions usual in the banking sector.

The same rules apply if a person related to the shareholder extends the loan and such person is not entitled to the corporate imputation credit or if a third party provides the loan financing, where such third party has recourse to the shareholder or to a person related to the shareholder.

A special safe haven debt/equity ratio of 9:1 would apply to German holding companies with respect to non-hybrid debt instruments. However, the German entities controlled by the holding company would not be covered by a special safe haven. As a consequence a holding company structure could not be used to increase the volume of acceptable shareholder loan financing of share acquisitions beyond the 9:1 ratio.

The likelihood of passage of this bill is difficult to judge. The business community has apparently softened its critical stance of 1988 as the thin capitalization rules as now introduced come in a package with lower corporate and personal income tax rates (see below at III). Several State Governments have criticized the bill's lower rate so that the entire package will go into the Bundestag/Bundesrat Joint Conference Committee. It is unclear whether the Committee will be able to reconcile the difference in opinion prior to the summer break.

G. *Investment grants and accelerated depreciation for investment in the new Länder; new proposals for enhanced provisions*

Existing law provides for a number of measures designed to stimulate investment in the five new *Länder*:

- investment grants (between 8 and 12 percent of the investment);
- accelerated depreciation (up to 50 percent over the first five years of the investment) through 1994;
- non-collection of trade tax on capital and net worth tax through 1994.

Effective 1 January 1993 investment grants were enhanced/modified:

- the 31 December 1992 deadline, by which investments had to be initiated, was cancelled;
- the 31 December 1994 deadline, by which the investments had to be completed, was extended by two years to 31 December 1996, except that the new deadlines do not apply to marketing (wholesale, retail) enterprises; financial institutions, insurance companies; gas and electricity utilities;
- 8 percent grant for investments initiated prior to 1 July 1994, 5 percent thereafter;
- 20 percent grant for manufacturing enterprises and craftsmen resident in the five new Länder on the day the Berlin Wall came down (9 November 89) for investments up to DM 1 million, 8 percent (5 percent) for the excess amount;

In addition, the following has been proposed:

- extension of the 50 percent depreciation by two years (through 1996);
- extension of non-collection of trade tax on capital and net worth tax by one year (through 1995).

H. *Relaxation of bank supervisory rules on German branches of European financial institutions;*[3] *possible effects on taxation*

Prior German bank supervisory law required the German branch of a foreign financial institution to show equity ("allotted") capital the amount of which depended, *inter alia*, on the lending volume of the branch. For tax purposes, the branch was not allowed to deduct interest payable to the head office on such allotted capital.

Effective 1 January 1993, under the "European Passport" approach, German branches of financial institutions resident in another EC country are not required to show allotted capital but have to show "sufficient liquidity". Due to the European Passport approach a number of financial institutions have begun to reorganize their German affiliates by transferring their business to a new German branch of the parent's head office.

Such reorganization may result in lower costs of funding and the ability to rely on the home bank's credit standing in the market. The German bank supervisory authorities having jurisdiction over the branch have to accept the banking licence issued in the head office's home country and can only request certain filings to be submitted by the branch.

A number of new tax issues arise as a consequence of these legislative changes of bank supervisory law:

2. Corporate Income Tax Act, Sec. 8a.
3. Banking Act, Sec. 53b.

© 1993 International Bureau of Fiscal Documentation

- Will the tax authorities accept that the German branch does not have to show allotted capital or will they require a notional amount for tax purposes?
- Can the branch be supplied with tax-favoured loan financing by the head office or by sister corporations or sister branches through straight or participating loans, silent partnerships or other hybrid instruments?
- Can a tax-neutral transfer of existing businesses to the new "European Passport" branch be achieved? This problem is of particular importance for bank subsidiaries that have been in existence for an extended period of time and are, therefore, likely to have accrued considerable goodwill that would need to be recognized in an arm's length transfer of its business.

It should be noted in this context that the "European Passport" concept can be extended by the government to financial institutions resident in a non-EC country. Section 53c Banking Act authorizes the Ministry of Finance to pass administrative regulations to this effect, provided that

- the home country of the foreign financial institution treats local branches of German financial institutions on a reciprocal basis;
- the other country supervises its resident financial institutions pursuant to internationally recognized principles;
- the other country extends national treatment to local branches of German financial institutions; and
- the other country's bank supervisory authorities are prepared satisfactorily to cooperate with the German competent authorities and such cooperation is safeguarded by bilateral agreement.

The Ministry of Finance has not, as of this writing, extended the European Passport approach to another non-EC country.

I. *Dividend strategies with German stock around ex-dividend date*

Due to the German corporate tax regime (imputation credit) and the unwillingness of the German legislature to permit a corporate tax refund to non-resident shareholders by treaty, stock of a German corporation is worth more in the hands of a resident taxable entity on dividend day than in the hands of a non-resident or a domestic tax-exempt entity. The imputation credit mechanism has led to a substantial volume of trade into Germany with respect to stock in German corporations around ex-dividend day designed to make the imputation credit available, at least economically, to non-resident shareholders. Surprisingly little administrative guidance exists on the acceptability of such "dividend strategies". A 1978 ruling denies the tax credit to the interim holder of stock that purchased stock from a non-resident shortly before ex-dividend day, collected the dividend, claimed the withholding and imputation credits, and agreed to sell the stock back at the quoted price soon thereafter. The ruling relies on abuse of legal form considerations.

A tax court decision of 1982 indicates that even a repurchase arrangement is acceptable and results in the attribution of the income derived from a security to its interim holder as the beneficial owner of the income. The decision dealt with debt instrument generating tax-exempt interest, not dividends.

The entire issue is sensitive as the use by non-residents of the imputation credit runs counter to a core element of the German corporate tax imputation system. The stock exchange supervisory authorities in Frankfurt have begun to investigate stock brokers apparently involved in holding stock as principal under short-term round-trip transactions. The volume of the most aggressive transactions is reported to have dropped significantly since these investigations were initiated. However, the investigators' findings have been kept confidential so far. The stock exchange supervisory authorities might well share the material on their findings with the tax authorities, particularly if criminal sanctions are called for.

The tax package currently before Parliament contains changes to Section 50c Income Tax Act. Pursuant to this provision a resident purchaser of stock in a German corporation cannot recognize a tax loss if he acquired the stock from a person not entitled to the corporate imputation credit, where the loss reflects a reduction in the stock's value attributable to the distribution of profits. A tax deduction for such loss is barred for ten years beginning in the year of the acquisition, and extends to losses from the disposition of the stock or extraordinary write-offs under a mark-to-market approach. Section 50c contains an exception for stock acquired on the exchange through a financial institution. The draft bill would modify the exchange-trading exception so that it only applies if it is not apparent to the purchaser of the stock that the seller is not entitled to the corporate imputation credit. The provision will most likely undergo further modifications when the bill is marked up in the Conference Committee.

II. OUTBOUND INVESTMENT

A. *Tightening of German CFC rules; effect on passive non-controlling investments by German residents abroad*[4]

Under previous law the controlling investment by German residents in a passive offshore company subject to an effective tax rate below 30 percent resulted in the imputation of the offshore company's passive income to the German resident shareholder (elimination of deferral). The imputed amount was treated like a dividend also for purposes of an applicable tax treaty. In the case of an investment by a German corporation the participation exemption under a tax treaty applied unless the treaty contained an activity clause.

Effective 1 January 1992 these rules were broadened with respect to certain types of passive income retained by the offshore company:

- passive investment-type income is now imputed to a shareholder that has a 10 percent or more interest in the offshore company even if such company is not German-controlled;

4. International Tax Act, Secs. 7(6), 10(6).

© 1993 International Bureau of Fiscal Documentation

- the participation exemption under a tax treaty is denied to the extent the imputed amount consists of passive investment-type income;
- passive investment-type income is also imputed if it is effectively connected with a PE which the German investor maintains in the low-taxing jurisdiction even if the income would otherwise be exempt under an applicable tax treaty;
- the rules described above take precedence over those provisions governing the treatment of investment in offshore mutual funds.

B. *Tightening of German rules on deductibility of foreign losses from domestic profits*[5]

Effective 1 January 1992 losses resulting, *inter alia*, from a write-down to lower market value of a participation in a foreign corporation; and the sale of a share in, or the reduction of the capital of, a foreign corporation can only be set off against current or future income from the same type of operation or participation, unless the foreign corporation is engaged in an active trade or business involving the manufacture or marketing of goods (except arms), the production or extraction of minerals or the rendering of commercial services.

III. TRENDS IN GERMAN TAX LEGISLATION

A. *Proposals for relief from personal and corporate income tax*[6]

A draft bill currently being considered by the *Bundestag* and *Bundesrat* would:

- lower the corporate income tax rates on retained profits from 50 to 44 percent; on distributed profits from 36 to 30 percent; on the profits of a German branch of a foreign corporation from 46 to 41 percent;
- mitigate the current "recapture" of corporate income tax in case foreign treaty-exempt income is distributed to a shareholder. This would enhance the tax situation of German holding companies and their shareholders;
- extend the dividend participation exemption under tax treaties to capital gains from the disposition of shares in a foreign subsidiary or affiliate;
- lower the *top personal income tax* rate on income from industrial or commercial activities from 53 to 44 percent in order to compensate for trade tax on income without eliminating this tax altogether (requiring an entirely new system of revenue sharing) and without an across-the-board lowering of the top personal income tax rate on all categories of income;
- defer the income tax liability for small and medium size businesses by allowing additions to a tax-deductible reserve in anticipation of future investment in depreciable property (maximum 45 percent of the anticipated production or acquisition cost of the asset). The reserve has to be dissolved, and the resulting amount taken into income, as soon as the asset is acquired and depreciation has begun, but at the latest at the end of the second year following the formation of the reserve. If a higher amount is reserved than actually invested the amount taken into income upon the dissolution of the reserve is increased by 6 percent to compensate for the tax deferral;
- extend certain tax benefits for investment in the new *Länder*.

These tax benefits would be partly offset by base-broadening measures in order to keep the entire package practically revenue-neutral. Such base broadening measures would include:

- new rules on thin capitalization (as discussed above at I.F.);
- deceleration of declining-base depreciation (30 to 25 percent for movable property; 10 to 7 percent for immovable business property);
- extension of the useful life of automobiles used in a trade or business from four to five years.

B. *Re-introduction of a solidarity surcharge; effect on non-residents*

There appears to be agreement between the major political parties that, effective 1 January 1995, the "solidarity surcharge" to personal and corporate income tax will be re-introduced on a "temporary basis" to contribute to the cost of German unification. No decisions have been taken as to when the surcharge would cease to apply. A similar surcharge was in effect in 1991 and 1992 at a rate of 3.75 percent of the personal or corporate income tax assessed during these years. The new solidarity surcharge would be imposed at a rate of 7.5 percent of the assessed income tax, bringing the effective marginal top income tax rate to 56.975 percent (as it relates to non-business income) and to 47.3 percent as it relates to business income (assuming that the current plans for lower rates are implemented). The rate on retained corporate profits would also increase to an effective 47.3 percent whereas the rate on distributed corporate profits would be 32.25 percent.

The old solidarity surcharge was treated as a covered income tax under tax treaties so that non-resident persons entitled to treaty benefits obtained relief to the extent the imposition of the surcharge resulted in a tax exceeding that permitted under the applicable treaty.

TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS

Nathan Boidman

Partner, Goodman, Phillips & Vineberg, barristers and solicitors, Montreal (other offices are located in Hong Kong, New York, Toronto and Paris). A chartered accountant with degrees in civil law and common law (McGill University), and was called to the Bar of Quebec in November 1981, Mr Boidman practiced accounting from 1964-1973 following graduation from McGill University with a bachelor of commerce degree in 1962.

Since 1974, Mr Boidman has restricted his practice to consulting on tax matters; he has written numerous articles and papers on international tax and lectures frequently on the topic.

Mr Boidman, Vice President of the Canadian branch of IFA and a member of the Tax Management Board on Foreign Income (and past member of the Canadian branch of the International Chamber of Commerce/Business and Industry Advisory Committee to the OECD (ICC/BIAC) Council and the Joint Committee on Taxation of the Canadian Bar Association and the Canadian Institute of Chartered Accountants) is contributing and consulting editor to several international tax journals and newsletters.

His books include The Foreign Affiliate System: Canadian Taxation after 1982 – a Structured Overview, published by CCH Canadian Limited in 1983; Taxation in Canada – Implications for Foreign Investment (in co-authorship with Bruno Ducharme), published by Kluwer in 1985; and U.S. Tax Reform – the Canadian Perspective (in co-authorship with Gary J. Gartner), published by CCH Canadian Limited in 1987.

This paper, prepared for presentation on 5 March 1993, reflected, in its original version distributed to participants at the meeting, Canadian developments to 22 February 1993. This version has been updated to reflect only a few - but significant - developments between 22 February and 19 May, the date this version was finalized.

I. INTRODUCTION AND OVERVIEW

A. *Scope*

Recent developments in Canadian tax law which may be of interest to US tax advisers are both of very recent vintage - e.g. the 21 December 1992 release by the Department of Finance of 235 pages of proposed "technical" amendments to the Income Tax Act[1] which include, however, many substantive changes - and those arising over the last year or two. I will address the topic from the perspective, sequentially, of matters which are of interest in the US outbound-Canada inbound context (e.g. US-based multinationals doing business in Canada) and, then, in the US inbound-Canada outbound context. My comments will, in part, seek to place in a workable perspective the Canadian response to certain recent US developments as well as certain other US developments affecting cross-border Canada-US tax practice.

B. *Background context: similarities and differences between Canadian and US tax systems*

Some if not all of you know that there is much similarity between the structure or scheme of the Canadian and US tax systems, particularly as a result of changes over the last ten or 15 years which have drawn the systems much closer together, although in certain respects significant differences remain. The following is a brief summary of the main areas of similarities and differences.[2]

1. Jurisdiction to tax

Both countries tax worldwide income of its residents[3] and tax only certain domestic source income of non-residents. However, Canada, unlike the United States, in accord with the general international norm, does not tax Canadian citizens who are not resident in Canada.

1. S.C. 1970-71-72, ch. 63 as amended ("the Act"). Draft Income Tax Amendments, Draft Regulations and Technical Notes, issued under Department of Finance Release No. 92-098 on 21 December 1992 ("the December 21/92 Proposals").
2. For an earlier comparison, see Nathan Boidman and Gary J. Gartner, "The Canadian and U.S. Tax Systems - Similarities and Differences", *Tax Management International Journal*, Vol. 15 No. 12 (December 1986), at 482.
3. This paper focuses on Canadian federal income tax law. However, each of the ten provinces - as well as the Yukon and Northwest Territories - also levy

© 1993 International Bureau of Fiscal Documentation

Although both countries treat as residents corporations formed within their jurisdictions, Canada also may tax, as a resident, a foreign incorporated company whose central mind and management is exercised in Canada (along the lines of the United Kingdom).

Canada retains the pre-1985 US "facts and circumstances" approach to determining the residence of individuals and does not deem as a resident a non-Canadian who has been granted a Canadian permanent visa. However, like the United States, a physical presence test applies in that a person who is ordinarily not a resident of Canada but physically present for 183 days or more in the year is deemed a resident for the entire year.[4]

2. Base broadening – rate reductions

Both countries in the second half of the 1980s adopted a basic income base broadening and tax rate reduction format, although the recent reversal of both factors in both countries has been more pronounced in the United States than in Canada (particularly on the tax rate side with the Clinton Administration proposals operating to further widen the gap in this area).[5] Note also that in general terms Canadian individual tax rates remain higher than those in the United States (taking into account the effect of local, i.e. provincial or state, taxation) with the highest marginal (combined federal and provincial) Canadian income tax rates for individuals ranging between some 47 to 52 percent as compared to the highest effective integrated US federal, state and even city tax rates which (except for New York City) would be, even after the Clinton proposals, somewhat lower. On the corporate side, it will be seen below, that Canadian tax rates are often but not always higher than those in the United States.

3. Capital gains

Both countries tax capital gains as well as ordinary income. However, in Canada the approach is to tax, at ordinary rates, three-quarters of a capital gain (or gain from disposing of so-called "eligible capital property", which is a distinct category of indefinite life of intangible assets such as goodwill), while the United States of course now taxes 100 percent of such gains, although in the case of individuals at differentiated tax rates.

Moreover, Canada taxes non-residents on capital gains realized from a wider class of Canadian-based property than does the United States in the case of foreign investors. For example, subject to treaty exemption, a non-resident is subject to Canadian tax on the sale of stock of a Canadian corporation, unless the stock is publicly traded and the seller owns less than 25 percent of the stock.[6]

4. Corporate liquidations

With the abolition of "General Utilities" in the 1986 Tax Reform Act both countries tax corporate liquidations and similar transactions at both the corporate and shareholder level and, generally, do not permit a tax-free step-up in inside basis upon the acquisition of corporations. However, under Canadian law a limited tax-free step-up is available with respect to inside basis of non-depreciable capital property. For example, in the case of an acquisition of a Canadian corporation (through a Canadian corporate acquisition vehicle), a post-acquisition liquidation of the target would result in a tax-free step-up in basis of underlying subsidiaries or other non-depreciable capital property such as land.[7]

5. Treatment of dividends

Both countries tax dividend or other shareholder distributions. In the cross-border context, under the 1980 Canada-US income tax convention ("the 1980 Convention") there is a 10 percent tax on dividends paid by a Canadian or US subsidiary to a US or Canadian parent company and a 15 percent withholding tax on dividends paid to Canadian or US shareholders who are either individuals or corporations not owning 10 percent or more of the voting stock of the payer Canadian or US corporation.

However, in the domestic context, under current law, while the United States still has the classical double tax system, offering no integration between corporate and shareholder level tax (subject of course to the recent Treasury proposals to radically change same), Canada provides a total or partial integration (depending upon circumstances) in respect of dividends paid by Canadian corporations to Canadian individual shareholders, although at this time there are no UK-ACT-type cross-border rebates or refunds available to US shareholders receiving dividends from Canadian corporations.

6. Basic scheme of taxation of foreign investors

Both countries tax, subject to treaty protection, a foreign person's income effectively connected to a domestic trade or business (in Canada referred to as income from carrying on business in Canada) and in the case of a foreign person's domestic

---

income tax on individuals (who are resident therein on the last day of the year or before terminating Canadian residency) and corporations (which carry on business therein through permanent establishments). Except in the case of Quebec (for both individuals and corporations) and Alberta and Ontario (for corporations) provincial tax law is administered, on behalf of the provinces, by the federal Department of National Revenue ("Revenue Canada"). In general the federal and provincial income tax law is quite similar and reference is made in the text below to the integrated effects of the two - particularly in respect of effective rates of taxation.

4. For details of the comparative position between the two countries in this respect see Nathan Boidman, L. Frank Chopin and Alan W. Granwell, "Tax Effects for Canadians of the New US Code and Treaty Residency Rules", *Tax Management International Journal*, Vol. 14 No. 5 (May 1985), at 143 (Part I) and Vol. 14 No. 6 (June 1985), at 183 (Part II) [and published in booklet ("The New US Residency Rules for Canadians") form by *CCH Canadian* in December 1985]. See also Nathan Boidman and Gary J. Gartner, "Effect of US Residency Rules on Canadians - The Proposed Regulations and Other Recent Developments", *Tax Management International Journal*, Vol. 16 No. 11 (November 1987), at 475 and Nathan Boidman, "A Canadian Perspective on the US Residency Regulations", *Tax Management International Journal*, Vol. 21 No. 7 (August 1992), at 442.

5. For a discussion of February 1992 proposals in Canada which would somewhat reverse the broadening of the corporate income base and also reduce certain corporate tax rates see Nathan Boidman, "Canadian Budget (Including Treaty Update)", *Tax Management International Journal*, Vol. 21 No. 4 (April 1992), at 199.

6. The proposed "10% stock" rule in HR 5270 would have drawn the two systems closer.

7. See Secs. 88(1)(c) and (d) *et seq.* of the Act and compare to IRC Secs. 336-338.

© 1993 International Bureau of Fiscal Documentation

source non-effectively connected income there is often a straight flat withholding tax on the gross income payment.

The statutory Canadian withholding rate, under Part XIII of the Act (Sections 212-218), in respect of specified types of non-effectively connected income[8] (i.e. dividends, rents, royalties, interest, etc.) is 25 percent while the US rate is of course 30 percent. Both countries permit net income elections in respect of non-effectively connected real property rental income.[9]

Both countries may extend the latter rules for non-effectively connected income to payments made by one foreign person to another through re-sourcing mechanisms.

7. Branch profits tax

In 1986 the United States adopted a long standing Canadian approach by implementing a branch profits tax on foreign corporations engaged in a domestic trade or business (in lieu of, in the US context, seeking to tax dividend distributions made by such foreign corporations, an approach never adopted by Canada). However, the Canadian statutory rate of branch tax is 25 percent, compared to that of 30 percent in the United States.

8. Earning stripping

Both countries are concerned with "earning stripping" through either transfer pricing (as discussed separately below) or through related party cross-border interest charges. However, the mechanism and approach are quite different in the two countries. In Canada, Section 18(4) of the Act provides a relatively straightforward prohibition (not simply deferral) against deductibility of interest paid by Canadian corporations to related non-residents to the extent of interest on related non-resident party debt which exceeds three times the shareholder equity of the corporation attributable to such non-residents. Contrast this to the aggregate effects of earning stripping rules of IRC Section 163(j) – to be extended by the Clinton Administration – and the possibility of recharacterization of the debt as equity under IRC Section 385.

9. Death taxes

Both countries levy tax at death but in radically different forms. The United States retains the traditional and conventional estate tax approach which Canada abolished at the federal level in 1972 (with the provinces following suit over the succeeding decade and a half – although the province of Ontario is now threatening to reintroduce succession duties). Since 1 January 1972 Canadian death tax takes the form of an income tax on unrealized appreciation in most types of property which are deemed to be sold upon death. This is an approach which has been discussed in recent years in US government circles (in addition to conventional estate taxes).

The significant difference in the two approaches (i.e. in one case estate tax is levied and in the other case a deemed income tax) leads to potential for severe double taxation where a Canadian individual dies owning US property or vice versa in the converse situation. As discussed below, this issue is under consideration in ongoing treaty renegotiations, between the two countries.

10. Corporate reorganizations

Both countries provide for tax-free corporate reorganizations in a variety of circumstances, particularly where no cross-border movement or entity is involved and, conversely, substantially restrict the applicability of non-recognition (in Canadian parlance, rollover) rules in the cross-border context.

The US approach from the technical standpoint is to provide generally for non-recognition transactions and then impose the cross-border restrictions through the specific provisions of IRC Section 367. The Canadian approach is to build the territorial limitation into the specific non-recognition rules so that, for example, a tax-free transfer of property to a corporation in exchange for stock (governed in the United States under IRC Section 351) is permitted under the comparable provision of Canadian law (Section 85 of the Act) only where the transferee corporation is a "Canadian corporation", which except in very narrow circumstances (as discussed further below) means one that has been, inter alia, formed in Canada.

In the cross-border context Canadian law never allows a tax-free transfer to a foreign corporation except where the property transferred constitutes shares of a foreign affiliate, that is a corporation in which a Canadian has a direct or indirect interest of at least 10 percent, and the transferee is (also) a foreign affiliate (after the transfer) pursuant to Section 85.1(3) of the Act.

11. Taxation of foreign operations

Perhaps the most basic or fundamental difference between the tax systems of the two countries arises in the international area where the US taxes repatriation of foreign subsidiary profits (subject to the available foreign tax credit relief) and severely restricts the movement of assets between the various controlled foreign corporations (leaving aside certain same country situations). Canada, on the other hand, under the foreign affiliate-exempt surplus/foreign affiliate property income rules, not only does not tax repatriation of profit from foreign subsidiaries operating in countries with which Canada has treaty relations but excludes from the Canadian counterpart of Subpart F (foreign accrual property income) inter-foreign affiliate transactions such as the payment of interest from a Canadian-owned US operating subsidiary to an offshore captive finance subsidiary of the Canadian group.[10]

12. Treaty override

Another basic difference and (potentially festering point of issue between the two countries) is the approach to treaty

8. More precisely Part XIII tax applies (to specified categories of payments) unless *both* the item is effectively connected to a business *and* the business is carried on through a *permanent establishment*, as defined in Part IV of the Income Tax Regulations made pursuant to the Act, whereas under US rules the mainstream net income approach applies where such items are effectively connected to a US trade or business whether or not a "permanent establishment" is involved. See Sec. 214(13) of the Act and Sec. 805 of the Income Tax Regulations made thereunder.

9. See Sec. 216 of the Act.

10. For a discussion of various relevant aspects of these rules see, *inter alia*, Nathan Boidman, (Canadian-American Tax Issues: Cross-Border Commen-

© 1993 International Bureau of Fiscal Documentation

override by domestic legislation. Unlike the United States (e.g. IRC Section 7852(d)) the Canadian statutory enactment which accompanies the implementation of each income tax treaty between Canada and another country specifically provides for override of domestic law by treaty provisions. The resulting basic difference in the manner of application and role of treaties between Canada and the United States frustrates Canadians and, more importantly, creates uncertainty for Canadians seeking treaty relief from US taxation.

However, Canada's hands in this area are not totally lily-white. For example, a pending technical amendment tabled in December 1991 (not to be confused with the December 21/92 Proposals) would extend to the terms "annuity" and "pension" the manner in which the Income Tax Conventions Interpretation Act[11] seeks to incorporate Canadian domestic definitions of terms for treaty purposes.[12]

13. Anti-avoidance law

While the United States adopted case-made law principles respecting business purpose, substance over form, step-transactions and the like, earlier and in a more comprehensive fashion than Canada, in 1988 Canada caught up somewhat by enacting a "General Anti Avoidance Rule" (GAAR) under Section 245 of the Act. GAAR allows Revenue Canada to recharacterize the effects of a transaction where one of the main purposes thereof is to achieve a tax benefit unless the transaction does not constitute a "misuse" of a particular provision of the Act or an "abuse" of the Act read as a whole. It has yet to be tested before the Canadian courts.

The enactment, however, clearly has inhibited the somewhat aggressive style which once characterized planning and structuring from the taxation standpoint, although during the late 1970s and 1980s Canadian courts had already served notice that transactions devoid of economic effect or substance would be ignored, notwithstanding that legal niceties or formalistic modalities appeared to comply with the requirements of the statutory rules.

14. Partnership and entity characterization

Neither country taxes a partnership as a separate taxpayer, but Canada does not have the US notion of recharacterizing unincorporated entities as corporations. This difference can cause a multitude of difficulties or uncertainties for cross-border joint business or investment undertakings.

There are of course many other similarities and differences between the two systems, but the foregoing review should provide some useful context in which to consider the following discussion of current developments.

II. CURRENT DEVELOPMENTS AFFECTING OUTBOUND US/INBOUND CANADIAN TRANSACTIONS AND EVENTS

A. *US-based multinationals operating in Canada*

1. Overview – basic excess foreign tax issue

US-based multinationals generally carry on business in Canada through Canadian-formed subsidiaries where, from the overall tax perspective, the predominant theme of US based multinational groups prevails, namely, stratagems for reducing foreign (Canadian) taxes in order to avoid excess foreign tax credit positions from the US perspective. In general terms such issue may arise by reason of:

(a) tax rate arbitrage factors,
(b) the particular effects of the 1986 legislated US parent company interest allocation rules to foreign source income under IRC Section 902 et al., or
(c) excess foreign tax credit positions *vis-à-vis* other controlled foreign corporations.

The first factor, tax rate arbitrage, is not in fact conclusive. Overall Canadian taxes do not always exceed those of the United States relevant to the US-based multinational, with the result that it is not always preferable that there be maximized a shift of Canadian subsidiary profits to the US parent. This is so even under the current Canada-US treaty which taxes dividend distributions from a Canadian subsidiary to a US parent at 10 percent (see discussion below respecting the probable advent of a reduced 5 percent dividend tax rate.)

Aggregate Canadian federal and provincial rates of tax on the undistributed profits of a Canadian subsidiary range from a low of 30 to 32 percent for manufacturing profits allocable to the province of Quebec to a high of some 45 to 46 percent on non-manufacturing profits allocable to most other provinces.[13] Given the 10 percent tax on dividend distributions by Canadian subsidiaries under the combined provisions of Section 212 of the Act and Article X of the 1980 Convention, the overall Canadian taxes on distributed profits is increased by some 6-7 percent and ranges from some 37-39 percent to some 51-52 percent.

If a US company has an effective US rate of tax (having regard to both federal and state taxes) which is less than the applicable Canadian taxes within the above noted range (which as discussed below may in fact be reduced by a rene-

tary), "Select Issues in Financing Cross-Border Business Activities", *Tax Notes International*, Vol. 3 No. 3 (March 1991), at 270 (Part I); Vol. 3 No. 4 (April 1991), at 397 (Part II). For a discussion of foreign affiliate rules see Nathan Boidman, "Canadian Tax Proposals - Cross-Border Effects - Part III", *Tax Management International Journal*, Vol. 19 No. 12 (December 1990), at 540. See also Nathan Boidman, "The Foreign Affiliate System: Canadian Taxation after 1982 - A Structured Overview", *CCH Canadian Limited*, 1983 and Nathan Boidman, "Canada's Taxation of Foreign Affiliates - 1982 Revisions", *Tax Management International Journal*, (4 April 1983), at 18 (Part I), (5 May 1983), at 17 (Part II), (8 August 1983), at 14 (Part III) and Vol. 13 No. 2(February 1984), at 48 (Part IV).

11. See Nathan Boidman, "Canada: New Legislation Respecting Treaty Interpretation", 10 *Intertax* (October 1983), at 383.

12. See Nathan Boidman, "Proposed 1991 Technical Amendments -Cross-Border Effects", *Tax Management International Journal*, Vol. 21 No. 3 (March 1992), at 159, 162.

13. In general terms a Canadian corporation pays a corporate tax of 28% (together with a small amount of surtax) to the federal government on income earned in and allocable to a province. There is a reduced rate of 23% (being reduced to 21% over 1993-94) on manufacturing profits. The provinces impose (a non-deductible) corporate income tax (on, generally, the same income base as taxable for federal purposes) at rates generally ranging from 14 to 15%. The province of Quebec has a rate of only 8.9% on business profits, while a few provinces have rates as high as 17%. Thus a company with manufacturing profits taxable in the province of Quebec pays an aggregate federal and Quebec corporate rate of tax of some 32% (reducing to 30% by 1994) while corporations earning non-manufacturing business profits in the highest taxed provinces may pay tax at aggregate rates as high as 45-46%.

© 1993 International Bureau of Fiscal Documentation

gotiated treaty), it would obviously be desirable from a pure tax rate arbitrage standpoint to focus on stratagems designed to shift profit from the Canadian subsidiary to the US parent. (Obviously the Clinton Administration proposals to increase the federal corporate tax rate to 36 percent on taxable income in excess of $ 10 million will decrease circumstances where US taxes are less than those in Canada.)

The second factor noted, the 1986 enacted IRC Section 904 allocation of US parent company interest to foreign source income, has of course substantially eroded effective utilization of foreign (Canadian) tax credits and results in substantial double tax (even though one could argue that there really is no double tax because the purpose of the IRC rule is to merely compensate the US fisc for the fact that the interest allocable to the Canadian dividend has previously served to reduce US domestic taxable income) – overall comprising a problem with which US corporate tax planners have struggled since 1986. A possible solution to this problem is to have loans taken directly by a Canadian subsidiary.

2. Impact of recent developments on basic excess foreign tax credit issuue

Are there any recent developments in Canadian tax law which would help solve or otherwise ameliorate the foregoing basic issues for US-based multinationals operating in Canada?

(a) *Profit shifting and Canadian transfer pricing law*

In principle profit shifts from a Canadian subsidiary to a US parent through transfer pricing arrangements as a means of solving an excess foreign tax credit issue are subject to the same constraints as would arise under US law in converse circumstances. As a capital importing country, the Canadian government has generally been concerned with intercompany charges made by foreign based multinationals to Canadian subsidiaries. Indeed it is somewhat ironic, given the concerns which have arisen in US government circles in recent years respecting earning stripping through inbound transfers by foreign-based multinationals to US foreign-owned subsidiaries, that it has generally been US-based multinationals which are the transferors in the intercompany transactions which concern Revenue Canada.

As in the United States, Canadian companies are required to maintain an arm's length standard in transactions with other members of a multinational group. However, there are no detailed statutory rules and little case law respecting the nature of an arm's length standard. Section 69 of the Act requires a price that "would have been reasonable in the circumstances had ... (the parties) ... been dealing at arm's length". Revenue Canada has published a non-binding "Information Circular" (IC-87-2) which reflects an approach patterned on the pre-January 1993 regulations under IRC Section 482 and the OECD transfer pricing guidelines (based themselves on the latter US rules).[14]

Although the Canadian government has yet to respond to the January 1993 US Proposed and Temporary IRC Section 482 Regulations, there is nothing in recent Canadian developments, aside from the role which advance rulings may play - as discussed below - which facilitates profit shifting through transfer pricing arrangements. Indeed, in order that there be effective compliance with intercompany pricing rules, recent developments, patterned on US precedents, have tightened audit and enforcement procedures.

Section 152(4)(b) of the Act has been amended to extend the normal three or four year period for reassessment (after the date of the original notice of assessment) to seven years (six years in the case of corporations not controlled by non-residents) where:

> "There is reason, as a consequence of a transaction involving the taxpayer and a non-resident person with whom the taxpayer was not dealing at arm's length, to assess or reassess the taxpayer's tax for any relevant taxation year."

Section 231.6, patterned on certain US law, was enacted to require a Canadian company involved in international transactions to produce "foreign-based information or documents", upon demand by Revenue Canada. Failure to comply with a request (the efficacy of which can at the election of the taxpayer be revised by a judge) will result in the following sanction:

> "... any court having jurisdiction in a civil proceeding relating to the administration or enforcement of this Act shall, upon motion of the Minister, prohibit the introduction by that person of any foreign-based information or document covered by that notice."

Section 233.1 was added, in order to increase reporting by Canadian corporations of intercompany transactions as follows:

> "Any corporation that, at any time in a taxation year, was resident in Canada or carried on business in Canada shall, in respect of each non-resident person with whom he was not dealing at arm's length at any time in the year, file with the Minister, within six months from the end of the year, an annual information return for the year in prescribed form and containing prescribed information in respect of transactions with that person."

14. For a full discussion see, *inter alia*, Nathan Boidman, "Transfer Pricing in Canada", 1989, Chapter in *The Tax Treatment of Transfer Pricing* (looseleaf service published by The International Bureau of Fiscal Documentation, Amsterdam); Nathan Boidman, "Related Party Transactions: Canada's New Administrative Guidelines Compared to IRS Section 482 and OECD Guidelines", *Tax Management International Journal*, Vol. 16 No. 11 (November 1987), at 447; Nathan Boidman, "Update on Transfer Pricing: *Indalex v. The Queen*", *Tax Management International Journal*, Vol. 17 No. 4 (April 1988), at 156; Nathan Boidman, "Intercompany Pricing - Irving Oil Case", *Tax Management International Journal*, Vol. 17 No. 6 (June 1988), at 251; Nathan Boidman, "The Section 482 White Paper and Canada-US Transactions", *Tax Management International Journal*, Vol. 18 No. 3 (March 1989), at 138; Nathan Boidman, "Revenue Canada Issues New Intercompany Pricing Reporting Form", *Tax Management International Journal*, Vol. 18 No. 5 (May 1989), at 230; Nathan Boidman, "Canadian Perspective on IRS Proposal for Intercompany Rulings", *Tax Management International Journal*, Vol. 19 No. 8 (August 1990), at 355; Nathan Boidman, "Canada-US Intercompany Pricing Update", *Tax Management International Journal*, Vol. 20 No. 4 (April 1991), at 176; Nathan Boidman, "US Transfer Pricing Proposals Will Affect Canadians", *Tax Management International Journal*, Vol. 21 No. 5 (May 1992), at 275; Nathan Boidman and Gary J. Gartner, "More Tempests in the US-Canada (Tax) Tea Pot", *Tax Management International Journal*, Vol. 21 No. 9 (September 1992), at 485; and Nathan Boidman, "Canadian Perspective on 1993 US Transfer Pricing Proposals", *Tax Management International Journal*, Vol. 22 No. 4 (April 1993), at 201.

© 1993 International Bureau of Fiscal Documentation

This form, T-106, which is patterned on US Form 5472 required in similar circumstances by the Internal Revenue Service, has been in force for some three years.[15]

The basic arm's length principle applies to the transfer of goods, rendering of services or outright transfer or licensing of intangibles. Revenue Canada had resolutely rejected the theory of the super royalty rule, at least as explained by the White Paper, in particular being concerned that super royalty legislation would provide a handy rationale for US licensors to overcharge Canadian licensees. Revenue Canada seemingly was also not enamoured with the January 1992 proposed regulations, particularly the comparable profit method, but as noted earlier its reaction to the watered down January 1993 Section 482 regulations is not yet known.

With respect to intercompany charges for services, Revenue Canada has indicated, without any particular statutory or case made law authority, that a mark-up or profit margin may not be appropriate or warranted but has acknowledged the effect of the 1980 Convention, which came into force in 1985, that US companies are not subject to a statutory rule (ironically originally enacted in 1963 in response to perceived excessive charges by US-based multinationals for services rendered to Canadian subsidiaries) imposing a 25 percent withholding tax on payments to related non-residents for administrative or management fees (even though rendered from outside of Canada) to the extent or in respect of that portion of such fee which exceeds the cost of the service so provided.[16]

Perhaps the only positive note on the transfer pricing scene for US-based multinationals is the announcement in November of last year that Revenue Canada, after a two year test period, will be adopting a generic advance ruling system for transfer pricing arrangements, presumably patterned on the US advance pricing agreement procedure. Two test cases apparently have just been completed and the ruling procedures are to be issued shortly.[17]

In summary it would appear that Canadian transfer pricing law cannot be considered to provide a handy mechanism for US-based multinationals to resolve foreign excess tax credit issues, although the advent of advance rulings may in some circumstances be of substantial benefit to a US group operating in Canada through Canadian subsidiaries.[18]

(b) *Financing arrangements*

How can financing arrangements help ameliorate the basic excess foreign tax credit issue? And do recent Canadian developments affect such stratagems? The answer to the first question may be affirmative but, except with respect to the interrelated effects of a renegotiated treaty, the answer to the second question would seem to be negative.

If a US company has an effective US rate of tax lower than the lower end of the Canadian range, it would seem desirable to structure investment in a Canadian subsidiary through interest- bearing debt. In this respect the following comparative Canada-US points may be noted:

Unlike the US approach, under Canadian tax law "a loan is a loan". Investment made in a Canadian corporation by way of loan, recognized as such under applicable corporate or commercial law, would be treated as such for Canadian tax purposes. There is of course no tax on repaying debt.

Further, even if the debt were recharacterizable as stock, under Canadian law the full amount of stock investment ordinarily may be repaid without tax even though the corporation may have undistributed profits on hand.[19] In other words, there is no comparable Canadian notion to the US rule that payment in respect of stock may be treated as a taxable dividend to the extent of underlying undistributed income ("earnings and profits"). As a result, the absence of deemed dividend treatment on the retirement of stock investment (provided the amount paid does not exceed the amount originally invested in the stock) provides much flexibility, from the Canadian standpoint, to a US company, having regard to the eventual repatriation of the investment, in deciding whether to invest in debt or shares of the Canadian subsidiary. In either case, the investment may be retired without Canadian tax.

It was noted earlier that, unlike the more complex and uncertain "thin capitalization" effects of IRC Sections 385 and 163(j), in Canada there is a clear, relatively well understood and relatively non-onerous statutory thin capitalization rule governing interest-bearing debt financings received from non-resident shareholders. Under Section 18(4) et seq. of the Act, interest paid on loans to foreign shareholders is fully deductible except to the extent of interest relating to that portion of loans received from 25 percent or greater foreign shareholders which exceeds three times the equity of the corporation attributable to such shareholders (measured by reference to paid-in capital and retained earnings). Accordingly, for example, in the case of an initial $ 10 million funding of a newly formed Canadian subsidiary, $ 7.5 million could be injected by way of fully deductible interest bearing debt and $ 2.5 million by way of capital stock investment.[20]

In some situations it might be overall preferable for the US parent company to fund the Canadian company with debt bearing no interest or below-market interest. This might arise, for example, where the Canadian subsidiary is in a loss position. Canadian tax law would accommodate such strategy and, in particular, would not impute interest (income or

15. For a discussion see Boidman, *supra* note 14 (*TMIJ*, Vol. 18 No. 5).

17. For a full discussion of this matter from the Canadian perspective see Nathan Boidman, "The Effect of the APA and other US Transfer-Pricing Initiatives in Canada and Other Countries", *The Tax Executive*, Vol. 44 No. 4 (July-August 1992), at 254.
18. For a discussion of certain other recent developments respecting subordinate transfer pricing law themes or factors see Nathan Boidman "Developments in Transfer Pricing", *Butterworths -Canadian Current Tax*, Vol. 2 No. 35 (November 1992). For example, in *Crestbrook Forest Industries Ltd. v. The Queen*, 92 DTC 6187 (F.C.A.), the Federal Court rejected an attempt by Revenue Canada to utilize information respecting comparables, voluntarily divulged to it in a government sponsored study of pricing in the pulp and paper industry. See also note 67 *infra* respecting *Crestbrook*.
19. See, inter alia, Secs. 84 and 89(1)(c) of the Act.
20. For December 1991 proposed amendments to the Sec. 18(4) thin capitalization, see Nathan Boidman, *supra* note 12, at 159-160.

© 1993 International Bureau of Fiscal Documentation

expense) for either party to the transaction.[21] Although as discussed earlier the Canadian "equivalent" of IRC Section 482, Section 69 of the Act, requires that amounts charged by a foreign related person to a Canadian company not exceed an arm's length amount, these rules do not require that a Canadian company pay an adequate amount to a foreign related party for goods or services.

Where a US parent makes an interest-bearing loan to a Canadian subsidiary, and incurs a 15 percent Canadian withholding tax on the interest payments under Article XI of the 1980 Convention, interest expense incurred by the US parent may serve to reduce credit, under IRC Section 901, in respect of the Canadian withholding tax.

As already noted, the interrelationship between interest deductions and foreign tax credits under the IRC becomes even more complex where dividends are received on stock investment, as a result of the 1986 tax reform amendments requiring a portion of the US parent company's interest expense, otherwise deductible against US domestic income, be allocated to and deducted from the foreign source (Canadian subsidiary) grossed-up dividend for purposes of applying the basic IRC Section 902 foreign tax credit limitation.

One possible solution to the latter problem, particularly where there is to be direct borrowing to fund the investment in the Canadian subsidiary, is to have the loan taken directly by the Canadian subsidiary. The income derived from the borrowed funds by the Canadian subsidiary would service the debt and thus reduce Canadian taxable income on a dollar-per-dollar basis. Such income would not flow through or to the hands of the US parent. However, where the US parent must guarantee such loans, there are a number of points to be considered:

(a) Is it possible, under the principles of *Plantation Patterns*,[22] that a loan guaranteed by the US parent would be considered to have been made to the US parent which has invested in stock of the Canadian subsidiary, so that interest payments by the Canadian subsidiary are treated as distributions to the US parent in respect of stock, with the result of not avoiding the problem at all?

(b) A guaranteed loan ostensibly has the benefit of avoiding the Canadian three-to-one debt-to-equity thin capitalization restrictions under Section 18(4) of the Act, described above. However, it should be noted that where such guarantee is collateralized by a deposit with the lender (or perhaps related entity), it may run afoul the "back-to-back" rule of Section 18(6) so as to result in the third party loan being treated as a shareholder loan for purposes of the thin capitalization rules.

(c) A collateralized loan may also give rise to Canadian withholding tax issues. There is no Canadian withholding tax on interest paid to an unrelated non-resident lender on a loan in respect of which no more than 25 percent of the principal of which is required to be repaid during the first five years of the loan,[23] or paid on foreign currency deposits with Canadian banks. However, there is concern that certain collateralized guaranteed (back-to-back) loans to Canadian operating subsidiaries result in unintended application of this exemption and avoidance of Canadian tax on interest effectively paid to related non-residents. Thus, for example, a number of years ago the Canadian government extracted an agreement from the Canadian Bankers Association that its members would not enter into back-to-back loan arrangements of this type. It is somewhat ironic that such concerns (and the latter anti-avoidance arrangement) could serve to obstruct a loan arrangement put in place by a US parent in order to avoid the harsh results of US tax law.

(d) Neither the thin capitalization nor the withholding tax concerns arise where the guaranteed loan is not collateralized or is collateralized with third party security.

(e) If the US parent charges a loan guarantee fee to its Canadian subsidiary, such amount is deemed under Section 214(15) of the Act to be interest subject to Canadian withholding tax. Such taxation would be permitted, at 15 percent, under Article XI(4) of the 1980 Convention which defines interest as meaning, *inter alia*, "... income assimilated to income from money lent under the taxation laws of the Contracting State in which the income arises". Would a foreign tax credit arise in respect of such Canadian withholding tax? From the US standpoint, a guarantee is viewed as a service, the income from which has a source at the place of residence of the guarantor?[24] However, under Article XXIV(3) of the 1980 Convention, items of income which Canada is permitted to tax under the terms of the treaty are supposed to be resourced in Canada for foreign tax credit purposes. Is there any reason why the IRS would not agree with such treatment? Finally recent audit experience is that Revenue Canada treats a guarantee as a service and would accept a reasonable arm's length charge under the Section 69 transfer pricing rules.

The foregoing only touches on some of the issues for direct finaning of US-owned Canadian subsidiaries.[25]

The US-controlled foreign corporation - Subpart F rules seem to generally eliminate overall benefits for US-based multinationals to finance Canadian operations through captive finance vehicles. For example, it would not ordinarily be advantageous to flow interest from a Canadian operating subsidiary to a third country captive finance company (as would be the case where a Canadian based multinational uses a third country captive finance company to finance a Canadian owned US subsidiary).[26]

However, US groups can benefit from financing Canadian subsidiaries through Canadian corporations qualified as a "non-resident-owned investment corporation" (NRO) under

21. Query, however, whether such loan would attract interest imputation for the US parent under IRC Secs. 482 or 7872.

Section 133 of the Act. A NRO is a corporation all of the shares of which are owned by non-residents and which derive income exclusively from certain passive activities such as investment in interest bearing securities.[27] The NRO pays a fully refundable 25 percent tax on its income, with Canadian withholding tax being exigible on dividends paid by the NRO to its non-resident shareholders as the same time that the NRO receives refund of the interim 25 percent tax on the income it has received.

There have been structures put in place where, depending upon a US taxpayer's specific foreign tax credit position under IRC Section 902 et seq., financing US-owned Canadian subsidiaries through NROs has proven beneficial.

There are two key factors from the US standpoint in respect of such arrangements. First, under the "same country" exception, interest paid by a Canadian operating company to the NRO would not be subject to attribution under Subpart F.[28] Second, there are circumstances where excess foreign tax credits, arising from Canadian or other foreign operations, or current or cumulative underlying foreign (i.e. Canadian) tax relevant to dividend payments, may serve, depending upon the particulars of the overall arrangement, to eliminate any net US tax on dividends paid by the NRO out of its interest income, notwithstanding that the net Canadian taxes paid in respect of the income realized in such fashion is restricted to the 10 percent withholding tax on dividends paid by the NRO.[29] In other words, in some circumstances the reduction of Canadian source taxation through the NRO interest payment arrangement is not offset by an increase in overall US taxes.

The only current development which may improve the latter arrangements for US-based multinationals is the ongoing renegotiation of the 1980 Convention and the likelihood that tax on cross-border interests will be reduced at least to 10 percent (from the current 15 percent) and that tax on cross-border intercorporate dividends would be reduced from 10 to 5 percent.

The reduction in the treaty interest withholding rate would improve the results of direct cross-border US parent-Canadian subsidiary loans as discussed above, to the extent that the current 15 percent withholding tax results in excess foreign tax credits. (With respect to this first point, it has been suggested that such a reduced dividend tax rate could be coupled with a change announced in the December 21/92 proposals, which would refund to foreign shareholders the deemed dividend tax payable on loans made by Canadian corporations to foreign shareholders where such loans are repaid, to withdraw funds from a Canadian subsidiary in advance implementation of the proposed treaty reduction in dividend withholding tax rates).[30]

The reduction in dividend rates could improve matters in two different ways. First, having due regard to the foregoing discussion respecting tax rate arbitrage, there could result, at least in certain cases, an effective overall Canadian corporate (profit) level and shareholder (dividend) level rate of tax which is less than the US (federal and state) tax applicable to the US-based multinational. Second, having regard to the NRO arrangement described, deductible interest charges can be effectively converted into payments taxable from the Canadian standpoint as dividends at a rate of 5 percent. The latter effect, however, will not arise if the approach as seen in the Protocol signed between Canada and the Netherlands on 4 March 1993 obtains in a new Canada-US treaty. In particular, the Protocol does reduce the withholding tax on dividends paid by Canadian subsidiaries to Dutch parent corporations from 10 to 5 percent (over a five year phase-in period commencing in 1993). It also reduces withholding tax on interest, under Article XI, from 15 to 10 percent. However, it specifically maintains a 10 percent tax on dividends paid by NROs to Dutch parent corporations and, to the extent such rules are incorporated in a new Canada-US income tax convention, interest payments pursuant to the NRO arrangement described above will continue to be effectively taxed, as at present, at 10 percent.

The prognosis for a 5 percent treaty rate on dividends was considerably enhanced by an announcement 25 February 1992 by the Canadian Department of Finance in its 1992 annual budget which, without mentioning the Canada-US treaty specifically, stated that there would be a basic change in Canada's tax treaty posture with respect to withholding taxes on dividends. The government would drop its long entrenched position of not granting withholding tax rates which are less than 10 percent and, instead, would negotiate a 5 percent withholding rate on intercorporate dividend flows. This development was not surprising given the strong US business lobby on US treaty negotiators to negotiate a reduction in the current 10 percent withholding rate.[31] As noted above, this new policy has been implemented for the first time in the 4 March Canada-Netherlands Protocol.

2. Note respecting relevance of third country treaties

Finally it should be noted that the proposed change of Canadian treaty policy on intercorporate dividends, changes in

27. Beyond the scope of this paper are concerns that intercompany loans by an NRO constitute the business of lending, thus invalidating the NRO status, unless circuitous procedures are employed. In this respect, however, see a recent Revenue Canada ruling (Advance Tax Ruling ATR-43, Utilization of a Non-Resident-Owned Investment Corporation As A Holding Corporation, 17 February 1992), which seemed to downgrade this concern or at least clearly accepts the circuitous procedure.

28. See IRC Sec. 954(c)(3) and (d)(3).

29. It is obviously an advantage that the net effect of the NRO arrangement from the Canadian standpoint is to reduce tax on interest payments to 10 from 15%. See below, however, the anti-avoidance approach reflected in the 4 March 1993 Protocol to the Canada-Netherlands income tax convention respecting the interrelationship between tax on dividends under Art. X and tax on interest under Art. XI. The same may well appear in the new treaty between Canada and the United States and consider the effects thereof on NRO arrangements, discussed below.

30. See Allan Lanthier, "Technical Bill Hits International Planning", *Canadian Tax Highlights*, (Canadian Tax Foundation), Vol. 1 No. 2 (16 February 1993), at 16.

31. For a full discussion of this matter, see Boidman, *supra* note 5. Reference may also be had to that article for a discussion of as yet unimplemented proposals to increase the rate at which manufacturing equipment may be depreciated (from 25 to 30% on a declining balance basis) and the change already noted in the reduced rate of tax on manufacturing and processing profit from (federal) 23 to 21% (before surtaxes) which will be phased in over a two year period commencing 1 January 1993. (Reference to that article and the earlier discussion respecting Quebec corporate rates of tax on business profits should take into account that subsequent to the publication thereof the Quebec rate of roughly 6% was raised to 8-9%.)

European taxation under the EC intercorporate dividend directives and the current treaty between Canada and Luxembourg would, in certain select situations, make it advantageous for a US-based multinational to consider using excess profits of a Canadian subsidiary to directly fund third country (say European) expansion and investment.[32]

B. *Other US outbound/Canada inbound business and investment matters*

1. Overview

Unlike the preceding discussion there is no predominant theme respecting the interrelationship between current Canadian developments and other US business or investment activities in Canada. A number of situations, however, may be of interest and useful to at least note briefly.

2. Cross-border software licensing

US companies which develop and sell standard application software directly to Canadian customers are generally treated as licensors (of software) - notwithstanding the single transaction, lump sum price nature of such arrangements - and under the combined provisions of Section 212(1)(d) of the Act and Article XII of the 1980 Convention subject to a 10 percent (withholding) tax on the gross sale price. This notwithstanding that both the Canadian Act and the 1980 Convention contain an exemption for non-resident licensors of computer software provided that the arrangement conveys to the licensee a right to reproduce and not simply a right to use. (This is based on computer software being subject to copyright protection as a literary work and thus eligible for the relevant Act and treaty exemption for payments for the right to reproduce a literary work subject to copyright protection.)

The latter exemption does not apply to the sale of prepackaged software given the usual prohibition against reproduction where the arrangement normally conveys simply a right to use (normally in perpetuity) but with restricted covenants respecting disclosure or reassignment.

Some US companies have sought the assistance of the IRS in dealing with this problem. In particular there was an item in the *BNA Daily Tax Report* last fall to the effect that certain US software companies believe that if the IRS would issue a ruling generally treating comparable inbound software transactions as the sale of property and not a licence, that Revenue Canada would be persuaded to adopt a similar position respecting inbound sales to Canadians by US companies.[33] This observer has noted (see note 32) that it is unlikely that Revenue Canada has the authority to modify the relevant interpretation and that a remedy would require either legislation or a change in the terms of the 1980 Convention. (See also note 60.)

The prognosis for relief for US licensors brightened considerably in March and April. In the 4 March Protocol to the Canada-Netherlands income tax convention referred to above there was instituted an exemption, under Article XII, from cross-border withholding tax on royalties paid for the use of computer software. This somewhat unexpected development was explained by the federal government in its 26 April Budget when it announced that, in order to increase Canadian industry's access to foreign technology, it was prepared through bilateral treaty negotiations to exempt both royalties paid for the use of computer software and royalties for patented information and know-how. In particular, the Department of Finance stated in the Budget Release:

> "New technology is being rapidly developed and integrated into production and distribution systems. It is important for Canadian businesses to acquire new technologies in order to maintain their ability to compete in the global marketplace. An issue identified in the December 1992 Economic and Fiscal Statement was whether the tax system is impeding the ability of Canadian firms to access these new technologies." (pps. 76-77 of Budget Speech)
>
> "The government also affirms its commitment to negotiate, on a bilateral basis, exemptions from withholding taxes for payments made for the use of computer software. Canada recently concluded a protocol to the Canada-Netherlands Income Tax Convention which provides for such an exemption." (p.78 of Budget Speech)

3. Cross-border divisive reorganization curtailed

Residents of the United States are generally exempt from Canadian tax on the sale of shares of a wholly owned Canadian subsidiary provided that the value of its shares are not principally derived from Canadian real estate or resource properties, pursuant to Article XIII(4) of the 1980 Convention notwithstanding that under domestic law such a disposition would be subject to Canadian tax. Conversely, the sale of shares of a Canadian real estate company or other corporation the value of the shares of which are principally derived from underlying real estate would be subject to Canadian tax pursuant to Article XIII(3) of the Convention.

In light of the foregoing rules and certain Canadian law respecting tax-free divisions of corporations into two or more successor corporations through "butterfly" reorganizations - entailing a combination of statutory and administrative made rules - a US owned Canadian corporation the assets of which do not principally comprise real estate (say an operating company with real estate assets used in carrying on same) can, under current law, be reorganized in such a fashion that appreciated real estate owned by the corporation can be sold without Canadian tax.

This could be accomplished as follows:

(a) The US shareholder of the Canadian corporation (Canco I) would establish a second Canadian corporation (Canco II) and transfer, on a taxable but treaty protected basis, a portion of the shares of Canco I representing the underlying value of real estate to be spun off, taking back shares in Canco II equal to the value of the portion of the transferred Canco I stock.

---

32. For a discussion see Nathan Boidman, "Canadian Treaty Developments - In the US Context", *Tax Management International Journal*, Vol. 20 No. 9 (September 1991), at 410.

33. For a full discussion of this matter (and the BNA report) see Nathan Boidman and Gary J. Gartner, "More Confusion Over Cross-Border Software Taxation", *Tax Management International Journal*, Vol. 21 No. 11 (November 1992), at 633.

© 1993 International Bureau of Fiscal Documentation

(b) The US shareholder would take full basis for Canadian tax purposes in the stock issued by Canco II, notwithstanding that the sale is exempted from Canadian tax under Article XIII(4).
(c) Canco I would then transfer the target appreciated real estate to Canco II under a deferred tax (rollover, non-recognition) transaction under Section 85(1) of the Act - comparable to IRC Section 351 - in exchange for preferred stock issued by Canco II.
(d) The intercorporate shareholdings (common stock of Canco I held by Canco II and the preferred stock of Canco II held by Canco I) would be unwound on a tax-free basis through redemptions relying, in part, on Section 112 of the Act which normally exempts from Canadian tax Canadian inter-corporate dividends.

At the end of the series of transactions the US shareholder would own all of the stock of each of Canco I and Canco II, Canco I would remain with the non-real estate assets and Canco II would own the real estate assets. The US shareholder would have a full basis in the stock of Canco II and he could then proceed to sell it to a third party notwithstanding that it is principally a real estate company.

This type of arrangement would be curtailed pursuant to the December 21/92 Proposals.[34] In particular, Section 55(3.1) would be added to the Act and have the effect of recharacterizing as a taxable capital gain the otherwise tax-free intercorporate dividend arising upon the unwinding of the cross shareholding created in the course of the butterfly transaction. The proposed change would have an immediate effective date (that is on 21 December 1992) although there would be grandfathered transactions occurring "... pursuant to a written agreement entered into on or before the announcement date (21 December 1992)".

Update

Perhaps it is not surprising that on 4 May the Department of Finance announced a broader rule to "... curtail a tax avoidance technique commonly referred to as the 'cross-border purchase butterfly'".[35] The Release goes on to state:

> "The cross-border purchase butterfly consists of a series of transactions designed to avoid tax on arm's-length sales of assets by Canadian corporations. The mechanism allows a capital gain at the corporate level to be deferred until the assets are ultimately disposed of by the purchaser in a subsequent taxable transaction. As well, the proceeds of sale are in effect received at the shareholder rather than the corporate level. Thus, the technique effectively converts a corporate distribution that would otherwise be subject to withholding tax into a capital gain which, in many cases, is sheltered from Canadian tax by a treaty exemption."
>
> The proposed amendment would eliminate the tax advantages of structuring a corporate asset sale as a purchase butterfly in cross-border situations.

Thus, the 4 May announcement effectively extends to any divisive reorganization and subsequent sale of part of the assets of a corporation the constraints outlined above (under the December 21/92 Proposals) even where the assets being spun off are not primarily Canadian real estate or resource properties. In other words, it will no longer be possible for a foreign-owned Canadian corporation to be sold only in part on a tax-deferred basis.

4. Cross-border mergers and acquisitions – generally

It was noted earlier that tax-effective acquisition of Canadian corporations may be assisted by the limited tax-free step-up in inside basis rule under Sections 88(1)(c) and (d) of the Act as well as by the various rules for financing Canadian subsidiaries also described earlier [which, in principle, can provide the basis (to the extent that a Canadian acquisition corporation is utilized) to repatriate without any Canadian tax the amount invested to acquire the Canadian company].

However, it was also noted that, except in the case of Canadian- based multinationals reorganizing their holdings in foreign affiliates, rollover (non-recognition) treatment is not generally accorded to cross-border corporate reorganizations. This makes it very difficult to combine on a tax-efficient basis Canadian and US operations or form a single-entity joint venture between Americans and Canadians.

For example, a Canadian cannot exchange on a tax-free basis stock of a Canadian corporation for stock of a US acquisition corporation (without resorting to certain types of step transactions which presumably would attract the attention of the GAAR referred to above). Similarly non-Canadian assets of a Canadian target cannot generally be spun off on a tax-free basis to a US acquirer.

If anything, the December 21/92 Proposals further tightened the net by extending the rules under Sections 88.1 and 219.1 of the Act (which, as described elsewhere, create taxable gain or income at both the corporate and shareholder level where a Canadian formed company is continued by export continuance rules out of Canada) to termination of Canadian residence by foreign incorporated companies which have been resident in Canada based on the central mind and management test.[36] Moreover, in the case of cross-border mergers all predecessor corporations will adopt the same residency status as the amalgamated corporation, under proposed Section

34. See *supra* note 1.
35. See Department of Finance Release 93-029, "Notice of Ways and Means Motion Tabled Relating to Cross-Border Purchase Butterfly Transactions".
36. One effect of the foregoing change respecting departing corporations is the (inadvertent?) termination of an interesting though illusive tax minimization arrangement. Under present law, a foreign incorporated company resident in Canada continuously since 17 June 1971 is deemed under Sec. 89(1)(a) to be a "Canadian corporation" for purposes of the Act and thus eligible to participate in tax-free reorganizations. At the same time under current law, as discussed further below, the termination of residence of such a corporation would not trigger the disposition-of-all-asset rule of Sec. 88.1 - referred to above -the corporation not having been formed in Canada (under the limited departure tax rules of Sec. 48 which are restricted under current law in general terms to non-Canadian capital property, also as discussed below). As a result of the latter factors, a taxpayer could transfer shares of a private Canadian corporation to such a "17 June 1991" corporation on a tax-free basis under Sec. 85(1) of the Act, which could then terminate Canadian residence without a departure tax (given that its assets consist of shares of a private Canadian corporation). If new residency were established in a country which has a treaty with Canada which provides capital gains exemption (generally in a non-real estate context), a tax-free sale of the Canadian shares could then be carried out, all in a fashion which would clearly constitute an unintended result (although technically sound and subject only to perhaps the Sec. 245 GAAR). However, the December 21/92 Proposals would terminate such stratagem in that the departing 17 June 1971 corporation would be deemed to dispose of all assets and not just Canadian capital property.

© 1993 International Bureau of Fiscal Documentation

128.2, which could have consequential adverse effects pursuant to the proposed deemed arrival or departure rules under Section 128.1.

In summary, although certain innovative approaches to cross-border mergers and acquisitions have been developed in niche situations in recent years,[37] it remains that it is very difficult to either merge a Canadian corporation or Canadian business assets in a cross-border joint venture or acquisition structure or spin-off Canadian assets to a non-Canadian entity in the course of a Canadian business acquisition.

5. Sale of Canadian real estate acquired before 1972

US persons who sell Canadian real estate are generally subject to full Canadian taxation on gains derived therefrom, including recapture of depreciation as ordinary income. Such taxation, arising under the combined provisions of Sections 2, 13, 38-55 and 115 of the Income Tax Act, is basically unfettered by the terms of the 1980 Convention.

However, the former (1942) Convention generally exempted US persons from Canadian tax on gains derived from the sale of Canadian real estate provided same are not associated with a permanent establishment in Canada under, inter alia, Article VIII of the 1942 Convention. To provide transitional relief for cross-border real estate investors who acquired property prior to the signature of the 1980 Convention (26 September 1980), Article XIII(9) of the 1980 Convention excludes from taxation a portion of gain realized on a post-effective date (generally for these purposes after 1985, given the one-year extension of the 1942 exemption beyond the 1 January 1985 effective date) disposition of real estate acquired before 26 September 1980.

The excluded portion is, generally, the greater of the amount determined by utilizing a valuation of the property on 31 December 1984 or by applying a formula which takes into account the holding period of the property before 1985 or after 1984. Under this formula a person who has acquired Canadian real estate say in 1950 and sold it in 1990 could pro-rate overall gain between (1) the period 1950 to the end of 1984 (as being exempt), and (2) the period 1985-1990 (as being taxable).

The pro-ration rule came into dispute in a 1992 decision involving the sale by a US person of Canadian real estate acquired in 1952 by reason of a Canadian domestic rule which accompanied the introduction of capital gains tax, generally, in Canada in June 1972. Under the domestic (transitional) rule a taxpayer received a cost base equal to the value of the property on December 31, 1971 so that a post-1971 sale of such pre-1972 property would give rise to gain measured by reference to the excess of sale proceeds over the deemed cost base established on 31 December 1971.

In the *Estate of the Late Isaac Kaplan and Her Majesty The Queen*,[38] Revenue Canada took the position that in applying the interrelated effects of the domestic transitional rule and that under Article XIII(9), the gain to be determined was based on the 31 December 1971 value of the property and the period for proration for the purpose of Article XIII(9) commenced only on 1 January 1972. Under such interpretation the overall taxable gain for the US taxpayer would exceed that arising if the Canadian transitional rule were ignored and there was taken into account the original acquisition date by the US taxpayer and his original cost. The Tax Court of Canada rejected Revenue Canada's approach to the application of Article XIII(9) and held that it should be applied without reference to the effects of the Canadian transitional rule.[39]

6. Corporate tax on capital

Aside from the corporate profits tax (and tax on dividend distributions), US investors or other owners of shares of Canadian corporations should be aware, generally, of tax on capital, normally imposed only under provincial taxing statutes but also on certain "large" corporations under the federal Act (and, in part, serving as a minimum tax). This "nuisance" tax can be quite costly and, for example, in the province of Quebec is equal to roughly one-half a percent of a corporation's capital (generally capital stock, retained earnings and long term debt). Under the federal Act it applies at a rate of one-fifth of 1 percent (with exemption for the first $ 10 million of capital).[40] (See also note 58.)

7. Canadian treaty exemption for third country corporations based in the United States

One would normally think that only corporations formed in the United States would qualify as residents of the United States for purposes of the 1980 Convention. However, a somewhat surprising decision of the Federal Court Trial Division in *Crown Forest Industries Ltd. v. The Queen*,[41] decided that a Bahamian formed shipping company having its central management and place of business in the United States qualified as a treaty resident of the United States notwithstanding that the corporation was also exempt from US tax by reason of IRC Section 883 respecting international shipping income.[42]

It may be noted that, paradoxically, in the case of individuals, Revenue Canada seems to take the point of view that a US citizen who is not "resident" in the United States in the "ordinary" sense is not entitled to treaty benefits from Canada notwithstanding general liability to US tax under the IRC.[43]

8. Interest deductibility

In order for interest to be deductible for Canadian tax purposes the specific provisions of Section 20(1)(c) of the Act must be met which, in general terms, require that the funds borrowed be utilized to earn income from investments or carrying on of a business. Canadian taxpayers, which obviously could include Canadian corporations owned by US persons, have had a multitude of disputes with Revenue Canada over the interpretation of this simply worded statutory provision where there is not a direct relationship between the borrowing of funds and the use thereof to earn income from a business or property.

For example, can a corporation deduct interest on funds used to pay a dividend or to redeem or otherwise reduce capital stock?

A Supreme Court decision in 1986, *The Queen v. Bronfman Trust*,[44] brought the pre-existing issues to a head in deciding that a trust could not deduct interest on funds borrowed to make a capital distribution (rejecting the taxpayer's claim that the borrowings were intended to preserve the income earning capacity of the assets retained and not used for the distribution). This brought into question certain Revenue Canada administrative tolerances respecting the deductibility of interest on funds not used directly to finance income earning activities.

As a result of the uncertainty stemming from *Bronfman*, the Department of Finance, commencing in the middle of 1987 and continuing through to December of 1991, has issued a series of draft proposals for amendment of the interest deductibility rules, where, as already noted, the focus is on conventional transactions which, however, do not entail direct use of the borrowed funds to earn income. It is now more than six years since the *Bronfman* decision, and legislation has yet to be finalized to clarify this obviously critical aspect of Canadian tax law. Therefore, US practitioners with clients having Canadian activities which require reference to interest deductibility under Canadian tax law are well advised to monitor this issue.[45]

9. Canadian surplus stripping rules in the international context

As noted earlier, a US shareholder of a Canadian corporation is generally exempt from Canadian tax on the sale of shares therein under Article XIII(4). However, distributions made by a Canadian corporation to a US shareholder in respect of stock (by way of redemption or reduction of capital stock or paid-up capital) are treated as dividends to the extent payment exceeds the relevant paid-up capital of the shares on which the redemption or other distribution is made. This rule (under Section 84 of the Act) applies regardless of the basis in the stock.

In order to protect the integrity of the foregoing deemed dividend rule and having due regard to both the aforementioned Article XIII(4) treaty exemption and the general rule under Canadian tax law that inter-Canadian corporate dividends are tax-free, there is an anti-surplus stripping rule contained in Section 212.1 which prevents a US person from selling shares of a Canadian corporation to a related Canadian corporation and receiving proceeds (other than shares of the transferee corporation) on a tax-free basis. Section 212.1 would treat any non-share consideration as a deemed dividend to the extent such would have arisen had there been a direct redemption or distribution by the transferred Canadian corporation.

In 1991 rules were tabled to extend the circumstances in which Section 212.1 would apply and, for example, could arise in a situation where a person other than the US shareholder or a person related thereto controls the target Canadian corporation.[46]

10. Incorporating a Canadian branch

Where a US corporation carries on business directly in Canada through a branch and seeks to transfer the business to a Canadian subsidiary, the combined effect of the rollover rules under the Act and/or the provisions of the 1980 Convention would generally provide for non-recognition treatment on such branch incorporation.

However, the transfer of Canadian real estate in the course of such branch incorporation would normally not qualify for non-recognition treatment (for example under Section 85 of the Act). The latter defect however has been cured by the enactment of Sections 85(1.1)(h) and 85(1.2) of the Act in 1991.[47]

11. Ambit of relief under Article XIII(8)

As noted earlier a US person who transfers Canadian real estate or shares of a Canadian corporation the principal value of which are derived from Canadian real estate is not afforded any treaty protection from tax otherwise arising under the Act. However, such gains (or others which may be taxed under Article XIII of the Convention) may be afforded deferral treatment under a discretion granted Revenue Canada by Article XIII(8) of the 1980 Convention.[48]

Canadian tax authorities felt compelled to mirror Article XIII(8) in a statutory provision, Section 115.1 of the Act. However, neither the treaty nor the statutory rule (as pro-

44. 87 DTC 5059.
45. For a discussion of the particular effect of the interest deductibility rules respecting financing of US subsidiaries by Canadian-based multinationals, see Nathan Boidman, "Cross-Border Effect of Interest Deduction Proposals", *Tax Management International Journal*, Vol. 21 No. 3 (March 1992), at 157, and discussion below. See also note 67.
46. For a full discussion see Boidman, *supra* note 12, at 160.
47. For a discussion see Nathan Boidman, "Canadian Tax Proposals - Cross-Border Effects", *Tax Management International Journal*, Vol.19 No. 9 (September 1990), at 397, 399.
48. Article XIII(8) reads as follows:
"Where a resident of a Contracting State alienates property in the course of a corporate organization, reorganization, amalgamation, division or similar transaction and profit, gain or income with respect to such alienation is not recognized for the purpose of taxation in that State, if requested to do so by the person who acquires the property, the competent authority of the other Contracting State may agree, in order to avoid double taxation and subject to terms and conditions satisfactory to such competent authority, to defer the recognition of the profit, gain or income with respect so such property for the purpose of taxation in that other State until such time and in such manner as may be stipulated in the agreement."

© 1993 International Bureau of Fiscal Documentation

posed to be amended in December 1991)[49] indicate the circumstances in which Revenue Canada will exercise such discretion.

What has become clear from applications to and discussions with Revenue Canada is that relief will not be provided under Article XIII(8) where a US person seeks to transfer Canadian property otherwise subject to tax under Article XIII to a US corporation under US IRC Section 351. Revenue Canada is of the view that the ambit of the provision does not include transfers to corporations, even if upon incorporation of same, and it is interesting to note that this position apparently underlies a similar position adopted by the IRS in applying to Canadians the provisions of Article XIII(8).

12. Cross-border aircraft leasing

As a result of an amendment to Section 212(1)(d) of the Act, adopted in 1992, US or other foreign lessors of aircraft to Canadian users are exempt from Canadian tax otherwise arising on rents or royalties paid to non-residents (which would, in the absence of such statutory exemption, be 10 percent in the case of payments to a US lessor under Article XII of the 1980 Convention).

This exemption has eliminated a host of convoluted arrangements previously utilized by Canadian lessors to avoid the effects of Canadian withholding taxes on international transactions.[50]

13. Canadian court takes very broad view of permanent establishment

In 1990 the Tax Court of Canada decided that a US person who regularly exhibited and ran a small shop at an annual two week fair in Vancouver had a permanent establishment within the meaning of the 1980 Convention. This finding comprised a very broad view of that fundamental treaty concept and US observers should take note of this case.[51]

C. *US transfers and moves to Canada*

1. Planning for high net worth individuals

US practitioners may deal with executive transfers to Canada or moves of high net worth US individuals or families to Canada (with or without renunciation of US citizenship). The latter may be tax motivated having regard to the effects of two interrelated Canadian tax rules:

- as noted at the outset, Canada does not impose a conventional estate, succession or inheritance tax; and
- since the introduction of the capital gains tax in Canada in 1972, there has been a step-up in cost base for incoming residents in respect of capital property the effect of which is to exclude from taxation the pre-arrival appreciation in capital property realized upon a post-arrival disposition thereof, pursuant to the present terms of Section 48 of the Act.[52]

It is obvious that, leaving aside the effects of certain anti-avoidance provisions under the IRC respecting expatriating US citizens who retain certain US-based property, the aggregate effect of the foregoing regime of Canadian taxation can, in appropriate circumstances, substantially reduce the overall taxation, particularly at death, of high net worth US taxpayers.[53] The scope of such potential saving would be increased by the December 21/92 Proposals.

In particular, as noted, under current law the step-up in cost base applies only to capital property (which, generally, is not based in Canada). The proposals would replace Section 48 by Section 128.1 and extend the step-up rule to all property, not just capital property (other than Canadian capital assets or assets used in carrying on a Canadian business) owned at the time of arrival. Thus, under these proposals, an incoming US person would be protected from Canadian tax on disposing of inventory or other non-capital property (say non-Canadian undeveloped real estate which normally does not qualify as capital property)[54] to the extent of pre-arrival appreciation realized on a post-arrival disposition. This new rule could also provide a step-up in cost base for intangible property of a business directly carried on by an incoming resident such as, for example, going concern commercial goodwill.

2. Consequential effects on incoming corporations

It should also be noted that the December 21/92 Proposals would change the rules respecting the assumption of Canadian residency by foreign formed corporations. Although such status would not generally arise in the case of a US formed corporation, having due regard to the interrelated effects of the 1980 Convention and Section 250(5) of the Act, it could in the case of a third country corporation, say, owned by an incoming individual.

The proposed (December 21/92) rules applicable to an incoming corporation would include a grind-down (in certain circumstances) in corporate paid-up capital for Canadian tax purposes, which as noted earlier (in the discussion of Section 212.1) comprises the measure of the amounts which may be distributed by a Canadian resident corporation without Canadian tax.

3. Part-year rule

A second change for an incoming (or departing) individual arises under the part-year residency rules of Section 114.

49. See Nathan Boidman, *supra* note 12, at 161.
50. For a full discussion see Nathan Boidman, "Proposed Exemption for US and Other Foreign Aircraft Lessors", *Tax Management International Journal*, Vol. 21 No. 2 (February 1992), at 88.
51. For a full discussion see Nathan Boidman, "Fowler - Permanent Establishment under the Canada-U.S. Treaty", *Tax Management International Journal*, Vol. 20 No. 1 (January 1991), at 38.
52. This rule can of course also mean that, in the case of depreciated property, liability to Canadian tax would arise on any recovery realized after arrival of the portion of the cost of property not matched by the fair market value at the time of arrival.
53. For alien residents of the United States who terminate US residency and take up residency in Canada similar considerations arise, although query, in that context, the effects of a departure-like tax under the passive foreign investment corporation rules (or any successors thereto).
54. As opposed to the US approach respecting the distinction between capital property and non-capital property with respect to real estate, under Canadian case law principles all non-personal-use undeveloped land is generally subject to a rebuttable presumption that it has been acquired for purposes of resale (unless an intent to develop can be substantially demonstrated) and thus is not treated as capital property; this is so even in the absence of a systematic business of dealing with and selling undeveloped land.

© 1993 International Bureau of Fiscal Documentation

Under present law a person who commences Canadian residency status also commences liability to Canadian tax on worldwide income thereafter unless at some point earlier in the same calendar year before residency commenced the individual was employed or carried on business in Canada, in which case during such period liability to Canadian tax on worldwide income enures.[55]

Section 114 is to be amended so that liability to Canadian tax on worldwide income would commence only after commencement of residency, notwithstanding pre-arrival employment in Canada or carrying on business in Canada.

4. Canadian treatment of IRAs

A change originally tabled in 1990 respecting cross-border retirement plans may be advantageous to residents of Canada who formerly worked in the United States or moved from the United States to Canada. These rules interrelate IRA accounts pursuant to IRC Section 408 and the Canadian rules respecting taxation of benefits derived from retirement or pension arrangements, under Section 56(1)(a)(i)(C.1) of the Act, and place certain restrictions on the extent of Canadian taxation of such plans and also permit tax-free transfers from such plans to Canadian registered plans.[56]

III. CURRENT DEVELOPMENTS AFFECTING INBOUND US/OUTBOUND CANADIAN TRANSACTIONS AND EVENTS

A. *Overview*

In general terms current tax developments respecting Canadian business or investment in the United States stem primarily from the United States and not Canada. This is seen across the spectrum, from (1) the effects of US transfer pricing law on inbound transactions between a Canadian parent and its US subsidiary (including, but not limited to, one-way initiatives such as the HR 5270 proposals respecting inbound transfers)[57] or other corporate/business orientated matters such as recent changes to branch profits tax regulations, the effects on Canadian based multinationals of anti-avoidance initiatives respecting captive finance arrangements (ranging from the conduit theory rulings to IRC Section 163(j) or the renegotiation of the Netherlands-US income tax convention), to (2) matters largely affecting private investment or individuals such as changes to the US estate tax rules and rates, finalization of IRC Section 7701(b) residency rules or the proposed changes respecting the effects of attribution rules for interests in foreign corporations which can substantially impact on Canadian families and Canadian holding companies with family members who have moved to the United States.

The scope of this paper does not include a review of such (or other) US developments affecting Canada-US transactions (whether in the outbound or inbound context); however, it will be seen in the commentary below that certain US changes have or can give rise to consequential or corollary Canadian changes in certain areas. However, as just indicated, recent Canadian tax changes affecting Canadian outbound-US inbound transactions are relatively limited in number and scope.

B. *Canadian-based multinationals operating in the United States*

1. Basic tax strategies under attack?

(a) *Overview*

As referred to earlier Canadian-based multinationals operating in the United States are generally exempt from tax on both undistributed and distributed profits of US subsidiaries. Furthermore, Canadian foreign affiliate-exempt surplus-foreign accrual property income rules (loosely comparable to the US controlled foreign corporation-Subpart F rules) provide much flexibility - not seen under their US counterparts - for shifting of profit between foreign affiliates in the group without creating exposure to Canadian tax. Thus, for example, interest earned by a Dutch or other captive finance affiliate of a Canadian-based multinational from loans made to a US operating subsidiary are not attributable to the Canadian parent and, to the extent that the captive affiliate is a resident in a country with which Canada has a treaty (such as the Netherlands), such interest income may be flowed back to (or repatriated by) the Canadian parent without Canadian tax.

These rules together with exemption from withholding under the current Netherlands-US tax treaty for interest paid by a US borrower to an affiliate Dutch lender have been (subject to the usual concerns arising under the US conduit theory rulings and the constraints imposed by IRC Section 163(j)) the cornerstone of many Canada-Netherlands-US group finance arrangements.

Moreover, in the foregoing context, under current Canadian law interest expense incurred by a Canadian parent to fund a Dutch finance company may be deducted against Canadian source profits of a Canadian parent, thus giving rise to "double dip" finance arrangements.

(b) *Changes in the wind?*

The current status of such arrangements has, however, not only been brought into question by US initiatives (those referred to above and others such as the possibility of a generic anti-treaty shopping IRC rule, such as that proposed in HR 5270) but, as well, in Canada. In particular, stemming from an aborted attempt to legislate interest deductibility limitations in 1981, relative to such arrangements, there has been ongoing concern that the Department of Finance will, one day, change the interest deductibility rules to prohibit the Canadian leg of the double dip finance arrangement just noted.

As recently as November of last year the relevant Canadian rules and their effects for Canadian based multinationals

55. This same effect can arise for a departing resident.
56. For a discussion see Nathan Boidman, "Canadian Tax Proposals - Cross-Border Effects - Part I", *Tax Management International Journal*, Vol. 19 No. 9 (September 1990), at 397.

© 1993 International Bureau of Fiscal Documentation

were given rather negative, high profile scrutiny in the annual report of the Auditor General of Canada to the House of Commons, where under the heading "Department of Finance Tax Arrangements for Foreign Affiliates Are Costing Canada Hundreds of Millions of Dollars in Lost Tax Revenues" there was substantial negative commentary on the manner in which Canadian multinationals utilize the foreign affiliate rules to minimize both Canadian and foreign taxes.[58]

The Auditor General's report led to hearings by the Public Accounts Committee of the House of Commons. On 23 April the Committee tabled a report in the House of Commons recommending immediate legislation to terminate aspects of these rules which the Committee claims is costing the government hundreds of millions of dollars in lost revenue.

2. Funding US subsidiaries with interest-free loans?

With respect to cross-border financing by Canadian based multinationals, the one recent development of interest arises out of the interest deduction proposals referred to earlier.

There are limited circumstances where it would be overall advantageous for a Canadian parent to capitalize a US subsidiary with non-interest bearing debt. Leaving aside the potential issues which may arise on the US side pursuant to IRC Sections 385 or 482,[59] such an arrangement could, inter alia, facilitate tax-free repatriation from the US perspective of short or medium term parent-provided financing for the US subsidiary.

However, if the Canadian parent has borrowed to fund an interest-free loan to a US subsidiary, can the interest thereon be deducted in computing the Canadian parent's Canadian source taxable income? At this point the conventional wisdom would appear, based both on case law and the proposed 21 December 1991 interest deductibility rules, to be negative; however, the matter is not totally clear having regard to certain conflicting Canadian case law.[60] On balance, given both the Canadian and US issues and uncertainties, it would generally appear inadvisable for a Canadian-based multinational to finance a US subsidiary through interest-free debt, particularly where the Canadian company has borrowed to fund such advances.

3. Loan guarantee fees?

It was noted earlier that a reasonable loan guarantee fee paid by a Canadian subsidiary to a US parent is treated as a proper deductible expense for Canadian purposes. The converse of that issue has arisen recently with Revenue Canada, under transfer pricing rules, for Canadian-based multinationals which do not charge fees for guaranteeing loans of US or other foreign subsidiaries. At present it appears that reassessments have not been issued and the underlying issue is whether a guarantee constitutes a service for Section 69 of the Act.

4. Tax rate arbitrage and transfer pricing

The earlier discussion respecting the impact of Canada's transfer pricing rules on US-based multinationals operating in Canada should also be considered in relation to Canadian-based multinationals operating in the United States. There is, however, a conceptual difference in the way in which the transfer price rules may operate in the latter context as opposed to the former notwithstanding that the rules are, in principle, equally applicable in respect of inbound or outbound transactions.

A review of the tax rate arbitrage factors dealt with above in the context of Canadian-based multinationals operating in the United States (and factoring in the effects of US withholding taxes on dividend distributions by a US subsidiary to a Canadian parent) would indicate that, as in the case of tax arbitrage favouring the movement of profit from a Canadian subsidiary to a US parent, it may similarly favour a movement or shift of profit from a US subsidiary to a Canadian parent, particularly one which carries on manufacturing activities (or operates in the province of Quebec). In such context both Revenue Canada and the taxpayer would have interests in common, namely to see transfer pricing rules operate to shift the maximum amount of profit from a US subsidiary to a Canadian parent.

One question is the effect on such strategy of the forthcoming adoption by Canada of an advance transfer pricing ruling procedure in the context of the various US developments respecting transfer pricing matters.

It is also worth noting in this context that Canada-US transfer pricing disputes have usually involved Revenue Canada inspired adjustments respecting inbound and not outbound transactions, basically never go to court and generally have been worked out either through private negotiations or through Canada-US competent authority procedure with a not inconsiderable degree of success by Revenue Canada in defending all or part of its proposed adjustments. Query however how successful "the Canadian side" will be in the likely increase of competent authority procedures stemming from IRS initiated adjustments respecting Canada outbound-US inbound transactions? The next few years should produce some interesting experiences and data in this area.

5. Canada-US-Mexico transactions

Finally, it may be noted that the establishment of tax treaty relations between Canada and Mexico in 1992 will, in general terms, ease the tax planning and structuring for Canadian based multinationals operating in both the United States and Mexico given that from the Canadian perspective profits generated in either country by subsidiaries established in either or both will be eligible for tax-free repatriation to Canada, under the foreign affiliate-exempt surplus rules.[61]

C. *Other Canadian outbound/US inbound business and investment matters*

1. Limited liability companies

As already noted it is US developments which largely affect Canadian investment in the United States. This is particularly so with respect to private investment or niche situations. Perhaps the only Canadian development in this area of real interest to US practitioners comprises the possible Canadian response to the advent in the United States of the limited liability company.

What are the effects for Canadians carrying on business and investing in the United States of the limited liability company (LLC) legislation in certain states (e.g. Alaska, Colorado, Delaware, Florida, Kansas, Texas, Utah, Virginia and several others) and the IRS ruling position treating LLCs as flow-through partnerships?[62]

An LLC can, inter alia, resolve the problem of how Canadian and US residents can joint venture through one US formed corporate-like entity without creating double taxation for the US party (given that flow-through "S" treatment does not apply in the case of a corporation with non-US resident/citizen shareholders).

From the Canadian standpoint, it was generally thought than an LLC would be treated as a corporation thus bringing into play (having due regard to certain administrative positions of Revenue Canada respecting the treatment of membership interests as classes of stock) the Canadian foreign affiliate-exempt surplus rules. However, apparently as a result of certain concerns respecting inappropriate foreign tax credits or deductions in respect of an interest in an LLC which is treated as a partnership for US tax purposes, Revenue Canada, in a "Round Table" discussion at the Annual Conference of the Canadian Tax Foundation held in Toronto in November 1992, announced that it was now studying (presumably in conjunction with the Department of Finance) the overall question of characterization and treatment for Canadian tax purposes of Canadian interests in LLCs.

2. Terminating Canadian corporate residence

Another recent development of perhaps more limited interest is the December 21/92 Proposal which would terminate Canadian residency status in the case of a Canadian formed corporation which "continues" - under export/import corporate continuance procedures from Canadian corporate jurisdiction into say one of the US states which has "import continuance" rules.

Heretofore, as noted above, even though such a corporation would be taxable, upon such export continuance from Canada, on unrealized appreciation in assets, under Section 88.1 of the Act (now to be replaced by Section 128.1) and, at a 25 percent rate, on the excess of the fair value of its assets over its debts and corporate paid-up capital, under Section 219.1 of the Act, it would, because of its original incorporation in Canada and the rules of Subsection 250(4) of the Act, remain a resident of Canada for Canadian tax purposes.

The December 21/92 Proposals would terminate such ongoing residence by adding Section 250(5.1) which will deem a corporation to be incorporated in the jurisdiction into which it has been continued. Thus, an exported corporation will be deemed incorporated in its new jurisdiction and thus not incorporated in Canada for purposes of the deemed residency rule under Section 250(4), and provided residency based on central mind and management in Canada is also terminated, such corporations will no longer be resident in Canada.

3. Cross-border death tax issues

It was noted at the outset that the combined result of the radical increase of US estate tax rates in 1988 and the separate system under Canadian law for imposing tax at death (on deemed dispositions of appreciated property) creates a potential for substantial double tax for Canadian individuals who directly own US property. This arises because Canada does not view US estate tax as a creditable income tax for purposes of determining the net Canadian income tax payable where a Canadian individual incurs a deemed disposition tax at death with respect to appreciated US property, in respect of which US estate tax also arises.

This issue attracted the attention of Canadian observers after the US estate tax rate increases in 1988 and led to the commencement of treaty negotiations in 1990 with a view to there being developed a treaty-based relief.

Given the tax jurisdiction normally accorded the country of source, it would seem reasonable that it would be Canada which would provide the relief and solution by ceding jurisdiction through a mechanism of treating US estate taxes as a creditable income tax for Canadian purposes.

Early on in the negotiations the Canadian treaty negotiators signalled that such relief would be provided in the new treaty and, as well, that the conclusion of negotiations would be without much delay. That was in 1990. It is now some three years later and the parties are still talking and nothing has been concluded.[63] In the interim individuals must consider a variety of other means of dealing with the potential exposure (including the double tax element) to US estate taxes.[64]

4. Proposed anti-avoidance rule: foreign partnership

The December 21/92 Proposals would terminate an opportunity to create basically artificial losses through investment in a partnership operating outside of Canada.

Partnerships are not taxpayers under Canadian law but rather a resident of Canada who is a member of a partnership,

62. See, for example Rev. Rul. 88-76, 1998-2 C.B. 360, and PLR 8937010.
63. For a discussion of the negotiations see Nathan Boidman and Gary J. Gartner, "Canada and U.S. Announce Treaty Negotiations", *Tax Management International Review*, Vol. 19 No. 2 (February 1990), at 89; Nathan Boidman, "Canadian Treaty Developments - In the U.S. Context", *Tax Management International Journal*, Vol. 20 No. 9 (September 1991), at 410; Gary J. Gartner, "Canada-United States Treaty Renegotiations Postponed", *Tax Management International Journal*, Vol. 21 No. 2 (February 1992), at 91; Nathan Boidman, "Canadian Budget (Including Treaty Update)", *Tax Management International Journal*, Vol. 21 No. 4 (April 1992), at 199.
64. For a full discussion see Nathan Boidman, (Canadian-American Tax Issues: Cross-Border Commentary), "Taxation at Death: Current Issues and Developments, Part I", *Tax Notes International*, Vol. 2 No. 6 (June 1990), at 578; Vol. 2 No. 7 (July 1990), at 702 (Part II); Vol. 2 No. 8, August 1990 (Part III).

© 1993 International Bureau of Fiscal Documentation

regardless of place of formation or operation, is subject to Canadian tax in respect of an aliquot share of partnership income while a non-resident of Canada is liable to Canadian tax in respect of an aliquot share of partnership income derived from carrying on business in Canada. In all such cases income for tax purposes is computed as though the partnership were a separate taxpayer and, thus, at the "level" of the partnership.[65]

As a consequence and in such context, a partnership determines basis in property and notwithstanding the absence of any specific elaborated rules on point, it appears that a partnership can only have one set of basis numbers for Canadian tax purposes (in contrast to the US approach which can allow for inside basis step-up in respect of certain incoming partners) and that such tax numbers commence being calculated only when there is either a Canadian resident partner in the partnership or a partnership that carries on business in Canada, where, even if there are only non-resident partners, filings are required under Canadian tax law.

In such latter context, therefore, it is the conventional wisdom that in the first year in which there is a requirement to report income of a partnership for Canadian tax purposes, determinations may be made at the level of the partnership by reference, generally, to, inter alia, original or historical acquisition costs of property, notwithstanding the present values thereof or the cost at which a person has acquired an interest in the partnership. This can present the following tax planning opportunity:

> Assume that in 1990 a partnership was formed by non-Canadians to acquire real property in the United States at a cost of $ 10 million. Assume further that by 1993 the partnership property has depreciated in value to $ 2 million and there is a first acquisition of interest in the partnership by a resident of Canada on 1 January 1993. Assume that the Canadian acquires 50 percent of the interest in the partnership at a cost of $ 1 million (reflecting 50 percent of the underlying value of the partnership's property). If the partnership then proceeds to sell the property for $ 2 million, an $ 8 million loss would be determined from a Canadian perspective having due regard to the historical cost of $ 10 million, notwithstanding the amount paid by the incoming Canadian partner for the interest.

To eliminate the relatively artificial loss which would be realized in the foregoing example, the December 21/92 Proposals would add Subsection 96(8) to read as follows:

> "For the purposes of this Act, where at any time a person resident in Canada becomes a member of a partnership and immediately before that time, no member of the partnership was subject to tax under this Part in respect of the income of the partnership, the cost or capital cost of each property that is inventory or capital property at that time of the partnership will be deemed to be equal to the lesser of,
> (a) its fair market value at that time, and
> (b) its cost or capital cost otherwise determined."

It is not clear why the rule does not also apply to cost factors relevant to goodwill and other like "eligible capital property" amortizable pursuant to the rules of Sections 14 and 20(1)(b) of the Act. However, it is not surprising that the rule does not work both ways and permit a step-up in underlying basis where the relevant value is greater than original cost.

The bottom line is that new Section 96(8) of the Act terminates an interesting tax planning opportunity for Canadians to effectively manufacture writeoffs for Canadian tax purposes through US or other foreign partnerships with depreciated property.

D. *Canadian movement to the United States*

US practitioners deal with Canadians who move to the United States either temporarily or permanently and spend substantial time there in personal or business capacities. Aside from the ubiquitous US issues (including those arising under IRC Section 7701(b)) there are a variety of Canadian considerations upon terminating Canadian residency. The December 21/92 Proposals affect certain of these considerations, already alluded to in the earlier discussion respecting incoming Canadian residents.

In general terms under present law (Section 48) a Canadian who terminates Canadian residency is deemed to dispose of all foreign and certain Canadian capital property at fair market value and must pay tax on his final tax return as though such property had been sold at the date of departure. An election can be made to defer such tax but security must be posted and there is potential exposure to Canadian tax upon post-departure appreciation in the property so elected.

It is now proposed to extend the applicability of the deemed departure tax to all property and not just capital property (other than certain Canadian-based property which would be subject to Canadian tax if disposed of by a non-resident). The main effect of this change would seem to pick up and tax under the departure rule foreign real estate not held as capital property and inventory and goodwill (and other "eligible capital property", as explained in note 57) of businesses carried on directly by Canadians outside of Canada. It will also trigger "depreciation recapture" respecting foreign rental real estate. Furthermore, departure tax in respect of the class of property added to the rule will not be deferrable by an election and lodging of security, such option being restricted to capital property.[66]

As noted earlier, a second change for a departing individual arises under the part year residency rules of Section 114, which will no longer operate to tax worldwide income of a person who terminates Canadian residency with respect to a period thereafter but in the same calendar year during which such individual was employed or carried on business in Canada.

65. See Sec. 96(1) of the Act.
66. An anomalous result appears to be that a departing resident will be deemed to dispose of goodwill (and other intangible capital property of an indefinite life, collectively treated as "eligible capital property" pursuant to Sec. 14 of the Act) of a Canadian based business and not have a right to elect out even though there would be continuing jurisdiction to tax same as a non-resident. This likely is an oversight in the drafting.

IV. CONCLUSION

The foregoing should provide a representative view of those aspects of both the Canadian tax system and recent developments which may be relevant to or affect situations encountered by US tax advisers. However, it does not purport to cover all recent developments and no attempt has been made to deal with specialized industries such as the resource or financial services sectors.[67]

67. See for example Nathan Boidman, "Canada-U.S. Treaty Interpretation - *Utah Mines Ltd. v. The Queen*", *Tax Management International Journal*, Vol. 20 No. 8 (August 1991), at 368 (dealing with non-deductibility of Crown royalties); Nathan Boidman, "Court Interprets Canada's Foreign Income Rules", *Tax Management International Journal*, Vol. 20 No. 3 (March 1991), at 134, and the related decision in *Canada Trustco Mortgage Company v. M.N.R.*, 91 DTC 1312 (T.C.C.), respecting the foreign accrual property income rules; proposed changes to the securities lending rules under Sec. 260 of the Act, issued on 23 December 1992 (Department of Finance Release No. 92-101); administrative issues with Revenue Canada respecting the creditability of Code Sec. 884(1)(f)(B) excess interest tax as a foreign tax; a delay until 1994 of federal proposals, in the 1991 federal budget, to disallow deductibility of provincial tax on capital (discussed earlier) and certain medical health insurance premium levies (Department of Finance Release 92-97, 18 December 1992); a decision respecting the taxability, under withholding, of late payment charges made by a Canadian importer to a foreign seller (*Wenger's Ltd. et al. v. M.N.R.*, 92 DTC 2132, T.C.C.); recent changes to Sec. 19.1 of the Act dealing with restrictions on deductibility by Canadians of advertising on cross-border media aimed at the Canadian market; the effect on the cross-border software sales issues discussed earlier of the September 1992 changes to the OECD 1977 Model Treaty (see Fred C. de Hossen, "Taxation of Cross-Border Software Payments", *Intertax* (December 1992), at 682); draft anti-avoidance legislation requiring accrual-based treatment of certain prepaid interest financing arrangements arising in the 1989-91 period; changes to various complex anti-avoidance type rules respecting after-tax (preferred share) financings; Canadian implications of the requirements for the use of Qualified Domestic Trusts by Canadians to defer U.S. estate tax; Canadian jurisprudence taking a very broad view of the facts and circumstances test for residency of individuals (e.g. *M. Glow v. The Queen*, 92 DTC 6467, F.C.T.D.); liberalization of rules respecting foreign investments by Canadians registered pension funds and similar tax-assisted arrangements; case-law respecting information demands by Revenue Canada in the international context, such as *Crestbrook Forest Industries Ltd. v. The Queen*, 92 DTC 6412 (F.C.T.D.) - reversed by the Federal Court of Appeal in an 12 April 1993 judgment (A-891-92) - and *Roseland Farms Ltd. v. The Queen*, 92 DTC 6365 (F.C.A.) and in the treaty exchange of information context, *Montreal Aluminium Processing Ltd. et al. v. A.G. of Canada et al.*, 92 DTC 6567 (F.C.A.), and restrictive Canadian court interpretation of interrelationship of treaties and domestic law where former Canadians exercise Canadian stock option plans as in *Hale, J. v. The Queen*, 92 DTC 6473 (F.C.A.). As well no reference has been made to taxation for activities in the Yukon or Northwest Territories, where the taxes therein replace those imposed by the provinces.

[continued from page 382]

In 1990 in a case where the 100 percent subsidiary corporation had been newly incorporated and only held liquidities, the Dutch Supreme Court posed a question to the EC Court of Justice whether, in this case, a 100 percent subsidiary corporation could be considered a separate "branch of activities". On 13 December 1991 the EC Court of Justice ruled that, *in general*, a 100 percent subsidiary could not be considered a separate "branch of activities" and therefore contribution thereof did not qualify for the internal reorganization exemption.

This ruling caused substantial uncertainty in the Netherlands since it would considerably increase the up-front cost of setting up a Dutch holding corporation; while it would still be possible to contribute EC resident subsidiaries under a merger exemption it would become virtually impossible to avoid capital duty on the transfer of 100 percent subsidiaries that are not resident in an EC member state.

On 6 January 1993 the Dutch Under-Secretary of Finance issued a regulation that stated notwithstanding the ruling of the EC Court of Justice the contribution of a 100 percent shareholding in a corporation may continue to be considered a contribution of an "independent part of an enterprise", i.e. a separate "branch of activities", provided both of the following conditions are fulfilled:

- the contributing corporation should itself carry on an active business; and
- the 100 percent shareholding that is contributed has to represent an organization of labour and capital that may be considered to form an independent enterprise.

Since the second condition in particular may in many cases not be very clear, it may be advisable to approach the Dutch Revenue before relying on this exemption to seek confirmation that the exemption is indeed available.

MEXICO:

TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS

Juan Pablo de la Calle Pardo

Lic. de la Calle, a law graduate of the Pan American University, is a principal of De La Calle and Associates. His Mexico City law firm specializes in Mexican and international corporate law. In addition, he is the founder and director of Grupo Mexico Te Invita, S.C., an international consulting firm advising US and European companies on cross-border business strategies. Lic. de la Calle is also active in the National Association of Corporate Lawyers.

I. INTRODUCTION

An understanding of Mexican tax policy cannot be gained from a superficial examination of the recent changes in the taxes themselves. Rather, in order to understand current tax policy, it is necessary to analyse policy and structural changes taking place in Mexico, and to understand the cultural, educational and political influence on the tax norms.[1]

President Carlos Salinas de Gortari's administration has been marked by the continuation of the change in direction initiated by his predecessor, Miguel de la Madrid Hurtado, as well as by structural changes which would have been difficult to conceive of under the previous administrations of the Institutional Revolutionary Party. Of course, tax policy could not be omitted from such changes, particularly because of the change in economic performance and the opening of the borders to international trade.

In this context, the government is continuing its efforts to strengthen public finances not only by the sale of state-owned companies (thus ceasing to intervene in productive activities that correspond to the private sector), but also by improving internal finances through tax collection. The 1991 and 1992 reforms coalesced the changes the country experienced during 1989 and 1990, introducing provisions that appear to enhance the tax collection process and foster taxpayer compliance. In addition, certain technical features were introduced to remove certain aspects of previous reforms that were difficult to implement, without abandoning tax collection policy in the process. This policy was expanded by broadening the tax base and by augmenting the policing capabilities of the Ministry of the Treasury and Public Credit.[2]

The following improvements in the Mexican tax system have taken place since 1988 (the beginning of the Salinas administration):[3]

- 14 of the 19 federal taxes in existence at the beginning of 1988 have been eliminated;
- the tax adjustments aim to promote investment insofar as tax rates have been significantly lowered, as compared to rates in the United States and Canada;
- important benefits are available with respect to dividends, instantaneous depreciation of investments and inflation adjustments for assets and liabilities;
- a broad tax simplification process was commenced concurrently with a system of control over taxpayers which rewards the compliant taxpayer and rigorously sanctions tax evaders and untimely taxpayers."[4]

These points summarize the scope of the tax changes that have taken place in the last four years. However, it is important to include the numerous changes in tax norms – principally in the area of income tax and taxpayer obligations – which Mexicans are accustomed to and which are fundamentally due to amendments to tax laws in order to eliminate evasion of income tax.

Clearly, much remains to be done before Mexico will have an internationally competitive system, and one which is easily understood by the majority of Mexicans. It is important to remember that 90 percent of Mexican companies are small. We need a tax system which is accessible and understandable to these small companies so they can compete with foreign companies that enjoy less confiscatory tax systems, with lesser tax rates, and which do not require excessive administrative expenses and a constant and costly need for specialized professional assistance.

Tax Survey

In 1992, *Expansion*, a prestigious business and financial publication in Mexico, published the results of a survey conducted among 695 executives regarding tax policy:

- 94% of those surveyed considered the tax provisions to be too complex;
- 63% found that a real tax simplification in Mexico has not taken place;
- 85% stated that the tax burden for businesses is reflected in their overall business costs;
- 72% use private external advisors (attorneys and accountants) to resolve their company's matters;
- 92% were of the opinion that modifications in the tax provisions were too frequent;
- 93% considered the criminal provisions relating to tax matters too rigorous.

The survey established criteria to improve the tax system:

- carry out a true tax simplification;
- relay to the taxpayer simple and clear tax provisions, with fewer changes;
- listen to the opinion of the taxpayer and permit valid deductions; and
- provide adequate training to the administrative personnel of the Ministry of the Treasury and Public Credit.

The conclusions of the survey reflect that

- while there has effectively been a change in tax policy, the change lacks the necessary tax simplification. The tax system needs to be adapted with an eye towards increased competitiveness with foreign systems, particularly with respect to Mexico's trading partners;
- a decision has been made not to make further amendments to the tax legislation since it was considered more important to provide security and permanence in the norms to the taxpayer than to issue changes to effect simplification;
- in accordance with a democratic perspective, real changes in the tax provisions should come from the voters through their representatives in the House of Representatives and the Senate; not as a unilaterally established policy of the Executive Branch;
- changes toward tax simplification have now become necessary so that those subject to the tax norms are able to comply and correspondingly assume responsibility for their failure to comply; and
- finally, the survey is an important indicator of what the tax reform in Mexico will be, as the reform is based on a selective analysis of the small and medium size companies that constitute more than 90% of the Mexican business sector.

Expansion, "Tax Survey" (November 1992) (Grupo Editoral Expansion), at 122.

The government has traditionally relied on frequent amendments to the tax system as a means to correct defects or to respond to taxpayer actions that are detrimental to tax policy. For example, in 1990, the government discovered that due to the late payment of taxes it was incurring a revenue loss as a result of inflation. The concept of "actualization" of tax payments was introduced so the tax authorities could recoup the loss caused by late payments through the actualizations, i.e. the substitution of the nominal value of such payments for their real value through the use of indices that actualize the value of the taxes due. At the same time, the authorities continued to impose late payment penalties as a sanction for failure to make timely payments.[5]

Nevertheless, under the 1990 reform, the taxpayer was able to credit the amount that was paid late in the principal payment, because the actualization was considered to have the same nature as the tax payment. This was true because late payment penalties have the character of an indemnification for the lack of timely payment and therefore have never been deductible. However, by 1991 the original actualization policy for tax payments had been modified because the deductibility of the portion corresponding to the actualized tax payment was prohibited. This evidences a certain sanctioning nature in the 1991 reform that is contrary to the original principle that results in, among other things, a financial burden and uncertainty for the taxpayer.[6]

Reforms were also included in the FTC in 1991 which tended to increase taxpayer control.[7] One clear example is the imposition of several liability on companies which, having the obligation to inscribe shareholders or partners in the Registry Book of Shares, made inscriptions without demonstrating that they had retained and paid the income tax resulting from the transfer.[8] This new liability imposes an unfair obligation on commercial companies because, under Mexican commercial legislation, a person is severally liable when he directly participates in the commission of certain acts. In this case, a commercial company – because it is an issuer of shares or partnership participation – does not involve itself as a party in the transactions that the holders or owners of such shares or partnership participations effect. Such transactions are beyond the control of the issuer because by law, the shares or partnership participations are created to circulate in the market.[9] Therefore, several liability should be imposed on the parties involved in the actual transaction, and not on third parties that have no connection with the transaction.

Another important change is the requirement that certain taxpayers obtain expert opinion with respect to financial statements for tax purposes. The confiscatory intention of the federal government is very clear; it seeks to know in greater detail what is going on in companies through the mandatory tax opinion. As a general rule a self-assessment system is applied in Mexico, so that the taxpayer determines its obligations and makes payments accordingly. Meanwhile, the government has the opportunity and right to review taxpayer accounts and to make any necessary determinations with respect to the correct application of the tax norm. In this case, it is clear that since 1991 the government has intended to restrict the taxpayer's right to freely contract, and to require taxpayers to present expert opinions with respect to their financial statements. Thus without using its arsenal of verifi-

cation tools, the government can ascertain whether the tax laws have been complied with. This obligation imposes another economic burden on the taxpayer.[10]

II. 1993 TAX MEASURES

A. *General*

No changes were made in the tax legislation at the beginning of this year.[11] This came as an unexpected contrast to previous years, as the government has traditionally made substantial amendments to the tax laws year after year. However, the various amendments made during 1992 and previous years cannot be overlooked because many of these changes entered into full force on 1 January 1993.

1992 was an important year for amendments to the federal taxes, i.e. a total of 25 amendments were made, including a reform of the tax laws and miscellaneous circulars issued by the Ministry of the Treasury and Public Credit. On 25 July 1992 numerous reforms were effected, and rules for administrative simplification were issued under the Simplified Tax Regime.[12] However, it is not expected new tax provisions will be introduced in 1993 (or the near future) to amend existing legislation,[13] although the Ministry of the Treasury and Public Credit may issue general obligatory rules in miscellaneous circulars through which new administrative provisions can be implemented.[14]

Mexico needs a tax system in which the basic structure of its legislation is preserved in order to achieve legal certainty for taxpayers, which permits them to make medium and long-term plans and strategies.

For 1993, the Law of Income of the Federation establishes an income tax policy designed to strengthen public resources; reduce tax rates and promote productive investment; redistribute the tax burden in favour of the lower income population; broaden the tax base; and promote a more internationally competitive tax system.[15] In accordance with these tax policies, the government formulated a number of changes.

The reforms to the tax regime focused on three general goals. First, a reduction of the average tax rates and an expansion of the tax base; second, establishment of internationally competitive tax rates, especially in respect of Mexico's trading partners in light of NAFTA; and third, strengthen the collection of taxes by promoting tax policing though the increased presence of tax authorities, diversifying controls and increasing sources of information.[16] Additionally, to adjust the tax system to international standards, to promote the influx of capital into Mexico, double taxation agreements will continue to be concluded.

B. *Federal income tax*

- The tax rate for companies was reduced from 39.3 to 35 percent.
- The tax on dividends was eliminated.
- The maximum income tax rate for individuals was reduced from 50 to 35 percent.
- The tax rate for the individual income tax was actualized according to the National Consumer Price Index ("INPC") and a subsidy was established which in 1992 could reach up to 50 percent of the tax.
- The withholding rate on financial interest payable to individuals was reduced.
- The capital gains tax on the sale of a residence was abolished.
- The limit on special savings accounts was increased from two to eight minimum wages, in effect for the Federal District.

C. *Value added tax*

Tax rates were reduced from 20 and 15 percent to 10 percent.

Application of the zero percent rate will be continued during 1993 as it applies to taxes on the sale and importation of patent medicines and products destined for food. However, the zero percent rate does not apply to the following, which are taxed at 10 percent:

- the sale of food prepared for consumption in the same establishment in which it is sold;
- different volumes or weights of milk;
- syrup or concentrates for the preparation of soft drinks dispensed in open containers, using electrical or mechanical equipment, and concentrates, powders, syrups of essences or extracts, and flavours which upon being mixed permit the obtainment of soft drinks; and
- caviar, smoked salmon and baby eels.[17]

D. *Special tax on production and services*

- The special tax on bottled water and soft drinks and the special tax on insurance policies were repealed.
- The rate of the special tax on cigarettes and tobacco was reduced, as was the special tax on alcoholic beverages.
- A mechanism was introduced that decreases the rate of the special tax on alcoholic beverages.
- A mechanism was introduced that decreases the rate of the special tax on beer as of 1993.

E. *Tax on the acquisition of real property*

The 10 percent tax rate in effect in 1990 will gradually be reduced to 2 percent in 1994. The rate for 1993 is 4 percent.[18]

10. IDC (23 January 1991), ANO VI, No. 117, at 1917.
11. The changes that were made in 1992 will be implemented and enforced as from 1993.
12. IDC (10 February 1993), ANO VIII, No. 167, at 2933.
13. The government stated that it did not consider it necessary to make further amendments to the tax system, i.e. the system is considered efficient, modern and competitive, and one with which it specifically seeks to give permanence to the tax provisions and security to the taxpayers.
14. These circulars frequently go further than the legal provisions they are supposed to regulate.
15. See *supra* note 2, at 2932.
16. It is hoped that the tax revenue will increase by approximately 2.4% in real terms, with respect to that of 1992, and increase the government's participation in tax revenues from 40.2% in 1992, to 40.9% in 1993.
17. Law of Income of the Federation, Art. 16, Sec. B, Sub-Sec. II.
18. Transitory Disposition of Miscellaneous Fiscal Law, Art. 22 Sec. I of 20 December 1992.

© 1993 International Bureau of Fiscal Documentation

The government intends to provide incentives relating to housing within the framework of the social policy which, to a significant extent, has been championed by President Salinas' administration. This is evident in the federal income tax exemption for residences, and in the reduction in the tax rate on the acquisition of real property.

F. *Tax on new automobiles*

The average rate has been reduced from 50 to 10 percent and, correspondingly, the maximum marginal rate of 50 percent has been reduced to 17 percent. Economy models are exempted from the tax. The purpose of these reductions is to provide incentives to the automotive industry and to stimulate modernization of vehicles in Mexico.[19]

G. *Penalties*

Penalty rates have decreased between 1990 and 1993, basically due to the fact that the rate of inflation in real terms has decreased.[20] The penalty for late payment of taxes was 3 percent in 1990; 2.25 percent in 1991; 1.5 percent in 1992; and 2.7 percent in 1993.[21]

There has also been a modification (confiscatory in nature) to the calculation of penalties for spontaneous payments.[22] When a taxpayer spontaneously pays all omitted taxes in a single payment, i.e. without having been issued an assessment by the tax authorities, the resulting penalties will be assessed from the date the tax was omitted until the date payment is made. Previously, a taxpayer could pay penalties not exceeding one year – a measure that benefited both the taxpayer and the tax collector, because it encouraged taxpayers to regularize their fiscal situation.[23]

H. *New peso*

According to the new Monetary Law which established the introduction of the new peso (eliminating three zeros from the old peso), as of 1993 two new monetary units will be in circulation, i.e. old pesos and new pesos. Any form of obligation may be paid with either unit.[24]

If 1992 taxes are paid in cash, they may be paid in new pesos or in old pesos. However, if payment is made by check, payment must be made in new pesos. Likewise, any tax accounting must be expressed in new pesos and centavos and, where relevant, fractions of the latter, as established by the new monetary unit and the Rule/Circular 18C of the Miscellaneous Circular for 1992.

I. *Several liability*

A change was made with respect to several liability for payments made to a resident abroad by another resident abroad. Several liability is imposed on Mexican companies, when a resident abroad provides such companies with dependent or independent personal services whereby payment for such services comes from another resident abroad.

J. *Tax vouchers*

As of 1 November 1992, the taxpayer must issue tax vouchers that comply with regulations established in FTC Articles 29 and 29A, in addition to regulations set forth in Rules 23 and 24 of the Miscellaneous Circular in effect for 1992.

K. *Tax opinions*

Another important change for 1993 is that certain companies are required to provide a tax opinion (as discussed above), issued by a public accountant or firm of accountants duly authorized for such purposes.[25]

L. *Residents abroad*

1. Income from salaries exempt from federal income tax

As of 1 January 1993, the period in which to compute tax residence for dependent services rendered in Mexico is based on the following: when the services are rendered for less than 183 days within a 12-month period during 1993 (whether or not consecutive) no income tax will be due. If the services are rendered for a period exceeding 183 days, the following applies:

- not exceeding 32,000 new pesos – exempt;
- exceeding 32,000 new pesos, but not more than 256,000 new pesos – 15 percent will be applied to the amount exceeding 32,000; and
- exceeding 256,000 new pesos – a 30 percent rate will be applied without the right to any deductions.[26]

2. Exempt income from fees

No income tax is due on fees paid by residents abroad, whether individuals or companies, that do not have a permanent establishment ("PE") abroad or, if they do have a PE, if the service is not related to such PE. However, this rule only applies if the service rendered lasts less than 183 days during a 12-month period (whether or not consecutive). If the period of service exceeds 183 days, the formula set forth above applies.

3. Relation to Title V of the ITL

The recent double taxation treaty with Canada and the treaty with the United States do not contain provisions complementary to the provisions of Title V of the ITL that regulate payments to foreigners.

19. See *supra* note 2, at 2932.
20. For example, if a taxpayer elected to make payments of taxes in instalments, the penalty rate was 2.0% in 1990; 1.5% in 1992; 1% in 1992; and 1.8% in 1993.
21. See *supra* note 2, at 2928.
22. Transitory Diposition, Art. 2 Sec. I (20 December 1992).
23. *Id.*
24. Law of Income of the Federation, Art. 20.
25. Tax opinions relating to 1992 must be presented by companies and businesses by 31 March 1991, and for individuals by 30 April 1993.
26. ITL, Art. 146 (the "tax pardons" provision).

© 1993 International Bureau of Fiscal Documentation

ITL Article 4-A provides that treaties which establish lower rates or different exemptions than those provided for in the ITL only apply when the taxpayer is resident in the country at issue under the terms of the treaty. Thus, assuming that domestic legislation (rather than the treaty) was applied to a taxpayer who is a resident abroad, application of Article 4-A would have to be challenged, since this would be a situation that could be corrected by the treaty, insofar as the treaty contains a mutual agreement procedure to resolve such a situation.

The entire regime for foreigners is susceptible to amendment and improvement. Nevertheless, the legislature should concentrate its efforts on a review of the PE concept, because the regime contains provisions at odds with internationally accepted concepts, thereby producing distortions. This is particularly relevant because the payments abroad provisions only apply in cases where the PE is situated in Mexico.

M. *Legal powers of review and determination of taxes*

Based on the exercise of their legal powers of verification, until 1990 the tax authorities could only determine taxes omitted in the last 12-month fiscal year for taxpayers who filed or should have filed a tax return, and for taxes corresponding to the period of time between the end of the fiscal year and the time the powers are exercised. However, if irregularities were found in the payment and determination of taxes, the tax authorities had the right to review up to five preceding years.[27] After 1993, the "tax pardons" provisions will be expanded in order to enlarge the review capabilities of the authorities, i.e. they will be able to review the past taxes up to five years even though no irregularities existed in the last period (year) of review.

The government has decided to eliminate the "tax pardon," whose sole purpose was to motivate taxpayers to comply with the law. For fiscal year 1993, the tax authorities may determine taxes issued in fiscal years ending in 1990, 1991 and 1992, as well as taxes corresponding to the period of time between the end of the fiscal year and the time when the cited powers are exercised.[28]

N. *Other*

As from 4 January 1993, procedures which have been carried out in the Offices of the Federal Treasury will be done in the Reception Booths for Tax Procedures, located in post offices or in the Tax Attention Booth of each Federal Tax Office. Procedures may no longer be carried out in the Offices of the Federal Treasury, where one may only verify the post office corresponding to one's tax domicile.[29]

III. TAX INCENTIVES AND SUBSIDIES

The crediting of an investment in the agricultural and forest sectors against an equivalent amount of the tax on assets, determined for the fiscal year is permitted; this amount may also be credited against past fiscal years.[30]

An incentive is granted for the import of machinery, equipment and consumer articles in the border zones and the free zones for companies and commercial centers established in those areas.

In relation to purchase/sale agreements for oil executed by the federal government and Petroleos Mexicanos or its subsidiaries, federal tax subsidies are granted to settle the patrimony[31] or trust for the issuance of ordinary certificates of participation "Petrobonos".[32]

There is also an incentive for savings plans and savings and loan companies.

A. *Exemptions and preferential treatment*

The exemptions relating to the tax on the acquisition of real property provided by federal law, in favour of decentralized entities, are no longer in effect, except for exemptions relating to property belonging to such entities that is considered part of the public domain.

Also no longer in effect are the provisions of the special laws, regulations, accords, circulars and administrative provisions (which contain total or partial exemptions or consideration for persons subject to taxation) that grant preferential or differential treatment with respect to income and federal taxes that are different from those established in the FTC, presidential decrees, international treaties, and the law which establishes such taxes and regulations.[33]

IV. INTERNATIONAL TREATIES

In the 1991 tax reform, Article 4A was added to the ITL, providing that international treaties which establish lesser tax burdens or exceptions different from those provided in the ITL will only be applied when the taxpayer is resident in the country under the treaty itself. Without engaging in a profound analysis of the constitutionality of such provisions, this reform grants foreign taxpayers the right to treaty benefits but only if they are resident in the contracting country to such treaty, under the terms of the treaty.

27. *Id.*
28. FTC Art. 64.
29. Transitory Disposition of Miscellaneous Fiscal Law (4 January 1993). This system, called the Tax Box, arguably makes tax procedures more difficult. The administrative function of the Mexican tax system relates to procedures such as inscription of companies, businesses and individuals, opening of establishments, mergers changes in domicile, suspension of activities, liquidation of assets, making of instalment payments, clarifications, requests for the issuance of identification certificates, receipt of informative returns, procedures for administrative actions with respect to returns, notifications and payments made, procedure for tax credits, filing of tax documents, incorporation into the census of importers, refund requests, etc. More importantly, foreign investors, particularly when they open companies in Mexico, must follow these procedures in order to commence operations, import machinery or consumer goods, or obtain tax identification certificates. Hopefully, such measures are consistent with the other changes the government has introduced as they relate to the flow of foreign investment into Mexico.
30. Law of Income of the Federation, Arts. 14 and 16.
31. E.g. capital, net worth.
32. IDC (20 January 1993), ANO VIII No. 167, at 2928 and 2927.
33. Law of Income of the Federation, Arts. 17 and 18.

© 1993 International Bureau of Fiscal Documentation

Mexico has entered into tax information exchange agreements with the United States and Canada, and has entered into double taxation treaties with Canada, Ecuador, France Italy, Spain and the United States. Negotiations for such treaties have been concluded with Belgium, Germany, the Netherlands and Switzerland, and negotiations are ongoing with Norway and the United Kingdom.

V. TAX EXPECTATIONS FOR 1993

The first and most relevant point for the tax reforms for 1993 without a doubt concerns the old complaint about the dramatic tax changes which take place annually. These changes have unduly complicated an understanding of and compliance with the tax law. In addition, the changes have hindered companies from planning their tax operations for the medium and long term since, on many occasions, once a plan is put into effect, changes in the tax laws modify the essence and consequences of the plan. As a result, on 10 November 1992, President Salinas, through the Minister of the Treasury and Public Credit, presented the Tax Reform Package to the House of Representatives for the year 1993. Contrary to that which has occurred in the preceding 21 years, the reform package only included the bill for the Law of Income of the Federation, the projected budget of expenditures of the federation, and the bill for the reform of the federal fee law. Interestingly, the usual proposals for reforms to the tax laws were not included since the adjustments made in July 1992 were considered adequate for the next year.

There probably will not be any reforms to the tax laws for 1993, or until the end of the present administration. This does not necessarily mean, however, that the Ministry of the Treasury and Public Credit will not issue new general resolutions in tax matters, commonly known as the miscellaneous resolutions which, while attempting to clarify the tax provisions, effectively create new legal situations that significantly change the fiscal regime.

For 1993, tax policy still has a policing nature. It cannot be denied that a policing environment exists in Mexico and that it has produced excellent results for the Mexican tax authorities during this administration. Since the introduction of the media publicity directed at compliance, the obligatory tax opinion and the campaign which has been carried out against "selected" taxpayers (artists, businessmen, politicians, professionals, etc.), these steps – intelligently taken by the government – have resulted in considerable increases in the taxes collected from 1989 to the present.[34]

In comparing the Mexican tax rates to those in the United States and Canada, it is important to recognize that the Mexican government has made an immense effort to reduce the federal income tax rates. Nevertheless, there is a difference in the determination of the taxable base which, in general terms, means that taxes are paid at higher rates in Mexico.[35]

Lastly, it is important to note that (compared to previous years) the present relationship existing between the policing government and the taxpayers has markedly improved. As of 1989, the tax authorities pretended to considerably increase the collection of revenue because a large number of taxpayers were blatantly violating the country's tax laws, a practice that had to be stopped. The situation has been improving, primarily due to the tax discipline effected by the Ministry of the Treasury. We have become aware of the benefits, and we have accepted the consequences of correctly acting as the governed and as the government. This results in the good of all, and obviously indicates a general improvement in the Mexican tax culture. [36]

The results accomplished by the Mexican government are extraordinary. Of course, much remains to be done, particularly with respect to simplification of the tax norms and a reduction in the tax rates applicable to individuals. It is time that evaders and those who violate the laws are punished, and those who duly comply with the norms are recognized and applauded. That is no more than just.[37]

VI. TOWARD TAX SIMPLIFICATION

The tax authorities have made many attempts to simplify the tax system so that it is understood by the majority of Mexicans. Nevertheless, to accomplish a true tax simplification, a fundamental change in attitude is required. First, the authorities need to gain confidence that taxpayers will comply with their tax obligations. Second, taxpayers must believe that voluntary compliance contributes to the common good of the society as a whole. It is a Mexican cultural tradition that individuals seek to evade taxes while the state seeks to close loopholes that have been available for the maneuvers and imagination of the professionals, and to exercise its right of collection by means of force and "tax terrorism".

Many speakers have called for a simplification of Mexican tax law. In this respect, it is worth mentioning some considerations that have been presented. During the Ninth International Forum, organized by the Ludwig Von Smises Research Institute, a work entitled "A Simplified Tax Model: the Option for Mexico" was presented by Mr Albin Rabushka. Mexico would benefit greatly by reducing its tax system to a single tax which would reach 5 percent of its gross national product, but only with respect to the federal income tax, leaving other federal taxes and social security intact. Mr Rabushka's proposal is really due to the need for tax simplification, understood as a future need, under the policy of collecting more tax revenue by the public sector and requiring that more economically active Mexicans abide by tax norms and comply with the tax obligations in an easy, simple and responsible manner.

Mr Javier Moreno Padilla, in his address at the 17th Annual Congress of the College of Professors and Researchers of Tax Law and Public Finances, A.C., held in Puebla, Mexico, maintained that the essential factor to establish an equilibrium between the different national interests, which would permit simplification of the tax norms, is "tax education" that favours both the "rationality of the system and also its justice". I would agree with this position.

According to Mr Moreno Padilla, to implement an administrative tax simplification, the following steps should be taken:

- develop clear and simple legislation that permits the taxpayers to understand its content so they can meet their obligations, which should be expressed in relation to their capabilities;
- norms of control must exist on the part of the treasury authorities;
- coherence must exist between the normative bodies. The issuance of excessive rules that discourage and confuse must be controlled;
- minimum tax quotas should be applied. An individual should have an economic incentive to produce; excessive taxes inhibit private sector initiative;
- norms should originate from the taxpayers, through a democratic exercise of representation in the House of Representatives and Senate. The provisions of the Executive Branch are normally estranged from the reality which they pretend to regulate;
- norms should be stable and permanent to guarantee the legal security and permit taxpayers to have confidence in, and knowledge of the norms.

> "Tax laws will receive a simpler treatment when the taxpayers comply with them to a greater degree in a spontaneous manner; at such time, it may be said that the objective of the technique and tax psychology of the taxpayers have been effectively reached."

We hope that Mexico will be a country that can achieve this desired tax simplification. For the present, it is our responsibility, as professionals in this area, both national and foreign, to begin such change by framing the problems and proposing solutions.

CONFERENCE DIARY

For further details of the events listed below please write to the organizers at the addresses indicated.

AUGUST 1993

49th Congress of the International Institute of Public Finance: Public Finance and Irregular Activities, Berlin, 23-26 August (English):

International Institute of Public Finance, General Secretariat, University of Saarland, 6600 Saarbrücken 11, Germany, Tel.: 49-681-302 3653, fax: 49-681-302 4369.

Principles of International Taxation, Amsterdam, 23 August-3 September 1993 (English):

IBFD International Tax Academy, PO Box 20237, 1000 HE Amsterdam, the Netherlands, Tel. 31-20-626 7726, Fax: 31-20-620 9397.

SEPTEMBER 1993

Interpretation of Tax Treaties, Amsterdam, 13-14 September 1993 (English):

IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, the Netherlands, Tel. 31-20-626 7726, Fax: 31-20-620 9397.

Treaty shopping workshop, Monte Carlo, 13-14 September 1993 (English):

Elizabeth Husband, ITPA Conference Liaison Office, PO Box 134, Sevenoaks, Kent TN15 6SZ, England, Tel.: 44-732-62910, Fax: 44-732-63762.

OCTOBER 1993

47th Annual IFA Conference, Florence, 3-8 October 1993; main subjects: interpretation of double taxation conventions, non-discrimination rules in international taxation (English, French, German, Spanish):

Secretary of the Conference, STRUMENTI, c/o ENIC, via Santa Caterina d'Alessandria 12, 50129 Florence, Italy, Tel.: 39-55-474737, Fax: 39-55-475037.

EC Corporate Tax Directives, Amsterdam, 14-15 October 1993 (English):

IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, the Netherlands, Tel.: 31-20-626 7726, Fax: 31-20-620 9397.

KNOWLEDGE AND TECHNOLOGY TRANSFERS TO AND FROM THE UNITED STATES

CHARACTERIZATION OF TRANSFERS OF COMPUTER SOFTWARE

Melvin S. Adess and Barbara M. Angus

Melvin S. Adess is a partner in the Chicago law firm of Kirkland & Ellis. He received his B.S. with highest distinction from Northwestern University, where he received the Haskins & Sells award, and his J.D. cum laude from the University of Chicago, where he was also a member of the Order of the Coif. He passed the Illinois Certified Public Accountants examination in 1966.

Mr Adess joined Kirkland & Ellis in June 1969 and was admitted to the partnership in January 1975.

Mr Adess was a Consultant to the American Law Institute Federal Income Tax Project on International Aspects of United States Income Taxation, which resulted in a number of important changes in the international aspects of US taxation made by the 1986 Tax Reform Bill. He is a member of the American Bar Association Committee on Foreign Activities of US taxpayers and has served on a number of Chicago Bar Association Federal Taxation Committees, including as former vice-chairman of the Corporation Distributions, Reorganizations and Foreign Tax Subcommittee. He is also a former member of the ABA Corporate Stockholder Relationship Committee – Distributions Subcommittee.

Mr Adess has lectured on International Aspects of US Taxation and on Tax-free Reorganizations, Liquidations and Incorporations and various international tax subjects at both the Law School and Graduate School of Business at DePaul University and on international aspects of US taxation at Northwestern School of Law; he has spoken on a variety of topics at numerous tax conferences, seminars and institutes, including the University of Chicago Federal Income Tax Conference; Practicing Law Institute; International Fiscal Association; the World Trade Institute; the Chicago Tax Club; the Colorado Springs Tax Institute; the Texas Tax Institute; the Illinois Institute on Continuing Legal Education; Chicago Bar Association Tax Conferences; and Tax Executives Institute. Mr Adess has authored articles on various tax subjects.

***Barbara M. Angus** is a partner in the law firm of Kirkland & Ellis. She is a graduate of Harvard Law School (cum laude) and Dartmouth College (magna cum laude). Ms Angus joined Kirkland & Ellis in June 1986 and was made partner in October 1992. She is a member of the adjunct faculty of DePaul University College of Law and Chicago-Kent College of Law, teaching courses in their tax LL.M. programs on Advanced Income Tax and Corporate Reorganizations. She has spoken and written on a variety of international tax issues.*

The authors gratefully acknowledge the assistance of Richard Aderman in the preparation of this paper.

I. INTRODUCTION

The characterization of transfers of intangibles has significant tax implications. The sale of an intangible may produce capital gain, while its license will produce ordinary income. For cross-border transfers of intangibles the characterization of a given transaction as a sale rather than a license has foreign tax credit and withholding tax implications and raises possible Subpart F issues. Rapid technological advancements in the computer software industry, coupled with new and varied forms of transferring such technology and pricing such transfers, are creating particular difficulties in characterizing software transactions under traditional tax principles. There is disagreement even within the software industry itself as to whether transfers of computer software should be characterized as sales or licenses for tax purposes.

This paper first briefly describes the tax principles underlying the sale versus license characterization of patent, know-how and copyright transfers. The paper then focuses on the current debate regarding the proper characterization of transfers of copyrighted computer software, an issue which has global tax implications and could potentially have significant implications well beyond the tax law.

II. TRANSFERS OF INTANGIBLES: SALE VERSUS LICENSE

The tax treatment of a transfer of an intangible depends on the nature of the intangible (e.g. patent, know-how or copyright) and the scope of the interest being transferred (e.g. exclusive or non-exclusive rights, full rights or rights which are limited in geographic scope or duration). For purposes of applying these principles, the transfer of an interest in an intangible must be distinguished from the transfer of a

© 1993 International Bureau of Fiscal Documentation

tangible article produced with the intangible. Moreover, the parties' characterization of the transfer is not controlling for tax purposes.

A. *Patents*

Internal Revenue Code Section 1235[1] provides special rules governing certain transfers of patents. A transfer that does not qualify under Section 1235 must be examined under general tax law principles to determine whether the transfer constitutes a sale or a license and whether it generates capital gain or ordinary income to the transferor.

1. Scope

For purposes of Section 1235, the term "patent" includes patents granted under Title 35 of the United States Code and any foreign patents that grant rights generally similar to those granted under a US patent.[2] Section 1235 is also applicable to transfers of a pending patent application and to transfers of the right to obtain a patent with respect to a product that is patentable.[3]

2. Characterization of transfer

The owner of a patent or patentable product may transfer to a third party the rights to the patent or may grant to the third party a license to use the patent.

(a) *Sale*

A patent transfer generates long-term capital gain if the transfer satisfies the rigid requirements of Section 1235 or if it qualifies for such treatment under other Code provisions.[4]

(1) *Transfers under Section 1235*
Section 1235 applies only to transfers by the individual who created the property or an individual who acquired the property from the creator for consideration before the invention was reduced to practice. Thus, treatment under Section 1235 is available only to certain *individual* transferors and not to *corporate* transferors.

The holder of a patent must transfer property that consists of all substantial rights in the patent to an unrelated person in order to qualify under Section 1235. Section 1235 requires that the property being transferred convey all rights with respect to the patent that are of value at the time the rights to the patent are transferred.[5] Accordingly, in order to qualify under Section 1235, the patent rights being transferred must not be subject to geographic limitations within the country in which the patent was issued, duration limitations more restrictive than the life of the patent or use limitations. A transfer of a non-exclusive license with respect to a patent will prevent a subsequent transfer of all remaining rights under the patent from qualifying under Section 1235.[6] Moreover, the retention of a right to use the patent may make the transfer ineligible under Section 1235.

Section 1235 provides long-term capital gain treatment for the transfer of a patent regardless of the transferor's holding period for the patent, the method of payment for the transferred interest and the transferor's status as a professional inventor. Section 1235 only covers the patent transferor's tax treatment; the tax treatment of the transferee is governed by general principles of the tax law regardless of whether the transfer qualifies under Section 1235.

(2) *Transfers not subject to Section 1235*
A patent transfer by a corporate transferor (or by an individual in a transaction not eligible for Section 1235) may constitute a sale that is eligible for long-term capital gain treatment. The extent to which the transferor must transfer all substantial rights with respect to the patent in order for the transaction to qualify as a sale is not entirely resolved. The Supreme Court in a case pre-dating the advent of the federal income tax has held that an assignment of a patent (as opposed to a license) must include the exclusive right to make, use and sell the invention throughout the United States.[7] If the transferor has the unconditional right to terminate the transfer or if the transferor transfers rights with respect to the patent for a period less than the entire useful life of the patent, the transaction will be characterized as a license rather than a sale.[8] Patent transfers which are subject to geographic or field of use restrictions may qualify as sales under non-Code Section 1235 case law, even though such restrictions would be fatal under Section 1235.[9] The prior grant of a non-exclusive license to another will not preclude a subsequent transfer from qualifying as a sale.[10] However, the retention of a right to use the patent may prevent sale treatment.

If a patent transfer constitutes a sale for tax purposes, it will be eligible for capital gain treatment only if the patent constitutes a capital asset in the hands of the transferor. Patents generally qualify as capital assets.[11] However, in the hands of a professional inventor, the patent would be inventory, stock in trade or similar property, and therefore would not be eligible for capital gain treatment.[12] To qualify for long-term capital gain treatment, the transferred property must have a holding period of at least one year, which in the case of a patent begins no earlier than when the patentable idea is actually "reduced to practice".[13] Accordingly, the holding period for a patent generally will not begin until there is a demonstration that the idea actually works.[14]

Payments for a transferred patent may be made in a lump sum or may be made over the life of the patent on the basis of use. A patent transferee may deduct as depreciation payments

© 1993 International Bureau of Fiscal Documentation

contingent on use at the time they are made.[15] Lump-sum payments are depreciable over the useful life of the patent.[16]

(b) *License*

If a patent transfer does not qualify as a sale of the patent, the transfer will constitute a license. A license involves a conveyance of rights under the patent in which the transferor retains legal title to the patent. The rights to make, use or sell articles produced under the patent may be conveyed by the license. Generally, a license will impose territorial and/or temporal restrictions on the transferee's use of the patent. The payments under a license may be made in a lump sum or may be contingent on the use or productivity of the patent.

Since no sale of property is involved in a license, the payments received by the transferor are ordinary royalty income.[17] The patent transferee is entitled to deduct such payments when made if the transferee is a cash-basis taxpayer or when accrued if the transferee is on the accrual method of accounting.[18]

B. *Know-how*

The tax law governing know-how is not as developed as the tax law governing patents. However, once an owner of a process determines that the process qualifies as know-how, an interest in the know-how may be transferred through a sale or a license.

1. Scope

The definition of know-how does not appear anywhere in the Code or Regulations. A non-patentable process must qualify as know-how in order to be considered property that is potentially eligible for capital gain treatment. The IRS has taken the position that information which constitutes a secret formula or process qualifies as know-how and that know-how may also include other secret information which does not rise to the level of a formula or process.[19] Although courts have generally adhered to the view that secrecy is a requirement for know-how, some courts have on occasion taken a more liberal approach to the definition of know-how. The Tax Court, for example, has allowed a non-secret formula to qualify as know-how in a situation in which it was transferred in conjunction with secret know-how.[20] Services performed may also be treated as a component of know-how if the know-how itself is the fruit of the transferor's labor or if the services are ancillary and subsidiary to the transfer of know-how.[21]

2. *Characterization of transfer*

The owner of know-how may transfer to a third party the rights to the know-how or may grant to the third party a license to use the know-how.

(a) *Sale*

The Code does not contain a specific provision governing know-how that is analogous to Section 1235. However, the IRS has adopted an approach which borrows heavily from the patent area. In order for a transfer of know-how to qualify as a sale, the transferor must transfer, for the entire life of the know-how, all substantial rights in the know-how together with the right to prevent its unauthorized disclosure. A transfer of know-how for a period shorter than its entire life will not qualify as a sale.[22] The IRS also has required that the transfer cover all rights to the know-how within all the territory of a country.[23] Although there is no case law specifically involving transfers of know-how which are subject to geographic or field of use restrictions, the principles developed with respect to transfers of patents are likely to be applicable.

A transfer of know-how that constitutes a sale will be eligible for long-term capital gain treatment if the know-how constitutes a capital asset in the hands of the transferor. A transfer of know-how by a professional developer gives rise to ordinary income because the know-how is not a capital asset under Section 1221. Rather such know-how is property held for sale to customers in the ordinary course of business.[24] In the case of know-how that constitutes a capital asset, the holding period required for long-term capital gain treatment commences when the taxpayer acquires the know-how or, if the know-how was developed by the taxpayer, when the know-how is reduced to practice.[25] If the transfer of know-how is ancillary to the transfer of other property and such other property satisfies the long-term holding period requirement, the know-how also satisfies such holding period requirement.[26]

Payments for transferred know-how that are contingent on the use of the know-how should be deductible as an allowance for depreciation at the time the payments are made.[27] A lump-sum payment for transferred know-how is depreciated over the useful life of the know-how, provided that such life can be reasonably estimated.[28] Know-how may not have a useful life which can be estimated, however, because the period over which secrecy will be maintained may be uncertain; if a limited useful life cannot be established, depreciation may not be allowed.

(b) *License*

A know-how license is treated substantially the same as a patent license. As with a patent, if a transfer of an interest in

© 1993 International Bureau of Fiscal Documentation

know-how does not qualify as a sale, it will constitute a license. Payments with respect to a know-how license constitute ordinary income to the transferor and are deductible by the transferee.[29]

C. *Copyrights*

As in the case of patents, there is a considerable body of law defining a copyright and the rights embodied in it. The availability of capital gain treatment for sales of copyrights is more limited than in the case of patents, however, because of the exclusion of copyrights held by the creator from the definition of a capital asset.

1. Scope

The term "copyright" is defined in Title 17 of the United States Code. A copyright exists the moment that a "work" is fixed in a tangible form, even prior to its publication. The copyright laws protect virtually any writing, work of art or creation in the entertainment field, as well as computer software and the writing of a program on a computer chip.[30] A copyright is an intangible that is separate from any physical embodiment of it; a transfer of a copyright differs from a transfer of a copyrighted article.[31]

2. Characterization of transfer

The owner of a copyright may transfer to a third party the rights to the copyright or may grant a license to use the copyright.

(a) *Sale*

In order for a transfer of a copyright to qualify as a sale, the transferor generally must transfer all substantial rights in the copyright.[32] However, the transfer of a fragment or subset of all rights under a copyright may qualify as a sale. One type of fragmentation that is permissible is a transfer covering the rights with respect to a single medium (e.g. a sale of just the movie rights). Geographic restrictions on the rights transferred also may not prevent sale treatment.[33]

The general provisions of the Code governing long-term capital gain treatment apply to the sale of a copyright. However, capital gain treatment may not be available for a sale by the creator of a copyright because the copyright will not constitute a capital asset in the creator's hands.[34] This exclusion from the definition of capital asset applies to copyrights held by an *individual* creator, but may not apply to *corporate* creators.[35] Capital gain treatment is also denied if the copyright is held for sale to customers in the ordinary course of business.[36] For a holder other than the creator, the holding period for long-term capital gain treatment commences when the copyright is acquired; for the creator, the holding period begins when the copyrightable idea is fixed in a tangible medium.[37]

Payments that are contingent on the use of the copyright should be deductible as an allowance for depreciation at the time such payments are made.[38] A lump-sum payment is depreciated over the useful life of the copyright.[39]

(b) *License*

A copyright license is treated substantially the same as a patent license. As with a patent, if a transfer of an interest in a copyright does not qualify as a sale, it will constitute a license. Payments with respect to a copyright license constitute ordinary income to the transferor and are deductible by the transferee.[40]

II. CHARACTERIZATION OF COMPUTER SOFTWARE TRANSACTIONS

A. *Overview*

The computer software industry has drawn a line in the sand over the proper tax characterization of transfers of copyrighted computer software. On one side is IBM, arguing that payments for software transfers, all of which take the form of a license, are properly characterized as royalties. On the other side is a coalition of 19 software manufacturers (the "software coalition"), contending that revenue from software transfers is properly characterized as proceeds from the sale of a product. Although the specifics of particular software transactions vary greatly, the issue has initially been joined in connection with the broad category of transactions in which pre-packaged, copyrighted software is transferred to a customer who is entitled to use such software in perpetuity.

This type of software transaction does not purport to be a transfer of the underlying copyright and hence the sale versus license issue cannot be resolved through application of the rules discussed above which govern copyright transfers. Rather, these software transactions more closely resemble transfers of copyrighted articles. The software coalition analogizes these transactions to the sale of one or more copies of a copyrighted book. However, the software transaction differs in form from the paradigm case of the transfer of a copyrighted book because of, among other things, the significant limitations imposed on the software transferee which are not imposed on the purchaser of a book. Indeed, the computer software transaction is universally cast in the form of a license in order to address concerns about computer piracy by providing the software developer with contractual rights pursuant to the license agreement in addition to the protection afforded by the copyright laws.

© 1993 International Bureau of Fiscal Documentation

The focus of the current debate in the computer software industry centers on a proposed IRS ruling sought by the software coalition that income earned by a foreign manufacturer on the transfer of copyrighted software to US customers constitutes sales income rather than royalty income and therefore is not subject to withholding under Section 881. It appears that the software coalition hopes that such a published ruling will encourage foreign jurisdictions, Canada in particular, to adopt a similar rule so that US software manufacturers will not be subject to foreign withholding on income earned on computer software exports.

B. *Description of representative software transactions*

The facts set forth in the proposed ruling are relatively simple. However, IBM cautions that the skeletal transaction described in the ruling in fact encompasses a wide range of complex arrangements between software manufacturers and their customers which should not be homogenized.

1. Industry practice

There are a wide variety of software products being marketed today by the software industry and both the products themselves and the forms in which they are marketed are continually evolving. The developer of computer software may market its product (i) by licensing another entity to reproduce and distribute the software to customers or (ii) by reproducing the software itself for distribution to customers directly or through a distributor. The treatment of the first type of transaction which involves a reproduction license conveying an interest in the underlying copyright is not at issue in the current debate. Rather, the dispute focuses on the end-user transactions in which the software developer transfers a finished software product to a customer for business or personal use.

(a) *Basic transaction*

The most straightforward type of transaction is the delivery to a customer of an off-the-shelf software package contained on a computer disk. The customer will pay a fixed, lump-sum price and will obtain the perpetual right to use the software. This type of transaction may involve an individual acquiring basic word processing software for use on his PC or a business acquiring extremely sophisticated software for use on multiple computers.

(b) *Delivery and pricing variations*

Numerous variations on this basic transaction have been developed by the software industry in response to competitive pressures and the varying business needs of its customers. Software may be packaged not as a separate computer disk but together with the hardware on which the program is to be run. Alternatively, a software developer may install the software directly on the customer's computer or may deliver a software product to the customer through electronic transmission. A software developer may deliver to the customer its entire library of software products in CD-ROM form with access to the individual programs restricted; the customer will pay for, and receive the access codes for, only those programs it selects.

The same software is often priced differently depending on the customer's intended use. The price of a particular software product may be determined based on the capacity and power of the computer system on which the customer will run the software. Moreover, software which will be run on a local area network may be priced based on the number of users who have access to the network. A business with multiple computers may obtain from the developer multiple copies of the same software product; alternatively, the developer and the customer may enter into an arrangement under which the customer receives a single copy of the software and has the right to make a fixed number of additional copies for its internal use.

These alternative transactions differ from the simplest software transaction because of variations in delivery and pricing terms. However, these transactions all involve the payment of a lump-sum price and the right to use the software for its entire useful life.

(c) *License agreement*

Of primary importance to computer software firms is the protection of the value of the copyrights underlying their software products. There is widespread concern that the copyright laws do not provide adequate protection with respect to computer software. Therefore, in order to maximize the protection of the software developers, virtually all end-user transactions are documented in the form of a license.

Computer programs are protected under the copyright laws as literary works. Under the copyright laws, the owner of a copyright is granted the exclusive right to reproduce and distribute copies of the copyrighted work for the duration of the copyright protection. The rights of the owner of the *copyright* are limited, however, and the owner of a *copy* of the copyrighted work is granted certain rights under the law. Under the "first sale" doctrine, the owner of a copy of a copyrighted work is entitled freely to sell or dispose of that copy, although special provisions applicable to computer software prohibit the commercial rental or lease of the copy without the authorization of the copyright owner. The owner of a copy of a computer program has the right to copy or adapt the program to the extent necessary in order to use the program and to make backup or archival copies. Such copies may be transferred by the owner of the copy in connection with a transfer of all of his interest in the program.

Preservation of the value of the underlying intangible is a particular problem in the case of computer software. First, it is extremely easy and inexpensive to make perfect copies of computer software. Second, a single copy of a software package may be used by multiple persons simultaneously. These characteristics make computer software piracy a major concern throughout the software industry. Although software developers are vigilant in pressing their rights under the copyright laws, there is concern that the copyright laws may not be adequate in the case of computer software. Because of

© 1993 International Bureau of Fiscal Documentation

this concern, computer software transactions are cast in the form of a license. Under this arrangement, the customer does not become the owner of the software copy and therefore does not acquire the rights provided under the copyright law to the owner of a copy of a copyrighted article. Moreover, the license agreement imposes explicit restrictions on the customer's use of the software.

The license agreements under which copyrighted software is transferred provide that the software developer retains ownership of the software copy. Moreover, the license agreement prohibits the customer from sublicensing, renting or leasing the copy to another user. The license agreement prohibits copying of the software except to the extent required for use on the customer's computer system or for the purposes of making backup or archival copies. Perhaps most importantly, the customer is prohibited from using the copy on more than one machine at a time and from reverse compiling or disassembling the software. Finally, the customer may transfer the software to a third party but must include a copy of the license agreement and must destroy any copies of the software. The restrictions imposed under the license agreement prevent the simultaneous use of the software by multiple persons and prevent the customer from transferring the software to a third party except in a transaction under which the third party would be subject to the license agreement. Thus, the software industry believes that the use of a license provides important protection to the software developer which complements the protection provided by the copyright laws.

2. Proposed ruling fact pattern

The fact pattern on which the proposed ruling is based involves a foreign corporation which develops and produces software products abroad for sale to end-users in the United States. Each software product consists of a copy of a program recorded on a carrier medium together with any associated documentation. The end-user pays a fixed lump-sum price for the software product. The foreign corporation requires that end-users enter into a license agreement, under which the end-user has the right to use the software in its own business for the remainder of its useful life but may copy it only for archival purposes and may use the software on only a single computer. The license agreement also prohibits the end-user from decompiling or reverse engineering the software program.

Under one scenario set forth in the proposed ruling, the foreign corporation which produced the software sells directly to the end-user. Under an alternative scenario, the foreign corporation uses a US corporation as its distributor.

C. *Framework of the issue*

The current debate regarding the tax treatment of software transactions focuses on transfers of pre-packaged software to customers for personal or business use. Transactions involving custom-designed software are not at issue. Transactions involving the grant by the software developer of a license to reproduce and distribute software also are not at issue.

The ruling proposed by the software coalition covers transfers to US customers by a foreign corporation of computer software developed abroad. Because the foreign corporation is not engaged in a trade or business in the United States, at issue is the characterization of the income from such transactions for purposes of Section 881. Under Sections 881 and 1442, a 30 percent withholding tax is imposed on fixed or determinable annual or periodical income paid to foreign corporations from US sources. Royalties earned by a foreign corporation from the use of a copyright in the United States are subject to the 30 percent withholding tax, unless such tax is reduced or eliminated by treaty. However, income derived from the sale of property is not subject to this withholding tax. The proposed ruling concludes that the software transaction is properly characterized as a sale and the income derived therefrom by the foreign corporation is not subject to the withholding tax.

The stated interest of the software coalition in sponsoring this ruling lies in convincing foreign jurisdictions to take the same position with respect to income earned by US firms on transfers of software to customers in such jurisdictions. The particular focus is on Canada which imposes a 10 percent withholding tax on royalties paid to US persons. The software coalition hopes that issuance of the proposed ruling by the IRS will encourage Revenue Canada to accept the position that transfers of software by US developers to Canadian customers should be characterized as sales, the income from which is not subject to the Canadian withholding tax.

IBM and several other US software firms have opposed the issuance of the proposed ruling. One of IBM's primary objections to the proposed ruling is that if the IRS were to treat the software transaction as a sale, the industry's position that such transactions constitute licenses and not sales for purposes of protecting the intellectual property rights involved would be undercut. Software transactions are carefully cast in the form of licenses in order to maximize the protection of the underlying intangibles; this enhanced protection is extremely important to software developers. IBM is concerned that if the software coalition succeeds in its efforts to obtain the proposed ruling, the sale characterization provided thereunder could be carried over to other areas of the law. If the transactions were treated as sales for purposes of the copyright laws, the rights of the customer with respect to the software would be enhanced and the developer's ability to control the use and subsequent disposition of the software would be restricted. Quite apart from the intellectual property issues, however, IBM has raised credible questions about the tax policy implications attendant to a ruling which allows a taxpayer to structure a transaction one way for non-tax purposes and yet argue for a different tax characterization.

D. *The software coalition's position*

In support of the proposed ruling the software coalition offers a detailed analysis of why software transactions should be treated as sales for tax purposes. Its analysis first focuses on the characterization of the software being transferred as a copyrighted article rather than an interest in a copyright; the analysis then focuses on the characterization of the transfer itself as a sale rather than a license.

© 1993 International Bureau of Fiscal Documentation

1. Computer software is a copyrighted article

The customer acquires in the software transaction the perpetual use of the software product but not any right to exploit the copyright underlying the software. The price paid by the customer is commensurate with the value of the use of the software not the use of the underlying copyright. Thus, the software coalition contends that the software transaction is similar to the sale of a copyrighted book. The software coalition notes that the tax law makes precisely this distinction between an interest in a copyright and a copyrighted article in the foreign sales corporation context; the temporary regulations provide that copyrighted software (as opposed to the copyright itself) constitutes export property eligible for benefits under the foreign sales company rules.[41]

In the software transaction, the software developer retains some control with respect to the software. However, the software coalition asserts that this retained control pertains to the underlying copyright rather than the copyrighted article. The customer receives the full right to put the copyrighted article, the software product, to its intended use. The license agreement simply preserves for the developer its full rights in the copyright and transfers to the customer only the copyrighted article.

2. The software transaction constitutes a sale

The determination of whether a transaction is a sale or a license for tax purposes depends on the substance of the transaction and not its form. Thus, the software coalition believes that the fact that the parties to a software transaction label the transaction as a license should not be dispositive for tax purposes. Moreover, a determination that the software transaction should be characterized as a sale for tax purposes will have no impact on the legal rights of the parties under the license agreement. For example, the IRS may recharacterize a finance lease as a sale, but this treatment by the IRS does not permit either party to claim that it is no longer bound by the terms of the lease.

The principles of Rev. Rul. 55-540[42] are applicable in characterizing the software transaction. The software coalition contends that, under Rev. Rul. 55-540, the following two factors are indicative of a sale: (1) the payment of an amount commensurate with the value of the property over an early and relatively short part of the property's useful life, and (2) the acquisition of the right to use the property in perpetuity. Notwithstanding variations in the delivery and pricing terms agreed to by the software developer and the customer, both of these factors are present in a software transaction: the price is a fixed amount which reflects the value of the software and is paid in a lump sum and the customer receives the right to use the software for its entire useful life. The specific transactions entered into by software developers and their customers are widely varied and complex; however, the two characteristics of payment of a lump-sum price and acquisition of the right to perpetual use are common to all end-user transactions. It is these common characteristics that are dispositive for tax purposes. Therefore, under Rev. Rul. 55-540, the software transaction should be characterized as a sale.

The software coalition further argues that the IRS applied the principles of Rev. Rul. 55-540 in this manner in a recent technical advice memorandum (T.A.M.) involving payments with respect to computer software. At issue in T.A.M. 9231002 (3 April 1992) was the treatment of income from extended maintenance contracts for computer software. Under these contracts, the software firm agreed to provide to the customer updates developed by the firm with respect to a software product that the firm had previously transferred to the customer. Like the software originally transferred to the customer, the updated version would be transferred pursuant to a license agreement. Although the transfers took the form of a license, the IRS concluded that the transactions should be characterized as sales under Rev. Rul. 55-540. Accordingly, the IRS ruled that the payments under the extended maintenance contracts constituted amounts received for a sale or other disposition for purposes of the Section 451 rules governing the treatment of advance payments.

The software coalition notes that the characterization set forth in the proposed ruling is consistent with the approach some courts have adopted for commercial law purposes. Software transactions have been treated as sales of goods for purposes of the Uniform Commercial Code (U.C.C.).[43]

The software coalition believes that its proposed treatment of the software transaction as a sale rather than a license is also consistent with the analysis of the essential elements of a license for other purposes of the tax law. In the context of both mineral rights transactions and trademark and franchise transactions (prior to the enactment of Section 1253), the analysis has focused on whether the transaction reflects a joint economic enterprise. A royalty payment reflects the transferor's continuing interest in the transferee's use of the transferred property; lack of this type of continuing interest is reflective of a sale rather than a license.[44] Because no such continuing interest or joint economic enterprise exists in the software transaction where the payment to the software developer is not based in any way on the profitability of the customer's use of the software, the software coalition contends that the transaction is properly characterized as a sale rather than a license.

In the software coalition's view, the characterization of the software transaction as a sale should apply for all federal income tax purposes. Thus, the implications of the proposed ruling will extend beyond the narrow withholding tax question. Moreover, even if the issue were limited to the withholding tax question, the issue is one of international significance which cannot be addressed solely in the context of the US–Canadian tax treaty negotiations.

E. *IBM's position*

IBM's analysis in opposition to the issuance of the proposed ruling focuses on the rationale for characterizing the transac-

© 1993 International Bureau of Fiscal Documentation

tion as a license for tax purposes. IBM also addresses the implications of the proposed ruling from a tax policy perspective.

1. The software transaction constitutes a license

The determination of the proper tax treatment of a transaction requires an analysis of the specific facts of the particular transaction. In the computer industry where the transactions engaged in by software manufacturers and their customers are widely varied and continually evolving, the development of a rule which has general application may be impossible and, in IBM's view, is imprudent. IBM believes that even the software coalition's preliminary analysis of the standard software transaction as a transfer of a copyrighted article is an oversimplification which places artificial importance on the fact that a physical copy of the software is transferred. In many transactions, the customer will not actually receive a physical copy of the software; rather, the software is electronically transmitted to the customer or is installed directly on hardware acquired by the customer. In other transactions, the customer receives a single physical copy of the software together with the right to make a fixed number of additional copies for its internal use. Alternatively, the customer may receive a single copy of software which is to be used on a network of computers. In such cases, the price is based on the usage of the software; even though the customer receives only a single physical copy of the software, the price paid will be very different from the price paid by an individual retail customer who acquires a single physical copy for use on one machine. The price of a copyrighted book – the paradigm copyrighted article to which the software coalition draws analogies – is not based on the number of users of the book over its life. Moreover, the focus on the physical software copy will become even less meaningful in the near future as electronic transmission becomes more and more prevalent in the software industry. Although IBM does not dispute that the physical software copy is a copyrighted article, IBM believes that the significant differences among software transactions even with respect to the most basic component, the physical software copy, demonstrate that the determination of the proper tax consequences must focus on the specifics of each software transaction as a whole.

The proper characterization of a transaction for tax purposes requires an analysis of the attendant facts and circumstances and where applicable the underlying contractual arrangements between the parties. Accordingly, a detailed examination of the ownership attributes held by each party to the transaction is required. IBM argues that the factors set forth in Rev. Rul. 55-540 and identified by the software coalition are not alone dispositive. No single attribute is determinative of whether a sale has occurred, and the relevant inquiry includes factors beyond those relied on in Rev. Rul. 55-540.[45] In IBM's view, the following attributes are particularly relevant in the context of a computer software transaction:

(a) the retention or relinquishment of control over the software product by the developer,
(b) the conduct of the parties with respect to the license agreement,
(c) the economic nature of the fee for the software,
(d) the allocation of economic risk and reward between the software developer and the customer, and
(e) the existence of tax-independent reasons for the form of the software transaction.

IBM contends that all of these factors support the conclusion that the types of pre-packaged software transactions it engages in should be treated as a license for tax purposes. IBM expressly limits its analysis to such transactions because of the important factual differences which make it imprudent to generalize about all software transactions.

Under the terms of the standard license agreement used in software transactions, the developer retains control over how the customer may use the software product. The customer may use the software on only one machine at a time, the customer may not lease or assign the software and the customer may copy or modify the software only in limited circumstances. Moreover, the developer retains title to the software. IBM argues that this retention of title and control by the developer is inconsistent with a sale.

Software transactions are universally cast in the form of a license. The software industry has been extremely diligent in pressing its rights both under the copyright laws and under the license agreements through which software is transferred. Moreover, corporate customers have become increasingly sensitive to avoiding violations of the license agreements through which they obtain software. IBM believes that the conduct of software developers and their customers is consistent with a license rather than a sale of the software product.

The fee paid in a transaction, even a one-time fee, is considered to be consistent with a license if the fee is solely for the use of the product. In the software transaction, the price paid by the customer reflects its right to use the software rather than its right to own the software. The value to the customer is in the actual use of the software and not in possession or ownership of a tangible physical copy. Although the customer acquires the right to perpetual use of the software, in IBM's view this "perpetual" use element is not particularly relevant in the context of computer software which can quickly become obsolete.

IBM further argues that the economic rewards with respect to the software lie principally with the software developer. The customer acquires only the right to the internal use of the software. The developer retains the economic profit potential associated with the transfer of the software to an unlimited number of other customers. The risks associated with the software also fall mainly on the developer who has borne the cost of developing and marketing the software and who must bear the risk that computer software piracy or obsolescence will reduce the future value of the software. The economic risk to the customer is limited to the loss of the price paid in the event that the software becomes obsolete.

Finally, IBM believes that the tax-independent reasons for structuring the software transaction as a license are compelling. The use of a license agreement is essential to the preservation of the developer's rights with respect to the

45. *Frank Lyon Co. v. United States*, 435 U.S. 561 (1978).

© 1993 International Bureau of Fiscal Documentation

copyright underlying the software. Indeed, the proponents of the ruling would not likely be willing to renounce the character of their software transactions as licenses for contract or copyright purposes in order to achieve sales treatment for tax purposes.

The analysis of a computer software transaction must necessarily take into account the specific rights transferred and retained by the parties. Despite the insistence of the software coalition, Rev. Rul. 55-540 cannot be viewed as requiring that every transaction involving a one-time charge and a perpetual term constitutes a sale. IBM points to General Counsel Memorandum (G.C.M.) 39580 (24 November 1986), in which the IRS considered a software transaction involving a perpetual term license and a one-time charge. The IRS concluded that the terms of the agreement were not consistent with a sale. Under the IRS's analysis, the rights retained by the transferor under the license agreement were sufficient to preclude the characterization of the transfer as a sale of either the copyrighted article or an interest in the underlying intangible. Moreover, contrary to the software coalition's criticism, the analysis in G.C.M. 39580 clearly distinguished between the copyrighted article and the underlying copyright, with the IRS concluding that neither was sold in the software transaction at issue.

Even if the analysis of the software transaction were limited to the two Rev. Rul. 55-540 factors identified by the software coalition, IBM insists that such factors would not support the characterization of a software transfer pursuant to a license agreement as a sale. The two factors which are considered by the software coalition to be indicative of a sale are (i) payment over a relatively short period of an amount approximating the price at which the software could have been purchased, and (ii) acquisition of the right to use the software for its remaining useful life. The price paid in a software transaction does not approximate the sales price for the same software. The price charged is based on the developer's assumption that it can prohibit unauthorized copying by the customer; if the developer were to sell the software it would forfeit control over copying and would have to be compensated for this risk. Moreover, unlike a customer that receives software under a license agreement, the *owner* of a software copy may be entitled to unlimited use of the software on a computer network; although software developers believe that the copyright laws prevent such use by the owner of a copy, the risk that such use would be permitted following a sale would require a higher price in the case of a sale. Thus, IBM concludes that the software coalition's analysis of the factors of Rev. Rul. 55-540 in the software context is based on a flawed factual premise.

IBM further contends that the IRS's conclusion in T.A.M. 9231002 that amounts received under an extended software maintenance contract constituted sales proceeds for purposes of the advance payment rules of Treas. Reg. § 1.451-5 is based on a similarly flawed premise. In applying Rev. Rul 55-540, the IRS assumed that the payments received by the developer under the maintenance contracts approximate the amount it would charge if it sold the software outright. That simply is not the case. Moreover, the IRS failed to take into account the ownership attributes retained by the software developer. Perhaps most importantly, the IRS in T.A.M. 9231002 expressly stated that its characterization of the payments as sales proceeds is applicable solely for purposes of Treas. Reg. § 1.451-5. The IRS specifically acknowledged that the payments may constitute royalties for purposes of other sections of the Code. Given the untenable position that a single transaction could be characterized as a sale for some tax purposes and a license for other tax purposes, IBM believes that T.A.M. 9231002 cannot be accorded much precedential value.

The other precedents relied on by the software coalition are similarly unconvincing to IBM. The fact that copyrighted software constitutes export property for purposes of the foreign sales company regulations does not address the issue of the characterization of the transfer of such software; indeed, export property may be the subject of a sale or a license. The fact that computer software transactions have been found by some courts to be subject to the provisions of the U.C.C. as sales of goods also should not be read to require an identical conclusion in the tax context. The U.C.C. has a specific purpose of modernizing and making uniform the law governing commercial transactions and its broad application is important to that purpose; the U.C.C. was not intended to have implications outside the commercial law context. Moreover, IBM believes that, at best, the U.C.C. case law is inconclusive since some courts have held that computer software licenses are not sales of goods subject to Article 2 of the U.C.C.

2. Issuance of the proposed ruling would not be sound policy

The transactions engaged in by the software industry are widely varied and highly complex. IBM believes that the simple fact pattern set forth by the software coalition in the proposed ruling is wholly inadequate to permit proper characterization of actual software transactions. An area where the facts vary from transaction to transaction and party to party is not the appropriate subject of a published ruling. The characterization of software transactions for tax purposes must be done on a case by case basis, with the focus on the particular facts rather than on broad generalizations.

Of even greater concern to IBM are the tax policy implications of the proposed ruling. A ruling that the software transaction is a sale would completely disregard the terms and conditions of the business arrangements agreed to by the parties to the transaction. The implications of a published ruling in which the tax characterization of the transaction is entirely inconsistent with the terms of the transaction could be far-reaching. The issuance of the proposed ruling would represent the IRS's blessing of a taxpayer's desire to assert one characterization for tax purposes while maintaining the opposite characterization for non-tax purposes. To date both the courts and the IRS have been unwilling to allow a taxpayer to disavow its form of a transaction in order to achieve more favourable tax consequences. To the extent the software coalition's real interest relates to the problem of Canadian withholding tax on income from software transactions, IBM believes that the issuance of the proposed ruling by the IRS is

© 1993 International Bureau of Fiscal Documentation

not the most sensible approach to the problem. Even if the IRS were to issue the ruling, there is no certainty that Canada and other foreign jurisdictions would take positions that are consistent. IBM concludes that the foreign withholding tax question could be better addressed directly through the bilateral treaty negotiation process.

Finally, and perhaps most importantly, the potential impact of the proposed ruling on the development of the intellectual property law with respect to computer software is extremely troubling to IBM. Software transactions are carefully structured as licenses in order to maximize the protection accorded to the underlying copyrights; treatment of the transactions as a sale for purposes of the intellectual property law would not be in the interest of any software developer. The risk that the characterization of the transactions as sales for tax purposes would have implications outside the tax law is unacceptable to IBM, particularly in a situation where the underlying tax issue could be dealt with more efficiently through other means.

F. *Evaluation of the competing positions*

In supporting their positions as to the proper characterization of the software transaction, both the software coalition and IBM struggle to fit the software transaction within the parameters of traditional tax analysis. However, each side is simply trying to fit a square peg in a round hole. The principal precedent that both sides focus on – Rev. Rul. 55-540 – addresses the sale versus lease issue rather than the sale versus license issue. Moreover, because of the unique characteristics of software and the transactions through which it is transferred, the determinative factors identified in existing precedents are not readily applicable in the context of the software transaction. By carefully tailoring the facts, each side is able to construct an argument that the existing precedents support its view as to the proper character of the software transaction. These competing analyses do not satisfactorily resolve the issue.

The proper characterization of the software transaction cannot be considered in a vacuum; the broader tax policy ramifications of a ruling that the software transaction constitutes a sale rather than a license must also be taken into account. IBM makes a very credible case that the software transaction should be characterized for tax purposes consistent with its legal and economic form – as a license. Consideration of all the implications, both for tax policy and beyond the tax law, weighs in favor of rejecting the proposed ruling.

As an initial matter, software transactions are continually evolving as new technologies are developed and the software transaction of the future will look less and less like the paradigm case of the sale of a copyrighted book. The current similarities between the software transaction and the traditional sale of a copyrighted article are disappearing and therefore should not form the basis for a published ruling as to the characterization of software transactions.

Software developers deliberately document the transfer of software in the form of a license agreement. This chosen form has important and substantial legal ramifications for both the developer and its customer. Where the form of a transaction is designed to achieve legitimate, non-tax objectives, the IRS generally should respect that form. Moreover, the parties that have chosen the form should not be permitted to disavow that form for tax purposes simply to achieve more favorable tax treatment. The software coalition is asking the IRS to declare that the software transaction will be treated as a sale for tax purposes in order to improve the software developers' tax position while the same transaction will be treated as a license for all other purposes in order to protect the software developers' valuable intangibles. The IRS should not lightly take such a step.

Finally, the tax savings that the software coalition envisions will arise from a ruling that the software transaction constitutes a sale may carry a very high price tag. Such a ruling would not go unnoticed by those engaged in litigation over the intellectual property rights associated with computer software. An IRS ruling characterizing the software transaction as a sale will likely have implications outside the tax law, implications which will undercut the intellectual property protections that the software industry has long fought for. The software industry should carefully consider whether the proposed ruling is really in its best interest.

IV. CONCLUSION

The debate over the proposed ruling characterizing the transfer of computer software as a sale rather than a license for tax purposes has been simmering for a year and a half. The software coalition has submitted to the IRS detailed arguments supporting the proposed ruling and IBM has submitted equally detailed arguments in opposition to the ruling. However, the IRS has yet to act.

To the extent that the purpose of the proposed ruling was to influence Canada to take a similar position with respect to computer software royalties earned in Canada, the ruling may no longer be necessary. Canadian finance officials recently announced their willingness to eliminate by tax treaty the withholding tax imposed on payments to non-residents for the use of computer software in Canada. Thus, the software coalition may have realized its goal of eliminating the Canadian withholding tax on computer software transfers to Canadian customers without resorting to an IRS ruling that would universally characterize the software transaction as a sale.

Indeed, the use of tax treaty provisions to eliminate the withholding tax on computer software transfers may be the best route for achieving the broader goals of the software coalition while avoiding the legitimate concerns raised by IBM with respect to the proposed ruling. The tax authorities can narrowly address the tax treatment of payments for computer software transfers through carefully drafted treaty language without being required to take a position with respect to the proper characterization of the underlying transaction as a sale or a license. This route avoids the risk that the proposed ruling's characterization of software transactions as sales would impair the intellectual property protection afforded by structuring such transactions as licenses. Perhaps the interests of the software coalition would be best served by redirecting their efforts toward the treaty negotiation process and abandoning the controversial proposed ruling.

I. INTRODUCTION

The purpose of this article is to summarize, evaluate and report on the existing professional and research literature on what tax audit strategies are likely to be most effective in enhancing tax compliance. In compliance research, especially survey research, definitions are of critical importance. This is true when comparing research that originates in one country, but even more so when transporting research findings from one country to another. It is possible to define "compliance" in a number of ways. For instance, "voluntary compliance" composes specific compliance (i.e. future voluntary compliance arising from a specific audit) and general compliance (i.e. future voluntary compliance arising from the existence of an audit programme).

In the United States, the Internal Revenue Service (IRS) is most concerned with the filing of an accurately completed, timely and fully paid return. The Panel on Taxpayer Compliance Research (Roth, Scholz and Witte, 1989, p. 2) adopted a definition of compliance implying no assumptions about taxpayers' motivations:

> Compliance with reporting requirements means that the taxpayer files all required tax returns at the proper time and that the returns accurately report tax liability in accordance with the Internal Revenue Code, regulations, and court decisions applicable at the time the return is filed.

Another type of compliance exists in terms of collecting additional tax detected through audit. In other words, this is "compliance" in the sense that the taxpayer was made to comply in that instance.

This article is structured as follows. In Part II, research into whether audits encourage voluntary compliance is reviewed. Part III reviews research on audit types, strategies and features which are claimed to be most effective in detecting non-compliance and assessing additional tax. Some overall conclusions are then made in Part IV.

II. THE EFFECT OF AUDITS ON TAXPAYER COMPLIANCE

The interdisciplinary nature of this type of research has a number of implications to a review such as this. First, it is important to compare like with like. For this reason, the review separately analyses the major types of research. Conclusions from each of these respective areas can be outlined and compared, although the inherent limitations of these research areas must also be noted. This enables overall findings to reflect inherent trade-offs between differing research methods. The breakdown used in reviewing the literature in relation to whether audits encourage voluntary compliance is as follows:

1. *Analytical (Economic Deterrence) Models* – These have drawn upon the economics of crime literature and assume a utility maximizer, an amoral "rational economic evader" who assesses the likely benefits and costs associated with evasion behaviour.

2. *Regression Modelling* – These econometric studies typically draw upon large US data bases such as the IRS Taxpayer Compliance Measurement Program, for analy-

© 1993 International Bureau of Fiscal Documentation

sis. As such, they do use aggregate "actual data", normally to test propositions derived from the models formulated in 1. above.

3. *Experimental Studies* – These studies test propositions from analytical models, but in a controlled laboratory setting, which models the tax reporting process. Parameters such as the tax rate, the probability of audit and the penalty rate can be manipulated to identify the effect of such changes on future compliance.

4. *Survey Studies* – Survey work is valuable as it identifies taxpayers' actual perceptions and attitudes about relevant variables. Occasionally, ex-post self-reported non-compliance is identified, although future intentions to comply (or to evade) are normally not measured in survey research - indeed such measurements would probably not be reliable.

5. *Professional Literature* – This includes accounting and law journals and periodicals specific to the tax profession. These journals (and sometimes conferences) involve an interface between researchers, practitioners and revenue authorities.

In a sense, the first category above, analytical models, represents *theoretical statements* about audit effectiveness and audit strategy. The next three categories collectively comprise the research that tests these theoretical predictions. The last category is one which is usually not a formal test of a theory, but the professional literature is still valuable. First, it represents reality in that practitioners are involved in the actual practice and conduct of audits. The importance of practitioners in encouraging voluntary compliance has only been realized and subject to serious research over the last decade. Second, there is an interface between research and practice, so that they both influence each other.

A summary of the review findings then follows in Part II.F. The summary addresses four specific issues:

(1) the impact of specific audits;
(2) the impact of a general audit presence in the community;
(3) taxpayers' perceived coverage rates;
(4) direct revenue effects.

A. *Analytical studies*

These models incorporate the concept of an economically rational taxpayer (or evader) who will evade tax as long as the pay-off from evading is greater than the expected cost of being caught. Allingham and Sandmo (1972) proposed a seminal economic deterrence model based on the expected utility function of the taxpayer who evades.[1] This model incorporates several aspects. First, the taxpayer has some level of risk aversion, the more risk averse the taxpayer is, the less likely (s)he is to evade taxes. Second, the taxpayer needs to have knowledge regarding the tax system in order to assess the probability of being detected and the extent of the penalties that may be incurred upon detection. Allingham and Sandmo prove that increasing the probability of an audit unambiguously reduces evasion.

Early economic models have drawn criticism for a number of reasons. Graetz and Wilde (1985) stated that the models were too simple, as they ignored the interrelationship with the revenue authority. Lewis (1982a, p. 132) reports that:

> the central frame of references should be what taxpayers' perceptions actually are rather than what they are assumed to be on the basis of rational and self interest assumptions .... [T]he decision to evade tax is based on an individual's perception of the chances of being caught, the size of the fine and tax rates, not on what they actually are.

In addition, apart from the parameters listed in the above quotation, there may be other psychological and sociological variables affecting perceptions and attitudes, and eventually, actual evasion behaviour. Graetz et al. (1986, p. 2) stated that even as a purely economic model, expected utility theory's exclusive focus on the individual taxpayers' decision-making promotes "an unduly restrictive vision of the compliance problem and potential responses to it". They state "an inadequate theoretical construct may both distort empirical analyses and imply unhelpful policy responses".

Extensions to the early models counter some of the criticisms. For instance, Alm (1988) analyses the joint choice of evasion and tax avoidance and concludes that the existence of another avenue of tax minimization alters the conclusions of some simple evasion models (i.e. if evasion penalties increase, taxpayers may turn to avoidance). This is of course true to the extent that evasion and avoidance are substitutes. Government policies to reduce evasion may not always increase the tax base if avoidance behaviour is possible and its cost is not prohibitive. The speed and spread of responsive avoidance behaviour and the search for new avoidance techniques may be another factor affecting the tax base. Of course, in practice substantial avoidance techniques may not always be available, e.g. as is now the case in New Zealand.

Beck and Jung (1989a) also extend previous economic models by incorporating uncertainty about taxable income and the associated liability. They make a number of interesting findings to be empirically tested in the future:

(1) Unless taxpayers are highly risk-averse, an increase in post-audit income uncertainty is much more likely to lead to a reduction in reported income.[2]
(2) Taxpayers' incentives to purchase tax advisory services as a means of reducing uncertainty are shown to depend on the audit probability and ordinary and penal tax rates. Increasing the audit probability will not necessarily lead to increased use of these services.

1. This expected utility function is expressed as:
$E(U) = (1-p)U(W-QX) + pU(W-QX-a(W-X))$
Where:
U = cardinal utility
p = probability of investigation
W = actual income (known only to the taxpayer)
Q = tax rate
X = declared income
a = penalty rate (a is assumed > 0)

2. One should note that post-audit income uncertainty, should normatively speaking, decrease and not increase.

© 1993 International Bureau of Fiscal Documentation

(3) The effects of tax rate changes depend on taxpayers' risk-taking attitudes and have an indeterminate effect upon reported income.
(4) Taxpayers' reporting decisions are identical under both progressive and proportional rate structures.

In summary, both early analytical models of evasion and recent extensions to them find that increasing the probability of audit encourages taxpayer compliance. Recent work suggests that if there is some uncertainty about the audit probability, then this will likely result in less aggressive reporting. This suggests a rationale for a tax agency not to fully disclose information relating to its audit strategies.

B. *Regression modelling of aggregate US data*

After the development of the analytical models reviewed in the preceding section, researchers were keen to empirically test their propositions. Empirical studies into tax law enforcement in the United States have greatly benefited from the Taxpayer Compliance Measurement Program (TCMP) and Exact Match File which allowed progress in this area.

With the assumption of a random audit strategy as an inexact but reasonable first approximation to true audit policy, Witte and Woodbury (1985) and Beron et al. (1988) both found that tax audits can be important stimulants to compliance, but these must be carefully designed for specific taxpayer groups. Witte and Woodbury note that the compliance effect is most significant on small proprietors, but only very small, although significant, on the compliance of middle income and wage earners.[3] They comment that the decline in audit rates in the United States in the 1970s could have accounted for a substantial portion of the decline in compliance during that period; and they state (at p. 8): "Our results certainly suggest that increased audit rates could have an important and salutary effect on voluntary compliance .... [O]verall audit rates have a lagged effect on compliance."

The findings of Dubin and Wilde (1988) generally support Witte and Woodbury and an economic approach to the compliance problem. They suggest (at p. 70) that different models of IRS behaviour may apply to different audit classes.

Beron et al. (1988) find that audits are more effective at inducing accurate reporting of deductions rather than income reporting, and suggest that significant compliance effects also stem from other policing activities such as matching procedures, checking for errors, the provision of information and educational programmes, pursuing tax in arrears and taking penal action, e.g. civil and criminal prosecutions. Several reasons are given for not finding consistent deterrent effects of audits, not least being the non-disclosure of the IRS's audit selection policy to academic researchers and also some inherent problems in model specification. The non-disclosure of audit policies on individual returns has meant that researchers have had to calculate audit probabilities themselves (from the aggregate data supplied) without knowing the reason for the audit. This makes it difficult to test the effects of one audit strategy against another audit strategy.

Klepper and Nagin (1989b) also use TCMP data to find marked variations in compliance levels according to the line item in the tax return and the difficulty of establishing non-compliance and penalty imposition for those line items. It is now widely recognized that research into attitudinal variables on compliance must explicitly consider and control the opportunity to evade, which may vary for different line items in tax returns.

Dubin, Graetz and Wilde (1990) return to this issue using more recent data – the studies above used 1969 data. Specifically, they note the drop in audit rates over 1977-1986 (individuals down 2.5 to 1 percent and companies down from 9.5 to 3 percent). This corresponded to a natural consequence of the budget policies of the period and also to a policy of substituting third party information reporting with increased IRS matching and penalties.[4] They estimate that self-reported taxes would have been US$ 15.6 billion higher in 1986 (about 4 percent of total reported taxes) had the audit rate remained constant at its 1977 level. They conclude:

> Our results corroborate the central role of audit rates in the revenue collection process. The impact of the decade long fall in audit rates on tax collections seems to have been serious indeed. A budgetary practice of including IRS audit personnel within a general political philosophy limiting the desired size of government agencies is enormously costly. Additional dollars spent on tax audits appear to have substantial marginal productivity....

In summary, the results of regression modelling research indicate that there is a deterrent effect to audits and that for most classes, audits have positive effects on compliance. However, these findings must be interpreted with caution. There are inherent problems in model specification which influence the results found, and Beron, Tauchen and Witte conclude that economists' understanding of the effects of audits is not very thorough.

Long and Burnham (1990) do not share the views of Dubin, Graetz and Wilde. They believe that given an audit programme is in place, it is hard to determine what the effects of varying detection probabilities are, due to changes in other enforcement resources (p. 756). They comment the IRS itself concluded "indirect revenue effects are very difficult to measure, we do not currently have estimates of them". This is discussed further in Part II.E. on professional literature.

C. *Experimental studies*

Experimental compliance studies are slightly different from regression models using large data bases, but as a group, experimental studies are similar in design. In a controlled laboratory setting, conditions are set up to mirror the tax reporting situation. That is, each subject receives an income and must decide how much to report. Taxes are paid on reported income only, but underreported income may be discovered with a certain probability of audit, in which case the subject must pay specified fines. At the end, subjects normal-

3. Possibly middle income wage earners are an already compliant group and one would not expect to find large significant effects on such a group.
4. They do not appear to control for changes in the tax and economic environment over the decade.

© 1993 International Bureau of Fiscal Documentation

ly receive a reward for their participation, conditional on their performance.

The parameters studied in experimental studies have traditionally been those used in economic deterrence studies (see above "Analytical Studies"). These can be manipulated with relative ease. The first study by Friedland (1978) examined responses to changes in tax rates, penalties and frequency of audits. Some of the earlier studies can be criticized on the grounds that their parameters, e.g. audit and penalty rates, were unrealistic.[5] In recent times, researchers have attempted to maintain "parallelism" with real world settings and have used "neutral" instructions. Many studies use student subjects which could potentially be of concern; however, responses from students have been shown to be similar to responses from other subject groups. The results from laboratory experiments must be interpreted with caution, especially in making generalizations about their results.

James Alm, a leading experimental researcher (1991, p. 584) has reviewed earlier experimental work and suggests:

1. Individuals report less income as the tax rate rises.
2. An increase in the penalty rate increases compliance.
3. More frequent audits encourage greater compliance.
4. Many individuals overweight the probability of audit, behaving as if the probability is higher than it actually is.
5. Compliance is reduced when individuals feel that they are treated unfairly relative to others, regardless of the source of the inequity (from the tax or the expenditure side).
6. The compliance decision is made jointly with the labour supply decision.
7. Individuals pay more in taxes when they receive something for their tax payments.
8. Compliance can be encouraged with rewards as well as penalties.
9. The institutions that determine the use of tax payments affect compliance. Individuals pay more in taxes when faced with a public programme that they select and that they know enjoys widespread support.
10. The introduction of uncertain tax policies increases compliance in the absence of government expenditures and decreases compliance in their presence.
11. A tax amnesty lowers post-amnesty compliance if the amnesty is not well designed.
12. Some individuals pay taxes because they believe that cheating is wrong.

Alm, McClelland and Schulze (1992) find that subjects tend to overweight the low probability of audit, resulting in the payment of more taxes than expected utility theory would predict. For instance, they found that even with a zero probability of audit, there was an average of 20 percent compliance in their experiment (expected utility theory would predict zero compliance). Alm et al. conclude (p. 36):

> In short, individuals exhibit a remarkable diversity in behaviour. They sometimes appear to overweight low probabilities, they sometimes appear to be risk-seeking, they are on occasion cooperative, and at other times they are free-riders. Whether any theory of compliance can be developed to explain such behaviour is unknown at present. However it is apparent that some new theory is needed.

Alm, Jackson and McKee (1992) also confirm that taxpayer reporting increases with greater audit and penalty rates, although they find that the increases are not large (an elasticity of 0.17) and "... given the difficulties in raising the audit rate significantly, the scope for increased compliance via increased audits seems limited".

In summary, it is generally accepted that in experimental settings, subjects who have been audited report greater post-audit compliance. Again, caution must be exercised in interpreting the research findings. First, to ensure that the conditions of the relevant experiment closely follow accepted research methods. Second, the magnitude of the effect of audits on compliance ranges widely.

D. *Survey studies*

Following the work of Vogel (1974) and the call of Lewis (1982a), numerous studies have collected survey data on tax evasion behaviour. The majority of these studies have been conducted in the United States, although survey data has also been collected in Sweden, Norway, the Netherlands, Australia and New Zealand.

Many studies have reported on the frequency with which respondents self-report cheating behaviour. Analysis following such surveys concentrates on what demographic and attitudinal variables are significantly (statistically) related to admitted cheating behaviour. A summary of these studies is given in Table 1, and shows wide variations in self-reports. In some studies audits were a significant correlate, although in other studies, no associations were found between previous audits and evasion behaviour.

Survey results should be interpreted cautiously. First, it is important to ensure sampling error and non-response bias is minimized. Second, differences across studies may be attributed to differences in the way taxpayers were sampled, differences in the wording or definitions used in survey questions, and when the survey was conducted.

Despite these comments, surveys are potentially very useful if they are representative of the taxpayer population, although they can be very expensive in terms of time and money. Accordingly, academic researchers have traditionally only been able to complete small-scale surveys, typically based in overseas countries.

Kinsey (1990) uses cross-sectional survey data to examine the effects of enforcement contacts made by the IRS on taxpayer sanction perceptions, the perceived fairness of tax laws and future intentions to cheat on taxes. On the future intention to cheat, she finds that the net effect of personal contact (with the IRS) is greater willingness to comply with the law.

The analysis included the outcome of the audit (paid more or did not pay more tax), and those respondents assessed additional taxes were more likely to plan to file fully compliant returns in the future. This group also reported higher sanction

5. Chang et al used audit rates of 10, 50 and 90% with implied penalty rates for these three cases, respectively being 900, 100 and 11%.

© 1993 International Bureau of Fiscal Documentation

perceptions and gives evidence of both deterrence and experiential effects among tax non-compliers contacted by the IRS about possible problems with their returns.

Table 1
International Statistics of Admitted Tax Evasion

Country	Time Period	Level of Evasion	Author
US	1974	33%	Spicer (1974)
	1975-1980	12%	Tittle (1980)
	1977	5.3% (OD)* 14.5% (UI)*	Mason & Calvin (1978)
	1981	24.7%	Grasmick & Scott (1982)
	1978	32%	McCrohan (1982)
	1982	14%	Rossi and Grasmick (1985)
	1984	20%	Yankelovich Skelly & White (1984)
	1987	28% (UI)	Porcano (1988)
Sweden	1969	16.4% (OD) 17.7% (UI)	Vogel (1974)
	1979	33%	SIFO (1979)
	1981	18.6%	Warneryd & Walerud (1982)
Norway	1980	18% (UI)	Isachen, Klovand & Strom (1982)
Netherlands	1981-1982	27%	Elffers Weigel & Hessing (1987)
Australia	1982	25% (UI)	Wallschutzky (1984)
New Zealand	1989	23% (UI) 12% (OD)	Hasseldine (1992)

Notes:
* (OD) = Overstating Deductions
* (UI) = Understating Income

Her study also included vicarious enforcement efforts and she suggests that the diffusion of tax information about instances of apparently unfair enforcement may persuade previously honest tapayers to join the ranks of non-compliers.

Kinsey's survey study is significant and unique because of its rigorous and in-depth focus on this topic. The essence of her conclusion is that future intentions to comply are influenced by the outcome of the audit, i.e. the effectiveness of the IRS in detecting non-compliance. That is, those who have paid more taxes perceive a greater probability of detection and intend to comply, whereas those who have been non-compliant in the past lower their perceptions of certainty and continue past habits. Further, the results for vicarious contacts suggest little deterrence effects – that is, respondents talk more to others about fairness (e.g. arbitrary decisions and rude treatment) than the effectiveness of the IRS.

E. *Professional literature*

The Report of the 1989 Peat Marwick Professors Symposium considered that innovative uses of computer technology could enable the the IRS to enhance the quality and efficiency of their audit programmes. They did note that the effect of uncertainty (e.g. audit probability) on compliance remains an important question.

The publication of journals like the *Bulletin* and *Tax Notes* allows rigorous academic research to be published in the professional domain. For instance Dubin, Graetz and Wilde (1987) state: "in our judgement, the dramatic diminution of IRS' audit capacity has been a massive policy mistake".

A contrasting view stems from Long and Burnham (1990) who believe that it is highly unrealistic to think that tougher enforcement of the current tax law can have a significant impact on the deficit, querying whether the TCMP accurately measures non-compliance at all! They believe that the major cause of the "tax gap" is complexity and ambiguity in tax requirements and not dishonest taxpayers. They comment (p. 756):

> The lack of any clearly observed evidence of deterrence perhaps may be explained by the fact that many of the cases of non-compliance that IRS auditors detect appear to have arisen because of a misunderstanding of tax requirements or uncertainties about how these requirements should be applied. It seems doubtful that doubling or tripling the audit rate would have much impact on these problems. In addition, as we previously saw even when the return of someone who deliberately cheated is audited by the IRS the agency rarely requires more than the payment of the taxes it claims have been misreported, plus accrued interest. Furthermore, the IRS is unlikely to detect all of the unreported income if the taxpayer has made a deliberate effort to keep the sources hidden. Thus, even when audited, the calculating tax cheat seldom is worse off than if he or she had reported the correct amount in the first place. Some deterrent!

In Australasia, a Tax Compliance Intensive Weekend Workshop was held in August 1989 and the work of Professor Ian Wallschutzky (1988, 1989, 1991, 1992) is also notable.

F. *Summary of specific issues*

The next four subsections will synthesize research in four sub-areas of whether audits affect compliance. Because of cross- country differences in social norms and conduct, it is important to view some of these with caution especially the section on coverage, rates, etc. where not only are we dealing with different taxpayers, but also with a different tax authority and socio-legal structure.

1. The impact of specific audits

On balance, across the four differing methods contained in this section, the research literature suggests that specific audits do improve compliance behaviour, as they contain both an education and deterrent effect. This is subject to two

© 1993 International Bureau of Fiscal Documentation

qualifications. First, it assumes that the taxpayer's group or audit class does not already have a high voluntary compliance level. For example, the compliance of middle income wage earners is unlikely to improve due to a specific audit, as they are already acknowledged as one of the most compliant groups. Second, it assumes that audits are carried out competently and unreported income is detected and assessed with penalty.

2. The impact of a general audit presence

Research accepts that there should be a general audit presence in the community. The issue is how large should the presence be? Opinions differ here with some research stating that audit activity should be increased and others saying there are more effective methods, or at least that the IRS can select audit cases better. Because of the "ripple effect",[6] it is again important that audits be conducted not only effectively but also fairly. There is an implicit acceptance among researchers that a revenue authority should not publish their specific audit strategy, but rather promote the view that a variety of factors may lead to audit. Interestingly, in the United States, taxpayers who might rate highly for audit attention will be given a "second chance", and be sent a "self-audit" checklist by the IRS.

3. Taxpayers' perceived coverage rate

Survey and experimental research indicates that individual taxpayers often overestimate the audit coverage rate (see Alm (1991)). Whether businesses share this view is unknown. As the probability of detection does influence taxpayer behaviour, it is in the best interests of the revenue for the audit rate to be made to seem as high as possible. Hasseldine and Kaplan (1992) found that 24 percent of their New Zealand respondents (drawn from electoral rolls) reported having been audited by the New Zealand Inland Revenue Department, although as the authors did not define the term "audit", a letter from a district office querying an item may have constituted an "audit" for some people.

4. Direct revenue effects

Of these four specific areas, this has been the least researched. Of course the direct revenue effects in terms of tax collected are dependent on case selection and the auditor's expertise. Two opposing views are shared by prominent researchers. Dubin et al. believe that audits have large direct and indirect revenue effects. Long and Burnham dispute this view. Accordingly, no firm conclusions can be made on this issue.

III. EFFECTIVE AUDIT STRATEGIES

The breakdown used in reviewing the literature in relation to the audit types, strategies and features most effective in detecting non-compliance and assessing additional tax is as follows:

1. *Theoretical Predictions* – This largely draws on a sub-part of the economic deterrence models discussed in Part II.A.
2. *Research Tests* – There has been little research conducted on the effectiveness of specific and pure audit "strategies". Rather the effect of withholding position and positive approaches to compliance have been canvassed more fully in the research literature and these are summarized here.
3. *Professional Literature* – Practitioners and revenue authority officials often share their views on effective auditing in professional journals.

A. *Theoretical predictions*

Extensions to the analytical models discussed in Part II.A. by a handful of researchers have concentrated on the existence of an optimal enforcement policy. Tauchen and Witte (1986, p. 40) note that even in simple multi-period models, developing an optimal audit policy is problematic. An audit strategy based on a taxpayer's previous history of evading achieves a higher level of compliance at the same cost as a random audit policy.

One of the most readable books for policy-makers on the economics of evasion is by Cowell (1990), who outlines an analytic framework for evasion decisions and points out how important the fundamental choice is between threats and thoroughness. Whether one emphasizes either the audit enforcement effort or the penalty regime is related to whether evasion is to be eliminated, or merely curbed to ensure that a government's budget constraint is met. A policy response to evasion is closely related to government's wishes for the actual role of the revenue authority, i.e. a revenue maximizer in terms of dollars or coverage of the population. If equality between taxpayers is to be preserved, attention should focus on audit enforcement rather than on the use of large penalties.

There are also several recent interactive theoretical models specifically related to tax enforcement which significantly extend the economic deterrence models discussed in the preceding section. Graetz et al. (1986) develop a model which explicitly integrates the relationship between the taxpayer and the revenue authority (assumed to have a revenue maximizing function over time) and considers the normal parameters found in the general economic deterrence models. Beck and Jung (1989b) also develop a model of the interplay between taxpayers' reporting decisions and tax audit policies under environmental conditions of uncertainty and information asymmetry. They state (p. 482):

> Our major conclusions are that increases in penalties, the tax rate, and tax liability uncertainty diminish taxpayers' reporting aggressiveness when penalties are proportional to the tax deficiency and transferable to the tax agency.

The fact that some of the relationships found by Beck and Jung depend on the underlying penalty structure has policy implications in the areas of tax penalty formation and efforts to simplify the tax structure.

Scotchmer and Slemrod (1989) show that optimal enforcement policy requires some randomness in the assessment of taxable income whenever reducing randomness is costly. One interesting result of their paper, which contrasts with

6. This "ripple effect" may be positive or negative.

© 1993 International Bureau of Fiscal Documentation

Graetz et al. (1986), is that tax collection agencies should not necessarily maximize revenue, but should maximize taxpayers' expected utility which will require a different view of randomness.

B. *Research tests*

There appears to have been little empirical research specifically conducted on audit types, strategies and features most effective in detecting non-compliance and assessing additional tax. Most of the literature on this topic seems to relate to the experiences of various revenue authorities around the world which provide a description of their enforcement efforts. One of the most commonly accepted strategies in encouraging compliance is to promote the use of withholding in the tax system, and although this is a little unrelated to audit per se, the use of such a system does of course have implications for audit policy. Another approach advocated by some authors is for revenue authorities to embrace "positive approaches" to tax compliance.

Hasseldine and Bebbington (1991) assert that policies covering both economic and psychological responses may be implemented and merit consideration by tax authorities. In this regard, legal sanctions would represent an economic variable whereas informal sanctions and appeals to conscience represent psychological responses. While research exploring the effect of formal sanctions on compliance has been relatively extensive (e.g. probability of detection and monetary penalties), less attention has been given to psychological responses.

Under standard economic deterrence models, the taxpayer's decision is based upon his/her beliefs about the probabilty of detection and legal penalties, if detected. Note that the taxpayer's decision is not driven by the actual probability of detection or the actual legal penalties. These models suggest that changes in the taxpayer's knowledge of tax system variables, such as formal economic penalties, will affect the taxpayer's decision on whether to evade or not. Educational programmes directed at taxpayers represent one source for this type of knowledge, although this information could also stem from other sources.

Among a group of US taxpayers, Violette (1989) recently found that a communication describing formal, legal sanctions increased compliance to a hypothetical tax scenario. A limitation of general deterrence theory is its unwarranted emphasis on economic variables such as the threat of legal sanctions. Similarly, Kinsey (1984) concludes that informal sanctions in the form of social stigma are an important factor in deterring deviant behaviour and may have applications to tax compliance. Freiberg (1990) contends that informal social sanctions have been under-utilized and should be considered as an avenue for improving tax compliance behaviour.

Grasmick and Scott (1982) contend that policies that increase the public's sense of moral duty to comply should be the most effective strategy for improving compliance, although they note such an approach may be difficult to implement as a national policy. Foremost among these reasons is that a moral appeal might be interpreted as a sign that authorities have no other way to extract compliance (Rossi and Grasmick, 1985). Implementation problems aside, an important initial question concerns whether communications of a moral or conscience nature are likely to influence compliance behaviour. Rossi and Grasmick (1985) also caution that such appeals may be limited to the extent that taxpayers have strategies to "neutralize" any guilt feelings.

Hite (1989) tested a positive approach to conscience appeals in the form of a public education programme, finding that an approach which emphasized free IRS services available to taxpayers did influence non-compliant respondent's opinions about the helpfulness of the IRS. She concludes that tax administrations should place greater emphasis on positive strategies.

Hasseldine and Kaplan (1992) compare responses from taxpayers receiving an appeal to conscience to responses from taxpayers not receiving such an appeal. An appeal to conscience, unlike legal or informal sanctions, does not impose penalties, but instead is intended to influence the taxpayer's evaluation of the equity of the taxpayer's exchange relationship with government. Because the prior two approaches only apply penalties, they are not expected to influence taxpayer beliefs. On the other hand, an appeal to conscience, because it may influence perceptions of equity, is expected to influence taxpayers' beliefs. Equity has been often cited as an important contributor in evasion decisions (Falkinger, 1988; Kaplan and Reckers, 1985).

The results of Hasseldine and Kaplan (1992) demonstrate that the communication of informal sanctions to taxpayers may result in higher tax compliance. However, the communication of existing legal sanctions for tax evasion in New Zealand or of a conscience appeal did not significantly result in improved hypothetical compliance. In contrast with Violette (1989), the group receiving the informal treatment were more likely to comply than those subjects receiving the legal communication of economic sanctions currently applicable in New Zealand. This reinforces suggestions made by researchers that more attention should be given by policymakers to methods other than the communication of existing legal sanctions to increase tax compliance. However, for taxpayers with prior experience in receiving "cash income", the use of legal sanctions may remain appropriate.

Unlike Schwartz and Orleans (1967) and Grasmick and Scott (1982), the conscience appeal did not significantly affect hypothetical compliance, although it was successful in increasing beliefs about the immorality of evasion behaviour. That is, the views of the morality of evasion appear to be pliable. This change of beliefs may have long-term benefits for a tax system that are not expected with other approaches using the threat of deterrence as a mechanism to extract compliance.

C. *Professional literature*

In an article in *Tax Notes*, entitled "Lower audit rate doesn't mean less scrutiny", IRS officials comment that although the use of audits is on the decline, they are still scrutinizing

© 1993 International Bureau of Fiscal Documentation

returns carefully. That is, the IRS is turning to more positive approaches and to the use of matching techniques to encourage compliance. Melia (1987, p. 1316) in his review of the Massachusetts state experience sums it up nicely:

> Tax administrators must realize that all taxpayers are different and respond out of different motivations. Some respond from fear of audit, some from guilt over failing to perform a basic obligation as a citizen and others out of gratitude when their government offers an amnesty or finally prints a tax form in plain English.

He believes any strategy to improve voluntary compliance must have three key elements: the stick (threat and reality of punishment), the carrot (valuing honest taxpayers with respect) and the conscience (a public education programme that spreads the message that evasion is a serious crime that picks the pockets of honest taxpayers and undermines the ability of all levels of government to perform their role).

IV. OVERALL CONCLUSIONS AND LIMITATIONS

One obvious limitation or caution of this article is that care must be taken in transporting the findings of international research into other countries where there may be subtle and not so subtle differences in the tax regime and social culture. This is why authors such as Lewis (1982) and Jackson and Milliron (1986) have called for further international studies in the tax compliance area.

Research strongly suggests that people who are audited are more likely to comply than those people who have not been audited. In addition, a general audit presence has a deterrent effect. So an audit programme should be an integral part of efforts to encourage compliance. Because it is taxpayers' perceptions that are important in compliance decisions (even if it is perceptions of economic variables), a communications strategy must also be a crucially important input into efforts to increase voluntary compliance.

Theoretical research predicts that audits which are targeted to some audit class (e.g on the basis of profession, age, gender, income, etc.) will stimulate compliance more than a simple random auditing rule. A concern of this is that there has been little empirical research into the effects of different audit strategies. Nor are there any clear published guidelines on how to develop audit classes, although there are probably many officials in revenue authorities around the globe, with their own entirely valid beliefs in this respect. Research into the uncertainty effects of audits is continuing and clearcut conclusions are not easy or indeed feasible.

Many now agree that audits should not be used in isolation. This is because as only a small percentage of taxpayers can be audited, it is inefficient as a sole mechanism to improve voluntary compliance. Rather, other measures such as taxpayer information and education, tax simplification, information reporting and the use of informal sanctions may significantly affect actual compliance decisions. Accordingly, it is suggested that revenue authorities should maintain a general audit presence, but alternative and complementary approaches designed to encourage compliance (e.g. positive approaches) should be examined. Research in the United States strongly suggests that the withholding position at tax preparation time and the influence of tax preparers are key variables in such decisions.

There is a sense of trade-off between the conclusions from the two broad areas of this review. Audits do reduce evasion, but they must be used in conjunction with other methods. High audit rates are probably a phenomenon of the past.

THE TAXATION OF PERMANENT ESTABLISHMENTS

The most in-depth and comprehensive treatment of the practical and theoretical aspects of permanent establishments available.

A commentary section, written by leading international tax experts, offers explanation and analysis of international tax law provisions.

Country chapters by local specialists give full information on the establishment and operation of permanent establishments in developed countries:

- Description of resident and non-resident tax liability.
- Definition of 'permanent establishment' in national law and tax treaties.
- Practical aspects of setting up a permanent establishment.
- Details of the tax treatment of permanent establishments: taxation of income, avoidance of double taxation and setting off of losses.
- Items of special interest from a practical and/or theoretical viewpoint.
- Principle differences between inward and outward investment via a permanent establishment and operation via a subsidiary.
- Taxation of personnel.

Chapters on EC Member States also include the effect of EC tax measures.

One volume, to be updated twice a year. 1993 subscriptions are inclusive of 1993 updates and supplements (which will include additional country chapters as the book expands: in due course virtually all OECD countries will be included).

Special introductory price up to 1 September 1993: 950 Dutch Florins
(Full price: 1,200 Dutch Florins)
Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

INTERNATIONAL:

ISSUES RAISED BY INTERNATIONAL COOPERATION IN REVENUE ENFORCEMENT: DIRECTIONS FOR THE FUTURE[1]

Vicki L. Beyer

BA (Nebraska), MA, JD (Washington); Assistant Professor of Law and Co-Director Asia-Pacific Law Institute, Bond University, Queensland, Australia; Assistant Editor, CCH Japan Business Law Guide.

I. INTRODUCTION

The established rule in international law is that no State will enforce the revenue laws of another State.[2] In these days of overseas investment and multinational corporations, this "principle of sovereignty" has the potential to promote tax avoidance. It makes tax enforcement extremely difficult where the taxpayer or his affairs are outside the jurisdiction. Many nations attempt to overcome these problems by entering into bilateral double taxation agreements.

The purposes of double taxation agreements are threefold: to prevent double taxation, to avoid tax treatment in one country that discriminates against the nationals of another country and to facilitate administrative cooperation between tax authorities. This article is concerned with the latter. It examines the ways in which nations cooperate to enforce their revenue legislation. Focusing, in particular, on Australia's double taxation agreements with the United States and Japan, two of its major trading partners, this article studies the provisions that mandate cooperation between the parties and considers the ways in which that cooperation takes place in the light of those provisions. Finally, the future direction of information exchange is discussed.

Contents

C. Spontaneous exchanges
VI. Confidentiality
VII. Conclusion

II. TAXING JURISDICTION

Most nations exercise their jurisdiction to tax on two bases: that the income was generated in that nation (i.e. source) and/or that the recipient of the income was either a resident or a citizen of that nation (i.e. residence). In Australia, residents are taxed on their worldwide income, regardless of its source, and non-residents are taxed only on their Australia-sourced income. The same is essentially true in the United States.

In Japan, however, while non-residents are taxed only on their Japan-sourced income, there are two categories of residents and two separate tax treatments. The categories are permanent and non-permanent resident, distinguishable by the length of time spent in Japan. Permanent residents are those who are domiciled in Japan or have been in Japan over five years, and non-permanent residents are those who have been in Japan between one and five years. Permanent residents are, as in Australia and the United States, taxable on their worldwide income, while non-permanent residents are taxable on their foreign-sourced income only if and when it is brought into Japan.

The wide net cast by the worldwide taxation of residents, combined with local taxation of local-sourced income, creates potential for double taxation. In addition, the existence of tax havens, different tax rates in different jurisdictions and special tax benefits for specified activities lead taxpayers to manipulate their activities to take advantage of lower tax rates or to use tax havens or to disclose their activities in the beneficial jurisdiction while keeping them from the tax authorities in other jurisdictions. In many instances, in the absence of double taxation agreements, tax authorities would be powerless to discover these activities.

1. An earlier draft of this article appears in the proceedings of the 5th Australasian Tax Teachers' Association Conference held in Christchurch, New Zealand, 17-19 January 1993.

III. COOPERATION BETWEEN TAXING AUTHORITIES

Although each double taxation agreement is specifically negotiated between the two parties, most are based on either the 1963 or the 1977 OECD Model Convention for the Prevention of Double Taxation.[3] Both OECD models contain information exchange provisions, although with the benefit of hindsight to reveal the flaws in the 1963 Model Convention, the provisions regarding information exchange in the 1977 Model Convention purport to better enable information exchange.

As a result of these two Model Conventions, nearly every double taxation agreement contains a provision mandating that tax authorities exchange information to facilitate enforcement of their respective tax laws. At a minimum, these treaty provisions all contain the following:

- provision for the type of information that is exchangeable, identified by purpose;
- provision for the protection of the information exchanged;
- provision for exclusion from exchange of specified types of information;
- provision that the tax authority must be legally entitled to the information.

In the Australia–US agreement, entered into in 1982 and based largely on the 1977 Model Convention, the relevant provision is Article 25 (Exchange of Information):

> (1) **[Exchange of information]** The competent authorities shall exchange such information as is necessary for carrying out the provisions of this Convention or for the prevention of fraud or for the administration of statutory provisions concerning taxes to which this Convention applies provided the information is of a class that can be obtained under the laws and administrative practices of each Contracting State with respect to its own taxes.
> (2) **[Non-disclosure]** Any information so exchanged shall be treated as secret and shall not be disclosed to any persons other than those (including a Court or administrative body) concerned with the assessment, collection, administration or enforcement of, or with litigation with respect to, the taxes to which this Convention applies.
> (3) **[Public Policy]** No information shall be exchanged which would be contrary to public policy.
> (4) **[Access to documents]** If specifically requested by the competent authority of one of the Contracting States, the competent authority of the other Contracting State shall provide information under this Article in the form of copies of unedited original documents (including books, papers, statements, records, accounts or writings) to the same extent such documents can be obtained under the laws and administrative practices of that other State with respect to its own taxes.
> (5) **[Collection of Taxes]** Each of the Contracting States shall endeavour to collect on behalf of the other Contracting State amounts equal to such taxes imposed by the other State as will ensure that any exemption or reduction in rate of tax granted under this Convention by that other State shall not be enjoyed by persons not entitled to such benefits.

In the Australia–Japan agreement, entered into in 1969 and taking effect in 1970, it is Article 18 (Mutual Agreement Procedure):

> (1) **[Exchange of information]** The competent authorities of the Contracting States shall exchange such information (being information available under the respective taxation laws of the Contracting States) as is necessary for carrying out the provisions of this Agreement or for the prevention of fraud or for the administration of statutory provisions against avoidance of the taxes to which this Agreement applies.
> (2) **[Information to be treated as secret]** Any information so exchanged shall be treated as secret and shall not be disclosed to any persons or authorities other than those concerned with the assessment or collection of the taxes to which this Agreement applies, or the judicial determination of appeals in relation thereto.
> (3) **[Trade secrets]** No information shall be exchanged which would disclose any trade secret or trade process.
> (4) **[Limitation on exchange of information]** A competent authority shall not be obliged by this article to disclose to the other competent authority any information which does not relate directly to the affairs of a taxpayer with whom that other competent authority is concerned.

The treaty obligation to exchange information is mandatory – note the language "competent authorities ... shall exchange". Nonetheless, the scope of the exchange is limited by a variety of factors, not the least of which is the attitude of the parties to the information exchange. Although the principle of sovereignty should not affect mere requests for information – as such requests would, at best, merely enable the requesting party to enforce its own revenue laws – historically it created a mindset that cooperation is not to be expected and, consequently, that requests for assistance would be futile.[4]

Tax authorities are gradually coming to accept that cooperative exchange of information is necessary if they are to gain the information they need to properly assess their taxpayers. Since the "basic prerequisite for successful tax enforcement efforts is the compilation of information on taxpayer activities",[5] "the only way of stemming the growing tide of international tax evasion and avoidance is through effective cooperation"[6] to acquire the information. In particular, Australia's cooperative relationships with both the United States and Japan have been steadily improving.

One example of this new mood favouring cooperation is the advanced pricing agreement effected between Apple Computers and tax authorities in the United States and Australia early in 1991. This negotiated agreement stipulates a transfer pricing methodology that all three parties will use to determine an arm's length price for transfers between branches of the Apple Computer company in the United States and Australia.

The concept of advanced pricing agreements originated in the United States, where they are permitted under US law by virtue of Revenue Procedure 91-22. The procedure entails

© 1993 International Bureau of Fiscal Documentation

negotiating an appropriate transfer pricing methodology on the basis of information provided by the taxpayer.[7] The amount of information required is so substantial as to be considered onerous by some, resulting in limited use of the advanced pricing procedure to date.

Normally a bilateral agreement between the IRS and the taxpayer in these circumstances does not protect the taxpayer from incurring double tax liability due to taxation in another jurisdiction. Yet, insofar as any double taxation problems will be resolved through information exchange and use of the competent authority procedure, it is only logical that these two mechanisms be invoked before the fact, rather than after. In particular, due to the different policies of different tax authorities as regards penalties and interest on refunds, an adjustment after the fact using the competent authority procedure may not fully restore the taxpayer.[8] From this thinking emerged advanced pricing agreements that also involved the tax authority of the other jurisdiction.[9]

The Apple Computer agreement is an example of the sophisticated result of such foresight. In announcing the successful negotiation of the agreement, Apple's representatives indicated their feeling that the benefits of the advanced pricing agreement procedure far outweigh the alternatives.[10] In particular, requisite evidentiary submissions were far less than would be expected in litigation and costs were significantly less.

In addition to a comparatively reasonable stance on the part of the IRS (*vis-à-vis* attitudes displayed in audit-type situations), Apple's application was also greeted with enthusiastic cooperation by the Australian Tax Office (ATO). The ATO used its data on the profitability of other Australian companies to determine a benchmark and, doubtless will include this benchmark figure in its data for future transfer pricing cases. The ATO's support for the advanced pricing procedure and its determination that the procedure succeed is evidenced by the amount of time and effort it devoted to this seminal application.

Another example of cooperation between taxation authorities is the Pacific Association of Tax Administrators (PATA). The members, Australia, Japan, Canada and the United States, meet twice a year to discuss common problems and potential solutions, as well as to exchange views on coping with international tax avoidance.[11] Each member is represented by its competent authority.

PATA has an executive council as well as working parties that set themselves to airing specific problems encountered by each. PATA has also developed a Code of Good Practice to which each member attempts to adhere vis-a-vis its relationships with the others.

Information has also been exchanged between PATA members. In fact, the close relationship between the four PATA members has resulted in the spontaneous exchange of information that may not have otherwise been made available. For example, Australia has recently received a list of "paper companies" in Hong Kong from a PATA member.[12]

IV. LIMITATIONS ON COOPERATION

As the opposition to cooperation fades, the limitations on treaty information exchange that remain exist in the provisions of the treaties themselves. The two major limitations are reciprocity and exclusion from exchange.

A. *Reciprocity*

All double taxation agreements require reciprocity as a general principle. A contracting state may not supply information that it would not be entitled, under its own law, to receive.[13] Further, a state may not request information that it would not be entitled, under its own law, to receive. In the Australia-US agreement, this principle is found in the language of Article 25(1): "provided the information is of a class that can be obtained under the laws and administrative practices of each Contracting State with respect to its own taxes". Similarly, in the Australia-Japan agreement, the language "(being information available under the respective taxation laws of the Contracting States)" draws the limitation.

The implication of this requirement is twofold. First of all, no request for information may be made until all domestic investigation avenues have been exhausted.[14] Secondly, if the information is not legally attainable domestically, it may not be requested of the treaty partner.

Tax authorities are not required to provide information that the requesting party "could not obtain under its own domestic laws".[15] The domestic information gathering powers of Australia, Japan and the United States illustrate the scope of this limitation. Since a detailed consideration of these powers is beyond the scope of this paper, the examination will, of necessity, be brief.

Under the provisions of the Australian Income Tax Assessment Act (ITAA), the Commissioner has the right of full and free access to all buildings, places, books, documents and other papers for the purposes of the Tax Act.[16] The Commissioner also has power to require any person to furnish information, attend and give evidence and produce all books, documents and other papers in the person's custody and under their control.[17] The result is that "where the information or

the person controlling it is physically in or linked to Australia, the ATO will usually be able to obtain that information unless it falls within one of the formal exceptions to the ATO's power".[18]

This latter power should enable to Commissioner to get information needed from a local person who has some knowledge of overseas activities (especially in the case of multinationals).[19] As a practical matter, however, companies may be in a position to dictate that only high-ranking employees, especially directors, disclose information to the ATO.[20]

The investigatory powers of the Information and Examination Division of the Japanese National Tax Administration appear to be similar to, although not quite as broad as, those of the ATO. The books and records of the taxpayer may be examined[21] and, if deemed necessary, third parties who have had dealings with the taxpayer may be questioned or compelled to disclose their books or records of those dealings.[22] In addition, tax officials have authority to elicit the cooperation of other government agencies to access documents and other information deemed "necessary in the examination of the taxpayer's income".[23]

Interestingly, while Japan's domestic information gathering powers appear to be as wide as those of Australia and the United States, it has limited the information it can supply pursuant to a treaty request by looking to its domestic restrictions on public disclosure and treating restricted information as excluded from exchange. This will be discussed in greater detail below.

The US Internal Revenue Service also has the authority to "examine any books, papers, records, or other data",[24] as well as to "summon the person liable for tax...or any officer or employee...or any person having...books of account...or any other person".[25] This ability to issue a summons appears to go beyond the investigatory powers of either Australia or Japan.

Ultimately, "the aim of a DTA in this regard is not so much to extend domestic investigative powers, but rather to bilaterally broaden the territorial scope for the application of those powers".[26] The interpretation of reciprocity in this regard offers a clear demonstration of this aim.

One other aspect of reciprocity is the notion that there is no obligation to provide information where no information is being provided by the other side in exchange.[27] Such an attitude has the potential to become petty, as well as to severely restrict information flows. "Accordingly, since the success of any reciprocal exchange of information program is determined by the extent of mutual cooperation, all competent authorities should advocate the adoption of a liberal reciprocity policy."[28]

B. *Excluded information*

In addition to the requirement of reciprocity, information exchange is further limited to only that information that the treaty partners have agreed to disclose. Therefore, where the partners have provided for protected classes of information, those classes are excluded from exchange. Generally, certain information is excluded from exchange in order to protect taxpayers.[29]

Limitations on disclosable information do not present any particular problems as regards the Australia-US treaty, the broad coverage of which even includes information to prevent fraud.[30] In fact, the only category of information excluded under Article 25(3) of the Australia-US treaty is that which is contrary to public policy.[31]

While the Australia–Japan treaty contains the same broad language as the Australia–US treaty *vis-a-vis* fraud, it excludes from exchange information "which would disclose any trade secret or trade process".[32] This exclusion is particularly important to the Japanese, as there does not seem to be any trust that information exchanged will be kept confidential.[33]

The Australia–Japan treaty also requires that the information disclosed "relate directly to the affairs of a taxpayer with whom that other competent authority is concerned".[34] While this latter limitation has been interpreted to mean that the information provided must relate to a resident of Japan,[35] in fact, the Australia–Japan treaty does not contain the language found in Article 1 of the OECD Model: "This Convention shall apply to persons who are residents of one or both of the Contracting States." Accordingly, tax authorities are entitled, under Article 18(4), to request information about non-resident taxpayers. The limitation of Article 18(4) is that the information requested must have a direct relationship to the affairs of the taxpayer. The problem it presents, therefore, is in determining what "direct" is.

Although a provision like Article 18(4) does not exist in the Australia–US treaty, the fact that Article 25 does not contain the sentence: "The exchange of information is not restricted by Article 1" which is found in the OECD Model Convention, while Article 1 of the Australia–US treaty does restrict

application of the treaty to residents of one or both treaty partners has been taken to mean that the information exchanged must relate to a resident.[36] This restriction impedes the ability of tax authorities to discover "laundering" of transactions through countries with which no double taxation agreement exists.

C. *Other limitations*

Another limitation is that only information necessary for the relevant purpose may be disclosed.[37] Interpretation of the word "necessary" could have a significant restrictive impact, especially as what is necessary in the eyes of one tax authority may not be so in the eyes of the other tax authority. This problem is somewhat alleviated by the commentary to Article 26 of the 1977 OECD Model Convention, which states that information should "be exchanged to the widest possible extent".[38] This implies that a narrow interpretation of the word necessary is undesirable.

One area where tax authorities are not generally limited by treaty language as regards the scope of their requests is whether the information requested has already been gathered. "Exchange is not limited to information already in the possession of the administration. The requested authority may be obliged to collect the information...regardless of whether or not the requested authority has any interest in the information".[39] While the requested authority may bear this obligation, there are doubtless many instances when it will not be carried out. Whether such inaction is deliberate would be difficult to say. Nonetheless, various delays due to the low priority likely to be assigned to a request from a foreign taxing authority may ultimately result in frustration of that request.

It is interesting to note, in this connection, that Japan has specifically entered a reservation to Article 26(2) of the OECD Model Convention. It will only "supply information obtained through special investigation or special examination as long as such investigation or examination is concerned with taxation in Japan".[40] While the Australia–Japan agreement is not based on the 1977 OECD Model Convention, it can be expected that Japan would take the same stance, nonetheless.

V. MECHANICS OF INFORMATION EXCHANGE

According to the Commentary to Article 26 of the 1977 OECD Model Convention, the first paragraph of the information exchange provisions implies three different types of information exchange: on request, automatic (also known as routine) or spontaneous.

A. *Exchange on request*

The stereotypical image of information exchange is that Country A, in the course of auditing Taxpayer X, comes to suspect that Taxpayer X has had dealings in Country B which have not been disclosed and therefore makes a request to Country B for information. The incidence of information requests in the United States has risen in recent years,[41] demonstrating the importance of this form of information exchange. The types of information involved includes information of control of companies and legal or financial documents relating to a taxpayer under investigation.[42]

In the case of a specific request, the requesting country would have to (a) very clearly identify the taxpayer and the information sought, (b) show that the taxpayer is subject to the laws of the requested country, and (c) show good faith.[43] Where the old attitude toward cooperation continues, such a request might be met with a variety of delays, resulting in untimely receipt of information, if it were to be provided at all. However, the procedure toward such requests in the United States illustrates the modern attitude toward information exchange.

In the United States, after the Revenue Service Representative for the requesting country has ascertained the legitimacy of a request, i.e. ensuring that it contains the three points mentioned above, the Criminal Investigation Division of the district in which the information is located assists in procuring the information.[44] The taxpayer is not informed that information is being provided to a treaty partner unless (1) the information is not in IRS files, (2) the taxpayer is not currently being examined by the IRS or (3) the IRS believes the information is confidential business information, such as a trade secret.[45] Needless to say, even with such a well established procedure, information requests are often subject to inadvertent delays simply because the relevant tax authority gives higher priority to its own domestic workload.

One situation in which an information request is likely to receive priority attention is when a quid pro quo can be expected, i.e. when the parties are exchanging information on the same taxpayer pursuant to simultaneous audits. In 1989, Australia and the United States entered into a Working Arrangement for the conduct of simultaneous examinations intended to enable the two countries to conduct simultaneous audits of selected taxpayers and exchange the information collected during those audits.[46]

Under the Working Arrangement, each country will nominate taxpayers that it wishes to audit and receive from the other country an indication of interest in participating. The nominee should be a taxpayer with activities in both countries who appears to have substantial non-compliance with the tax laws

© 1993 International Bureau of Fiscal Documentation

of both countries and activities involving a tax haven. If both countries agree to simultaneously audit the nominee, then formal requests for exchange of specific information will be issued, although it is anticipated that spontaneous exchanges will also take place.

The United States has similar working agreements with several other countries and has found the procedure quite effective.[47] By and large it enables tax authorities to "obtain and exchange information more efficiently and thoroughly and with greater specificity and speed".[48] The ATO also plans to make greater use of simultaneous audits.[49]

B. *Automatic exchanges*

As the name implies, an automatic exchange of information involves the regular provision of pre-determined information without a specific request. Basically, treaty partners agree in advance on the type of information and the timing of the exchange.[50] The types of information most often subject to automatic exchange is that relating to periodic receipts, especially of investment income.[51] Australia and Japan established a system of automatic information exchange on real estate investment in 1989.[52] As a result of information provided by the ATO, the Japanese National Tax Administration has been able to investigate several cases of tax evasion among Japanese engaging in foreign investment.[53]

Automatic information exchange is a relatively inexpensive way to cooperate with one's treaty partners.[54] Because the type of information subject to automatic exchange is routinely received by the tax authority, it is fairly simple to provide to the treaty partner.[55] In fact, the United States will only supply information collected by tax officials "in the ordinary course of their business".[56] However, treasury regulations require that the IRS annually submit to its treaty partners copies of US tax forms showing "a payee with an address in the respective partner's countries".[57] A decade ago, the United States provided treaty partners with half a million documents annually;[58] doubtless that figure has greatly increased since then.

Crinion has stated that automatic exchanges of information are the only exchanges that are effective.[59] Certainly automatic exchanges are by far the largest volume of information exchange and are becoming increasingly more sophisticated. Magnetic tapes containing the relevant data are used by the United States in its routine exchanges with Germany and Canada.[60]

C. *Spontaneous exchanges*

A spontaneous exchange occurs when the tax authority of one country supplies without request information about a taxpayer that it believes may be of use to another country. The information supplied would have been discovered during its own investigation or in the course of complying with an information request from another treaty partner. "Exchange of information articles in treaties will be considered to authorize such spontaneous exchanges if they (1) contain general language indicating that the competent authorities shall exchange such information as is necessary 'for carrying out the provisions of this convention' or 'for the prevention of fraud or the like in relation to the taxes which are the subject of this convention,' and, (2) do not specify any particular manner in which the exchanges are to be carried out."[61]

Australia frequently engages in spontaneous exchange, probably providing more information than it receives.[62] This is consistent with the overall cooperative attitude demonstrated toward information exchange by the ATO.

No matter which type of exchange is undertaken, there are no required forms that the information provided must take. This has often resulted in information received under an exchange being useless or, at best, difficult to use.[63] This is particularly a problem insofar as certain forms may be required to render information admissible as evidence before a judicial body.[64]

In an attempt to overcome this problem the Fiscal Division of the OECD has developed a standard multilingual form to facilitate recognition and processing of data received.[65] This form has great potential use to Australia, particularly as regards information received from Japan.

VI. CONFIDENTIALITY

Once the various limitations on the type of information to be exchanged and the manner in which the exchange is to take place have been overcome, there remains a final hurdle of whether the country to which the information is being given could misuse the information.

In most countries, the information received by taxation authorities is required by law to be kept confidential; it usually cannot be released to anyone outside of the taxation authority. Where this is the case, double taxation agreements have served to facilitate information exchange by including the tax authority of the treaty partner as an information recipient. At the same time, confidentiality is protected by limiting the uses to which the treaty recipient can put the information. In the case of the Australia-US agreement, that limitation is found in Article 25(2); in the Australia–Japan agreement it is in Article 18(2).

An example of the confidentiality requirements placed by domestic law are the secrecy provisions in the ITAA, which bind the ATO not to disclose any information without legislative authority. While the provisions of double taxation agreements override all provisions of the ITAA except Section 160AO and Part IVA,[66] it is still necessary that the information disclosed not exceed the limits on information exchange discussed above.

In the United States, tax returns and information related to computation of a taxpayer's tax liability are considered confidential.[67] Section 6103 establishes circumstances under which such information may be disclosed and to whom. Section 6103(k)(4) provides that disclosure may be made to the competent authority under a double taxation agreement "but only to the extent provided in, and subject to the terms and conditions of, such ... agreement". In further authorizing disclosure to the likes of "persons have material interest", "committees of congress", "federal officers for administration of federal laws not relating to tax administration", and for "statistical use", arguably the scope of Section 6103 is much broader than the Australian secrecy provisions. However, insofar as treaties made under the authority of the United States are the supreme law of the land,[68] the limitation of Article 25(2) of the Australia–US double taxation agreement takes precedence over the IRC[69] and would serve to prevent any information provided to the United States by Australia from being used for any purpose other than tax enforcement.[70] For example, the United States "will not provide information received from one treaty partner to another".[71]

Japanese secrecy provisions are more like those of Australia, although Japan does not see the existence of the double taxation agreement as an authorization for disclosure. In principle, Japan's policy reflects the language of the treaty, i.e. it feels that information exchanged may only be used by tax authorities concerned with tax assessment and collection or in legal actions relating to tax assessment and collection.[72] In spite of this stated policy, however, it entered a reservation to the OECD Model Convention to the effect that "it would be difficult for Japan, in view of its strict domestic laws and administrative practice as to the procedure to make public the information obtained under domestic laws, to provide information requested unless a requesting State has comparable domestic laws and administrative practice as to this procedure".[73] In all likelihood this is to be interpreted to mean that Japan will very closely scrutinize the laws of its treaty partner. As mentioned above, Australia's confidentiality provisions probably come close enough to satisfy Japan's requirement. The US provisions, on the other hand, may give the Japanese authorities pause.[74]

In fact, Japan has engaged in positive information exchange with 34 of its 36 double taxation treaty partners. In 1986, it engaged in 113,000 instances of information exchange.[75] The number of cases of exchange grew to 118,000 in 1987 and continues to grow at present. The bulk of these are pursuant to automatic exchanges; spontaneous exchanges remain uncomfortable to Japanese tax authorities.

A country receiving information under a treaty exchange is prohibited by the limitations on disclosures contained in the treaty from passing that information on to a third party.[76] In spite of this, however, the Japanese have indicated that they are not adverse to spontaneously supplying to a treaty partner information uncovered as a result of information received from another treaty partner.[77] This is an interesting position, given the general Japanese reluctance to engage in spontaneous exchange.

The limitation on disclosure overprotects taxpayers, since it means that a revenue authority has no access to information originating in a country with which it has no treaty, even if it has a treaty with another country in receipt of the same information. Australia, the United States and Japan have, to some degree, overcome this problem by entering into bilateral double taxation agreements with most of the industrialized nations of the world.

The United States has gone one step further by signing the OECD Council of Europe Multilateral Convention for Mutual Administrative Assistance in Tax Matters.[78] This convention provides for a broader based exchange of information, while at the same time mandating strict secrecy. For example, the IRS has adopted a procedure whereby it will notify US citizens of the information being requested and will allow objection through the administrative appeal mechanism.[79] While the convention has now taken effect, its impact is limited by the fact that only the United States and a handful of northern European countries have ratified it to date.[80]

VII. CONCLUSION

Increased international transactions have created the potential for tax liability by a single taxpayer in multiple jurisdictions. This, in turn, creates the potential for tax avoidance. Double taxation agreements exist to prevent both double taxation and tax avoidance.

66. Income Tax (International Agreements) Act, Sec. 4(2).
67. IRC Sec. 6103(a).
68. US Constitution, Art. VI, cl. 2.
69. See discussion in Curtin, *supra* note 2, at 36, n. 8.
70. The notion that the US standards of confidentiality may be low is interesting when compared with the concern of US taxpayers that "other countries' controls over the dissemination of confidential taxpayer information may not be as strict as the rules applicable in the United States." See, J.L. Andrus, M.C. Bennett, D.M. Merrick, D.I. Meyer, C.D. Swenson, and L.B. Terr, "Competent Authority Assistance in Tax Controversies under the New IRS Procedures", *Tax Notes* (1991), at 1279, 1284.

72. Kawada, *supra* note 54, at 330.
73. OECD Commentary: observations and reservations on Art. 26.
74. Indeed, Japanese tax authorities have been reluctant to cooperate with the IRS in its attempts to secure audit information in at least one case. See *United States v. Toyota Motor Corporation*, 569 F.Supp. 1158 (C.D. Calif. 1983), cited by J. Huston, T. Miyatake & G. Way, *Japanese International Taxation* (1990), at 6-149.
75. H. Sakurai, "Saikin no Kokusai Kazei wo Kaerimite" ("Looking Back on Recent International Taxation"), 9 *International Taxation* (1990), at 8, 11.
76. Woellner and Burns, *supra* note 49, at 198.
77. Kawada, *supra* note 54, at 333.
78. Fisher, *supra* note 29, at 85.
79. Id.
80. The United Kingdom cited its large network of bilateral double taxation agreements as the principle reason that it did not sign the convention. This rationale is interesting, since the United States has embraced the convention, while at the same time seeking to expand its network of treaty partners. Id. at 86.

© 1993 International Bureau of Fiscal Documentation

All of the double taxation agreements discussed herein contain specific provisions for exchange of information to counteract attempts at tax avoidance. Constraints of confidentiality make it extremely difficult to know exactly how treaty partners have reacted to their treaty obligations.[81] Nonetheless, it is certain that as the potential for tax avoidance increases, so too does the willingness of treaty partners to cooperate to combat it.

While the precise details of exchangeable and excluded information may vary slightly between treaties, there is a consistent pattern of including as exchangeable information calculated to facilitate tax enforcement without damaging the taxpayer's business efforts.

The arrangements made between Australia and the United States and Australia and Japan for regular and routine exchange of information, as well as the Working Arrangement between Australia and the United States on simultaneous audits are examples of the type of international cooperation in revenue enforcement already taking place. International alliances such as PATA also demonstrate recognition by tax authorities that further cooperation is necessary. While there are still difficulties and times when tax authorities cannot or will not cooperate, those situations seem to be diminishing. On the other hand, the exchange measures described above can be expected to continue, and in fact increase, over the years to come.

81. See, e.g. Degulis, *supra* note 31, at 511: "At present, there exists no body of tax information which highlights the administrative actions of both treaty partners with regard to a particular transaction." The gist of Degulis' article is that tax planners could engage in more efficient tax planning if they had access to information concerning the mechanics of tax treaty implementation between treaty partners.

Transfer Pricing Strategy in a Global Economy

by Jill C Pagan and J Scott Wilkie

For all tax practitioners, corporate financial departments, fiscal authorities and academics & researchers, 'Transfer Pricing Strategy in a Global Economy' represents a landmark in transfer pricing. In one volume you will find practical analysis and guidance on the operation of transfer pricing today, and also challenging thought on theoretical issues affecting its future development.

Includes:

- Clear definition of transfer pricing and full historical background
- Contrast of legislative approaches and differences between major countries
- Role of transfer pricing in a range of transactions
- Full constructive assessment of the vital Sundstrand case
- Discussion of Advance Pricing Agreements
- Advice on dealing with fiscal authorities
- Treaty considerations
- Practical guidelines to developing and implementing a transfer pricing strategy

KAZAKHSTAN AND RUSSIA:

TAX FOUNDATION SIGNS AGREEMENTS WITH KAZAKHSTAN AND RUSSIA

Charles E. McLure, Jr.

Hoover Institution, Stanford University, Economic Advisor to the Tax Foundation Delegation

On 15 March 1993 the Tax Foundation led a delegation of representatives of American and British business to Alma Ata, Kazakhstan to discuss with officials of the government of Kazakhstan tax aspects of improving the investment climate of the country. Most of the delegation then proceeded to Moscow, where from 21-24 March it met with officials of the Ministry of Finance, the State Tax Service and two committees of the Supreme Soviet.

While in Alma Ata, the delegation concluded a joint protocol with the Ministry of Finance and the State Tax Inspectorate calling for adherence to generally accepted principles of tax policy and also for specific measures needed to improve the investment climate of Kazakhstan. Since the Tax Foundation had previously presented a detailed report to representatives of the Russian government based on meetings held in Moscow in July 1992 (see the January 1993 issue of the *Bulletin*), the memoranda of understanding signed with the Ministry of Finance and the State Tax Service and with the committees of the Supreme Soviet were more general than the Kazakhstan protocol.

Among the members of the Tax Foundation delegations were representatives of Chevron Overseas Petroleum and British Gas, both of which anticipate developing the petroleum reserves of Kazakhstan; Conoco, which has oil interests in Russia; Bechtel, the multinational construction firm; Baker Hughes, a supplier of oil-field equipment and services; Citibank; Archer Daniels Midland Company, a major food processing company; Philip Morris International, a conglomerate in tobacco products and food processing; three major international accounting firms, Arthur Andersen, Ernst & Young and Price Waterhouse; and the law firm of Baker & McKenzie.

PROTOCOL

Tax Aspects of Improving the Investment Climate in the Republic of Kazakhstan[1]

The delegation sponsored by the Tax Foundation wishes to encourage and support the Republic of Kazakhstan in its transition to a free market economy, so it can become an active member in the world commercial and political community. A successful transition is important for many reasons, most notably because it will improve the standard of living for the Kazakhstani people and enhance the prospects for prosperity.

The delegation further wishes to see multinational enterprises and other investors become trusted partners in the successful transition process. Prosperity in Kazakhstan, among other things, requires that the tax policy and administrative system not discourage the personal saving and capital investments that are necessary for the economic progress that will increase the national wealth and welfare of the people of Kazakhstan. To achieve this objective, the tax policy and administrative system of the Republic of Kazakhstan must

1. The signatories to the Protocol between Kazakhstani institutions and the Tax Foundation were as follows:

Derbisov, E.Z.	*Minister of Finance*
Ospanov, M.T.	*First Deputy Minister of Finance* *Chief of the Central Tax Inspectorate*
Daniel A. Witt	*Executive Director* Tax Foundation
W.E. Frenzel	*Distinguished Fellow* Tax Foundation
Charles E. McLure, Jr.	*Economic Adviser to the Tax Foundation Delegation* *Senior Fellow* Hoover Institution Stanford University
Jack A. Barbanel	*Chairman* East-West Trade and Commerce Group

Other members of the Tax Foundation delegation to Almaty were:

Mr George W. Reardon	*Director of Taxes* Archer Daniels Midland Company
Mr Steven J. Willoughby	*Tax Manager* Arthur Andersen & Co.
Ms Clyde Tyree Crook	*International Tax Manager* Baker Hughes Incorporated
Mr John L. Fruth	*Partner* Baker & McKenzie
Ms Diana S. Dowling	*Associate* Baker & McKenzie
Mr Marlen E. Lawson	*International Tax Manager* Bechtel Group, Inc.
Ms Linda Senat	*Senior Tax Advisor* British Gas, PLC
Mr David M. Krattebol	*Vice President – Finance* Chevron Overseas Petroleum, Inc.
Mr Richard C. Lam	*Manager and Tax Counsel* Chevron Overseas Petroleum, Inc.
Mr David K. Tomney	*Vice President and Senior Tax Counsel* Citibank USA
Mr John R. Braden	*Partner* Ernst & Young
Ms Stella Aris	*Manager* Ernst & Young Kazakhstan
Mr Gregory Galligan	*Director of International Taxes* Philip Morris International
Mr Robert Call	*Project Manager, Eastern Europe* Philip Morris Europe, SA
Mr Ray Darnell	*Senior Manager* Price Waterhouse

© 1993 International Bureau of Fiscal Documentation

simultaneously satisfy certain requirements, including fairness, stability, reliability, simplicity, clarity, and economic neutrality. Foreign investment in Kazakhstan should be encouraged by a tax system which incorporates these characteristics as key tenets of a long-term tax policy.

At meetings held in Almaty from 15 to 19 March 1993 the Tax Foundation; the sponsoring delegation of the Tax Foundation; the Ministry of Finance, represented by Derbisov E.Z., Minister; the Central Tax Inspectorate, represented by its Chief, Ospanov M.T.; as well as the Committee for Economic Reforms, Finance, and the Budget of the Supreme Soviet, represented by its Chairman, Takezhanov S.T., have recognized that specific concrete actions are required to achieve the long-term goals stated above.

The undersigned mutually pledge to use their best efforts to accomplish the actions set forth below to achieve those goals and thus attempt to reconcile the revenue requirements of the Republic of Kazakhstan with the goal of developing a system which will encourage savings, local investment, and foreign investment.

Procedural Actions

The Republic Of Kazakhstan should provide an open legislative process for dealing with tax matters that permits adequate opportunity for interested parties to express their views on tax legislation before it is enacted. Such a process requires timely publication of proposed legislation, in order to allow adequate time for analysis and preparation of comments. The Tax Foundation undertakes to solicit and coordinate relevant comments from the private sector. Such comments from experienced tax professionals will promote clarity in laws, help ensure that specific legislation is consistent with long-term goals, and assist the Republic in avoiding mistakes of other overly complicated tax systems. Such comments may include written drafts of proposals as well as legislative acts and instructions of other countries, as appropriate.

The Central Tax Inspectorate should formally issue public, legally binding regulations interpreting legislation, instructions to taxpayers, and clarifying rulings on questions raised by taxpayers in order to assist them in understanding and complying with the law. Whether such guidance is of a general nature or occurs in response to requests by specific taxpayers for clarification, it must always be within the framework of the legislation; the Tax Inspectorate must never go beyond the letter and intent of the law. The process for issuing such guidance must take into account the complexity of the matter and may involve advance public comment on regulations of general interest. Rigorous internal review and publication of all such guidance will help assure consistency and clarity of guidance. The Tax Foundation will consult with the Tax Inspectorate to assist in drafting specific administrative procedures designed to accomplish these objectives.

In formulating tax policy, the Government and the Supreme Soviet should seek the views of the Central Tax Inspectorate in its areas of expertise. This will help to assure that newly enacted legislation does not needlessly increase the complexity of the system.

The Government of the Republic of Kazakhstan should provide a mechanism for prompt review at the Republic level of positions taken by local tax inspectors. Local tax authorities should not be allowed to deviate from the laws and normative acts adopted by the Government of the Republic of Kazakhstan or change them unilaterally. Nor should local tax authorities be allowed to alter agreements concluded between the Government of the Republic of Kazakhstan and foreign investors. The Tax Foundation will consult with the Supreme Soviet, the Ministry of Finance, and the Central Tax Inspectorate to assist in drafting specific administrative procedures designed to accomplish this objective.

The Tax Foundation will provide assistance and recommendations for improving the organization and operation of the Central Tax Inspectorate. Such assistance and recommendations will be based on generally recognized principles of tax administration. One commonly accepted principle is the establishment of a professional and responsible tax inspectorate composed of a national cadre of trained personnel having expertise in the administration, implementation, enforcement and interpretation of the tax laws of the country. A professional tax inspectorate is responsible for uniform and fair administration of the tax laws; its integrity must be beyond question. Advancement and promotion must be based on objective considerations of merit, performance, and experience, without regard to political influence or favor. In many countries the tax inspectorate has the budgetary resources necessary to fulfill its mission in an independent manner.

Types of Taxes

The Government of the Republic of Kazakhstan has made substantial progress in the tax legislation enacted in 1991, and since amended. Some of these laws now need to be re-examined to see that they are achieving intended objectives and especially that they are not discouraging investment.

Many forms of taxation currently found in the Republic of Kazakhstan create undesirable economic distortions and are unfair. These include taxes on turnover or gross receipts, which burden business enterprises, including those that are not earning an adequate return, and thus discourage investment. There may be a limited role for excise taxes and for property taxes to fund local governments, but excessive reliance on these taxes should be avoided.

Clear income sourcing rules are needed to distinguish between income sourced in Kazakhstan and income sourced outside Kazakhstan. Sourcing rules are necessary for the proper taxation of branches and non-resident foreigners. The Tax Foundation will consult with the Government in preparing a draft of such legislation.

The Republic of Kazakhstan should reduce the number of separate taxes and contributions designated for specific activities. Allocations for special purposes should come from the general budget. Reducing the number of separate taxes will reduce the complexity of the system for both administrators and taxpayers. The allocation of budget resources will be more flexible if expenditures are not tied to specific revenue sources.

© 1993 International Bureau of Fiscal Documentation

Accounting for Profits

The Republic of Kazakhstan should allow internationally accepted accounting standards to be used for maintaining the basic accounting records for calculating tax liability. The use of common international concepts and accounting language will promote understanding between the agencies of the Government of Kazakhstan, international lenders, and potential investors. It will minimize administrative and compliance costs over time by improving uniformity of approach and, therefore, understanding.

Provision must be made to ensure that the value of depreciation and other allowances is not eroded by inflation and changes in the value of the currency. This may be accomplished by periodically adjusting the value of assets for inflation (without imposition Of tax on such adjustments) or by permitting the investor to maintain its books in a freely convertible currency.

Tax Rates

The expectations of the Republic from foreign investment in the Republic of Kazakhstan must be realistic. Foreign investment can be expected to yield many benefits for the Republic. These include foreign currency, high quality jobs for Kazakhstan citizens, and a higher standard of living. It should be recognized, however, that increased tax revenues from foreign investments alone will not solve the problems of current budget deficits.

Both statutory and effective tax rates should be moderate, so as not to discourage saving and investment. The members of the Tax Foundation delegation appreciate the need to control budget deficits and the difficulty of reducing public expenditures (including subsidies to state enterprises) under the current circumstances. It is important, however, to remember that in the long term only a growing private sector can provide productive employment, a rising standard of living, and the tax revenue needed to finance essential government services. An overburdened private sector will not experience the saving and investment needed for dynamic growth.

Treatment of Tax Losses

Business enterprises should be allowed to carry tax losses forward for a reasonable period so they can recoup their start-up costs before starting to pay taxes. This is the common practice throughout the world. Such loss carry-forwards should be adjusted for inflation or changes in the value of currency to protect them from the loss of value.

Losses from one line of business in Kazakhstan should be allowed to offset the income from other lines of business in Kazakhstan controlled by the same business entity.

Creditability of the Profits Tax

It is important that the profits tax qualify for a foreign tax credit in jurisdictions which allow such credits. A critical consideration for most potential foreign investors is that profits earned in Kazakhstan should not be subjected to double taxation. Although individual investors with unique circumstances or investors from particular countries may not find a credit necessary or advantageous, the Tax Foundation delegation believes that the standards generally used to determine the creditability of foreign taxes are consistent with the broader policy of taxing only realized economic income. The Tax Foundation will consult with the Government in drafting proposed legislation to ensure that all technical requirements for creditability are met.

It would be desirable to adopt technical changes to the profits tax to meet the normal requirements for creditability. Creditability generally requires that the profits tax be imposed by law and be based on net income, calculated by deducting from revenues received all expenses associated with earning such revenue.

Value Added Taxes

A VAT that is properly structured and applied does not discourage saving and investment. The Tax Foundation notes that under the current Kazakhstan law the VAT paid on fixed assets is added to the cost of the assets and is not recoverable. The inability to recover the full VAT paid to suppliers of fixed assets is contrary to common international practice and represents a major disincentive to capital intensive industries. In some cases it raises important issues of definition, and it increases costs of compliance and administration. To avoid discouraging investment in capital intensive industries, the Republic of Kazakhstan should reconsider the treatment of VAT paid on fixed assets. The Government of the Republic of Kazakhstan recognizes the importance of this view, and will strive to bring its law into conformity with such standards when conditions in the Republic permit.

Mechanisms should be developed to ensure that the VAT does not adversely affect the cash flow of an investor. Refunds must be paid promptly to avoid loss of value due to inflation and currency devaluation.

The application of VAT to financial services and credit card services involves extremely complex issues. This problem should be discussed with representatives of these industries, especially those actively considering doing business in the Republic of Kazakhstan.

Excise Taxes

The Republic of Kazakhstan should avoid the use of excise taxes that discriminate against the production and consumption of high quality consumer products. This can be achieved by utilizing specific excises (indexed for inflation) or by levying ad valorem excise taxes at uniform rates.

Currency Matters

The Tax Foundation delegation believes that provisions for mandatory conversion of foreign currency should be avoided. Potential foreign investors view mandatory currency conversion requirements as an unproductive cost of doing business, especially while the economy of Kazakhstan is unstable and there are no secure opportunities and instruments for reinvestment of local currency. The Government of the Republic of Kazakhstan has noted these views but has

© 1993 International Bureau of Fiscal Documentation

advised the Tax Foundation delegation that the present circumstances in the Republic do not permit flexibility on this point, but agrees to continue to review and discuss this matter.

Stability During the Transition Period

During the transition to a market economy and for the period of potential instability, it is important that foreign investment be encouraged. The Republic should adopt a clear policy that investors will be guaranteed stability in the total amount to be paid as taxes, duties, fees, etc. This policy should be reflected in any new laws that give legislative authority for implementing agreements made before those laws come into effect. During this transition period the Republic must develop the reputation of being a reliable business partner. Different formulas may be applied to give effect to this guarantee. The Tax Foundation will consult with the Government in drafting specific legislation for consideration by the Republic.

Expatriate Taxation

The Law Concerning Income Tax on Citizens of the Republic of Kazakhstan and Stateless Persons should be amended with respect to the taxation of foreign citizens. Enactment of the following provisions should simplify administration and encourage additional Western technology and training:

- Limit the taxation of foreign citizens working in Kazakhstan to Kazakhstan source income only;
- Specifically identify the items to be excluded from taxation in Kazakhstan which are paid as an increment to the employee's compensation in connection with taking up residence and working in the Republic;
- Consider reducing statutory rates to bring effective tax rates into line with those in many other countries;
- Remove the prohibition on enterprises, institutions, and organizations paying the tax on the salaries of citizens; and
- Exempt foreign citizens from the application of the social taxes, when such foreign citizens' salaries are paid in a foreign currency.

The Tax Foundation will consult with the Government of the Republic of Kazakhstan in drafting specific legislation for consideration by the Republic in these areas.

Training, Education and Exchange of Information

Continued cooperation, dialogue, and information sharing between private sector investors and policy makers from the Supreme Soviet, the Ministry of Finance, and the Central Tax Inspectorate, and other Ministries would be desirable. Contingent on funding, the Tax Foundation stands ready to assist the Republic of Kazakhstan in these efforts. The parties will explore jointly the feasibility of establishing a training program for Kazakhstan tax administrators and possibly also for tax policy makers from the Ministry of Finance and the Supreme Soviet. The objective of this program would be to train Kazakhstan personnel in principles of free market economics and tax policy; advanced business practices; accounting and finance; and computer technology as it relates to tax collection. The program could include business men and women to ensure that the curriculum is practically oriented, and not simply theoretical.

Conclusion

We, the undersigned, are fully committed to continued cooperation and educational programs to help advance the long term policy goals of the Republic of Kazakhstan outlined above. The Tax Foundation, working in cooperation with its members and other interested parties, will consult with the tax authorities of the Republic of Kazakhstan in designing and implementing a tax system and will seek opportunities for further cooperation with the Kazakhstan signatories.

Signed in duplicate in Almaty, 19 March 1993. This protocol is prepared in the English and Russian languages, both being equally valid.

eration [the Ministry of Finance of the Russian Federation, and the State Tax Service of the Russian Federation] (the participants) encourage and support Russia in its transition to a free market economy so it can take its rightful place in the world commercial and political community. A successful transition is important for many reasons, most notably because it will improve the standard of living for the Russian people and enhance the prospects for World peace and prosperity.

The participants further wish to see multinational enterprises and other investors from around the world become trusted partners in the successful transition process. Prosperity in Russia, among other things, requires that the tax policy and administrative system not discourage the personal savings and capital investments that are so necessary for the economic progress that will increase the national wealth and welfare of Russia. To achieve this objective, the Russian tax policy and administrative system must simultaneously satisfy certain requirements.

During our meetings 21-24 March 1993, in Moscow, the participants have identified long-term tax policy goals which are appropriate for a successful market economy, especially one which encourages saving, investment, and international commercial cooperation. The undersigned agree that achievement of these goals should be based on the following principles:

Stability

Stability is a critical feature of a tax system that will encourage saving and investment. A stable system creates certainty, is reliable, and makes planning and economic assessment possible.

Reliability

Investors and global commercial enterprises should be able to rely on continued application of the tax laws and their interpretation which are in existence at the time they make their investments and commercial commitments. Taxpayers must be able to rely on published laws, decrees, regulations, and rulings on a long term basis. Laws must be administered fairly and consistently, with limited administrative discretion. Taxpayers should be protected from unreasonable and capricious interpretations of the law. Changes in interpretations of tax laws should only be applied prospectively, never retroactively.

Certainty

Laws and regulations interpreting them must state precisely the tax consequences of various actions. Legally binding advance rulings interpreting new provisions of the tax system that otherwise might be unclear must be readily available. It is crucial that regulations and letter rulings be issued quickly.

Simplicity

Simplicity helps ensure the taxpayer understanding of the tax law necessary for compliance. Russia should avoid complexity in tax legislation and regulations . Mechanical adoption of the complex tax laws found in many Western countries should be avoided.

Satisfactory Definition of Taxable Profits/Income

The measurement of profits (income) for tax purposes should include a deduction for all reasonable and necessary expenses. This is necessary to facilitate economic transparency, to avoid creating an environment which lacks appropriate incentives for investment, and to assure foreign tax credits in other countries.

Evaluation of Proposed Legislation

It is important that the proposed legislation be available for preliminary analysis, discussion, and comment by all taxpayers.

Tax Rates

The overall level of taxation should be reasonable so that the tax system does not discourage investment. The members of the Tax Foundation delegation appreciate the need to control budget deficits and the difficulty of reducing public expenditures (including subsidies to state enterprises).

Double Taxation

The problems of applying Russian taxation on worldwide income of foreign citizens resident in Russia should be studied to ensure that double taxation is avoided.

Training, Education and Exchange of Information

Continued cooperation, dialogue, and information sharing between private sector investors and policy makers from the

Find out about taxation in one of the fastest changing areas of Europe...

Taxation & Investment in Central and East European Countries

Volume V of IBFD's "Guides to European Taxation"

Now completely revised to offer up-to-date reviews of the new taxation systems for companies and individuals in Bulgaria, Croatia, the Czech Republic, Hungary, Poland, Romania, Russia, Serbia and the Slovak Republic:

- Introduction to the economic structure
- Forms of doing business
- Foreign investment
- Outline of the tax system
- Details of the taxation of companies
- Details of the taxation of individuals
- Taxes on payroll and social security
- Transaction taxes
- Taxes on property and transfers of property
- Local taxes
- International aspects.

Profiles of the taxation systems of Albania, Belorussia, Estonia, Kazakhstan, Latvia, Lithuania, Slovenia, Tajikistan, Turkmenistan, Ukraine and Uzbekistan will also be included. Full chapters on these and other countries will be added in due course.

Includes tables showing taxes levied on companies in **all** countries in the region and the applicable rates.

Annual subscription: 1,400 Dutch Florins. Includes updates throughout 1993!
Two binders, updated three times a year. First chapters issued in Autumn 1992 – others will be released throughout 1993.
Subscribers to "Taxation in European Socialist Countries" pay only a renewal fee to receive the new guide: 500 Dutch Florins.
Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

E. Capital gains
F. Limitation on benefits
G. Relief from double taxation
H. Non-discrimination
I. Administrative provisions
III. Conclusion

I. INTRODUCTION

For more than 30 years the US and Israeli governments have been trying to find common grounds in order to conclude an income tax treaty. These efforts reached a climax in 1965 when the two countries signed the first income tax treaty. Because the 1965 proposed treaty contained a tax sparing provision it failed ratification in the US Senate. In 1975 the two countries agreed on a new treaty; however, since the 1975 proposed treaty was signed before the 1977 US model income tax convention, the treaty did not contain some of the features of the US model, which have become mandatory in newer US treaties. Consequently, on 30 May 1980, the two countries agreed to the first protocol to the 1975 treaty. The United States did not ratify the treaty, and there were objections made to the treaty by both countries. A second protocol was signed which contains more substantial amendments to the original treaty, and given the scope of amendments to the original treaty, a consolidated treaty was put forward for signature. Based on the 1975 treaty and amended by the first and second protocols, the treaty was signed by the two countries on 26 January 1993.

II. HIGHLIGHTS OF THE TREATY

A. *General structure*

The structure of the treaty does not follow the format commonly found in the 1981 US (Draft), the 1980 UN, the 1977 or 1992 OECD model income tax conventions (see Table I). The treaty lacks a personal scope provision similar to Article 1 of the models. It contains introductory provisions dealing with the scope of the treaty and definitions, as well as a provision dealing with the sourcing of income not found in the models (Articles 1-5). The provisions concerning the taxation rights of the source and residence country also differ from the models (Articles 6-24). Unlike the models, the treaty only covers the taxation of income – a provision concerning taxation of capital similar to Article 22 of the model treaties is not found in the treaty. Relief from double taxation in the state of residence is provided for in Article 26, and the treaty contains a number of special provisions, including limitations on benefits (Article 25), non-discrimination, mutual agreement procedure and exchange of information (Articles 27-29).

B. *Scope of the treaty*

1. Taxes covered

The scope of the convention is limited as compared to the OECD and US model treaties. The OECD model provides that taxes levied at all levels of government are included under the treaty, whereas the US/Israel treaty limits US taxes to federal taxes, excluding state taxes;[1] this provision is taken from the US model and is commonly found in US treaties (the only exception is the US/UK treaty). The treaty contains an additional limitation in that the federal social security taxes (FICA or SECA taxes) are not covered, and since the United States and Israel have not signed a separate totalization agreement on social security taxes, Israeli nationals residing temporarily in the United States are subject to social security tax (however, any social security payments received are exempt from taxation in both countries).[2] The treaty also allows the United States to impose its personal holding company tax[3] and accumulated earnings tax[4] without regard to any provision of the treaty.[5]

1. Art. 1(1)(a).
2. Art. 22.
3. IRC Secs. 541-47.
4. IRC Secs. 531-37.
5. Art. 6(5). However, under the treaty an Israeli corporation is exempt from the personal holding company tax unless a US resident or citizen owns, directly or indirectly (within the meaning of IRC Sec. 544), 10% or more in value of the outstanding stock of the corporation at any time during the taxable year, and the corporation will be exempt from the accumulated earnings tax unless 25% of the voting stock of such a corporation is owned by US residents or citizens.

Table 1
Treaty Structure

Art. 1:	Taxes Covered.
Art. 2:	General Definitions.
Art. 3:	Fiscal Residence.
Art. 4:	Source of Income.
Art. 5:	Permanent Establishment.
Art. 6:	General Rules of Taxation.
Art. 7:	Income from Real Property.
Art. 8:	Business Profits.
Art. 9:	Shipping and Air Transport.
Art. 10:	Grants.
Art. 11:	Related Persons.
Art. 12:	Dividends.
Art. 13:	Interest.
Art. 14:	Royalties.
Art. 14A:	Branch Tax.
Art. 15:	Capital Gains Tax.
Art. 15A:	Charitable Contributions.
Art. 16:	Independent Personal Services.
Art. 17:	Dependent Personal Services.
Art. 18:	Public Entertainers.
Art. 19:	Amounts Received from Furnishing Personal Services of Others.
Art. 20:	Private Pensions and Annuities.
Art. 21:	Social Security Payments.
Art. 22:	Governmental Functions.
Art. 23:	Teachers.
Art. 24:	Students and Trainees.
Art. 25:	Limitation on Benefits.
Art. 26:	Relief from Double Taxation.
Art. 27:	Non-Discrimination.
Art. 28:	Mutual Agreement Procedure.
Art. 29:	Exchange of Information.
Art. 30:	Diplomatic and Counselor Officers.
Art. 31:	Entry into Force.
Art. 32:	Termination.

The treaty provides that all Israeli income taxes are covered,[6] including taxes imposed by the Income Tax Ordinance, the Land Appreciation Tax Law, the Income Tax Law (adjustments for inflation) and "all other taxes on income administered by the Government of Israel (including, but not limited to, the profit tax on banking institutions and insurance companies and the income tax components of a compulsory loan)".[7] The most significant differences from the original treaty are the exclusion of capital gains taxes, and that the tax on "involuntary defense loan" has since been repealed, which will reduce the importance of the inclusion of taxes on compulsory loans.

2. Geographic scope

Article 2 contains the geographic scope of the convention. The term "United States" means the 50 states and the District of Columbia, but none of the US possessions or territories. The treaty defines the geographic scope to cover the territorial sea, the seabed and subsoil of the submarine areas adjacent to the coast over which the United States and Israel respectively "exercise[s] sovereign rights, in accordance with international law",[8] a provision which has some importance for Israel and the territorial disputes in the Middle East.

Israel does not generally apply its legislation to Judea, Samaria or Gaza. Instead, the legislation which was in force in these territories when they were occupied by Israel is applied in the territories in accordance with international public law. Thus neither Israel nor the United States will consider these territories to be covered by the treaty.[9] In contrast, Israel annexed East-Jerusalem (1967) and the Golan Heights (1981) after the 1967 war, and presently exercises what is viewed as "sovereign rights in accordance with international law" over these areas. Consequently, Israel will consider residents in East-Jerusalem and the Golan Heights to fall within the scope of the treaty. Whether this is also the case for the United States is more questionable. The United States is among the countries which do not recognize Jerusalem as the capital of Israel, but the United States has maintained that recognition of Jerusalem as the capital awaits a comprehensive settlement of the disputed territories. The United States could be forced to make a decision on this issue.[10]

3. Personal scope

A significant difference from the models and most US treaties is the lack of a personal scope provision similar to Article 1 of the US or OECD models. Consequently, the treaty does not contain a provision similar to Article 1(3) of the US model, which allows the United States to impose taxation based on citizenship, a provision which is contained in all US tax treaties.[11] The treaty does, however, allow the

6. Art. 1(1)(b).
7. Israel generally imposes its taxes on income and capital gains on a territorial basis regardless of the status of the individual recipient. Israel's Income Tax Ordinance (New Version) (ITO) 5721-1961 as amended (hereinafter referred to as "ITO") provides in Sec. 2 that "income tax shall be paid...on the income of any person accrued in or received in Israel". The ITO defines the term "income" broadly, to include interest, dividends, gains or profits from employment, pensions, annuities and income derived from any dwelling house.
The limited territorial scope of the Israeli tax system as determined under ITO Sec. 3 is extended by Sec. 5 which provides inter alia, that "...any profits or gain produced by a person from a business the control and management of which are exercised in Israel or from a vocation which he is generally carries on in Israel" is deemed to be income sourced in Israel, and as such subject to Israeli taxation. This provision deems certain income derived outside Israel to be Israeli-source income, an inclusion which limits the territorial basis of Israeli taxation.
8. Art. 2(1)(a)(ii), 2(1)(b)(ii).
9. If part of the territories were to become part of Israel, it would raise a question as to whether the treaty would be extended automatically to the new territories. The issue is not similar to the Chinese takeover of Hong Kong in 1997, where questions could be raised as to the territorial scope of Chinese tax treaties after 1997. See Weizman, "The Territorial Scope of Tax Treaties: Emerging Problems and the Chinese Case", 17 *Tax Planning International Review* (No. 6 1990), at 24. Such a territorial change would be similar to the West German takeover of East Germany, discussed in Prokisch & Rodi, "Double Taxation Conventions after Reunification", 31 *European Taxation* (September 1991), at 263, and given the size of the territory, it is most likely that the succession would lead to automatic extension.
10. The problem would typically arise if a company resident in East Jerusalem or the Golan Heights is engaged in business activities in the United States. The company would claim that in determining whether income is taxable in the United States, the IRC, and especially its broad definition of a permanent establishment (PE) ("US trade or business"), and its use of the force of attraction doctrine to allocate income to a PE, should not be applied. Instead, the company would claim treaty protection, and argue that the question must be determined under the provision dealing with PE (Arts. 5 and 8). A decision on the tax issue would, in effect, force the United States to make a decision on a very politically sensitive issue.
11. The United States subjects its citizens and residents to taxation on a worldwide basis. IRC 1986, as amended, Secs. 1(a), 11(a) and 61(a). US citizens and residents are taxed on worldwide income regardless of whether the income is earned in a foreign jurisdiction, and regardless of whether the taxpayer is residing in that jurisdiction when the income was derived.

© 1993 International Bureau of Fiscal Documentation

United States to tax its citizens on their worldwide income.[12] The provision allowing taxation based on citizenship is found in Article 6(3) ("general rules of taxation"), which provides that "a Contracting State may tax...its citizens as if this Convention had not come into effect".[13] The provision further contains the so called "lingering" citizenship rule under which the term "citizenship" is deemed to include an individual who has relinquished his citizenship during the ten-year period following such loss of citizenship if the principal purpose was tax avoidance.[14]

The treaty's lack of a personal scope provision similar to Article 1 of the models may be significant, because it could bring into question whether the scope of the treaty is limited to persons who are resident in one or both contracting states. There is little doubt that the United States will follow Rev. Rul. 72-378,[15] where interest payments made by a US bank on a loan to a UK branch of a Swiss bank were subject to US withholding tax on interest, and the US bank was unable to claim protection under the Swiss treaty. This is in accordance with the generally accepted view under which the scope is limited to persons of the contracting states. In a recent case the English High Court questioned this principle.[16] In this case, London branches of banks resident in West Germany and Brazil received interest from corporations in the United States. The court refused to deny the treaty benefits to branches of corporations not resident in third country states because the treaty did not contain a provision similar to Article 1 of the OECD model.[17] However, this decision appears to be contrary to Article 34 of the Vienna Convention on the Law of Treaties, which provides that the treaty does not "create either obligations or rights for a third state without its consent". It is also contrary to the 1977 OECD Commentary to Article 24, paragraphs 54 and 55 which was (based on the 1992 OECD report entitled "Triangular Cases") replaced by the 1992 OECD Commentary. However, the new credit system under Article 24 of the 1992 OECD Commentary (cf. paragraphs 51-54) does clearly assume that the treaty benefits do not extend to third country residents. It therefore appears that *Commerzbank* is not correct and consequently it should not be assumed that it will be followed in Israel even though it is a common law jurisdiction.

4. Residency

Article 3 provides that taxation under the convention is generally based on residency. The term "residence" is based on "fiscal residence", where residency is assigned to the state in which the taxpayer has the greater personal ties. Article 3(1) is different from the models. This provision defines the term "resident" of Israel and the United States respectively, and includes corporations and any person resident under the state's law, but in the case of a partnership, estate or trust only to the extent that the income derived under the state's tax law is subject to taxation as a resident either in the hands of the respective entity or its partners or beneficiaries. Thus US partnerships, estates and trusts or their partners or beneficiaries are considered residents for treaty purposes so long as they are subject to US taxation. The treaty also contains a special rule for US citizens and aliens holding a "green card" who are considered US residents only if they have a substantial presence, permanent home or habitual abode in the United States.[18]

If an individual is considered a resident of both contracting states[19] residency is determined under Article 3(2), which is a tiebreaker provision similar to the models, and it contains the following criteria for determining the residency of individuals: (1) permanent home; (2) center of vital interests; (3) habitual abode; (4) citizenship; and (5) if (1)-(4) are not applicable then the issue is to be decided according to the competent authority procedure. The provision contains a special rule under which a person who is an *oleh* (new immigrant) as defined in Section 35 of the Israeli Income Tax Ordinance is deemed to be treated as an Israeli resident.[20]

12. Art. 6(3) does not limit the taxation based on citizenship to the United States as is the case under most US treaties. Israel is also allowed to imposed taxation on its citizens under the treaty, and may decide to do so in the future. In fact, the Israeli Commissioner of Income Tax recently announced that a recommendation to tax Israeli citizens on worldwide income is being considered.

13. Certain provisions are excluded from the scope: grants (Art. 10), charitable contributions (Art. 15A), private pensions and annuities (Art. 20(2)-(3)), social security payments (Art. 21), relief from double taxation (Art. 26), non-discrimination (Art. 27), mutual agreement procedure (Art. 28), and benefits available to US residents, provided they are not US citizens or have US immigrant status as follows: governmental functions (Art. 22), students and trainees (Art. 24) and diplomatic and consular officers (Art. 30).

14. The lingering citizenship rule is taken from the US model Art. 1(3) and has the IRC as its source, i.e. Sec. 877.

15. 1972-2 C.B. 662.

16. *IRC v. Commerzbank AG*; *IRC v. Banco do Brazil*, [1990] S.T.C. 285.

17. *Id.* at 301-302.

18. Art. 3(1)(c). This rule appears to be contrary to the lawful permanent residence (green card) test under the objective residence definition, which provides that a person is a resident of the United States if he at any time during the calendar year is a lawful permanent resident. The criteria is not conclusive, and previous Treasury Regulations which provided that a person with lawful permanent residence would be deemed a US resident, was struck down in *Schumacher*, 32 BTA 1242 (1935), on the ground that an irrebuttable presumption was not favoured. Instead, Treas. Reg. § 1.871-2(b) creates a presumption of residency, which is controlling "in the absence of exceptional circumstances".

19. Residency in the United States is based on either an objective or subjective definition. The objective definition is linked to two tests: lawful permanent residence (green card) or substantial presence. The latter is automatically satisfied if the alien is present in the United States for 183 days or more, or can be satisfied if the alien spends less than 183 days in the United States, and "spends significant amounts of time in the United States", a term determined under a special formula. The subjective definition is, as the term indicates, subjective. It is based on the degree of attachment to the United States, and a series of factors are included in the determination of residency.
Similarly, residence in Israel for individuals is defined under the ITO, as "..an individual who resides in Israel except for temporary absences that seem reasonable to the Assessing Officer and do not contradict that individual's claim to be an Israeli resident". This definition is not inclusive. As a general rule a person will be considered a resident in Israel if he spends more than 183 days in any tax year (the tax year is from 1 January to 31 December). In addition, residency may be determined under subjective criteria, and guidelines enumerate a number of factors to be considered in determining residency. The most important factor is generally the physical presence of the taxpayer and his family, and all factors indicating where the centre of the taxpayer's life is situated.
The new final regulations under IRC Sec. 7701(b) are discussed in Rothschild & Schinner, "Determining Residency for Federal Income Tax Purposes, an Introductory Note", 47 *Bulletin for International Fiscal Documentation* (February 1993), at 84.

20. Art. 3(2)(a). ITO Sec. 35(d) extends to the term "oleh" as it provides that "a person who holds an oleh's visa or an oleh's certificate under the Law of Return 5710-1950, or a person entitled to said visa or certificate and who holds a visa and permit of temporary residence under the Entry into Israel Law 5712-1952, and a person who belongs to a category of persons for whom the Minister of Finance has prescribed that they will be treated as olim". Generally, persons who are allowed immigration to Israel under the Law of Return are Jews or persons with a Jewish father or grandparent.

© 1993 International Bureau of Fiscal Documentation

While the tiebreaker provision has reduced the potential for double residency (and thereby double taxation), the treaty does not provide measures to prevent double residency for companies.[21] This question is therefore left to the competent authorities to solve on a case-by-case basis, and it may well cause problems as the United States and Israel apply very different rules for determining the residency of companies.[22]

5. Permanent establishment

The permanent establishment (PE) provision found in Article 5 is broader than the OECD and US models.[23] Article 5(1) is in substance identical to the two models, while Article 5(2) has a broader scope. Different from the models is the inclusion of the following as a "fixed place of business" under (d)-(j): a warehouse, a farm or plantation, a store or other sales outlet, and most importantly, the maintenance of substantial equipment or machinery for a period of more than six months. The treaty does not, however, include "a place of management", as found in the models. The scope of the building site provision is similarly broader in the sense that the period is reduced from 12 to six months which is in accordance with the UN model.

The exclusion provision found in Article 5(3) is also different from the models. While (a)-(d) are identical to the models, (e) is not found in the models. It provides that "[t]he maintenance of a fixed place of business for the purpose of advertising, for the supply of information, for scientific research, or for similar activities which have a prepatory or auxiliary character, for the resident", does not constitute a PE. This provision seems to have the 1977 OECD Commentary as its source, and does not appear to be of major significance. Similarly, (f)-(g), which are not found in the models, merely mirror the equipment provision[24] and the building site provision.

Article 5(4) is not found in either of the models. It provides that a resident of a contracting state who sells goods in the other contracting state will be deemed to have a PE if the goods were subject to substantial processing in that contracting state (whether or not purchased in there), or were purchased in that contracting state and not subjected to substantial processing outside that state. Again, the scope of the provision is broader than the OECD and US models.

Article 5(5) and (6) contains the definition of a dependent and independent agent as a PE. These definitions are almost identical to the models, and the slightly different wording does not alter the scope of the models. Article 5(7) contains a provision not found in the models, providing that a PE does not exist merely because a resident sells merchandise displayed at a fair or convention in the other contracting state. Article 5(8) is similar to Article 5(7) of the models, but whereas the models refer to "controlled company", the treaty merely refers to "relation".

Article 5(9) is a new invention, providing that the PE principles apply not only to residents of the contracting states, but also to non-residents in determining whether they have a PE in the contracting states; and not only to the contracting states, but also to determine whether residents have a PE outside the contracting states. These principles are to be applied, however, "only for purposes of this Convention", and the provisions appear to be geared towards allocation of income.

C. *Taxation of income*

1. General rules

Article 6 dealing with "General Rules on Taxation" is not found in the models. The general rule is contained in Article 6(1), which provides that "[a] resident of one of the Contracting States may be taxed by the other Contracting State on any income from sources within that other Contracting State and only on such income subject to any limitations set forth in this Convention". The sourcing of income is to be determined under Article 4, a provision not found in the models. The purpose of Article 4 is to avoid a potential for sourcing conflicts.[25] Whereas the sourcing rules under the treaty are contained in a specific provision, the models have placed them in different articles (e.g. dividends, interest, royalties, capital gains), and the treaty also includes other types of income the competent authorities are able to "agree to the same determination of the source of particular items of income". The treaty also contains special rules with respect to the source of income from the rental of tangible personal property, the disposition of intangible or tangible personal property, performance of personal services and business profits attributable to PEs.[26]

---

21. In contrast, Art. 3(3) contains a provision different from the models. It applies only to non-individuals, and provides that until the competent authorities have made a determination, the person will not be treated as a resident of any state except for purposes of Art. 26 (relief from double taxation), Art. 27 (non-discrimination), Art. 31 (entry into force), and for payments by such a person covered by Art. 12(2) (dividends), Art. 13(2)-(3) (interest) and Art. 14(1)(b) (royalties).

22. In the United States, IRC Sec. 7701(a) provides that the characterization of a corporation as foreign or domestic is based on the place of creation and organization, and a domestic corporation is one organized in the United States (defined as the 50 states and the District of Colombia). In contrast, ITO Sec. 1 provides the following definition of a "resident in Israel" as applied to a "body of persons": "(1) a body registered in Israel, its principal activity being in Israel, but if it is registered as a foreign company it shall be considered a resident of Israel only if so requested; if such a request has been submitted, it cannot be withdrawn before three years have passed, unless the Minister of Finance so permitted; (2) any body of persons the control and management of whose business are exercised in Israel".
Until 1978, the residency of corporations was determined exclusively under the principles laid down in Sec. 1(2). The purpose of Sec. 1(1) was to discourage Israeli companies from locating control and management outside Israel, while conducting trade or business in Israel as non-resident companies. Sec. 1(2) contains the English principles under which residency of companies is determined on the basis of the location of the corporate body which exercises the company's policy functions, typically the location of the board of directors. Application of these principles are a source of controversy surrounding double residency of corporations, and it is regrettable that the issues are not resolved under tax treaties, particularly where, as is the case here, the contracting states follow very different theories (incorporation vs. management and control).

23. The PE provisions in US treaties generally provide protection against the broader determination under US domestic law ("US trade or business"), e.g. IRC Sec. 864(b), as well as the application of the force of attraction doctrine, e.g. IRC Sec. 862(c)(2). In contrast, an Israeli PE is taxable only on income "accruing in, derived from or received in Israel", and the treaty does not provide any protection for the US taxpayer.

24. Art. 5(2)(j) and 5(2)(i).

25. Art. 4 of the treaty is equivalent to Art. 16 of the US/Japan treaty. This provision is not commonly found in tax treaties. It is, however, sometimes found in US treaties even though the provision is not contained in the US model. The issue is discussed in *Income Tax Treaties* (Bischel (ed.)) (New York: Practising Law Institute 1978), at 30-32.

26. Art. 4(5)-(8).

© 1993 International Bureau of Fiscal Documentation

2. Real property

Article 7(1) provides that income from real property is taxable in the situs country.[27] Article 7(2) is similar to the US model as it applies paragraph (1) to income derived from the direct use, letting or use in any other form of real property. A major difference is contained in Article 7(3)(a), which provides that gains derived by a resident of Israel from the disposition of a US real property interest may be taxed by the United States, and Article 7(3)(b), which similarly provides that gains derived by a resident of the United States from the disposition of a comparable interest in real property in Israel may be taxed by Israel. The term "comparable right" include rights in a legal entity, which under Israeli domestic law are considered a disposition of rights in real property. The provision is intended to conform to the "FIRPTA" legislation adopted by the United States in 1980,[28] legislation which caused a storm of criticism, as it was an override of most US tax treaties.[29] These rules make it more favourable for Israelis to own US real property directly. This may, however, be unfavourable in case of death as it may lead to a maximum 55 percent US estate tax (tax phases down to 50 percent for deceased who die after 1993).[30] This problem has typically been solved by mortgaging the real property or by interposing an entity which qualifies as a corporation for US tax purposes.

3. Business profits

The business profits provision in Article 8 is similar to the OECD and US models. The only substantive difference is the inclusion of a provision that the US tax on insurance premiums paid to foreign insurers will not be imposed on insurance or reinsurance premiums which are the receipts of a business of insurance carried on by a resident of Israel whether or not that business is carried on through a PE in the United States.[31] The main effect is to make Israeli insurance companies more competitive in insuring risks of their Israeli clients with respect to property with a US situs.

Article 11 provides that in cases where the profits between related enterprises are adjusted, the other contracting state is obliged to make a corresponding adjustment, provided the first adjustment is based on the arm's length standard. The inclusion of a corresponding or correlative adjustment clause is generally not found in Israeli treaties, and while the inclusion may be seen as an improvement, the treaty contains measures only to avoid economic double taxation (Article 25), while it lacks measures to avoid the legal double taxation that will arise if the contracting states are unable to agree on what is to be considered arm's length consideration. More importantly, the treaty's mutual agreement procedure (Article 28) does not provide for such disagreements to be solved by compulsory arbitration between the competent authorities.[32]

4. Shipping and air transport

Whereas the OECD and UN model treaties provide that profits from the operation of ships or aircraft are taxable only in the state where the place of effective management of the enterprise is situated, and the US model treaty provides for such profits to be taxable in the state where the enterprise is organized, Article 9(1) of the new treaty provides that profits are taxable only in the state from where the shipping and air transport profits are derived. The difference is significant since profits are not always derived from the state where the place of management is situated. Given the different approach adopted under the treaty, Article 9 does not include a provision similar to Article 8(2)-(4) of the OECD and UN (alternative A) models. Instead, the treaty's Article 9(2) contains a provision which is similar to Article 8(2)-(3) of the US model, and includes income derived from rental of ships or aircraft, income incidental to income falling under paragraph (1), and income derived from the use, maintenance and lease of containers, trailers or related equipment.

5. Grants

Israeli tax law provides special tax incentives to promote foreign investments, and the treaty contains a special provision for dealing with these incentives. Article 10 provides that if Israel has made a qualifying grant to a US resident, then the resident may choose either to include or exclude the grant in his gross income. A qualifying grant is one approved by Israel for investment promotion in Israel,[33] but does not

27. Israeli taxpayers are still allowed to make the annual net basis election with respect to US real property income. The election is provided under IRC Sec. 871(d)(1), and allows non-residents to treat income derived from real property as if effectively connected with a US trade or business. If the taxpayer makes the net basis election, a deduction is allowed for related expenses (e.g. depreciation and interest), while the 30% withholding tax on gross income is not applicable. Israeli residents deriving income or capital gains from US real property are exempt from taxation in Israel, unless they are gains from the sale of shares in a corporation which holds real property.

28. IRC Sec. 897.

29. Sec. 1125(c) of the Foreign Investment in Real Property Tax Act of 1980 ("FIRPTA") expressly provided that it would apply without regard to any tax treaty relief after a five year delay, which was intended to allow the United States time to renegotiate the treaties which were being overridden. However, the delay led to no treaty amendments which would allow the United States to impose its tax on shares in companies holding real property, and the treaty override was left to stand.
The question of treaty override has been addressed in some recent treaties, e.g. the 1989 US–Spanish treaty, where the protocol provides for consultation on the negotiation of modifications to the treaty if and when there are "substantial changes in the domestic legislation", and the 1992 US–Mexico treaty, where the consultation requirement in Art. 20 of the protocol is made more firm.

30. IRC Sec. 2001(c)(1) and (2)(D).

31. Art. 8(8).

32. The lack of such a resolution measure may be significant as the United States is applying still more strict intercompany pricing rules. See Weizman, "Transnational Compliance with Intercompany Pricing: The Case of the United States and Korea", *Intertax* (1992), at 544; Weizman, "US Transfer Pricing: Grim Prospects for Multinational Companies", 3 *International Company and Commercial Law Review*, (1992), at 163; Weizman, "US Transfer Pricing: Grim Prospects for Multinational Companies", 9 *Oil & Gas Taxation and Law Review*, (1992), at 282; and Weizman, "Transfer pricing: dystre udsigter for multinationale selskaber", 48 *Skattepolitisk Oversigt* (1992), at 194.

33. A qualifying grant is granted under Law for the Encouragement of Capital 5719-1959, Sec. 40B, which allows grants to be given to: (1) a company which has a share capital; (2) a cooperative society which has a share capital; (3) a registered partnership with limited liability of the capital of which at least 95% of the capital belongs to a company, or cooperative society, and which owns an approved enterprise, being an industrial enterprise or industrial building. Also entitled to the grant are owners of approved enterprises or recognized enterprises which have acquired as property of the enterprise any Israeli-made machinery or equipment mentioned in Sec. 62(a) of the Law. The amount of grant is a percentage of the original cost of the property of the enterprise or of the industrial building and of the expenditure incurred by the owner of the enterprise with respect to land. Grants generally vary according to the geographic zone in which the enterprise is located.

include any amount which in whole or part, directly or indirectly: (1) is in consideration for services rendered or to be rendered, or for the sale of goods; (2) is measured in any manner by the amount of profits or tax liability; or (3) is taxed by Israel. If the resident chooses to exclude the amount, then it will be treated as a contribution to capital which the resident is deemed to have made to the Israeli corporation. The resident's basis in the Israeli stock is not increased by the deemed contribution, and the basis of the property of the Israeli corporation will be reduced by the amount of the deemed contribution. The effect of Article 10 is to prevent the US resident from escaping taxation, and it allows the resident receiving a qualifying grant only to defer his tax liability.

The grant provided under the treaty is different from the tax sparing credit (or matching credit), which is sometimes granted to countries which – like Israel – offer tax holidays or reduced tax rates to encourage capital and investment. This idea was developed in the United States in the 1950s, and tax sparing was included in a number of US treaties in the 1960s. Among these treaties was the proposed US/Israel treaty of 1965, which was greeted by the Foreign Relations Committee with the general hostility against the tax sparing credit, and the treaty was never reported out by the Committee. The Senate's view is that tax sparing creates a bias in favour of foreign investment over domestic investment, while developing countries believe that the industrialized country is collecting the tax "spared", which will destroy the purpose of the unilateral measures to stimulate investment. This is demonstrated in Tables 2 and 3.

6. Charitable contributions

Another controversial provision relates to the special treatment of charitable contributions. A provision was included in the first protocol of 1980, which provided for the deductibility of charitable contributions by US persons to Israeli charities and vice versa; the deduction was limited to 25 percent of Israeli source income. This provision was greeted with sharp criticism by the Senate when the treaty and first protocol were considered in 1981. The Senate stopped short of making reservation to the provision. The provision has not been deleted from the treaty but is contained in Article 15A of the consolidated treaty which provides for the same 25 percent limitation. This provision should not, however, be expected to meet the hostility which it previously encountered, as similar provisions since then have been accepted by the Senate without congressional concern (and is similarly included in the new proposed 1992 US-Mexico treaty).

7. Personal services

Article 17 dealing with dependent personal services is almost identical to the US model. The similarities do not extend to independent personal services. Article 16 provides that income derived by an individual who is a resident of one of the contracting states from the performance of personal services in the other state in an independent capacity is generally taxed only by the country of residency. An exception to this rule is provided for income derived by an individual who is a resident of one of the contracting states from the performance of independent personal services in the other state, which may be taxed if the individual is present in that other state for a period or periods aggregating 183 days or more in the taxable year. In addition, the treaty's Article 19 is not found in any of the models. Under Article 19 consideration received for the furnishing of personal services is not taxable as business profits under Article 8 of the treaty, a rule which is subject to certain limitations.

D. *Withholding taxes* (see Table 4)

1. Dividends

(a) *General tax structure*

The corporate tax systems applied in the United States and Israel are different. Corporate taxation in the United States is based on the classical system, and the corporation and shareholders are each subject to a separate level of taxation, whereas Israeli corporate taxation is based on a "double tier" system. The 1990 Israeli tax reform eliminated the corporate income tax on distributed profits to take effect from 1 January 1992,[34] and a corporation will only have to pay the 40 percent corporate income tax rate on undistributed profits,[35] whereas shareholders are subject to a flat 25 percent tax on dividends[36] (the rates may be reduced as low as 10 percent for corporations, and 15 percent for shareholders if the company is an approved enterprise). Both tax systems provide relief for intercompany distributions. In the United States a corporation may deduct 70 percent of the dividends received from a taxable domestic corporation,[37] and affiliated corporations may elect to deduct 100 percent of dividends received from members of the affiliated group (at least 80 percent ownership).[38] In Israel intercompany dividends are free of corporate taxation in the hands of the recipient corporation.[39] The corporate tax systems applied by the United States and Israel should no longer cause the disparity that may result when the classical and imputation systems clash, a confrontation

which is typically unfavourable to the country applying the classical system.

(b) *Withholding on Israeli-source income*

The treaty rules on dividends are different from the models. The treaty does not provide for any definition of the term "dividends" similar to Article 10(3) of the OECD and US models. Thus for treaty purposes the term will be determined exclusively in accordance with domestic tax law. In addition, Israeli tax law generally provides for a withholding tax of 25 percent on dividends paid by Israeli corporations to foreign shareholders,[40] a rate which is reduced to 15 percent for profits from an approved enterprise.[41] The treaty applies the general distinction between dividends on intercompany shareholding and dividends on portfolio shareholding. The Israeli withholding tax under the treaty is 25 percent with respect to portfolio shareholding (i.e. no reduction of withholding tax).[42] The treaty does provide for a special rate for substantial holdings, i.e. a special rate of 12.5 percent is generally applicable to the US shareholder if the paying corporation is not entitled to the special tax rate applicable to approved enterprises under Israel's Encouragement of Capital Investments Law (1959), and only if: (1) the recipient US corporation owns at least 10 percent of the outstanding shares of the voting stock; and (2) not more than 25 percent of the gross income of the paying corporation consists of interest or dividends (subject to certain limitations).[43] If the US corporation is the recipient of a dividend from income derived during any period for which the corporation is entitled to the reduced tax rate applicable to an approved enterprise under Israel's Encouragement Capital Investments Law (1959), then the withholding tax rate is reduced to 15 percent if the corporation meets the above conditions. In addition, the reduced withholding tax rate will not be applied to dividends paid by corporations whose income is taxed under Sections 64 (certain house property companies) and 64A (certain family companies) of the Israeli Income Tax Ordinance , or in substantially the same manner. In such cases, the income will be treated as if it were business profits taxable under Article 8.

(c) *Withholding on US-source income*

US tax law generally provides for a 30 percent withholding tax on dividends paid by US corporations to foreign shareholders.[44]. The treaty applies the same distinction between dividends on intercompany shareholdings and dividends on portfolio shareholdings as is applied to Israeli-source income. As a result withholding taxes are reduced to 25 percent for portfolio shareholdings, and a special rate of 12.5 percent is provided for substantial holdings, provided that: (1) the recipient Israeli corporation owns at least 10 percent of the outstanding shares of the voting stock; and (2) not more than 25 percent of the gross income of the paying corporation consists of interest or dividends (subject to certain limitations).

A special exception is provided for dividends received from a US Regulated Investment Company (RIC)[45] or Real Estate Investment Trust (REIT).[46] These two types of companies are exempt from corporate taxation under US tax law, and this could create a loophole because of the exemption of intercompany dividends provided under Israeli tax law. To prevent this, Article 12(3) provides that distributions from a RIC are subject to the 25 percent US withholding tax rate provided for portfolio shareholdings. Distributions from a REIT are likewise subject to the 25 percent withholding tax rate, provided the resident holds less than a 10 percent interest in the REIT. If the shareholding of the REIT is 10 percent or more, distributions will be subject to the full 30 percent US withholding tax rate.[47]

(d) *Branch tax*

In 1986, the United States enacted the branch profits tax under Tax Reform Act of 1986. The branch profits tax was adopted as IRC Section 884, which imposes a branch profits tax and a branch interest tax in lieu of the 30 percent US withholding tax on dividends. The branch profits tax was intended to equalize the tax treatment of US branches with the tax treatment of US subsidiaries of foreign corporations. Prior to 1986, foreign corporations engaged in a US trade or business were not subject to the 30 percent withholding tax on dividends and interest paid to foreign recipients unless more than 50 percent of the payor's gross income for the preceding three years was effectively connected with a US trade or business. However, repatriation of earnings of a US subsidiary to its foreign shareholder was subject to the 30 percent withholding tax unless less than 20 percent of corporate earnings were US-source income ("80/20 corporations"). Therefore, branches were treated more favourably than subsidiaries of foreign corporations, and the branch profits tax was intended to equalize the treatment of branches and subsidiaries.

The branch profits tax was subject to a storm of criticism as it was seen as an override of most US treaties. It was a measure

40. ITO Sec. 125B.

41. In addition to the lowered tax rate on dividends, the regular corporate tax rate of 40% is similarly reduced to 25%. Furthermore, an approved enterprise having foreign ownership may be subject to an even lower corporate tax rate: (1) foreign ownership less than 49% results in a 25% tax rate; (2) 49% or more but less than 74% results in a 20% tax rate; (3) 74% or more but less than 90% results in a 15% tax rate; and (4) 90% or more results in a 10% corporate tax rate. The general corporate tax rate of 40% has recently been reduced by 1% starting from this fiscal year, and will be reduced by 1% in subsequent years until the tax rate reaches 36%.

42. Art. 12(1)(a).

43. Art. 12(2)(b).

44. IRC Sec. 871(a)(1)(A).

45. IRC Secs. 851-860. Certain investment companies, which are classified for tax purposes as corporations, may elect to be taxed on a flow-through basis. The investment company must maintain a diversified portfolio and 90% of its gross income must be derived from dividends, interest and gains from the sale of stock or securities. If the company qualifies as a RIC, all distributed income is taxed only to the shareholders, while the company is taxed only on its undistributed income.

46. IRC Secs. 856-860. A company which qualifies as a REIT is also subject to taxation on a flow-through basis. The company must satisfy a number of requirements, most importantly that the company is widely held, that 75% of the gross income is derived from passive real estate activities, and that 95% of the taxable income is distributed as dividends.

47. The United States may generally not impose a 30% withholding tax on income which is protected under a treaty. The reason is that US residents are subject only to a 28% tax rate (which increases to 33% and then again decreases to 28%), and a 30% withholding tax on income such as dividends would be discriminatory, and therefore a violation of the treaty's prohibition against discriminatory treatment. See Arnold, (Canadian Tax Foundation, 1991), at 237.

© 1993 International Bureau of Fiscal Documentation

which even the United States perceives to be discriminatory, and contained as such an override of the non-discrimination provision in US treaties.[48]

The treaty with Israel includes and permits the imposition of the branch profits tax, and provides a necessary exception to the non-discrimination provision. However, the 30 percent branch profits tax rate is reduced under Article 14A of the treaty to 12.5 percent or 5 percent. Article 14A provides that a corporation which is a resident of a contracting state "may be subject in the other Contracting State to a tax in addition to the tax allowable under the other provisions of this Convention". In the case of the United States, the treaty provides that the branch tax may be imposed only on:

- the "dividend equivalent amount" of the profits effectively connected with a US trade or business or taxable under Article 7 (real property) or Article 15 (capital gains), and this branch tax may not exceed 12.5 percent; or
- the excess of interest deductible in the United States in computing the profits of the corporation that are taxable in the United States and attributable to a PE or taxable under Article 7 (real property) or Article 15 (capital gains), and this branch tax may not exceed 5 percent.[49]

In the case of Israel, Article 14A(2)(b) provides that: "tax may be imposed only on the amounts sufficient to provide that a branch in Israel of a US corporation...is taxed in a manner comparable to a similarly situated Israeli corporation and its United States shareholder".

2. Interest

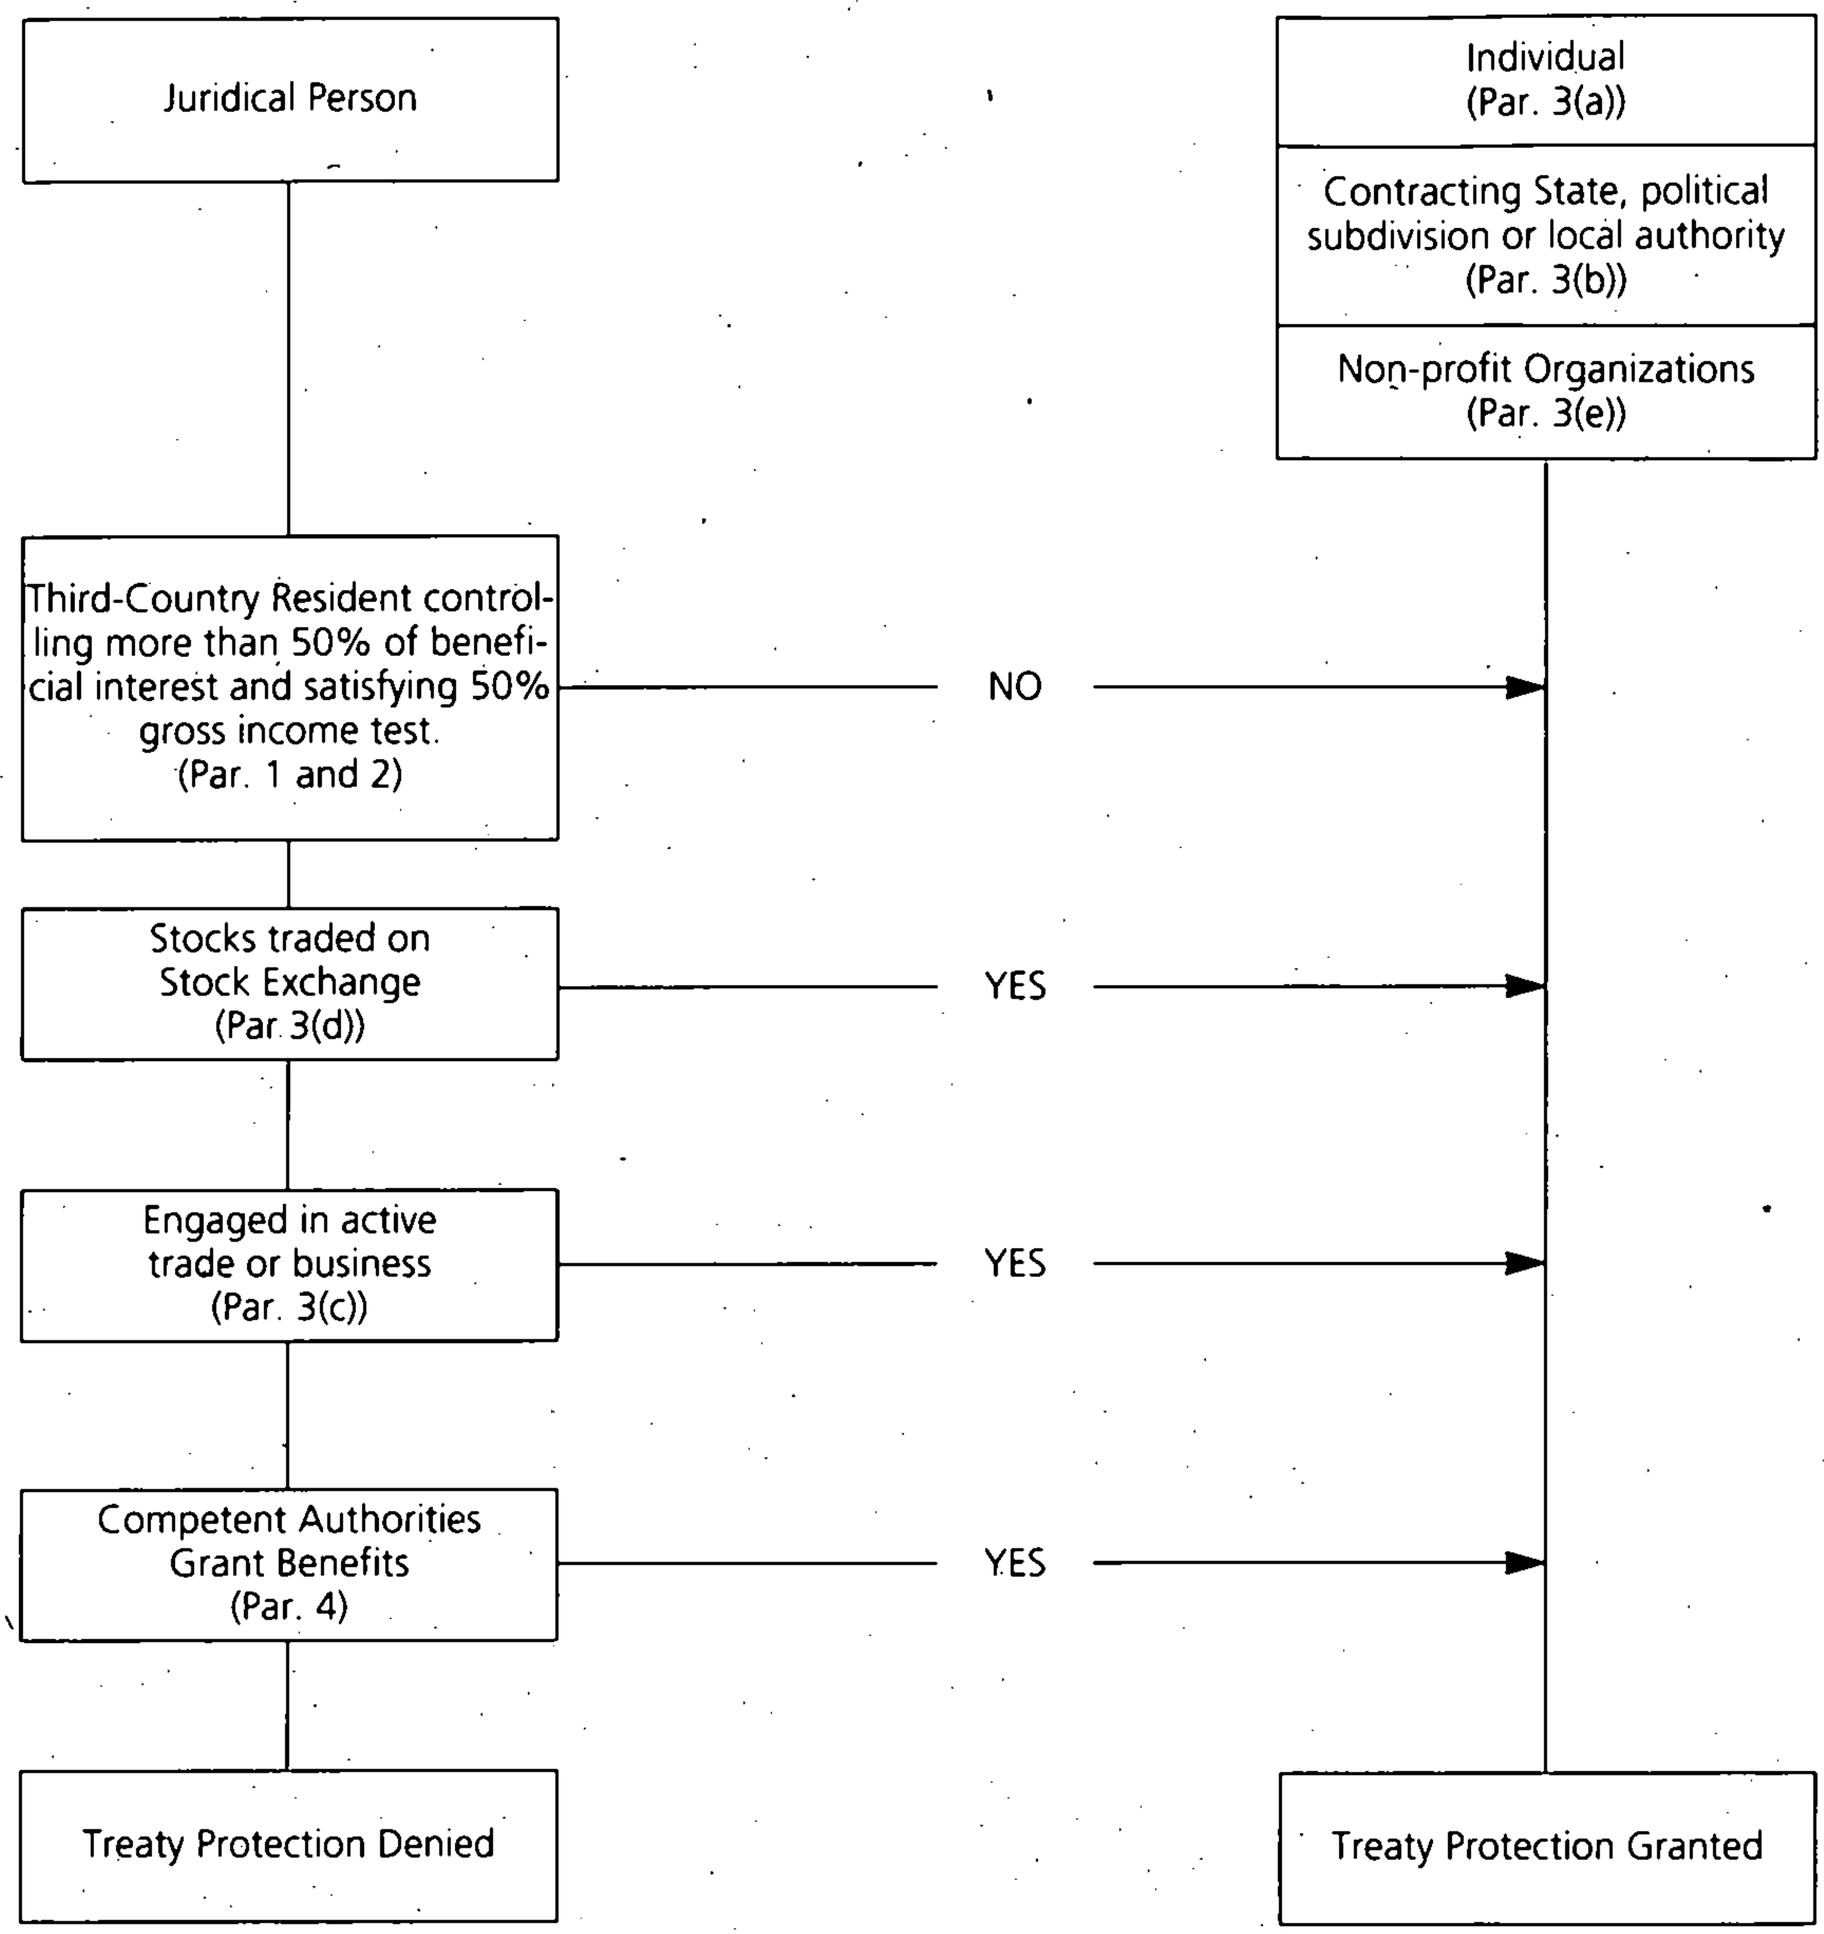
The Israeli withholding tax rate on interest is generally 25 or 45 percent,[50] whereas the US withholding tax rate is 30 percent.[51] Article 13 has adopted a split jurisdiction concept for purposes of taxing interest income similar to the OECD and UN models. In contrast, Article 11 of the US model provides for a reciprocal exemption. While the OECD and UN models provide that interest income may be taxed in the residence country of the creditor, and the country of source may impose a withholding rate not exceeding 10 percent, the treaty allows the country of source to impose a withholding rate not exceeding 17.5 percent.[52] In addition, the treaty provides for a special election which allows residents to elect to have interest income taxed as if the income were business profits taxable under Article 8 of the treaty.[53]

3. Royalties

Israel imposes a general 25 or 40 percent withholding tax rate on royalties,[54] whereas the US withholding tax rate is 30 percent.[55] While most tax treaties, including Article 12 of the OECD and US models, provide that royalties derived from within a treaty country by a resident or corporation of the other contracting state are exempt from taxation in the country of source, Article 14(1) has adopted a rule similar to Article 12(2) of the UN model, which allows the country of source to impose a withholding tax not exceeding 10 percent of the gross amount of a copyright or film royalty and 15 percent of the gross amount of an industrial royalty. The term "industrial royalty" is defined to include the right to use patents, designs, models, plans, secret processes or formulae, trade marks or similar property rights.[56]

E. *Capital gains*

The treaty's provision on capital gains is different from any of the models, and the reason is only in part due to differences between related provisions. The treaty provides that capital gains are taxable only in the country of residence, unless: (1) the gain is taxable under Article 7 (real property); (2) the gain is taxable under Article 8(6) (business profits); (3) the resident is present in the other contracting state for a period aggregating 183 days or more during the taxable year; or (4) the gain is derived by a resident from the disposition of stock in a corporation of the other contracting state, provided the resident owned 10 percent or more of the voting power of the corporation within the year prior to the sale. Article 15(2) provides an exception to (4) in cases where the transferor and the transferee are residents of the same state; the transferee's basis in the asset is determined by reference to the transferor's basis; and either corporation or a common parent resident in the same state owns, directly or indirectly, 80 percent of the voting power or value of the other corporation. In such a case the amount of gain taxable in the other state will be limited to the value of cash or other property received by the transferor. An exception applies if the contracting state in which the transferror is resident subjects a greater amount of gain to taxation, in which case the other contracting state will be allowed to tax the gain in accordance with its domestic law.



F. *Limitation on benefits (see Table 5)*

The limitation on benefits provision contained in Article 25 of the treaty is taken from the US model. The approach contained in Article 25, however, is different from Article 16 of the US model, and reflects current US anti-treaty shopping policies. Firstly, Article 25 operates with a 50 percent beneficial third-country ownership for denial of benefits under the treaty, whereas the similar percentage in the US model is 75 percent. Secondly, Article 25 provides two additional exceptions for third-country investors who are engaged in a so called "active conduct of a trade or business",[57] and for shares which are regularly traded on a recognized stock exchange.[58] The first exception allows benefits for third-country investments in non-profit organizations which are generally exempted from taxation under domestic law, provided that

Limitation on Benefits (Article 25)

more than 50 percent of the beneficiaries, members or participants are persons entitled to the benefits under the treaty.[59] The second exception provides that "a person that is not entitled to the benefits of the Convention pursuant to the preceding provisions of this Article may, nevertheless, be granted the benefits of the Convention if the competent authority of the State in which the income in question arises so determines".[60]

G. Relief from double taxation

Since the United States and Israel apply the credit method to relieve double taxation under domestic law, it is not surprising that this is the approach adopted under the treaty. Article 26(1) has adopted the method applied in the United States to relieve double taxation. Thus the direct and indirect tax credit method is applied. The foreign tax credit in the United States is limited in a number of ways. Firstly, the foreign taxes must be income taxes as defined under domestic tax law. Secondly, the foreign tax credit is limited to the proportion of the US tax which the source income bears to total US taxable income in a taxable year; and finally, the foreign tax credit is limited by the allocation of income to a specific "basket" of income. These limitations are applied under the treaty.

Article 26(1) provides that the United States will allow a citizen or resident of the United States a credit against the US tax liability on the appropriate amount of taxes paid or accrued to Israel. In the case of a US corporation owning at

59. Art. 25(3)(e).
60. Art. 25(4)(a).

© 1993 International Bureau of Fiscal Documentation

least 10 percent of the voting stock of an Israeli corporation from which it receives dividends in any taxable year, credit will also be allowed for the appropriate amount of taxes paid or accrued to Israel by the Israeli corporation paying such dividends with respect to the profits out of which such dividends are paid. The credit granted is similar to the credit provided under IRC Section 902, and the treaty does not generally provide any benefits not already available under the IRC with respect to the crediting of Israeli taxes.

Relief from double taxation is provided under Israeli tax law under a credit method similar to the one applied by the United States, and like the United States, Israel imposes an overall limitation on creditable taxes. Israel will accordingly credit US taxes in accordance with the principles under Article 26(1).[61] In addition, Article 26(2) provides a special rule which is related to the US taxation of its citizens. If a US citizen is a resident of Israel, then with respect to items of income that are exempt from US taxation, or are subject to a reduced rate of US taxation when derived by a resident of Israel who is not a US citizen, Israel will allow as a credit against Israeli tax, credit for foreign tax (only the tax paid, if any) that the United States may impose under the treaty, and for purposes of computing US tax liability.[62] The United States will allow as a credit against US tax the income tax paid to Israel after the credit, and the credit will not reduce that portion of the US tax that is creditable against Israeli tax, and for the purpose of relieving double taxation in the United States, items of income will be deemed to arise in Israel to the extent necessary to avoid double taxation.[63]

H. *Non-discrimination*

Article 27 contains a non-discrimination provision which differs from most treaties. Like the models, the requirement is not limited to the taxes covered by the treaty,[64] the non-discrimination provision is generally limited to citizens ("nationals"), and PEs,[65] and companies controlled by a resident of the contracting states are protected.[66] The treaty does not contain provisions like Article 24(3) of the OECD model applying the requirement to stateless persons resident in a contracting state, or like Article 24(5) applying the requirement to interest, royalties and disbursements paid by an enterprise in one contracting state to a resident of the other contracting state, which must be deductible in calculating the taxable profits under the same conditions as if they had been paid to a resident of the same contracting state as the enterprise. In addition, the treaty's Article 27(4) differs from the models, as it provides that "[n]othing in this Article shall be construed as preventing either Contracting State from imposing the tax described in Article 14A (branch tax)", a provision which will allow the United States to impose its branch profits tax despite any claim of discriminatory tax treatment.

I. *Administrative provisions*

One objection to the original 1975 treaty was the scope of the exchange of information provision, and it is somewhat surprising that the second amendment includes the provision contained in the original treaty. Article 29(1) provides, as do the models, that the competent authorities will exchange such information as is necessary to carry out the provisions of the treaty, and to prevent fraud or fiscal evasion, and that any information exchanged will be treated as secret and will only be disclosed to authorities involved in assessment, collection or administration of taxes subject to the treaty. Article 29(2) provides the general exceptions to exchange of information:

- to carry out administrative measures at variance with the laws or the administrative practice of that or of the other contracting state;
- to supply particulars which are not obtainable under the laws or in the normal course of the administration of that or of the other contracting state;
- to supply information which would disclose any trade, business, industrial, commercial or professional secret or trade process or information, the disclosure of which would be contrary to public policy. Article 29 does not, however, contain provisions similar to Article 26(3)-(6) of the US model.

Article 28 is similar to the mutual agreement procedure provided under Article 25 of the models. Article 28(1) is similar to the US model,[67] and provides similarly that the competent authorities, upon the request of the taxpayer, will try to reach an agreement with the competent authority of the other contracting state in order to avoid taxation not in accordance with the convention. The number of issues suggested for agreement is limited under Article 28(2) to:

- attribution of income to a PE;
- allocation of income, deductions, credits and allowances between related persons;
- determination of source of income;
- characterization of income;
- exchange of information. Article 28(3) is similar to the US model,[68] and Article 28(4) provides that taxes will be imposed or refunded in accordance with any agreement between the competent authorities and "notwithstanding any procedural rule (including statutes of limitations) applicable under the law of either Contracting State".

Despite the presence of a competent authority procedure, it is by no means a guarantee that disagreements between tax authorities will be solved to the benefit of the taxpayer. While the United States in a recent treaty agreed to allow disagreements between the competent authorities to be settled through arbitration, it is regrettable that the treaty with Israel does not contain any arbitration procedure.[69]

61. Art. 26(3).
62. Art. 26(2)(a)-(b).
63. Art. 26(2)(c).
64. Art. 1(3).
65. Art. 27(2).
66. Art. 27(3).
67. US model, Art. 25(1)-(2).
68. Art. 25(4).
69. The 1989 US treaty with Germany contains a special provision concerning the mutual agreement procedure (Art. 25) which allows the contracting states to have their disputes submitted to arbitration (para. 5). However, arbitration is not compulsory as it requires that the competent authorities "agree", and it requires full exhaustion of remedies, which will make it a slow and expensive process. In addition, the procedure cannot be initiated by the taxpayer. The US government has since indicated that arbitration procedures will not be included in future US

© 1993 International Bureau of Fiscal Documentation

III. CONCLUSION

A tax treaty between the United States and Israel is long overdue. The treaty will harmonize conflicting international tax rules, and the overlapping tax jurisdiction claimed under the domestic laws of the two countries. The result is to ensure a fiscal predictability and certainty which will encourage economic relations between the two countries. While tax treaties generally are perceived to prevent double taxation, the fact is that treaties merely reduce the possibility of double taxation, and the extent to which this is achieved depends entirely on the treaty in question. The measures for the avoidance of double taxation could have been improved substantially. Firstly, the treaty places an undue reliance on the competent authorities to resolve any conflict that may arise under the treaty. Secondly, the treaty lacks a provision dealing with the increasingly important issue of treaty override, and this is especially important with respect to US treaties, since the US government for more than a decade has been overriding its bilateral obligations by unilateral measures. Thirdly, the treaty is significantly different from the model treaties. It lacks provisions regarding personal scope, directors' fees, miscellaneous income, taxation of capital, territorial extension, and the denial of treaty protection for certain residents may well have a negative impact on bona fide investments, especially investments by third-country residents. The most important shortfall of the treaty could perhaps be seen as its failure to accommodate the tax incentives provided under Israeli tax law. The reduction of Israeli tax rates for approved enterprises below US tax rates does not benefit the investor as much as the US Treasury, and the lack of a tax sparing provision will not only discourage the very investments which the incentives are intended to encourage, because Israeli tax treaties with industrialized countries generally provide for tax sparing, it will make it more difficult for US multinationals to compete.

treaties. It is, therefore, not surprising that the treaty with Israel does not provide for an arbitration procedure.

However, the new proposed US–Mexico treaty contains an arbitration provision, and while this treaty, like the US-German treaty, provides for an entirely voluntary arbitration procedure, the treaty does suggest that arbitration is considered appropriate if the competent authorities cannot agree. The arbitration provision in the Mexico treaty will not become effective until it is made effective through an exchange of diplomatic notes. This delayed effective date reflects the general IRS reluctance to cede control over the competent authority procedure. Given recent US treaty policies on this issue – and the treaty override issue – the new US model is being awaited with anticipation.

Tax Policy in OECD Countries: Choices & Conflicts *by Ken Messere*

The first ever survey and evaluation of past, present and future domestic tax policies in OECD countries.

Ken Messere, former head of the OECD's Fiscal Affairs division, reviews tax developments and reforms, confronts analytical and general policy issues and makes a close study of particular taxes and the choices governments face in establishing a taxation system.

A vast range of OECD material is condensed into this single, detailed volume. The result is an invaluable, permanent source of reference on theories of taxation practice in the OECD countries.

The book includes the following subjects: Australian tax system, residence and source, capital gains tax, income and concepts of income, deductions, tax accounting, international taxation, anti-avoidance provisions, special classes of taxpayers, fringe benefits tax, and other related subjects.
(B. 57.836)

Bangladesh

SUMMARY OF TAXATION RULES IN Bangladesh 1992-93.
Dhaka, Metropolitan Chamber of Commerce and Industry, 1992, pp. 118.
Detailed summary of all the main taxes levied in Bangladesh.
(B. 57.835)

Indonesia

TAXATION LAWS OF INDONESIA.
Volumes 1, 2A/B/C, 3A/B, and 4. Prepared by Drs. S. Sutanto.
Singapore, APTIRC-Asian-Pacific Tax and Investment Research Centre; Amsterdam, IBFD Publications BV, 1992.
Completely revised second edition of loose-leaf publication providing a systematic compilation of Indonesia's tax rules and regulations. It offers users a vital source of hard information on the new Indonesian tax system. Volume 1 contains Law No. 6 of 1983 on the administrative provisions and procedures such as taxpayer registration, tax payment and submission of objection and appeal, and all relevant decrees and circulars. Volumes 2A, 2B and 2C contain Law No. 7 of 1983 as amended by Law No. 7 of 1991 on Income Tax and subsequent decrees and regulations interpretating the finer points of the law, such as who is a taxpayer, what is income and the definition of a permanent establishment. Volumes 3A and 3B contain Law No. 8 of 1983 on Value Added Tax and Sales Tax on Luxury Goods and subsequent regulations and also the Tax on Land & Buildings, and Stamp Duty. Volume 4 (Reference Guidebook) contains texts and brief summaries of the main taxes and provides an article-by-article index to the relative decrees and circulars.
(B. 57.837)

NIEDERLASSUNGSRECHT.
Regierungsdekret 17/1992. Cologne, Bundesstelle für Aussenhandelsinformation, 1992.
Ausl. Wirtschafts- und Steuerrecht, Reihe A: Gesetzestexte und Erläuterungen, Heft 12/92, pp. 35.
Full text of Government Decree of the Republic of Indonesia 17/92 regarding the share ownership requirements in foreign investment companies and explanatory note.
(B. 57.822)

New Zealand

THE TAX PRACTITIONER 1992.
The complete guide to income tax practice. Edited by Richard Chan and Frank Owen.
Wellington, Butterworths, 1992, pp. 1050.
Annual publication to assist anyone who has an interest in, or an obligation to pay, or give advice upon taxes. The book deals with income tax and includes chapters on accident compensation, goods and services tax, land tax, stamp and cheque duties and estate and gift duties. This 1992 edition incorporates changes in the law enacted up to 31 December 1991.
(B. 57.834)

GOODS AND SERVICES TAX LEGISLATION.

CONTENTS

VOL. 47 NO. 9 **SEPTEMBER 1993**

1993 IFA CONGRESS IN FLORENCE	471	*Karl Beusch*
ITALY WELCOMES FURTHER EC HARMONIZATION	474	*Augusto Fantozzi* The process of corporate tax harmonization in the EC has thus far conferred significant benefits on Italian enterprises. This article examines the Ruding Committee Report and the Response of the EC Commission to the Report in the Italian context.
IMPLEMENTATION OF THE EC MERGER DIRECTIVE	480	*Guglielmo Maisto* Italy implemented the merger directive in December 1992 via a Legislative Decree. The new provisions significantly alter the domestic tax regime applicable to corporate reorganizations, and they offer a welcome clarification of certain civil law issues involving international mergers and divisions. However, the provisions in the Decree give rise to some rather significant discrepancies between the regimes applicable to domestic and cross border reorganizations, and under certain circumstances EC reorganizations appear to be less favourably treated than non-EC international reorganizations.
IMPLEMENTATION OF THE PARENT-SUBSIDIARY DIRECTIVE	493	*Siegfried Mayr* In 1992 the Italian government was authorized to issue a Legislative Decree necessary to implement the parent-subsidiary directive – the relevant decree was issued on 6 March 1993. This article summarizes the taxation of cross border dividends before the directive was implemented, and then examines the new measures dealing with the tax treatment of such dividends.
THE TAX ON THE NET WORTH OF ENTERPRISES	496	*Paolo Ludovici* One of the recent measures aimed at reducing Italy's huge budget deficit is a tax on the net worth of enterprises. Mr Ludovici describes the main features of the new tax, including the instructions provided in the Ministry of Finance's Implementing Decree of 7 January 1993 and Circular No. 7 of April 1993.
TAX TREATMENT OF FINANCIAL INSTRUMENTS IN ITALY	502	*Simona Bellettini* Many statutes and administrative measures affecting the securities market in Italy have been adopted over the last ten years – the process has recently intensified in order to keep up with more developed financial markets. This article summarizes the general rules of Italian tax law which are relevant to financial instruments and then overviews the income tax and VAT aspects of derivative products.

TAXATION OF ITALIAN – BASED FLOWS OF INTEREST AND ROYALTIES IN AN INTERNATIONAL CONTEXT	510	*Guiseppe Marino* A general concern has arisen about how taxation may influence inward and outward direct investment flows, the ways in which revenue from international transactions is shared between countries and new possibilities for tax avoidance. An examination of these issues requires an analysis of the domestic tax regime and how this regime interacts with tax treaties.
TAX INCENTIVES IN ITALY	516	*Andrea Manzitti* Mr Manzitti looks at the evolution of tax incentives in Italy, describes the main incentives and offers some thoughts on possible future developments.
TAX AVOIDANCE: THE ITALIAN EXPERIENCE	522	*Bruno Gangemi* This article reviews the history of tax avoidance measures in Italy, including the recommendation made by the tax reform committee in 1963 and which the Parliament repudiated the commission's recommendation, the use of the Civil Code to counter avoidance and recent developments (implementation of EC directives).
TAX TREATY DEVELOPMENTS	529	*Andrea Manganelli* After examining the interaction of Italian tax treaty policy with domestic law provisions, this article focuses on key provisions of four recently signed treaties with EC partners, explaining how deviations from the OECD model reflect an important evolution of the relationship between the Italian tax system and other tax systems.

1993 IFA Congress in Florence

Karl Beusch

Panoramic View of Florence

Italy was the first host country for an IFA Congress outside the Netherlands when the Congress convened in Rome in 1948. After again being held in Rome in 1956 and exactly ten years ago in Venice, now we meet in Florence, capital city of Tuscany and centre of cultural life with worldwide recognition.

As this is my last IFA Congress as your president, I am delighted that the scientific programme will be the peak of the agenda. Both Subject I and Subject II are of fundamental importance and current interest.

Subject I, "Interpretation of Double Taxation Conventions", tackles the fundamental question about the application of double tax treaties. The purpose of these treaties is the avoidance of double taxation and the prevention of fiscal evasion. A necessary condition to achieve these goals is an identical interpretation of the provisions by the respective tax authorities and courts of the contracting states. How to reach this concept of "common interpretation" will be one of the major topics to be discussed. In this context some countries have readopted the primacy of domestic tax law which is detrimental to uniform international principles.

Subject II, "Non-discrimination rules in international taxation", is also fundamental. The principle of non-discrimination is governed by rules contained in domestic law as well as in international, supranational, bilateral or multilateral conventions. I expect the resolution to suggest how to shape the non-discrimination principle in a better and more complete manner.

With regard to the Working Sessions of the two main Subjects, I would like to draw your attention to a procedural change for the discussion by the panel and the participants from the floor, and the voting procedures of the congress resolutions' respective résumés. As the new procedure is implemented on a trial basis only, the participants are kindly invited to cooperate and contribute to the discussions.

The number of seminars is once again increased – Florence offers six. Seminar A, "Harmonization of corporate taxes in the EC", will focus on the goals of the five EC corporate tax measures adopted prior to 1 January 1993, i.e. in particular realizing neutrality of competition and avoiding distortion in order to improve the productivity and competitiveness of EC-based enterprises.

© 1993 International Bureau of Fiscal Documentation

Comparing the situation in various jurisdictions, Seminar B, "Taxation of employee fringe benefits", investigates the different methods to tax employee fringe benefits, such as inclusion in the employee's income, denial of a deduction to the employer and imposing a fringe benefits tax on the employer.

"Environmental taxes and charges", the subject of Seminar C, are coming into effect in more and more countries in order to limit negative environmental effects. The seminar will overview what kind of taxes and charges have been introduced and summarize the experiences to date of "eco-taxes".

Seminar D, "Corporate tax on distributions (equalization tax)", looks at methods of avoiding economic double taxation by lowering the tax rate on dividends distributed or by granting imputation credits. Possible undue benefits for shareholders are countered by specific adjustments, i.e. the so-called "equalization tax".

Seminar E, "Resolution of tax treaty conflicts by arbitration", describes the arbitration clauses in tax matters which have been included in recent treaties and discusses the principal and practical problems of the arbitration procedure.

Finally, Seminar F, "Italian tax treatment of new financial instruments", gives an overview of the accounting and tax treatment of financial products such as futures, options and other forward exchange and interest rate contracts under Italian law.

The social programme offers not only the opportunity to experience a unique accumulation of historical places and magnificent works of art, but also requires a tough choice – four different settings are offered for the Gala Dinner. In any case your choice will be perfect and I am personally looking forward to meeting the IFA-family again.

Welcome to the 1993 IFA Congress in Florence!

SUBJECTS AND SEMINARS OF THE 1993 IFA CONGRESS

SUBJECT I
Interpretation of double taxation conventions
General Reporters:
Prof. Dr. Klaus Vogel (Germany)
Dr. Rainer Prokisch (Germany)
Discussion Leader:
David A. Ward Q.C. (Canada)
Chairman:
Prof. Avv. Victor Uckmar (Italy)

IFA NEWS

FRENCH BRANCH

In a study meeting to be held on 17 November 1993, Mr Michel Noemie will speak on tax aspects of capital reductions linked to a disinvestment in public companies or partnerships.

KOREAN BRANCH

The annual seminar, to be held in December, will consist of a panel presentation and a talk by a government official regarding recent developments in international tax.

SWISS BRANCH

The Swiss branch will be hosting a joint meeting with the US branch 30 September – 1 October. Subjects discussed include recent developments in Swiss and US taxation, treaty shopping and limitations on inbound debt financing.

ITALY WELCOMES FURTHER EC HARMONIZATION

Augusto Fantozzi

Augusto Fantozzi is a professor of tax law at the University La Sapienza in Rome. He is also founder-partner of Studio Legale e Tributario Fantozzi-Biscozzi, and of STI-Studio Tributario Internazionale-Fantozzi-Uckmar.

Contents

I. Introduction

II. Recent Developments in the EC Policy of Corporate Tax Harmonization
- A. Overview of the Ruding Committee recommendations and the Commission's response
- B. Recommendations to harmonize corporate taxes

III. Conclusion

I. ITALY

Italy is one of the original six signatories to the Treaty of Rome, which provided the impetus to the institution of the European Communities. Since then, Italy has fulfilled its commitment to the evolution of the community of states. The Treaty of Maastricht, the most recent step in a 35-year process, was promptly ratified by the Italian Parliament. However, with respect to the adoption of tax measures issued at the Community level, Italy has not been the most diligent member state, particularly in the case of directives concerning direct and indirect taxes. However, after the recent implementation of the EC directives in the field of direct and indirect taxes, the Italian tax system is now awaiting adoption of new harmonizing measures.

The compulsory adoption of EC directives in the tax area has offered a solution to problems relating to the fiscal aspects of international economic activities, an area particularly afflicted by weak aspects of the Italian tax system. For example, Italian tax legislation does not provide favourable conditions for foreign investment in Italy, nor does it provide advantageous rules for profits from Italian investments abroad.

The few measures adopted at the EC level have increased the level of competitiveness of certain features of the Italian tax system, (e.g. tax regime for inbound dividends) and certain long-standing problems have been resolved by implementation of the EC directives. Any expectation of further improvement in the Italian rules governing transnational economic operations should be analyzed in light of future developments in the process of corporate tax harmonization.[1]

This article examines two important documents issued at the EC level in 1992, i.e. the Ruding Committee Report and the Response of the EC Commission to the Report. Portions of those documents that more directly address issues which are relevant from an Italian perspective will be examined in detail.

II. RECENT DEVELOPMENTS IN THE EC POLICY OF CORPORATE TAX HARMONIZATION

The process of harmonizing of corporate tax systems in the EC has developed enormously in the last three years. Since the Commission published its 1990 document, "Guidelines for Corporate Taxation,"[2] renouncing its ambitions of full corporate tax harmonization in the member states, the first steps towards harmonization have been taken. The adoption of the parent-subsidiary directive, the merger directive and the 1990 arbitration convention represent an historical event in the harmonization process.

In the Guidelines, the Commission outlined the fundamental principle of subsidiarity, i.e. harmonization will be realized through intervention at the Community level only insofar as serious distortions are not removed by the harmonizing effects that economic integration will have on the tax systems, or by separate action on the part of member states.

The first evidence of the introduction of the principle of subsidiarity was the withdrawal of the proposed 1975 Directive,[3] in which the imputation system was presented as the harmonized method for the elimination of double taxation on dividend flows, and which imposed a minimum and a maximum limit for corporate tax rates. Further evidence of the Commission's new approach was the abandonment of the 1988 draft proposal on the determination of profits of undertakings, which aimed to harmonize national rules on the determination of the taxable base. Under the new approach, the Commission intends to focus on harmonization of the rules governing tax aspects of transnational operations, rather than on intervention in national legislation which governs domestic economic events.[4] The Guidelines recommend-

1. This process will be discussed in Seminar A of the 1993 IFA Congress, so reference should be made to the results of the panel members' discussion.
2. SEC(90)601 of 2 April 1990.
3. COM75(392) final.
4. The same consideration is also expressed in point 38 of the Commission's latest communication.

© 1993 International Bureau of Fiscal Documentation

ed immediate adoption of the parent-subsidiary directive and the merger directive. The recommendation was taken up by the Council in July 1990, and the march towards harmonization began. The accomplishment of such result demonstrates that as of 1990, the Commission more astutely interpreted the Council's reluctance to relinquish too much sovereignty of the member states in direct tax matters. In this respect, the importance of fiscal policy as a means to reinforce the economic policy of each member state should never be neglected.[5]

An analysis of the Ruding Report and the Commission's reactions to the Report should be undertaken in view of the new position outlined in the Guidelines. The Ruding Committee's investigation was announced in the Guidelines, and the response of the Commission is expressly defined as a "communication ... further to the Guidelines presented on 20 April 1990".

The Commission's reactions to the Ruding Committee recommendations which are likely to cause significant changes in domestic legislation governing internal taxation were rather cool. However, the Commission warmly welcomed recommendations which deal with aspects of domestic legislation which regulate cross-border transactions.[6]

A. *Overview of the Ruding Committee recommendations and the response of the Commission*

Unlike the systems of other member states, the Italian system has benefited greatly from the introduction of EC measures in fiscal matters. Thus further harmonization would be certainly welcomed.

However, full implementation of the measures suggested by the Ruding Committee would create other problems primarily related to Italy's particular financial situation, which because of the pressing need for an increase in tax revenue, does not allow any flexibility of fiscal policy. The recommendations discussed here are those aimed at reducing double taxation of transnational flows of income and recommendations concerning further harmonization of corporate income tax.

1. Elimination of double taxation of cross-border income flows

The elimination of obstacles to the development of European-wide economic activities is one of the most important purposes of the tax harmonization policy followed by the European Commission. The creation of the European Common Market could not be realized without the establishment of economic conditions similar to those of an internal market. Therefore, all factors which contribute to make transnational investments more burdensome than domestic investments should in principle be removed.

In the tax area, obstacles which impede the creation of a common market usually consist of discriminatory treatment of foreign- source income as compared to income derived from domestic sources. Many obstacles for corporate taxpayers have been removed through the adoption of the parent-subsidiary directive. However, application of the directive is limited to instances where certain conditions – which are in some respects restrictive – are met. One specific recommendation of the Ruding Committee addresses the elimination of double taxation on cross-border income flows when the country of residence of the recipient provides for an imputation system in the domestic context. This recommendation, in the Ruding Committee's opinion, should help to solve the problems of transnational investments when the income derived therefrom, being exempt in the hands of the recipient, is subject to equalization taxes upon redistribution.

The prompt adoption of the other two directives presently under discussion in the European Council, i.e. the interest and royalties directive and the directive for the taking into account of losses of permanent establishments ("PEs") and subsidiaries situated in other member states, has been suggested by the Ruding Committee in order to facilitate intra-Community financing and licensing operations and to promote the creation of productive activities in other member states.[7] The implications of adoption of these proposals are commented on below.

(a) *Tax treatment of income earned abroad*

The elimination of double taxation on cross-border income flows is significantly related to the elimination of double taxation of foreign-source profits. An unresolved dilemma is whether the classical system or an imputation system should be adopted throughout the EC as a harmonized system. In those member states which provide for a full or limited imputation regime and an exemption system governs foreign-source income, the redistribution of exempt foreign-source income on the part of resident companies raises problems of equalization taxes.[8] Equalization taxes aim to equalize the tax credit granted to resident shareholders of the distributing company. The imposition of equalization taxes constitutes double taxation, since the profits originally taxed in the hands of the foreign company are subject to an additional burden when redistributed by the resident company.

This issue was specifically addressed by the Ruding Committee through a recommendation which could significantly affect the Italian tax system. The Committee recommended

5. The same conclusions may be drawn taking into account the process of conclusion of the arbitration convention. The purpose of the convention, i.e. elimination of double taxation resulting from uncoordinated application of transfer pricing adjustments, was originally to be achieved by a directive. The proposed directive presented to the Council on 29 November 1976 (COM(76)711 final) never obtained the Council's approval. The text was transposed into a multilateral convention, which was signed on the basis of Art. 220 of the Treaty of Rome. By adopting a convention rather than a directive, the member states have prevented the EC Court of Justice from gaining authority in this area. The member states apparently deemed such a transfer of authority from a national body to an EC body too rigorous.
6. I will assume that only the proposed measures which have been agreed to by the Commission are likely to be implemented in the near future. Therefore, only those measures will be discussed from an Italian perspective.
7. The effects of the losses directive on the creation of new productive activities in other member states could be extremely favourable inasmuch as it would permit the recovery at the level of the parent company or the head office of the start-up losses which normally arise in the event of newly created activities.
8. Some form of equalization tax is levied by Italy, France and Germany.

© 1993 International Bureau of Fiscal Documentation

that those states which, like Italy, apply equalization taxes on the distribution of profits earned in another member state should be required, on a reciprocal basis, to allow such tax to be reduced by corporate income tax paid in the other member state in respect of dividends remitted by a subsidiary, or profits earned by a PE.[9]

The reciprocity principle has already been adopted in Italian tax treaty policy; see for example, the new treaties with France, Germany, the United Kingdom and the Netherlands.[10] Under the UK and French treaties Italy grants a repayment of the underlying tax credit on dividends distributed to French or UK shareholders. Under the UK treaty the benefit reciprocally granted is limited to the repayment of the tax credit. Under the French treaty, if the equalization tax has been effectively paid by the Italian company, and the French shareholder is not entitled to the full tax credit refund, the equalization tax may be refunded as an alternative to payment of the tax credit. These conditions have been agreed upon on a reciprocal basis so that Italian shareholders obtain the same benefit.

The German and Dutch treaties only provide for a refund of the equalization tax. Neither Germany nor the Netherlands was able to recognize any payment of the underlying tax credit to Italian shareholders, and the only benefit granted to Dutch and German shareholders is a refund of the equalization tax.

To fully implement the Committee's recommendation, the current tax regime applicable to dividends paid to an Italian company by its EC resident subsidiary, and the regime applicable to profits that such company has produced abroad through a PE, should be almost completely revised. However, due to contradictory measures recently adopted with respect to the treatment of business income flowing from abroad, the current situation appears quite confused.[11]

For example, the legislation implementing the parent-subsidiary directive introduced a 95 percent exemption for dividends received by Italian parent companies from their EC resident subsidiaries, no equalization tax being due upon redistribution. This situation is different from the one described by the Ruding Committee since no equalization tax is levied. However, no double taxation occurs, and there is no need to implement the Committee's recommendation. It should also be noted that the treatment of dividends received from EC resident subsidiaries is different from the system adopted to avoid double taxation on intercompany flows of dividends in a domestic context, where an imputation system fully avoids double taxation.

In different circumstances, double taxation would not be solved by the measures suggested by the Committee. When the benefits of the parent-subsidiary directive are not available (for example, because of an insufficient participation or because the one year holding period is not met), only a partial exemption is granted with a partial levy of the equalization tax. In particular, dividends received by Italian companies from non-resident associated companies (holding more than 10 percent of the voting rights in the case of quoted companies, more than 20 percent in other cases) are 60 percent exempt, 40 percent being taxable. The equalization tax levied on redistribution of such dividends is approximately 8 percent of the dividends received. In this situation, the advised solution would eliminate the double taxation that arises upon the levy of the equalization tax. Unfortunately, it would not help to abolish the double taxation which amounts to the tax due on the 40 percent of the dividends which do not benefit from the exemption.

When neither the parent-subsidiary directive nor the partial exemption applies, pure double taxation occurs; for example, when dividends are received by enterprises which do not have a corporate structure or by companies which do not hold the requisite participation necessary to benefit from the partial exemption. In these cases dividends received are fully taxable in the hands of the recipient, and no equalization tax is due. Thus, the recommendation of the Ruding Committee would not produce any positive result.

These problems, however, could be resolved by adoption of provisions aimed to substantially reduce the participation threshold as prescribed by the parent-subsidiary directive and by extending the directive's application to all enterprises subject to income tax. These measures are also suggested by the Ruding Committee.

With respect to profits realized abroad by a PE of an Italian company situated in another member state, the current situation is different from the one described by the Ruding Committee, as domestic legislation and Italian tax treaties provide for an ordinary foreign tax credit method, and therefore double taxation is generally avoided. In these cases, no equalization tax is levied, as the PE's profits do not benefit from an exemption when Italy is the country of residence of the head office.

(b) *Draft directive for taking into account losses of PEs and subsidiaries situated in other member states*

European economic integration is another objective to be accomplished for the realization of the Common Market, i.e. EC-resident enterprises should be able to operate in the European context under the same conditions under which they

9. See the Ruding Report, Conclusions and Recommendations, Part III, Policy recommendations.
10. All of these treaties, with the exception of the Netherlands treaty, are effective.
11. Newly introduced measures include:
- legislative decree No. 136 of 6 March 1992 implementing the parent-subsidiary directive;
- Art. 11(14) of Law 413 of 30 December 1991 (the 1992 Finance Act), which denies the 60% exemption from IRPEG for profits from foreign associatd companies which have their fiscal residence in a tax haven;
- foreign PE's profits are traditionally treated under an ordinary foreign tax credit regime;
- profits from EC resident subsidiaries can benefit from a 95% exemption from IRPEG and from a full exemption from equalization tax (ITC Art. 96 bis);
- profits from foreign associated companies (particiation greater than 20% of the voting rights and 10% in the case of quoted companies) are only subject to IRPEG up to 40% of their total amount but are subject to equalization tax (ITC Art. 96(1);
- profits from foreign associated companies resident in a tax haven are fully subject to IRPEG but not to equalization tax (ITC Art. 96(1)bis);
- profits from foreign associated companies are fully subject to IRPEG but not to equalization tax ITC Art. 56).

© 1993 International Bureau of Fiscal Documentation

operate in a single state. Currently, the location of an enterprise's units in a foreign country usually gives rise to initial losses, and in some cases the attempt to expand to foreign markets fails.

The possibility of recovering foreign losses at the level of the head office or at the level of the controlling company would assist in obtaining a positive result. To this end, on 6 December 1990 the Commission submitted to the Council a proposal for a directive for taking into account the losses of PEs and subsidiaries situated in other member states.[12] The Commission stressed the importance of rapid approval of the directive in the Guidelines, and the Ruding Committee concurred. The matter was not covered in the Response of the Commission.

No official documents have been issued by the Council, but "rumours" from Brussels confirm that the proposal has been divided into two directives, i.e. one concerning PEs and the other concerning subsidiaries. Such a division would aim to facilitate prompt adoption of the proposed directive's provisions concerning losses suffered by PEs. The provisions of the official draft which relate to the losses of subsidiaries would, in fact, constitute the main obstacle to adoption of the directive.

The approval of the directive only with respect to losses of PEs would not create significant changes in the Italian legislation. The proposal provides for two methods which can be adopted by the member states, i.e. the credit method or the method of deducting losses and reincorporating subsequent profits. The explanatory notes to the directive clearly state that those countries which already adopt the credit method would probably maintain such method, while those countries which adopt the exemption method should implement the deduction and reincorporation method.

The system presently applicable in Italy with respect to the income of foreign PEs' provides for a credit method, although it is limited to corporate income ("IRPEG"). For the purposes of local income tax ("ILOR"), the exemption system applies.[13]

The tax courts have consistently held that as the profits of PEs which are situated abroad are exempt from ILOR, then losses suffered by such PEs should not be taken into account in determining the taxable base for ILOR purposes. In this respect, it is worth noting that Article 3 of the directive, which lists the taxes to which the enterprises of member states must be subject in order to benefit from the directive, does not mention ILOR, but only IRPEG and the individual income tax ("IRPEF").

The absence of ILOR from the list might imply that, as far as Italy is concerned, the obligations provided by the directive are limited to IRPEG and IRPEF and do not encompass ILOR. Thus, the current regime would be in line with the directive's provisions which deal with losses of foreign PEs, and implementation of the provisions contained therein would be unnecessary.

Substantial changes should be introduced if the draft directive dealing with losses is approved in its present official version, i.e. including losses of foreign subsidiaries. The same holds true with respect to the Ruding Committee's recommendation of full horizontal and vertical offsetting of losses within groups of enterprises at the national level. These major changes would be necessary in Italy due to the absence of provisions allowing groups of companies to consolidate their accounts for tax purposes.

In the absence of group relief, losses of domestic and foreign subsidiaries are usually taken into account by resident head group companies by devaluing their participation in the subsidiaries' capital. Such devaluation achieves the purpose in an effective way only with respect to participation in companies with capital represented by shares. In these cases, it is possible to benefit from the system of evaluation of participations in non-quoted shares under ITC Article 61(3)(c), which provides that in the event of a decrease in the value of the participation, the new value should be determined taking into account the capital losses resulting from a comparison of the last balance sheet approved by the issuing company with the last balance sheet approved prior to the purchase of the participation. If losses have been incurred by the subsidiary, such losses would be normally covered by a reduction of capital or a diminution of reserves. In both cases the result is a decrease in the net asset worth of the company, which would allow the capital loss to emerge upon a comparison of the two balance sheets. Thus, a sort of deduction of losses of subsidiaries is permitted.

On this point, some concern has been expressed with respect to participation in non-resident corporations, since the tax authorities have frequently expressed doubts about the truthfulness of the balance sheet of companies resident outside of Italy. These doubts, however, should not affect the situation where the Italian company holds shares in a company resident in the EC, as the implementation of the fourth company law EC directive (78/660-EC) in all member states has harmonized the principle for drawing up the profit and loss account and the balance sheet throughout the Community.

Some problems may arise, however, when the participation is in companies with capital represented by quotas or similar instruments rather than by shares. In this case, the only provision which can help Italian companies is ITC Article 66(3), which allows the deduction of an extraordinary loss when the loss of one or more goods which belong to the enterprise is ascertained on the basis of certain and precise evidence. In the case of non-in-share participations, the loss can be certainly and precisely determined only in the event of a reduction of the capital of the company to nil, with its subsequent reconstitution; the participation can be considered as lost. With respect to participations in EC resident companies, some problems arise in Dutch BVs or German GmbHs, the capital of which cannot be reduced to nil, but only to the legal minimum.

(c) *Interest/royalty draft directive*

The proposed directive on a common system of taxation applicable to interest and royalty payments made between

12. COM(90)595 final.
13. See ITC, Arts. 115 and 117.

© 1993 International Bureau of Fiscal Documentation

parent companies and subsidiaries in different member states was presented by the Commission to the Council on 6 December 1990.[14] Its adoption would serve the creation of a Common Market having the characteristics of a domestic market where the transactions between companies of different member states are not subject to less favourable tax conditions than those applicable to the same transactions carried out between companies in the same member state. Apart from the more favourable financial implications derived from abolition of withholding taxes on cross-border payments of interest and royalties, the actual benefit which might derive from adoption of the directive depends on the foreign tax credit regime in effect in the member state of residence of the company which receives the payment. Where such credit system is effectively elaborated, the withholding taxes levied in the country of the paying company may generally be recovered by the recipient company.

Major benefits may be derived by the paying company inasmuch as the amount of interest and royalties due under the financing or licensing contract is determined net of withholding taxes levied at source.

With respect to the implications of adoption of the directive, some concern may be expressed for the decrease in revenue which is likely to result. The current withholding tax rate in domestic legislation on interest and royalties paid to non-residents is, respectively, 30 percent and 21 percent. The rate is usually reduced by double tax treaties, although the reduction is rather limited compared to withholding tax rates applicable (domestically or under the treaties) in other member states. The withholding tax rate on interest in treaties with other member states is 15 percent, and for royalties, Italian treaty policy has generally preferred the insertion of a 5 percent withholding tax provision, although the 1977 OECD model provides for a zero rated withholding tax. Therefore, complete abolition of withholding taxes on such payments to non-residents would decrease Italy's tax revenue.

B. *Recommendations to harmonize corporate taxes*

Among the recommendations of the Ruding Committee relating to the harmonization of corporate taxes, one draws immediate attention, i.e. not only minimum and maximum rates are necessary, but also minimum standards need to be set for determination of the taxable base. This is a logical conclusion, since distortions cannot be avoided only by a band of rates if the tax base varies significantly from member state to member state. However, it will be difficult to determine the minimum standards for the tax base, and at what point the line with "drastic harmonization" should be drawn. Member states will probably perceive this as the final step towards full harmonization of corporate tax despite the subsidiarity principle, which was reiterated as a valid principle by the Ruding Committee.

In fact, the Commission has coldly reacted to most of the Ruding Committee suggestions to harmonize corporate tax systems. In its communication of 26 June 1992 the Commission expressed firm reservations on the recommendations concerning the harmonization of the tax base. The reservations were based on the following:

- differences in tax base rules generally have relatively little impact on the divergences in the cost of capital between the different member states;
- most of the proposed harmonization measures would have the effect of reducing the corporate tax base, which, all other things being equal, would necessitate an increase in rates;

Only a few of the Ruding Committee's suggestions were considered desirable by the Commission, i.e. those relating to the definition of taxable profits, the carry-over of foreign losses, the deductibility of pension contributions paid by or for expatriate workers and the deductibility of insurance premiums.

1. Measures for the introduction of a minimum and maximum tax corporate tax rate

As far as the creation of a uniform band of tax rates for the entire Community is concerned, major problems would arise in Italy if the Ruding Committee's suggestion to introduce a 40 percent maximum rate for corporation tax was followed. In this respect, the Ruding Committee's recommendation was probably the result of the convergence demonstrated by other member states for a reduction of the corporate income tax rates. An opposing position has been adopted by Italy, where the latest news is that the aggregate of IRPEG and ILOR has increased the burden on corporate profits from 47.8 to 52.2 percent in the last year. Again, the particular financial situation facing the Government does not allow any flexibility. In addition, the need to meet economic and financial requirements set out in the Treaty of Maastricht exacerbates the situation.

No problems should arise if the minimum 30 percent tax rate was introduced, provided that tax incentives hitherto allowed by the Community are safeguarded. To promote the development of Southern Italy, a total exemption from IRPEG for a period of ten years is granted to companies established in the Mezzogiorno area after 29 March 1986. The exemption is applicable from the date of incorporation of the company, and the incentive is maintained for equalization tax purposes, which is usually levied when the company's income has been subject to reduced taxation. ITC Article 106(2) provides that the equalization tax does not apply to companies which benefit from the above incentive.

2. Specific measures for harmonization of the tax base

The Commission made favourable comments about certain recommendations of the Ruding Committee concerning measures to be adopted with respect to determination of the tax base. It is therefore worth noting the current Italian position as the measures are likely to be implemented in the near future.

(a) *Definition of taxable profits*

The rules for determining taxable profits should under no circumstances be more favourable than rules governing the calculation of profits for accounting purposes. Italy already con-

14. COM(90)571 final.

© 1993 International Bureau of Fiscal Documentation

forms to this principle. Under Italian law taxable business income is based on the result shown by the profit and loss account, as adjusted by the provisions of the ITC. Such adjustments usually increase taxable income, if compared to business income computed according to accounting rules. Hidden incentives do not exist, and they are not likely to be introduced.

(b) *Carry-over of losses*

The carry-over of losses should be harmonized throughout the EC according to the rules set forth in the 1984 proposed directive, as amended in 1985.[15] This proposal provides that if the undertakings of a member state draw up, for tax purposes, annual accounts consisting of a balance sheet and a profit and loss account, and the result of such computation is a loss, such undertakings should be allowed to carry back their losses for three years or carry them forward for an unlimited period of time.

Adoption of the proposed directive would be welcomed by Italian enterprises, as currently the only provisions of the ITC which deal with business losses (Articles 8(3) and 102) provide that, for IRPEF or IRPEG purposes, losses derived from business activities may be carried forward for five years insofar as they cannot be set off against net taxable profits of each year.

The adoption of the 1984 directive would put the Italian legislation in line with the regimes applicable in most other member states. However, some concern may be expressed as the carry-back of losses would determine the necessity of a refund of taxes already paid in previous years. Refund procedures in Italy are particularly time-consuming, and a carry-forward procedure, if it can be utilized in the year after the losses were incurred, may be financially more convenient for the enterprise.

3. Deductibility of contributions paid to foreign pension funds by or for expatriate workers

It is suggested that the Commission take steps to ensure that contributions to pension schemes paid by or on behalf of expatriate workers are deductible for tax purposes, regardless of where the pension fund is situated.

The ITC does not appear to contain any specific provisions prohibiting such a deduction, i.e. the deduction is allowed provided the negative item of income represented by the contributions paid are related to the activities of the enterprise. This condition should be considered as fulfilled when the beneficiary of the pension is an employee of the enterprise.

When the deductibility of contributions paid by the employee is at issue, the rules set out in ITS Articles 10 and 48 provide that in general, a deduction is allowed since no distinction is made between Italian or foreign funds.[16]

III. CONCLUSION

The process of corporate tax harmonization in the EC has thus far conferred significant benefits on Italian enterprises. Over the last few years the EC Commission has emphasized the necessity for a more realistic and concrete approach, pursuing less ambitious aims with a greater degree of decision. After the adoption of the merger directive, the parent-subsidiary directive and the arbitration convention, further discussion has commenced which hopefully will lead to the adoption of the other two outstanding proposals, i.e. the losses directive and the interest and royalties directive.

Further harmonization cannot be easily forecasted, as the views of the Ruding Report and the Commission are significantly different. The few measures which the Committee of experts and the EC Commission have agreed upon are the most likely to be introduced in the near future, and should not create too many problems as far as their impact on the Italian tax system is concerned.

However, further extension of the scope of harmonization would grant to the Italian system the possibility of being in line with the high standards of other member states, and would therefore be certainly welcomed.

15. COM(84)404 final.

16. This interpretation was confirmed by the tax authorities in Ministerial Circular No. 19/3595 of 1979 and by the decision of the Central Tax Court No. 3975 of 11 May 1988. A decision of the Central Tax Court (No. 247 of 15 January 1991), in which the deduction was not allowed, was based on the restrictions to the cross-borders transfers of currency. These restrictions were subsequently abolished in observance of EC regulations, and therefore problems in this respect have been finally solved.

I. INTRODUCTION

Directive 434/90/EEC of 23 July 1990, concerning the common system of taxation applicable to mergers, divisions, transfer of assets and exchanges of shares concerning companies of different member states (hereinafter "the Directive") was implemented in Italy through Legislative Decree No. 544 of 30 December 1992 (hereinafter "the Decree").[1] The new provisions constitute, on the one hand, a significant change in the internal tax regime applicable to corporate reorganizations whilst, on the other hand, they afford a welcome clarification of some underlying civil law issues regarding the legal possibility to execute international mergers and/or divisions. The provisions contained in the Decree give rise to significant discrepancies between the regime applicable to domestic and cross border reorganizations. Moreover, under certain circumstances, EC reorganizations seem to be even less favourably treated than non-EC international ones, which continue to be governed by the provisions applicable to domestic reorganizations.

This article describes the provisions contained in the Decree and outlines and discusses the above-mentioned discrepancies.

II. THE CROSS BORDER MERGER

A. *Civil law provisions applicable to mergers in general*

Mergers are governed by Articles 2501-2504 sexies of the Civil Code (some of these provisions were introduced through Legislative Decree No. 22 of 16 January 1991 to implement Directive 78/855/EEC of 9 October 1978).[2] No definition of merger is given by the Civil Code. However, a definition of merger has been elaborated by scholars[3] to include the situation where two or more companies join their structure and their assets without losing their legal personalities, even though a new entity is created in the process.

Two types of merger can be envisaged:

- the *merger by the formation of a new company*, defined by Directive 78/855/EEC as an operation whereby two or more companies are wound up without going into liquidation and transfer all of their assets and liabilities to a company that they set up, in exchange for the issue to their shareholders of shares in the new company and a cash payment, if any, not exceeding 10 percent of the nominal value of the shares so issued; and
- the *merger by acquisition*, defined by Directive 78/855/EEC as an operation whereby two or more companies are wound up without going into liquidation and transfer to another company all their assets and liabilities, in exchange for the issue to the shareholders of the company or companies being acquired of shares in the receiving company and a cash payment, if any, not exceeding 10 percent of the nominal value of the shares so issued.

B. *Civil law regime applicable to international mergers*

The civil law regime applicable to international mergers is not expressly governed by the Civil Code; in the past scholars have debated the legal possibility to execute international mergers considering the situation where a foreign incorporated company acquires an Italian company and where an Italian incorporated company acquires a foreign company.

Soc.*(1968), at 582.

© 1993 International Bureau of Fiscal Documentation

According to prevailing literature, the legitimacy of cross border mergers is based on:

- Article 16 of the Provisions on the Law in General according to which "aliens enjoy the civil rights attributed to citizens on condition of reciprocity and subject to the provisions contained in special statutes". This provision also applies to foreign corporate entities;
- Articles 2506 et seq. of the Italian Civil Code which recognizes the possibility for foreign corporate entities to operate within the Italian legal system;
- the non-existence of any express provision which precludes the cross border merger.

Scholars have taken the view that international mergers are possible even where the company to be acquired has its seat in Italy,[4] although it has been affirmed that such transactions were only possible so long as the foreign company was subject to Italian company law rules.[5] In any event, it is commonly agreed that shareholders of the company to be acquired are entitled to withdraw from the (acquired) company.[6] This would make the merger more difficult in certain situations, namely where the acquiring company does not own the entire capital of the acquired company.

In conclusion, cross border mergers are not prohibited under Italian civil law although it may be required that the company resulting from the merger (e.g. the acquiring company) be subject to Italian law after the merger has taken place. If this theory is correct cross border mergers could be subject to some limitations.

C. *Tax regime*

Three different tax regimes for mergers can be envisaged as a result of the implementation of Directive 434/90/EEC:

- regime for domestic mergers;
- regime for international mergers not covered by the special EC regime;
- regime for international mergers covered by the special EC regime (hereinafter referred to as "EC mergers").

1. Domestic mergers

Tax rules on mergers, other than EC mergers, are found in Consolidated Tax Act ("CTA") Article 123, which provides that the merger does not give rise to the realization or distribution of capital gains or losses on the assets of the merged companies, including inventories and goodwill (principle of neutrality).

In computing the taxable income of the acquiring company, the merger surplus entered in the balance sheet as a result of the share exchange ratio or the cancellation of the shares in the acquired companies owned by other companies taking part in the merger, is not taken into account. Additionally, no account is taken of the merger deficit entered in the balance sheet as a result of the share exchange ratio, provided such deficit does not result in a revaluation of the assets of the acquired company. On the contrary, the merger deficit resulting from cancellation of the shares in the acquired company owned by the acquiring company can be used for a tax-free revaluation of the assets of the acquired company (up to their market value), including goodwill.[7] Subsequent capital gains or losses as well as depreciation are calculated on the revalued amount.

Losses generated by the companies taking part in the merger (which can be carried forward for five years for IRPEG purposes only) can be used by the acquiring company subject to the following limitations:

(1) the profit and loss account of the company whose losses can be carried forward relating to the fiscal year prior to the resolution of merger must show revenues as mentioned in Article 2425-bis, first part no. 1 of the Civil Code, and expenses for subordinate labour higher than 40 percent of the average of the two previous years;
(2) if the test described under (1) above is satisfied, available losses to carry forward cannot exceed:
   - the net book value as shown in the last approved financial statement (or, if lower, in the interim financial statement required in merger procedures by Article 2501-ter of the Civil Code) of the company, the losses of which are carried forward without taking into account any equity contribution made during the 24-month period prior to the date of said statement;
   - if the shares or quotas of the corporation, the losses of which have to be carried forward, were owned by the acquiring company or another company involved in the merger, the losses cannot in any event be carried forward up to the amount of the devaluation of said shares or quotas taken by such company from which such shares or quotas have been purchased after the occurrence of the losses and before the merger;
   - lastly, carried forward losses cannot exceed the amount of tax-free capital gains realized as a consequence of the merger deficit.

Moreover, provisions or reserves subject to tax deferral entered in the balance sheet of the acquired company have to be included in the income of the acquiring company if and to the extent they are not entered in the balance sheet of the acquiring company.[8]

The merger will not give rise to any gain or loss for the shareholders of the acquired company, provided no cash payments are made by the acquiring company. The tax basis of the shares of the acquired company is carried over to the shares of the acquiring company allotted as a result of the merger.

4. Marziale, "La fusione delle società nella disciplina comunitaria" in *Le Società* (1986), at 980; Simonetto, *supra* note 3, at 376.
5. In particular, see Simonetto *supra* note 3 who takes the view that such merger is recognized when the foreign acquiring company is subject to Italian company rules. Such view has also been adopted by the Court of Appeal of Milan; see Decree 7 May 1974 in *Riv. Not.* (1975), III, at 584.
6. See Santamaria *supra* note 3, at 584.
7. The revaluation is allowed up to the difference of the tax basis for the company which owns the shares of the company being acquired, which are cancelled as a result of the merger, and the net book value of the company being acquired.
8. This provision does not apply to reserves which are taxed only in the case of distributions if the merger gives rise to a merger surplus or to a merger deficit resulting from the exchange ratio. However, in such a case, an amount equal to the amount of such reserves will be included in the taxable income of the acquiring company upon distribution of the merger surplus or reduction of the share capital because it is considered excessive.

2. International non-EC mergers

The recognition and legitimacy of a cross border merger under Italian civil law should lead to the conclusion that international mergers can be effected by applying internal law rules governing mergers.[9] From the civil law viewpoint, the transfer of assets and liabilities from the acquired company to the acquiring company would be recognized so that the acquiring company would take over all such assets and liabilities without interruption. From the tax viewpoint, Article 123 does not include any restriction to its applicability to cross border mergers and does not prevent its application to non-resident taxpayers.[10]

If the assets and liabilities of an Italian acquired company are transferred to an (existing or new) Italian permanent establishment ("PE") of the foreign acquiring company, the continuity of the assets and liabilities would be recognized both for civil law and tax purposes, and Article 123 would apply. Moreover, the merger deficit resulting from cancellation of the shares in the Italian acquired company may be used for a tax-free revaluation of the assets transferred to the PE.

On the contrary, some doubts arise if:
- after the merger the acquiring company does not maintain a PE in Italy showing the assets and liabilities of the acquired company; or
- the Italian acquired company maintained assets outside Italy and such assets do not appear in the books of the Italian PE after the merger.

Under these circumstances, the assets of the acquired company which are not reflected in the books of the PE would cease to be subject to Italian tax rules. It is worth noting, however, that the circumstances under which a gain is realized for tax purposes are expressly mentioned in CTA Articles 53 and 54,[11] which do not appear to include the situation where the assets "leave" the Italian tax jurisdiction. Consequently, no taxable event would occur. It is, however, very likely that the tax authorities would nonetheless take the view that the "departure" of the assets from the Italian tax jurisdiction would amount to a taxable event under the above-mentioned Articles 53 and 54, i.e. the destination of goods to a purpose other than the business purpose of the enterprise (the assets which are no longer tax relevant in Italy would no longer be "used" for the purpose of the Italian enterprise, regardless of the fact that they remain used within the conduct of the business of the foreign enterprise). In any event, the "departure" does not necessarily give rise to taxable income, because the real value of the asset may coincide with its book value (perhaps as a result of the imputation of the merger deficit).

The same conclusion outlined above for application of Article 123 to cross border mergers should apply to mergers where an Italian company is acquiring a foreign company. In particular, a tax-free revaluation of the assets of the acquired company, up to the merger deficit, is also allowed.

3. EC mergers

(a) *Definition of EC cross border merger*

The mergers governed by the Decree include both the merger by the formation of a new company and the merger by acquisition; in the latter case no requirement is set forth regarding the number of shares of the acquired company to be held by the acquiring company at the time the merger takes place.

Based on Article 2(a) of the Directive, the Decree provides that the merger cannot give rise to a payment in cash greater than 10 percent of the par value of the securities issued by the acquiring company and received by the shareholder of the acquired company.[12]

The Decree applies to mergers in which companies from two or more
member states are involved. Such companies will be the merged companies, i.e.:
- in case of merger by acquisition, both the acquiring and the acquired companies;
- in case of a merger by formation of a new company, the companies being dissolved. In this respect, the residence and the legal status of the newly formed company appear to be immaterial.[13]

The legal status and fiscal residence of the shareholders of the merged companies is immaterial. At least one of the companies taking part in the merger must be a company resident in Italy; however, the Decree also considers the case of a merger between non-resident companies, which involves a PE situated in Italy.[14]

The Decree does not allow non-eligible companies to take part in the merger: a merger between two companies of two different member states and a non-eligible company (being an EC company not complying with the requirements set forth by the Decree or a non-EC company) is not regarded as a qualified EC merger. On the contrary, the Decree does not exclude or limit the scope of the special EC regime where a third eligible company is involved and such company is resident in the same member state where one of the other companies is resident. In this case, the EC regime fully applies to all companies taking part in the merger.

---

9. CTA Art. 123.
10. Art. 123 is included in CTA Title IV, which sets out "common provisions", i.e. provisions applicable to all entities covered by the CTA itself.
11. Pursuant to CTA Art. 53, goods which are inventory and shares give rise to gross revenue upon sale for consideration, contribution to the capital of other companies, receipt of indemnities as reimbursement for loss or damage, if destined for the personal use of the entrepreneur or his relatives, upon distribution to the shareholders and if destined for purposes other than business purposes. Pursuant to CTA Art. 54, assets, other than goods which are inventory and shares, give rise to capital gains upon a sale for consideration, contribution to the capital of other companies, receipt of indemnities as reimbursement for loss or damage, if destined for the personal use of the entrepreneur or his relatives, upon distribution to shareholders, if destined for purposes other than business purposes or upon an increase of the book value of such assets.
12. The Decree refers only to the "par value of the securities" without taking into consideration the "accounting par value" which is referred to by the Directive. This concept is unknown in Italian civil law (the "accounting par value" was included in the Directive at the insistence of countries, such as Belgium, which have companies whose participation is not represented by a par value. See Thommes, "Commentary on the Merger Directive", in *Commentary on the EC Direct Tax Measures and Member States Implementation* (Amsterdam: International Bureau of Fiscal Documentation, 1991), at para. 19 referring to Belgian "Parts sociales" and German "Kuxe").
13. On the contrary, the Directive also applies where only one of the merged companies is an eligible company, the other being the newly formed company.
14. Decree Art. 1(d).

© 1993 International Bureau of Fiscal Documentation

(b) *Eligible companies*

The requirements that non-resident companies must meet in order to benefit from the special regime are set out in Article 3 of the Directive. The "subject to tax" requirement mandates that the companies involved in the eligible transactions must be subject to one of the taxes listed in Annex B to the Decree (the same as those described in Article 3 of the Directive), without the possibility of an option of being exempt. The "subject to tax" requirement is the same as the requirement in Article 2 of Directive 435/90/EEC (the parent-subsidiary directive). However, the Italian decree implementing the parent-subsidiary directive contains a more specific description of the "subject to tax" requirement where it affirms that companies benefiting from exemptions limited in time or having a territorial application are covered by the EC regime.[15]

In my opinion, the clearer definition of the "subject to tax" requirement can also be adopted for the merger directive, because it merely represents the interpretation of the Italian Government to the requirement set forth by the Directive.[16] Thus there would be no doubt that companies benefiting from the territorial exemption in the South of Italy fall within the scope of the European regime; accordingly, companies set up in Madeira which benefit from the corporate tax exemption up to the year 2011 are also eligible. However, under no circumstances would Luxembourg holding companies set up in accordance with Law of 31 July 1929 and Grand duchy Regulation of 17 December 1938 be eligible as they are not subject to or temporarily exempted from direct taxes.

As to companies resident in Italy, there exist some discrepancies between the Decree and the Directive. For example:

(1) With respect to the legal form of companies resident in Italy, Article 1, paragraph 1(a) of the Decree provides that the special regime is also applicable to cooperative companies and mutual insurance companies.[17] These forms, however, are not expressly included in the Annex to the Directive; as a consequence, it may be questioned whether they can be qualified as eligible companies by the tax legislation of the other EC countries.

(2) The Decree does not expressly consider the case where a company incorporated outside Italy is deemed to be resident in Italy for tax purposes (because its administrative seat or main purpose of business is located in Italy) and intends to benefit from the special regime granted by the Decree. Two scenarios can be envisaged:

   (a) the Decree applies only where the resident company has been set up in Italy. This interpretation would be contrary to the Directive and must be rejected;

   (b) the Decree applies to any company resident in Italy regardless of its legal form, and regardless of the fact that the company is not in one of the forms listed in the Annex to the Directive. In my opinion, this is the correct interpretation, supported by the wording of the delegation law and the CTA,[18] and by the Legislative Decree which implemented Directive 435/90/EEC.[19] Thus a company incorporated, for example, in China but deemed to be resident in Italy for tax purposes can benefit from the special regime set out by the Decree.

(3) The Decree does not require that a company resident in Italy according to Italian tax law not be considered resident outside the EC under the terms of a double taxation agreement concluded with a third state.

(4) The Decree does not consider the case where a company incorporated in Italy is deemed to be resident in another EC member state pursuant to a double taxation treaty. This would prevent application of the Decree in a merger where two companies incorporated in Italy are involved, one of which has its treaty residence in another member state.[20]

(c) *Tax neutrality of the merger*

The Decree does not expressly provide that the EC merger does not give rise to the realization or distribution of capital gains or losses on the assets of the merged companies, including inventories and goodwill (the principle of neutrality affirmed in Article 4, paragraph 1 of the Directive and in CTA Article 123, paragraph 1). This result is considered an automatic consequence of the merger itself, which need not be expressly set out in the Decree. However, based on the Directive, Article 2, paragraph 7 of the Decree jeopardizes the principle of neutrality where an Italian company is acquired by a non-resident company as long as the assets of the Italian acquired company are not attributable to or connected with an Italian PE of the acquiring company.[21]

In particular, the Decree expressly provides that items of the business which are transferred as a result of a merger become taxable if they do not form part of the PE resulting from the merger or if such items are subsequently transferred or taken away from such a PE. This rule appears to close a loophole contained in the CTA which did not expressly provide for the taxability of latent gains of assets attributable to a PE in Italy of a non-resident taxpayer, where such assets are transferred to the head office. The loophole is now eliminated but only in

15. Legislative Decree No. 136 of 6 March 1993.

16. The Delegation Law does not contain any definition of "subject to tax" in Art. 34 (relating to Directive 434/90/EEC) or in Art. 35 (relating to Directive 453/90/EEC). As a result, both Directives had to be applied pursuant to the provisions of the Directive, without any extension being allowed (Art. 2(f) of the Delegation Law). Since the Directives set forth the same requirement, in my opinion, the interpretation of the requirement will be the same in both implementing decrees.

17. The other eligible companies are joint stock companies (excluding SICAVs), limited partnerships with shares, limited liability companies and public and private entities referred to in CTA Art. 87, para. 1(b), i.e. entities resident in Italy for tax purposes, having as their exclusive or main purpose the carrying out of business activities (it should be noted that on the contrary the Directive does not set forth any specific requirement as to the purpose of such entities, provided they carry out a business activity.

18. CTA Art. 87, para. 1(a) only mentions the legal forms typical of companies set up in Italy. However, companies set up abroad but resident in Italy for tax purposes are also within the scope of CTA Art. 87, para. 1(a); if this were not the case such companies would not have been subject to tax in Italy. The Delegation Law also mentions exclusively the legal forms typical of companies set up in Italy. Such a law, however, should be interpreted to include companies set up abroad. Thus the extension of the subjective scope of the special regime to companies not taking one the legal forms listed in the Annex to the Directive is based on the Delegation Law itself.

19. Legislative Decree No. 136 of 6 March 1993.

20. This issue is common to all transactions covered by the Decree.

21. Italian tax law does not contain a definition of PE, but case law and administrative practices refer to the OECD definition.

© 1993 International Bureau of Fiscal Documentation

respect of mergers covered by the Directive so that the EC regime appears to present a less favourable treatment compared to other non-EC qualified cross border mergers.

It is not clear which criterion will be applied in determining whether or not the single assets are attributable to the PE; in other words, it is doubtful whether the entry of the assets into the PE's balance sheet would be sufficient for such assets being considered attributable to the PE. In my opinion, such "accounting criterion" may not be sufficient; the Decree often refers to an effective connection, which if interpreted according to the OECD commentary, requires that those assets be economically linked to the PE, i.e. be associated with its activity.[22]

(d) *Revaluation of the assets as a consequence of the merger deficit*

Under Article 2, paragraph 1, the higher value of the assets of the acquired company entered in the balance sheet of the acquiring company as a consequence of the merger deficit (if any) need not be included in taxable income but will not be recognized for tax purposes.[23]

It should be pointed out that Article 2 makes reference to the "merger deficit" without specifying that such deficit will result from the cancellation of the shares in the acquired company. Consequently, the deficit resulting from the exchange ratio can also be used to increase the book value of the assets of the acquired company. This constitutes a significant difference compared with the tax regime applicable to domestic and non-EC international mergers.

Article 2 of the Decree, however, provides that increases in value of the assets owned by the acquired company are not taxable as such, provided such assets are "effectively connected with a PE situated in the territory of the State or abroad, existing at the date in which the merger is effected or resulting from the merger itself". It is difficult to understand the reason for this requirement in this context, and to determine the circumstances where such requirement is not met. The only circumstance appears to be where:

- the acquired non-resident company only owns domestic (non-Italian) situs assets; and
- after the merger these assets do not constitute a PE of the Italian resident acquiring company; and
- the head offices of the acquired company and the acquiring company (to which such assets respectively relate prior to the merger and after the merger) are not considered PEs within the meaning of the Decree.

I am of the opinion, that in light of the above, in the context of Article 2, paragraph 1 of the Decree, the "effectively connected" requirement is always met.

(e) *Value for tax purposes of the assets transferred as a consequence of the merger*

Pursuant to Article 2, paragraphs 1 and 2 of the Decree the assets transferred to the acquiring company as a result of the merger maintain the same value for tax purposes that such assets had prior to the merger. If the acquiring company increases the book value because of the imputation of the merger deficit, a table will be attached to the tax return, showing the difference between the book value and the tax basis of each asset.

The value for tax purposes is the value recognized for Italian tax purposes (if the foreign acquired company has a PE in Italy or if the acquired company is resident in Italy) as well as the value recognized in applying the taxes of the state where the acquired company was a resident.[24] It is not clear what value should be taken into account where an Italian resident company acquires the Italian-situs assets of a foreign company (other than the assets relating to a PE situated in Italy) and some of these assets have two different bases, i.e. one for application of Italian taxes and the other for application of foreign taxes. This circumstance may be common for participations in Italian companies or Italian-situs real property and could depend on different evaluation rules for tax purposes[25] as well as on special reorganizations effected by the foreign company.[26]

This situation is not covered by the Directive, which only applies to assets which are either connected with an after-merger PE of the acquiring company in the state of the acquired company (Article 4) or with a pre-merger PE of the acquired company in the state of the acquiring company (Article 10). The Directive, indeed, allows the states of both the acquiring and the acquired company to tax the capital

22. This issue has been dealt with in more detail by the US Internal Revenue Service in Regulation §1.864-3, where, with reference to fixed or determinable income and capital gains, both the "asset-use test" and the "business activities test" are described. As for the asset-use test, the Regulation specifies that [§4(c)(4)] "due regard shall be given to whether or not the asset, or the income, gain or loss, is accounted for through the trade or business conducted in the United States, that is whether or not the asset, or the income, gain or loss, is carried on the books of account separately kept for that trade or business, but this accounting test shall not by itself be controlling. In applying this subparagraph, consideration shall be given to whether the accounting treatment of an item reflects the consistent application of generally accepted principles in a particular trade or business in accordance with accepted conditions or practices in that trade or business and whether there is a consistent accounting treatment of that item from year to year by the taxpayer".
It should be noted that the accounting criterion was adopted by the 1969 proposed merger directive (Art. 4, lett. b)), but was rejected in the final version of the directive.

23. It is therefore clear that there is a discrepancy between the tax regime applicable to domestic mergers versus the regime applicable to EC mergers which seems to be less favourably treated. Furthermore, if the view is taken that a cross border merger can take place without tax consequences through the application of CTA Art. 123 (i.e. according to the rules which basically govern domestic mergers), the conclusion can be reached that a cross border merger between an Italian acquiring company and a foreign non-EC acquired company is more favourably treated than an EC-qualified cross border merger.
Pursuant to Art. 2, para. 2, last sentence of the Decree, such provision (regarding the non-taxability of the revaluation of the assets as a consequence of the merger deficit) applies where the acquiring company is a company resident in Italy as well as where the acquiring company is a company not resident in Italy. In practice, however, this provision does not apply to non-resident acquiring companies because the increase in value of the assets of the Italian PEs resulting from foreign balance sheets is in any case immaterial for Italian tax purposes.

24. The value for tax purposes in the state where the asset is situated should be immaterial.

25. For instance, because of tax-free revaluations allowed by foreign countries, of extraordinary revaluations effected to offset losses (if allowed) or of different accounting rules as to the expenses to be capitalized.

26. For instance, where a foreign company having a PE in Italy has been merged into another foreign company and the latter company has increased the value for tax purposes of the assets connected with the PE as a result of the merger deficit.

© 1993 International Bureau of Fiscal Documentation

gains related to the assets which are not connected with either of the above-mentioned PEs.

As a result, the issue should be resolved exclusively on the basis of Italian legislation, which is not at all clear.[27] It seems reasonable, however, to give priority to the value that the assets under examination had for Italian tax purposes prior to the merger, regardless of the fact that such value is higher[28] or lower[29] than the value for application of foreign taxes. An official interpretation by the tax authorities would obviously be welcome.[30]

(f) *Merger of companies with PEs*

Special issues arise when one of the companies taking part in the merger has a PE abroad:

(1) *Italian acquired company with PE in the state where the acquiring company is resident*

In this case, according to Article 2, paragraph 3 of the Decree (which is based on Article 10, paragraph 2 of the Directive), the PE will be considered as if it had been disposed of at its market value, but a tax deduction will be allowed equal to the tax that (in the absence of Directive 434/90/EEC) would have been charged by the state where the PE is located.[31] Needless to say, the determination of the taxable gains in the two countries may result in different amounts as a consequence of different tax bases and, in some circumstances, of different criteria in determining the market value. Moreover, the state where the PE is located would have exempted such gains even if the Directive had not been applicable. If Article 10, paragraph 2 of the Directive and Article 2, paragraph 3 of the Decree are interpreted literally, no tax deduction would be granted in such circumstance.

(2) *Italian acquired company with PE in a third EC state*

The regime described under (1) would apply.

(3) *Italian acquired company with PE outside the EC*

Under a literal interpretation of Article 2, paragraph 3 of the Decree, the regime as described in (1) would be applicable. In my opinion, however, no deduction will be granted with respect to the tax that the state where the PE is located would have applied in the absence of the Directive: the Directive does not apply to non-EC countries, so only taxes actually paid in the non-EC countries can be credited against the tax due on the deemed disposal of the PE. As this credit would be a real foreign tax credit, the deduction will be granted only for purposes of IRPEG.

(4) *Foreign acquired company with PE in Italy*

This case has already been dealt with above: the Italian acquiring company will receive the assets connected with the PE having the same tax value. It should be mentioned that the transfer of the PE by the acquired company would have not been taxed in Italy even in the absence of the Directive; thus care should be taken in determining whether the acquired company can benefit from the tax deduction allowed by Article 10, paragraph 2 of the Directive.[32]

(5) *Foreign acquired company with PE in a third EC state*

This case is not specifically dealt with in the Directive. As far as the Directive is concerned, the last sentence of Article 2, paragraph 1 appears to be applicable in this case; thus the value for tax purposes of the PE for the acquiring company appears to be the same value recognized for tax purposes in the state of the acquired company. However, if the state where the acquired company was a resident applies Article 10, paragraph 2 of the Directive (which grants the right to tax the capital gains arising from the transfer), the value for Italian tax purposes should be the fair market value of the PE, i.e. the value which is taken into account by the state of the acquired company in computing the taxable income pursuant to the above-mentioned provision of the Directive.[33]

(6) *Foreign acquired company with PE outside the EC*

This case is not dealt with by Article 10 of the Directive. In principle, the member state of the acquired company has the right to include in the taxable income of the acquired company the difference between the market value of the assets of the PE and their value for tax purposes. As far as Italy is concerned, however, the regime described under (5) applies.

---

27. According to Italian legislation, the transfer of the Italian-situs asset to the Italian-resident acquiring company does not give rise to any taxable income for the acquired company. Thus if the state of the acquired company decides to impose the tax upon such transfer, no allowance could be given for taxes that would have been paid in Italy (the deemed tax credit only applies in case of a transfer of PEs).

28. According to Italian legislation, the taxable income is determined as the commercial income, adjusted to take into account the specific criteria set out in the CTA. There is no special criterion which can be applied in the case under examination (unless the last sentence of Art. 2, para. 1 is deemed to be applicable by way of analogy). Thus in principle upon disposition of the isolated asset, there would be no difference between the amount of commercial profits and the amount of tax profits; in the absence of an ad hoc criterion, it is still doubtful whether the higher value can be taken into account.

29. As mentioned in the previous note, in principle upon disposition of the isolated asset, there would be no difference between the amount of commercial profits and the amount of tax profits; in the absence of an ad hoc criterion it is doubtful whether the tax authorities can claim an upward adjustment of taxable profits. In my view, the tax authorities can not argue that capital gain will be deemed to have been realized at the time the asset is entered in the balance sheet at the higher value, inasmuch as the value in the acquiring company's balance sheet is the same as that entered in the acquired company's balance sheet.

30. Another issue to be taken into account is the determination of the value for tax purposes of assets which in the case of disposal did not give rise to a taxable gain in the country of residence of the acquired company (e.g. shares where the participation exemption is also applicable to capital gains) or in the country of residence of the acquiring company (e.g. Italian-situs real property owned by the acquired company by more than five years, which, in the case of disposal, had been tax-exempt in Italy).

31. It is doubtful whether such deduction would be granted against ILOR as well, because in some circumstances these gains are included in taxable income for purposes of ILOR, i.e. when the PE does not have separate accounting and management. ILOR is not listed in Art. 3(c) of the Directive or in Annex B attached to the Decree, and according to Italian tax law the foreign tax credit is granted only with respect to IRPEG. In my opinion, excluding ILOR from the scope of the deduction provision would be contrary to the spirit of the Directive as set forth in the preamble; however, it is likely that such exclusion will be affirmed by the tax authorities.

32. It should be noted that the applicability of foreign taxes does not allow a step-up in basis of the assets connected with the PE.

33. Art. 10, para. 2 is mainly applicable in the member states which use the credit method in taxing income of the PE. With respect to states which use the exemption method, the value for tax purposes should be the fair market value at the date of the transfer; in this way the value of the PE for Italian tax purposes would be made independent from the method adopted in the member state of the acquired company.

© 1993 International Bureau of Fiscal Documentation

(7) *Merger between non-resident companies where the acquired company has a PE in Italy*

In this case, there would be no taxation in Italy, but the assets of the PE maintain their pre-merger value for tax purposes.

(g) *Merger of companies with foreign-situs assets not connected with PEs*

Neither the Directive nor the Decree expressly take into account the tax regime applicable to the difference between the real values of foreign-situs assets not constituting a PE (and not connected with either a pre-merger PE of the acquired company or with a post-merger PE of the acquiring company situated in the member state of the acquired company) and their values for tax purposes. The following scenarios can be envisaged:

(1) *The acquired company is a resident in Italy*

In this case, the solution depends on the connection of the foreign-situs asset with the PE situated in Italy which comes into existence after the merger has taken place. If the asset is related to such a PE, no taxation arises in Italy; otherwise it would be considered as disposed of at its market value and taxed accordingly. The problem is whether the connection is to be determined on an actual basis (i.e. operative connection) or whether it is sufficient that the foreign-situs asset results from the accounting books of the PE. As mentioned above, an operative connection is required (the Decree in fact requires that assets be "effectively" connected with the PE).

(2) *The acquiring company is a resident in Italy*

This case would not give rise to substantial issues from an Italian tax perspective. It should be mentioned, however, that if the state where the acquired company is a resident applies the tax on the difference between the real value and the tax value of the asset being transferred, the tax value of the asset for the acquiring company will be the real value.[34]

(3) *Neither the acquiring nor the acquired companies are resident in Italy and the asset is located in Italy*

In this case, according to Italian tax law no taxation would arise in Italy (even if the asset is not connected with a PE in the state of the acquired company).

(h) *Provisions or reserves subject to tax deferral*

Pursuant to Article 3 of the Decree (based on Article 5 of the Directive), provisions or reserves subject to tax deferral entered in the balance sheet of the acquired company must be included in the income of the acquiring company if and to the extent they are not entered in the accounting books of the PE situated in Italy of the acquiring company.

(i) *Carry-forward of losses from previous years*

Pursuant to Article 4 of the Decree (based on Article 6 of the Directive), losses generated by the Italian resident acquired company can be used by the foreign acquiring company under the limitations set out in CTA Article 123, paragraph 5 in proportion to the difference between the assets and liabilities effectively connected with the PE in Italy and up to such difference.

(j) *Allotment of shares to the shareholders of the acquired company*

Consistent with the general principle governing domestic mergers, the allotment of shares representing the capital of the acquiring company to a shareholder of the acquired company in exchange for shares representing the capital of the latter company, does not give rise to any taxation in the hands of that shareholder.[35]

The value for tax purposes of the cancelled shares will constitute the tax basis of the shares received by that shareholder. Cash payments must be included in the taxable income of the recipient shareholders. The wording of the Decree does not seem to allow a different interpretation: the gross amount of the cash payment will be taxable, so the tax basis of the shares received will be exactly equal to the tax basis of the shares cancelled, as if no payment had been made.

This result is illogical since it could lead to a tax value of the shares received being even higher than the market value of the shares themselves. Such would be the case of a merger between two companies (A and B) each having a share capital (and net worth) of 100, wholly constituted by cash. Assuming that each company is owned by one shareholder (respectively, X and Y) having a participation of the value of 100, after the merger by acquisition of B by A, Y would receive shares in A for 90 and a cash payment for 10. If the gross amount of the cash payment is taxed, the value of the shares received will remain 100. In this case, the shareholder will evaluate the participation for tax purposes as 100, while the actual value of such participation is 90. Moreover, according to Italian tax law, the cash payment should not be deemed consideration for the disposal of the shares but should fall within the category of income from capital, as income from participation in companies.[36] Thus such income, being fully taxable, will be considered as distributed profit even if the company does not have any profit to distribute.

Due to such qualification, it can be affirmed that if a cash payment is made by a company resident in Italy:

- the company which makes such a cash payment should apply the dividend withholding tax;
- EC companies, which can be considered as parent companies of the acquiring company (after the merger has been effected), should be exempted from the dividend withholding tax;

34. The taxation, if any, in the state where such asset is located is immaterial in determining the value for tax purposes of such asset under Italian law. However, in such a case the tax basis of that asset in the third state for the acquiring company will be the value on the basis of which the capital gains had been determined.
35. Decree Art. 2, para. 5; Directive Art. 8, para. 1.
36. Such income is referred to in CTA Art. 44, the application of which in case of cash payments is expressly affirmed by Legislative Decree No. 543 of 30 December 1992, which sets out the tax regime for domestic divisions (the nature of the cash payment is common among the different transactions).

© 1993 International Bureau of Fiscal Documentation

- with respect to other persons resident in treaty countries, the withholding tax must not exceed the rate provided for in the dividend article;
- Italian resident recipients (and, under some circumstances, persons resident in France and the United Kingdom) can benefit from the dividend tax credit.

On the contrary, cash payments made by companies not resident in Italy for tax purposes are subject to the following regimes (such payments will always be exempt from ILOR):
- if received by individuals or transparent entities, the payments will be included in full amount in taxable income;
- if received by companies which do not qualify as affiliate companies (e.g. they hold less than 20 percent of the voting rights of the paying company, or 10 percent if the latter is a listed company), the payments will be fully subject to IRPEG;
- if received by companies which qualify as affiliate companies, only 40 percent of such payments will be subject to IRPEG;
- if received by companies which qualify as parent companies, only 5 percent of such payments will be subject to IRPEG.

It is worth noting that all of these issues would not exist if the cash payment had not always been considered as fully taxable. In the above example, for instance, it is clear that the cash payment constitutes a reimbursement of the share capital which should not be taxable. On the contrary, if company B's net worth would have been constituted by 90 share capital and 10 retained earnings, it would have been reasonable to consider the cash payment as paid out of company B's retained earnings.

III. EC CROSS BORDER DIVISION

A. *Civil law provisions applicable to divisions*

The civil law regime of divisions is governed by Articles 2504 septies-2504 decies of the Civil Code, which have been enacted to implement Directive 82/891/EEC of 17 December 1982 ("the Sixth Directive"). As for mergers, Italian law gives no definition of division. However, in line with the provisions of the law, doctrine has defined a division as the operation whereby the net worth of a company is split into parts to be transferred to two or more existing or new corporations.

Three types of division can be envisaged:
- *division by the formation of new companies*, defined by Directive 82/891/EEC as the operation whereby, after being wound up without going into liquidation, a company transfers to more than one newly-formed company all of its assets and liabilities in exchange for the allocation to the shareholders of the company being divided of shares in the recipient companies, and possibly a cash payment not exceeding 10 percent of the nominal value of the shares allocated;
- *division by acquisition*, defined by Directive 82/891/EEC as the operation whereby, after being wound up without going into liquidation, a company transfers to more than one company all of its assets and liabilities in exchange for the allocation to the shareholders of the company being divided of shares in the companies receiving contributions as a result of the division ("recipient companies"), and possibly a cash payment not exceeding 10 percent of the nominal value of the shares allocated;
- *division by acquisition combined with a division by formation of one or more new companies.*

It is worth noting that under Italian law partial divisions are allowed, i.e. divisions where the company being divided does not cease to exist, and only part of its assets is distributed to the recipient(s) company(ies). Moreover, in accordance with Directive 82/891/EEC Italian law permits shares in the recipient companies to be allocated to the shareholders of the company being divided otherwise than in proportion to their rights in the capital of that company (see below). The Civil Code rules on divisions do not expressly govern cross border divisions. However, no rules or principles appear to exclude that this is possible under the existing civil law regime (the legal arguments for supporting the legitimacy of international divisions are primarily the same used in the past to uphold the recognition of cross border mergers).[37]

B. *Tax regime*

As a result of the implementation of Directive 434/90/EEC, three different tax regimes for divisions can be envisaged:
- regime for domestic divisions;
- regime for international divisions not covered by the special EC regime;
- regime for international divisions covered by the special EC regime (hereinafter referred to as "EC divisions").

Such regimes can be combined even in the framework of the same transaction.

1. Domestic divisions

Tax rules concerning divisions, other than EC divisions, are found in CTA Article 123-bis, which was introduced through Legislative Decree No 543 of 30 December 1992, enacted simultaneously with the Legislative Decree implementing the merger directive.

Art 123-bis provides that a division (total or partial) does not give rise to the realization or distribution of capital gains or losses on the assets of the company being divided, including inventories and goodwill (principle of neutrality). In computing the taxable income of the recipient companies, the division surplus entered in the balance sheet as a result of the share exchange ratio or the cancellation of the shares in the divided company owned by the recipient company, is not taken into account. Nor is account taken of the division deficit entered in the balance sheet as a result of the share exchange ratio, provided that such deficit does not result in a revaluation of the assets of the company being divided.

37. See II.B. above.

© 1993 International Bureau of Fiscal Documentation

On the contrary, the division deficit resulting from the cancellation of the shares in the company being divided owned by the recipient company can be used for a tax-free revaluation of the assets of the former company (up to their market value), including goodwill. Subsequent capital gains or losses as well as depreciation are calculated on the revalued amount.

Losses generated by the companies taking part in the division operation (which can be carried forward for five years for IRPEG purposes) can be used by the companies taking part in the operations subject to the same limitations established in case of merger.[38] Moreover, provisions or reserves subject to tax deferral entered in the balance sheet of the company being divided must be included, in proportion to the net worth of such company received by any recipient company, in the income of the recipient companies if and to the extent they are not entered in the balance sheet of such latter companies.

As to the shareholders of the divided company, the division does not give rise to any gain or loss provided no cash payments are made by the receiving company (or companies). The tax basis of the shares of the divided company is carried over to the shares of the receiving company (or companies) allotted as a result of the division.

Italian tax law therefore affords neutrality to both partial and total divisions but expressly provides that the tax benefits under Legislative Decree No. 543 will not apply to divisions which give rise to a transfer of assets not constituting a branch of activity and to divisions whereby the attribution of the shares of the recipient companies does not maintain the proportionality between the shareholders of the divided company.[39]

It is not clear, however, what benefits the law is referring to: the revaluation of the assets of the divided company in the books of the recipient companies or more extensively the neutrality of the division itself (latent gains attached to the assets of the divided company do not constitute a taxable gain and the shares of the recipient companies assigned to the shareholders of the divided company do not give rise to a taxable event).

2. International non-EC divisions

The tax rules in CTA Article 123-bis do not expressly govern cross border divisions; however, since a cross border division is recognized for civil law purposes, there is no reason to exclude cross border divisions from the scope of the article. This conclusion gives rise to a puzzling situation, and to a situation where the EC regime may be less favourable than the regime applicable to non-EC cross border divisions.

The issues arising in respect of the tax regime of such divisions are the same described above for international non-EC mergers.[40]

3. EC divisions

The divisions governed by the Decree include both the division by the formation of a new company and the division by acquisition (a combination of such types of division is also recognized). Such divisions, however, are total. Moreover, the shares in the recipient companies must be allocated to the shareholders of the company being divided in proportion to their rights in the capital of that company. Consequently, any partial division or division in which the shares of the recipient companies are allocated between the shareholders in a non-proportional way do not fall within the scope of the EC tax regime.

The EC regime is only applicable where the share of the net worth of the divided company to be transferred to each recipient company is constituted by a business or by an independent part of the business. In this respect, the division operation which implies the transfer of a branch of activity to some recipient companies only does not appear to fall within the scope of the Decree.[41]

Based on Article 2(b) of the Directive, the Decree provides that the division cannot give rise to a payment in cash greater than 10 percent of the par value of the securities issued by the recipient companies and received by the shareholders of the divided company. The Decree applies to divisions in which companies from two or more member states are involved. Such companies are the divided company and at least one of the recipient companies; the legal status and fiscal residence of the shareholders of such companies are immaterial. At least one of the companies taking part in the division must be a company resident in Italy. However, the Decree also considers the case of a division between non-resident companies, where a PE situated in Italy is involved.[42]

The Decree specifies that the EC transnational character of the division must be verified for each recipient company. This requirement is not met where both the divided company and one of the recipient companies are resident in Italy. In such a case, the EC regime is applicable only to the portion of the net worth transferred to the recipient company which satisfies the EC transnational character.[43]

With respect to the Italian resident recipient company, the ordinary regime set forth in CTA Article 123 bis applies. Thus within the framework of the same division operation, different tax regimes will be applicable: the EC regime for the portion of the net worth transferred to the non-Italian resident recipient company and the domestic regime for the portion of the net worth transferred to the Italian resident company.

The rules described for cross border mergers also apply in respect of the eligibility requirements for companies taking part in the division, and in respect of the tax regime.

38. See II.C. above. The law clarifies that the provisions dealing with the acquiring companies will be applied with respect to the recipient companies, while the provisions dealing with the acquired companies will be applied with respect to the company being divided.
39. CTA Art. 123-bis, para. 11.
40. See II.D. above.
41. It should be noted that the determination of the existence of a business constitutes an issue of fact, which in the past, with respect to registration tax issues, gave rise to significant problems and to extensive case law.
42. Decree Art. 1(d).
43. This is a significant difference compared to the tax regime of EC mergers which, provided that at least one acquired company is resident in another member state, also applies to the transfer of assets from an Italian resident acquired company to the Italian resident acquiring company.

IV. EXCHANGE OF SHARES

A. *Definition*

Article 2(d) of the Directive defines an exchange of shares as "an operation whereby a company acquires a holding in the capital of another company such that it obtains a majority of the voting rights in that company in exchange for the issue to the shareholders of the latter company, in exchange for their securities, of securities representing the capital of the former company, and, if applicable, a cash payment not exceeding 10 percent of the nominal value, or in the absence of the nominal value, of the accounting par value of the securities issued in exchange".

The Decree also provides a definition of the transactions which fall under the EC regime applicable to the exchange of shares. Article 1, paragraph 1(e) of the Decree refers to "exchanges and contribution of shares or quotas through which one of the persons listed in paragraph a) (e.g. a qualified EC company) acquires or integrates a controlling participation according to Article 2359, paragraph 1, no. 1 of the Civil Code[44] in one of the persons listed in the same letter residing in a different member state, attributing to the participants its own shares or quotas in exchange for those received in exchange or contribution and, if applicable, a cash payment not exceeding 10 percent of the nominal value of the latter shares or quotas, provided that at least one of the participants to the transaction is a resident in the territory of the state or the participation exchanged is connected with a PE in Italy of a person listed in paragraph a)" (e.g. a qualified EC company)".

The Decree therefore appears to give a more precise scope of application to the EC exchange of shares. For example:

- the exchange must result in a company acquiring or integrating control of the voting rights of another company. The first situation arises when the acquiring company does not own any participation prior to the exchange, or when such company already owns some shares or quotas of the acquired company prior to the date when the exchange takes place but such shares or quotas do not constitute a controlling participation. The second situation (integration) includes the situation where the beneficiary company owns the majority of the shares or quotas prior to the exchange of shares – the transaction simply integrates (or reinforces) control;
- the cross border requirement of the transaction is met if both the acquired and the acquiring companies are eligible companies and they are resident of different member states.[45] In this respect, the residence and legal status of the shareholders of the acquired company are immaterial. However, at least one of such shareholders (the participants) must be resident in Italy for tax purposes.[46] If this requirement is met, the EC regime is applicable to any participant, including non-Italian resident participants.[47] On the contrary, if no participant is an Italian resident person, the Decree is not applicable and the ordinary taxation rules will apply. Thus, for instance, the acquisition by a French company of a holding in an Italian limited liability company which is owned by a Dutch company may give rise to taxable income in Italy of the Dutch company: this result is clearly contrary to the Directive, which provides for an unlimited obligation to exempt such gain (i.e. not solely with regard to gains realized in the state of residence of the participant);
- the cross border requirement is also met if the acquired shares are connected with a PE situated in Italy of an eligible non-resident company (participant);
- it is not necessary for the acquiring company to issue new shares, i.e. it is possible to assign existing shares in exchange for the shares or quotas received;
- the exchange can give rise to a cash payment which cannot exceed 10 percent of the par value of the shares or quotas of the acquiring company to be assigned to the shareholders of the acquired company.

B. *Tax regime*

According to domestic tax law, income from the disposal of shares[48] realized by a resident taxpayer is subject to different regimes depending on the status of the taxpayer. If the taxpayer is other than an entrepreneur, the gain falls in the category of miscellaneous income and is taxed at a flat rate of 25 percent. However, in case of a disposal of "small participations" (e.g. participations representing less than 2, 5 or 15 percent of the capital of the company whose shares are sold, depending whether such company is a listed company, a non-listed joint stock company or any other company), the gain is calculated on a percentage of the sale price (or, in case of transfer to the capital of a company, the real value), which for non-listed companies is equal to 7 percent. Moreover, the tax is applicable at the flat rate of 15 percent, so that the actual tax in case of a disposal of small participations in non-listed companies is equal to 1.05 percent of the sale price (or the real value). Such regime is also applicable to non-resident persons (both natural and legal) not having a PE in Italy. However, no tax will be levied by Italy to the charge of non-resident persons upon disposal of shares whose certificates are not physically located in Italy at the time of the disposal.[49]

44. Pursuant to Art. 2359, para. 1, no. 1 of the Civil Code, the following are considered controlled companies: "companies in which another company, by virtue of the shares or quotas held, has the majority required for resolutions of the ordinary shareholders' meeting".
45. See II.E.2. above. It follows that if an Italian company contributes the controlling shareholding of a Swiss resident company to a Dutch company, the regime set forth for an EC exchange of shares would not be applicable.
46. This requirement confirms that an exchange of shares may involve more than one participant. Thus, for instance, the acquiring company might increase its capital and receive from various persons shares which, taken as a whole, constitute a controlling interest in an EC company residing in another member state.
47. For example, if an Italian company, owned by an individual resident in Italy and by a 1929 Luxembourg holding company is acquired by a French company, the EC regime is applicable to the 1929 Luxembourg holding company. If, on the contrary, the Italian company is fully owned by the 1929 Luxembourg holding company, the EC regime will not apply. It is difficult to understand the reason for this different treatment, which does not appear to be allowed by the Directive.
48. Pursuant to CTA Art. 9, para. 5, for income tax purposes, the provisions relating to the transfer for consideration also apply to transfers to the capital of companies. Moreover, in case of such transfers, the gains are determined as the difference between the real value of the shares and their last value for tax purposes.
49. CTA Art. 123, para. 1(f).

© 1993 International Bureau of Fiscal Documentation

If the taxpayer who disposes of the shares is a resident entrepreneur (including a PE in Italy of a non-resident person), income from the disposal of shares is always included in taxable income and subject to IRPEG and ILOR at the cumulative rate of 52.2 percent. However, if the taxpayer does not have the purpose of purchasing and selling participations in other companies or entities and the participation to be disposed of is not constituted by shares, the taxation of such income can be spread over a maximum period of five years.

If the Decree applies, any income or gain realized by a resident taxpayer does not constitute taxable income, but the value for tax purposes of the participation disposed of is carried over to the shares of the acquiring company received in exchange.[50] It should be noted that:

- the Decree does not require that the shares of the acquiring company be entered in the accounting books of the participant entity at the same value recognized for tax purposes. Such shares can be entered at their real value, so the exchange of shares may give rise to income recognized for civil law purposes only: upon distribution of such income, an equalization tax liability may arise;
- the Decree does not require that the tax basis of the acquired shares for the acquiring company be the same as that recognized for the participants. Thus the value for tax purposes for the acquiring company is the real value of the shares acquired.

If a cash payment is made by the acquiring company, the amount received is fully taxable in the hands of the recipient.[51] If the recipient is an entrepreneur, resident in Italy, the amount received is taxable in the year received or in five years, depending on the business purpose of the recipient and on the legal form of the participated company. The shares received maintain the entire value for tax purposes of the shares disposed of, as if the cash payment had not been made.[52]

If the recipient, a resident of Italy, is other than an entrepreneur, the amount received falls in the category of miscellaneous income and is taxed accordingly.[53] If the recipient is a non-Italian resident, in most cases the cash payment is exempt from Italian tax under the terms of the relevant double tax treaty, if any.

V. TRANSFER OF ASSETS

A. *Definition*

Pursuant to Article 1(c) of the Decree, the provisions contained in the Decree are also applicable to a "contribution of a business or of an independent part of business from one to another person referred to in letter a) (the eligible companies), provided that one of the two persons is resident in Italy for tax purposes". The Decree defines the transfer of assets as the transfer of a business (*azienda*) or of an independent part of a business. Article 2555 of the Civil Code defines the azienda as "an aggregate of property organized by an entrepreneur for the conduct of an enterprise".[54] A going concern is therefore a complex of assets forming an autonomous whole through which the enterprise may be conducted. In this respect the definition is similar to the one contained in Article 2(i) of the Directive, where it refers to "all the assets and liabilities of a division of a company which from an organizational point of view constitute an independent business, that is to say an entity capable of functioning by its own means".[55]

To benefit from the special EC regime, the transfer of assets must take place between eligible companies from two different member states,[56] provided at least one company is a resident in Italy for tax purposes. This requirement is also met where a non-resident company contributes its Italian PE to the capital of an Italian resident company (so called "incorporation of the PE").

B. *Tax regime*

1. Non-EC transfer of assets

Capital gains on the contribution of a business by an Italian resident company are taxed in Italy at ordinary income tax rates (IRPEG and ILOR). Capital gains are computed by deducting the depreciated cost of the business from its real values. Such gains are always taxable, but they may be included, at the taxpayer's option, in their entire amount in the year in which they are realized or in equal instalments in the current and in the following fiscal years, but not exceeding the fourth.[57] Capital gains could be offset against losses carried forward. The acquiring company may calculate

50. Decree Art. 2, para. 5.
51. CTA Art. 2, para. 5.
52. See II.E.10.
53. The tax regime to be applied depends on the amount of the participation disposed of, considering the cash payment as proportionally shared by all shares (or quotas) disposed of. In other words, it is not possible to consider that the cash payment represents the full consideration for the disposal of some shares only (whose amount can be determined in proportion of the ratio between the cash payment and the real value of the shares disposed of).
54. Contracts of sale of a business must be evidenced in writing. The seller has an obligation not to compete with the buyer for a period of five years (Art. 2557 of the Civil Code). Unless otherwise agreed, the buyer succeeds to contracts stipulated for the conduct of the business that are not of a personal nature. However, the third contracting party may withdraw from the contract within three months from the date of notice of the transfer if there is just cause, but in such case the liability of the seller is unaffected. Analogously, the assignment of claims and receivables pertaining to the business is effective against third persons if and when they are notified of the transfer (Art. 2559 of the Civil Code). The seller is not released from debts incurred in the operation of the business prior to the sale, unless it is shown that the creditors consented to such release (Art. 2560 of the Civil Code).
The rules that apply in case of sale of a business also apply in a contribution of a business. The Italian Civil Code does not provide for any specific regulation concerning the contribution of a business, i.e. it is regulated by general provisions on contribution in kind to a company as set forth by Arts. 2342 (contribution) and 2343 (appraisal of contributions in kind).
As to labour law issues, in the case of transfer of a business, employment contracts continue with the buyer, and the employee retains the right arising from the seniority attained by him prior to the transfer (Art. 2112 of the Civil Code). Moreover, the trade union bargaining units of both the seller and the purchaser and the trade associations must be notified of the transfer of a business in which more than 15 persons are employed at least 25 days prior to the date of the agreement.
55. See *supra* note 39.
56. See II.E.2. above.
57. CTA Art. 54, para. 4.

© 1993 International Bureau of Fiscal Documentation

depreciation on the real value of the assets included in the business received. For the first year, depreciation is reduced by one-half. Anticipated depreciation may be taken only for the first year in an amount equal to the ordinary depreciation; thus for the first year the maximum depreciation to be deducted is equal to the full ordinary amount. Acquired goodwill may be depreciated over five years.[58]

2. EC transfer of assets

Pursuant to Article 2, paragraph 2 of the Decree, the transfer of assets does not give rise to any taxable gain (or loss), provided the value for tax purposes of the business transferred is carried over to the shares received in exchange for the transfer. If the transferor company is resident in Italy (contributing assets other than foreign PEs), the regime is only applicable with respect to the assets which after the transfer will be effectively connected with a PE in Italy of the recipient company.[59]

The Decree, however, does not prevent such shares from being entered in the accounting books of the transferor at their real value at the time of disposal. The difference between the real value and the book value of the assets transferred will be entered in an ad hoc reserve, which is taxable (for IRPEG and ILOR purposes) upon distribution to the shareholders (or upon actual realization of the gain, through the disposal of the shares received).

As far as the recipient company is concerned, the assets included in the business received as a result of the transfer of assets maintains the same value for tax purposes that such assets had prior to the transfer. If the recipient company records such business at its real value, a table is to be attached to the tax return showing the differences between the book value and the tax basis of each asset.[60] Consequently, the same gain may be taxed both in the hands of the transferor company (upon disposal of the shares received) and in the hands of the recipient company (upon disposal of the business received), whilst in the absence of the Directive such gain would have been taxed only once in the hands of the transferor company (this is a typical case of economic double taxation).

No special rules are provided for the tax basis for depreciation, so the ordinary rules should apply.

C. *Contribution by an Italian company of the foreign PE*

If a company resident in Italy contributes to the capital of another EC (non-Italian) company a PE situated in a member state other than Italy, the PE is considered as if it had been disposed of at its market value, but a tax deduction is allowed equal to the tax that (in the absence of Directive 434/90/EEC) would have been charged by the state where the PE is located.[61] The capital gain arising from the deemed disposal of the PE will be exempt from ILOR (provided the PE has separate accounting and management).

In such a case, the tax basis of the shares received in exchange for the transfer of the PE will be increased by an amount equal to the taxable income corresponding to the tax actually due after deduction of the foreign deemed tax (the amount of the tax due will be multiplied by 2.778). If a company resident in Italy contributes to the capital of another EC (non-Italian) company a PE situated outside the EC, Article 2, paragraph 6 of the Decree does not apply. Only taxes actually paid in the non-EC countries may be credited against the tax due upon the deemed disposal of the PE. Moreover, although not specifically affirmed, in this case the value for tax purposes of the shares received in exchange for the transfer of assets should be the real value of such PE, as if no (actual) foreign tax credit had been granted.

VI. CONTRIBUTION OF AN ITALIAN PE BY A NON-RESIDENT COMPANY TO ANOTHER NON-RESIDENT COMPANY

This transaction is specifically covered by Article 1(d) of the Decree. The same regime described under transfer of assets applies.[62]

VII. ANTI-ABUSE PROVISIONS

The Decree does not contain an anti-abuse provision. The lack of anti-abuse provisions is very likely due to a lack of coordination of the provisions contained in the delegating law. Indeed, Article 34 of the delegating law empowered the Government to enact ad hoc rules implementing the Directive,[63] and introduce a tax regime applicable to (domestic) divisions.[64]

The first paragraph of Article 34 did not contemplate an anti-abuse provision while paragraph 2 contained a reference to anti-abuse provisions as follows:

> "non-application or revocation of the tax benefits regarding the mergers, divisions or exchange of shares if such transactions between companies or persons of different member states are effected without valid economic reasons and with the exclusive purpose of obtaining fraudulently a tax saving".

This provision focused on the transactions contemplated by the Directive but was wrongly included in the delegation law regarding domestic divisions. Consequently, the delegation law did not grant any power to the Government to enact anti-abuse provisions connected with the transactions contemplated by the Directive.

The issue now arises as to whether anti-abuse provisions in other statutes may apply to the transactions contemplated by the Directive. In particular, an anti-avoidance provision

58. CTA Art. 68, para. 3.

which may be applied is Article 10 of Law No. 408 of 28 December 1990, which stipulates that the tax offices have the power to disallow for fiscal purposes the portion of the cost of acquisition of the participation or any other tax advantage obtained in connection with mergers, concentrations, transformations, divisions and capital reductions carried out without valid economic reasons and for the sole purpose of fraudulently obtaining a tax saving. This provision may be deemed to be applicable to the operations falling within the scope of the Directive; indeed, the scope of such provisions is even more stringent than the scope of the EC anti-abuse provision.[65]

65. Directive Art. 11."A member state may refuse to apply or withdraw the benefit of all or any part of the provisions of Titles II, III and IV where it appears that the merger, division, transfer of assets or exchange of shares ... has as its principal objective or as one of its principal objectives tax evasion or tax avoidance; the fact that one of the operations referred to in Article 1 is not carried out for valid commercial reasons such as the restructuring or rationalization of the activities of the companies participating in the operation may constitute a presumption that the operation has tax evasion or tax avoidance as its principal objective or as one of its principal objectives."

CONFERENCE DIARY

For further details of the events listed below please write to the organizers at the addresses indicated.

SEPTEMBER 1993

Interpretation of Tax Treaties, Amsterdam, 13-14 September 1993 (English):
IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, the Netherlands, Tel. 31-20-626 7726, Fax: 31-20-620 9397.

Treaty shopping workshop, Monte Carlo, 13-14 September 1993 (English):

© 1993 International Bureau of Fiscal Documentation

IMPLEMENTATION OF THE PARENT-SUBSIDIARY DIRECTIVE

Siegfried Mayr

Dr Mayr received a degree in Economics and Commerce from the University of Padua, and a Law Degree from the University of Milan. He was a guest professor in Italian tax law at the University of Hamburg (Germany) and the University of Innsbruck (Austria). He has taught seminars on international tax at the University Bocconi and the University Cattolica of Milan. He also teaches tax law at a post-graduate institute in Milan.

Dr Mayr started his professional career as a tax manager with the Milan branch of a US audit firm and is now partner of the tax consulting firm Mayr Camosci Guareschi Piantanida in Milan.

He has writtten numerous articles on taxation in Italian and foreign tax journals and has spoken at seminars and conferences both in Italy and abroad. He was the national reporter for Italy at the 1981 and 1985 IFA Congresses.

I. INTRODUCTION

The parent-subsidiary directive[1] requires member states to generally eliminate withholding taxes on profit distributions by a subsidiary to its parent company, and to provide relief from double taxation for the parent either by the credit or the exemption method. Under Law 142 of 19 February 1992 the Italian Government was authorized to issue a Legislative Decree necessary to implement the parent-subsidiary directive. Decree No. 136 was issued on 6 March 1993,[2] and it radically alters the taxation of dividend streams between Italian companies and companies of other EC states.

This article summarizes the taxation of cross border dividends before the directive was implemented, and then examines the new measures dealing with the tax treatment of such dividends.

II. OUTBOUND DIVIDENDS

A. *Domestic law*

Dividends paid by an Italian company to a non-resident shareholder are subject to a final withholding tax of 32.4 percent, unless a tax treaty provides otherwise.[3]

Italy applies an imputation system to eliminate the double taxation of dividends for resident taxpayers who receive dividends from resident companies.[4] Under the imputation credit mechanism, a resident taxpayer is entitled to a dividend tax credit which is equal to 9/16 of the dividend received. The credit corresponds to the corporate income tax paid by the distributing company, and is credited against the taxpayer's final tax liability. A non-resident shareholder, however, may not avail himself of the benefits of the Italian imputation mechanism, although he is entitled to a refund of the tax paid abroad on the dividends received if he provides proper documentation (which must be issued by the tax authorities) that he in fact paid a final tax on the dividends.[5] The refund is equal to two-thirds of the withholding tax levied in Italy, resulting in an effective Italian dividend tax of at least 10.8 percent.

To prevent a resident shareholder from claiming a tax credit in respect of dividends derived from income which was not subject to corporate income tax, or subject to tax at a rate lower than the 36 percent corporate rate, an equalization tax is applied at the company level to equalize the amount actually paid with the shareholder's tax credit. The equalization tax is levied at the rate of 56.25 percent of the excess of the amount distributed to the shareholder from the tax year's earnings over 64 percent of the income declared for purposes of the corporate income tax.[6]

B. *Tax treaties*

The majority of Italy's treaties reduce the withholding tax on outbound dividends to rates ranging from 5 to 25 percent. The only treaty which provides for a complete exemption from tax is the old treaty with the Netherlands; under that treaty a total exemption applies if the Dutch company has a 75 percent holding in the Italian subsidiary.[7]

Under the new treaties with France and the United Kingdom, the imputation tax credit is extended to non-resident shareholders (see below).

III. INBOUND DIVIDENDS

A. *Domestic provisions*

Foreign-source dividends received in Italy are included in the taxable base of Italian residents under the principle of worldwide taxation. The Italian imputation

1. Council Directive 435/90 of 23 July 1990.
2. The directive required member states to implement the provisions before 1 January 1992, so the decree applies retroactively to that date.
3. Income Tax Assessment Code ("ITAC"), Art. 27(3).
4. The imputation system was adopted in 1977. See ITAC Art. 14.
5. An exception to this rule applies to a foreign parent company which has a permanent establishment ("PE") in Italy. In such a case, the dividends form part of the taxable income of the PE, and the PE is entitled to the benefit of the tax credit which it can then pass on to the foreign parent company.
6. ITC Art. 105.
7. A new treaty has been signed but is not yet in force.

© 1993 International Bureau of Fiscal Documentation

regime does not extend to foreign-source dividends – such dividends are subject to tax in the hands of the Italian recipient, although unilateral tax relief is granted in respect of the foreign withholding tax suffered. However, no indirect foreign tax credit is granted on the foreign corporate profits out of which the dividends were paid. Inbound dividends are taxed differently according to the type of recipient.

In the case of individuals, foreign-source dividends are taxed at the ordinary progressive rates in the hands of the recipient with a tax credit granted as relief for the foreign withholding tax.

In the case of Italian companies, the taxation of foreign-source dividends depends on the extent of the participation in the foreign company.[8] If the participation is at least 20 percent the foreign-source dividend is taxed on only 40 percent of its gross amount, thus exempting 60 percent for purposes of corporate income tax. If the holding is less than 20 percent the foreign-source dividend is fully taxable for corporate income tax purposes (at a flat rate of 36 percent).

Application of the equalization tax is affected when foreign-source dividends are redistributed by an Italian company. As stated above the equalization tax is due in respect of dividends deriving from income which was not subject to corporate income tax in whole or in part in order to balance the shareholder's tax credit granted under the imputation regime. In theory when foreign-source dividends are redistributed the exempt 60 percent should be subject to the equalization tax. However, under ITC Article 96, paragraph 1 such dividends are deemed to be subject to corporate income tax for equalization tax purposes, resulting in an equalization tax liability of only 20.25 percent of gross foreign-source dividend (if no foreign withholding taxes have been imposed).

When dividends are distributed by companies resident in countries having a "preferred tax regime", the 60 percent exclusion does not apply – the dividends are taxed at the 36 percent rate.[9]

B. *Tax treaties*

With very few exceptions (i.e. the Brazilian and German treaties), all of Italy's tax treaties provide for the taxation of inbound dividends. Taxation of only 40 percent of the gross dividend under domestic law may also be applied in respect of dividends flowing from a treaty country if the Italian shareholder is an Italian company which holds at least 20 percent of the foreign company.[10]

IV. THE PARENT-SUBSIDIARY DIRECTIVE

The parent-subsidiary directive provides that when EC parent and subsidiary companies meet certain requirements, dividends paid by a corporation resident in an EC country to a corporation resident in another EC country which owns at least 25 percent of the capital of the distributing company will not be subject to withholding tax in the subsidiary's country of residence. The dividends will also be exempt from tax in the hands of the recipient EC parent company, or be subject to tax with a credit for underlying tax paid by the subsidiary on the distributed income. No minimum holding period is set forth to qualify for the benefits of the directive, although member states may require a minimum holding period of two years.

As mentioned above, Legislative Decree No. 136 of 6 March 1993 implements the provisions of the parent-subsidiary directive on the basis of Law No. 142.

A. *Entities to which the Decree applies*

To qualify for the benefits under the Decree both the parent and subsidiary company must be a company that is listed in the Annex to the directive. Further, both companies must be tax resident in EC member states and must be subject to corporate income tax.

The following companies are targeted by the Decree: joint stock companies, limited liability companies and other public and private companies which have as their exclusive or main purpose the conduct of a business.

A company is resident in Italy for income tax purposes if its legal seat, administrative office or principal object is situated in Italy.

As a general rule, all resident companies are subject to corporate income tax. However, the Decree provides that cases of exemption from corporate income tax which are limited in time and with respect to the territory do not preclude application of the new provisions.[11] Consequently, companies which have their registered office in the south of Italy (Mezzogiorno) which benefit from particular exemptions may be considered among the entities to which the directive applies.

B. *Participation and holding period*

To qualify under the Decree a company must hold at least 25 percent of the capital of a company of another member state, and the parent company must have maintained the requisite holding for an uninterrupted period of at least one year.

C. *Transactions to which the Decree applies*

The provisions only apply to "distributions of profits", a term which encompasses actual dividend distributions, but it excludes profits derived from the liquidation or winding up of the distributing company, as well as amounts attributed to the parent in connection with its holding as a result of tax treaty provisions (e.g. the payment of dividend tax credits, as in the French and UK treaties). The exclusion of the latter implies that such distributions will be subject to withholding tax (as specified in the treaty) when paid from Italy and that they are subject to ordinary taxation in the hands of the Italian parent when received from abroad.

8. ITC Art. 96(1).
9. Such countries are listed in a Ministerial Decree.
10. Because tax treaties allow Italy (as the state of residence of the shareholder) to tax the dividends coming from the other country, the actual taxation is made according to domestic law which, as mentioned, provides for partial exemption in certain cases.
11. Decree Art. 1, para. 2.

© 1993 International Bureau of Fiscal Documentation

D. *Outbound dividends*

Under the directive, dividends distributed by an Italian subsidiary to an EC resident parent company are exempt from Italian withholding tax, provided the parent company meets the participation and holding requirements mentioned above. Although the directive contains no provisions with respect to refund procedures, the Decree provides that non-resident companies meeting the parent-subsidiary requirements are entitled to a full refund (vs. the two-thirds refund described above) of Italian withholding tax levied on outbound dividends. The Decree further provides that the refund process can be bypassed if the foreign parent company specifically requests the exemption from withholding tax and submits documentation issued by the foreign tax authorities which certifies that all conditions required for application of the directive have been met.[12] The Italian subsidiary must attach such documentation to the withholding agent return.

E. *Inbound dividends*

Italy opted for the exemption method to eliminate economic double taxation; according to this method dividends paid by a qualifying subsidiary are totally exempt from tax.[13] The Decree added a new provision to the ITC (Article 96 bis) which provides that dividends received by an Italian parent are exempt from taxation for 95 percent of their gross amount if both the parent and the subsidiary meet the residency and participation requirements.[14] Taxation of the remaining 5 percent reflects the alternative granted to member states to disallow certain charges relating to the participation.

The Decree also excludes application of the equalization tax that would generally apply upon the distribution of exempt income if the Italian parent redistributes the dividends (exempt for 95 percent) to its shareholders, i.e. the tax credit in the ordinary amount (9/16 of the dividend which matches the IRPEG tax normally applicable to the company profits) is maintained even if the parent has paid the IRPEG on only 5 percent of the dividend received.

The only limitation introduced by the Decree concerns the refund of the tax credit: the tax credit may be fully utilized up to the amount of tax due on total income (including the tax credit in the amount of 9/16 of the dividend). However, an excess tax credit arising because of the dividend tax credit is not refundable, and therefore should be considered as lost. In setting this limit, the Decree only makes reference to personal income taxes, so some doubt exists as to whether it applies to shareholders who are corporate entities, or whether it may be claimed that the dividend follows the ordinary rules so long as it is received by corporate entities, and that the limitation only comes into play when the dividend is redistributed to an individual by the last company in the chain.

Another purpose of the limitation is to prevent residents of states whose treaty with Italy provides for the payment of the tax credit (i.e. treaties with France and the United Kingdom) from obtaining a refund of the tax credit on dividends distributed by Italian companies and deriving from EC subsidiaries (on which the Italian parent has been subject to tax on only 5 percent of its amount). The unclear wording of the law does not allow a conclusion as to whether or not this objective has been achieved.

Capital losses resulting from a profit distribution of an EC subsidiary to an Italian parent company are not deductible in respect of the amount equal to the dividends that were not subject to tax because of the exemption.

F. *Anti-avoidance provisions*

The Decree denies the benefits of the directive in the case of dividends distributed by companies which are directly or indirectly controlled by entities which do not reside in the EC, and which have been organized for the sole or main purpose of benefiting from the exemption.[15]

G. *Effective date*

The provisions have retroactive effect to 1 January 1992. However, Article 3 of the Decree provides the retroactive effect to 1 January 1992 with reference to the date of the resolution to distribute the dividends;[16] thus distributions which took place in the past (but after the date of effect) or which will take place in the future, will only come within the scope of the provisions if the relevant resolution was dated after 1 January 1992.

---

12. For a discussion of this issue, see Simona Belletini, "Parent/Subsidiary Finds Home in Italy", *International Tax Review* (April 1993), at 36.
13. The withholding tax levied by Italian banks on inbound dividends which fall within the scope of the directive has also been abolished.
14. Italian PEs of companies resident in other EC countries are also eligible for the 95% exemption provided the residency and participation requirements are met.
15. It should be noted that the anti-avoidance provision has been extended to an Italian parent controlled by an entity residing outside the EC, thus disallowing the 95% exemption on dividends received from EC subsidiaries.
16. The directive itself only makes reference to the distribution and not to the decision to distribute.

THE TAX ON THE NET WORTH OF ENTERPRISES

Paolo Ludovici
Studio Maisto e Miscali, Milan Italy.

I. INTRODUCTION

One of the extraordinary measures aimed at reducing the astronomical Italian budget deficit was Decree Law No. 394 of 30 September 1992 (hereinafter referred to as "the Decree Law"),[1] which introduced a tax on the net worth of enterprises. The tax, which resembles the tax applicable during 1954-1973[2], is considered a "temporary taxation measure which better fits the goal of increasing revenue within the framework of a policy of tax equalization and harmonious completion of the tax system".[3]

This article describes the main features of the new tax on net worth, including the instructions provided in the Ministry of Finance's Implementing Decree of 7 January 1993 and Circular No. 7 of 21 April 1993.

Contents

A. Scope
B. Taxable base
C. Reduction of net taxable worth
D. Determination of the tax
E. Deductibility
F. Allocation of the net worth tax for accounting purposes
III. The Role of Double Taxation Treaties
A. Treaties which include capital taxes
B. Allocation of the right to tax capital
C. Method for avoidance of double taxation on capital
D. Netherlands treaty

II. APPLICATION OF THE TAX

The net worth tax will apply as from the financial year current at 30 September 1992 until the business income tax is revised (currently scheduled to be completed by 30 June 1994), or if the revision is completed earlier, until the financial year current at 30 September 1994.[4] Thus in principle the new tax is applicable to no more than three financial years. It is worth mentioning, however, that although the new tax is initially a temporary emergency measure, it cannot be ruled out that it will be made permanent.

A. *Scope*

The net worth tax is imposed on all entities which carry out (or are deemed to carry out) business activities in Italy and which are subject to tax on business income. In particular, the following taxpayers are subject to the net worth tax:

- resident joint stock companies, limited liability companies, cooperatives and mutual insurance companies.[5] Any activity carried out by these companies is considered a business activity, so their entire net worth is subject to the tax;
- resident state-controlled and private entities (besides companies) which have as their exclusive or main purpose the carrying out of commercial activities. Any activity carried out by these entities is considered a business activity, so their entire net worth is subject to the tax;
- resident state-controlled and private entities which do not have as their exclusive or main purpose the carrying out of commercial activities. However, these entities are only subject to the net worth tax on the share of net worth attributable to business income produced by the entity;[6]
- resident general and limited partnerships. Any activity carried out by these partnerships is considered a business activity, so their entire net worth is subject to the tax;
- resident individual entrepreneurs;
- permanent establishments (PEs) in Italy of non-resident individuals, companies and entities.

The following entities are excluded from the scope of the net worth tax:

- EEIGs since they are not considered taxable persons for personal income tax purposes;[7]
- UCITS, wherever established, which are not considered to be carrying out commercial activities.[8]

B. *Taxable base*

The criteria for determining the taxable base depends on the bookkeeping regime applicable for tax purposes to the taxpayer. According to Decree No. 600 of 29 September 1973, the following regimes are applicable:

1. The Decree Law was converted into law, with modifications, through Law No. 461 of 26 November 1992.
2. Prior to 1973 companies were also subject to a corporation tax equal to 0.75% of the net worth, increased by 15% of the taxable income which exceeded 6% of the net worth (Law No. 603 of 6 August 1954 and Arts. 145-155 of Presidential Decree No. 645 of January 1958
3. See the Ministerial Report on Decree Law No. 394/1992, published in *Il Fisco* (1992), at 8926.
4. Decree Law, Art. 4, para. 1.
5. *Id.* Although not specifically mentioned in the law, companies incorporated abroad but resident in Italy for tax purposes (because their administrative seat or the main purpose of their business is situated in Italy) are subject to the Italian law applicable to joint stock companies. See Italian Civil Code Art. 2507.
6. According to Art. 8, para. 1 of the Implementing Decree, the net worth tax is not due by non-commercial entities which produce business income in the course of relief, health, educational, cultural or sporting activities and which keep separate accounting records for such activities.
7. Art. 11 of Legislative Decree No. 240 of 23 July 1991.
8. Art. 9 of Law No. 77 of 23 March 1983, as amended by Legislative Decree No. 83 of 25 January 1992 and Art. 14 of Legislative Decree No. 84 of 25 January 1992.
Some doubts had arisen about Italian SICAVs established as joint stock companies, which are expressly mentioned in Art. 1 of the Decree Law. These doubts were resolved by the 21 April 1993 Ministry of Finance Circular which stated that such entities do not carry out commercial activities.
In the author's view, the Ministry of Finance's conclusion is correct although based on an erroneous argument. Indeed, Art. 1 of Law Decree No. 394/1992 makes reference to joint stock companies without setting forth as an additional condition that such companies must carry out business activities. The conclusion is correct, however, because the reference to CTA Art.

© 1993 International Bureau of Fiscal Documentation

- the ordinary bookkeeping regime, which is mandatory for resident companies and entities which have as their exclusive or main purpose the carrying out of commercial activities;[9]
- the simplified bookkeeping regime, which is applicable to partnerships and individual entrepreneurs whose annual turnover does not exceed 1 billion lire (350 million lire for service enterprises).

1. Entities subject to the ordinary bookkeeping regime

For entities required to keep accounting books according to the ordinary regime, the taxable base is equal to the net worth shown in the last approved balance sheet, reduced by profits of the current year.[10] If there is no balance sheet (e.g. in the case of a merger, transformation, division, etc.) or if the balance sheet has not yet been approved by the shareholders meeting, the net worth is determined from the accounting books and entries at the end of the tax period.

The items comprising net worth are specifically listed in Article 2 of the Implementing Decree, which refers to Article 2424 of the Italian Civil Code, the provision which regulates the company assets and liabilities statement. In particular, the following items are mentioned (this list is not intended to be exhaustive):

- subscribed capital or endowment fund. The decree specifies that reference should be made to subscribed capital even if not fully paid-in (the amount owed by shareholders must be shown as a separate item on the assets side). For PEs in Italy the endowment fund consists of the functioning capital allocated to the PE by the home office;[11]
- amounts paid by shareholders (or partners) which do not have to be refunded, and payments to the capital account;
- share premium account and equalizing interest paid by subscribers for new shares or quotas;
- revaluation reserves established pursuant to specific laws;[12]
- legal reserve, statutory reserve, reserves established pursuant to tax amnesty legislation and other reserves and funds, regardless of the tax regime applicable thereto;[13]
- own shares reserve;
- reserves destined for reinvestment pursuant to specific incentive legislation;[14]
- provisions for generic liabilities and charges, e.g. provisions for unscheduled expenses, unspecified risks, fluctuation of the value of business assets and liabilities, renewal of plant and inventory;
- reserves and funds for the self-financing of future investments in business assets;
- merger (or division) surplus;[15]
- profits (and losses) of previous years;
- current year losses, which will be determined without considering the amount of the net worth tax if shown in the loss side of the profits and loss account relating to the same year.[16]

Consistent with the characterization given by accounting principles, provisions for specific liabilities and charges, and reserves and funds for downward adjustments of the book value of business assets[17] are not included in the net worth which comprise the base for computation of the net worth tax. According to Article 2, paragraph 2 of the Implementing Decree, the same exclusion applies to reserves for accelerated depreciation[18] up to the amount of depreciation which will be accounted for civil law purposes in future years.[19]

2. Persons subject to the simplified bookkeeping regime

For persons falling within the scope of the simplified bookkeeping regime, the taxable base is determined as the sum of the following items:

- book value of inventory and works in progress; and
- book value of depreciable business assets net of the depreciation. Both tangible and intangible assets are taken into account for these purposes.

87, para. 1, lett. a) must be interpreted as a reference to joint stock companies *subject to corporate income tax*, whereas SICAVs are not subject to such tax.

9. Taxpayers not mandatorily subject to the ordinary bookkeeping regime may, however, elect to be subject to it.

10. Decree Law, Art. 1, para. 2. As explained below, losses of the current year are taken into account in determining the taxable net worth.

11. Non-resident companies with a PE in Italy are required to keep separate and distinct accounts for purposes of determining income produced by the PE (Art. 14 of Decree Law No. 600 of 29 September 1973). For application of the net worth tax, the "force of attraction" principle (according to which some income is deemed to be attributable to the PE) should not have any effect, i.e. the net worth of the PE should be determined by taking into account only the assets and liabilities actually related to it.

12. The most recent revaluation laws are Law No. 72 of 19 March 1983, Law No. 408 of 29 December 1990 and Law No. 413 of 30 December 1991.

13. There are various types of reserves and funds under the Italian tax system:
- reserves and funds which, upon distribution, do not constitute taxable income for the distributing company but constitute taxable income for the shareholders;
- reserves and funds which, upon distribution, give rise to an equalization tax liability to the charge of the distributing company and constitute taxable income for the shareholders;
- reserves and funds which, upon distribution, do not constitute taxable income for either the distributing company or the shareholders;
- reserves and funds which, upon distribution, are to be included in the taxable income of the distributing company and constitute taxable income (for their net amount) for the shareholders;
- reserves and funds which, regardless of their use (even for covering losses) are included in the taxable income of the company.

The full amount of these reserves and funds is included in the net worth. It should be noted that prior to the enactment of Decree Law No. 513 of 31 December 1992 (now reproduced in Law No. 131 of 28 April 1993) reserves and funds subject to a possible future tax liability had to be considered for 50% of their amount (Art. 1, para. 3 bis, Decree Law No. 394/1992).

14. For example, profits to be reinvested in Valtellina or in the south of Italy (Mezzogiorno).

15. On the contrary, the merger (or division) deficit cannot be considered a negative item of net worth.

16. For accounting purposes, the net worth tax can be shown as a separate item in the profits and loss account or can be deducted directly from the existing net worth.

17. The Ministry of Finance Circular lists, among other things, the following funds and reserves: fund for taxes to be paid; reserve for exchange risks; reserves for personnel severance pay; bad debt fund; reserve for the writing-down of participations; fund for technical depreciation; fund for financial depreciation; technical reserves of insurance companies and entities.

18. According to CTA Art. 67, para. 3, the amount of ordinary depreciation may be increased by way of accelerated depreciation up to two times in the first and the two succeeding fiscal years.

19. Accelerated depreciation does not have to be taken into account for civil law purposes. Thus the depreciation period for tax purposes is shorter than the period for civil law purposes. For civil law purposes, depreciation to be made after completion of the tax depreciation will be computed as a reduction of the reserves for accelerated depreciation.

© 1993 International Bureau of Fiscal Documentation

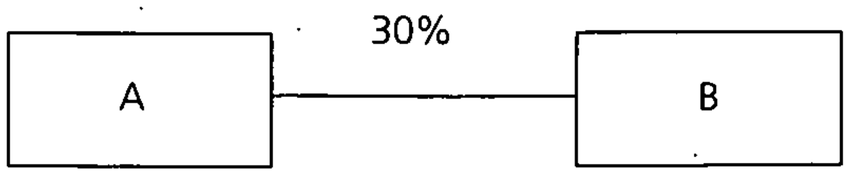
However, if a simplified regime taxpayer elects to be subject to the ordinary bookkeeping regime, he may elect to be subject to the net worth tax according to the rules set forth above.[20]

C. *Reduction of taxable net worth*

Article 1, paragraph 4 of the Decree Law provides for a reduction in the taxable base for taxpayers (other than those keeping books according to the simplified regime) which own participations in companies or entities subject to the net worth tax. This provision aims to prevent economic double taxation which would be particularly burdensome in groups of companies having a highly vertical structure. In the absence of this provision the same net worth would be subject to the net worth tax twice, i.e. once at the company level and again in the hands of the shareholder.

1. Participation

Contrary to the practice in most countries, the Decree Law does not set forth any requirement as to the extent of the participation, i.e. the special mechanism applies to any taxable person regardless of the extent of the participation. However, the allowance is granted only if the entity is a taxable person for purposes of the net worth tax. As a result, participations in foreign companies do not in principle give rise to a reduction in the taxable base.[21] Moreover, the allowance is granted only if the taxable base of the participated company or entity is determined as the net worth and not as the sum of the book value of inventory and depreciable assets.



2. Minimum holding period

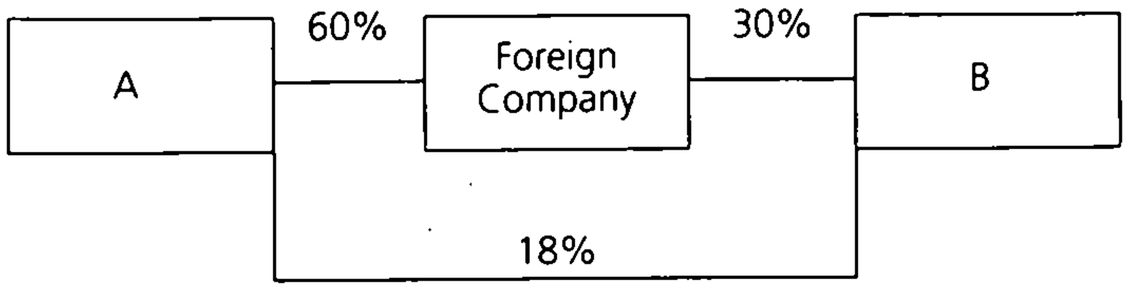
To benefit from the mechanism for the avoidance of economic double taxation, the participation must be held without interruption for the three month period preceding the end of the tax period. If during the last three months the taxable person purchased other shares or quotas in the participated company or entity, the allowance is granted only with respect to the shares or quotas which fulfil the minimum holding period requirement (so the mechanism is applicable on a share-per-share basis).[22]

3. Amount of the reduction

According to Article 1, paragraph 4 of the Decree Law and Article 6 of the Implementing Decree, the amount of the reduction is determined as the lower of the following amounts:

- the book value of the participation as resulting from the assets side of the balance sheet of the participating company (or from any other accounting book or entry if the balance sheet has not been approved); and
- the net worth value of the participated company. For these purposes, the net worth is determined gross of any reduction granted with respect to the participation held by the participated company, and net of current profits. The net worth results from the balance sheet of the participated company which has been approved prior to the approval of the balance sheet of the participating person.

Case 1
- Net worth of A 1,000
- Book value of the participation in B 400
- Net worth of B (net of current profits) 5,000
- Share of B's net worth attributable to A 1,500
- Reduction in A's net worth 400
- Taxable base 600



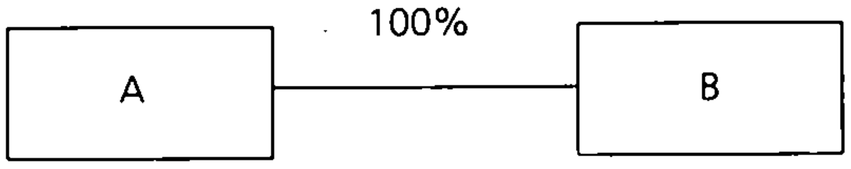
Case 2
- Net worth of A 1,000
- Book value of the participation in B 400
- Net worth of B (net of current profits) 1,000
- Share of B's net worth attributable to A 300
- Reduction in A's net worth 300
- Taxable base 700

4. Reduction for participations in Italian companies held through non-resident companies

The Decree Law takes into account the case where a taxable person[23] holds an indirect participation in an Italian resident company[24] through a non-resident company or entity.[25] In such a case, the law provides that the reduction in the taxable net worth will be determined on the basis of the percentage of indirect holding in the Italian company, up to an amount equal to the book value of the participation in the foreign company. This reduction is granted regardless of the amount and composition of the net worth of the foreign company and regardless of the tiers of indirect holding. Although not specified by the Decree Law, any participation held by foreign entities down to the Italian indirectly-owned company must comply with the minimum three month holding period requirement.

20. Non-business entities may apply for application of the net worth tax only if they keep a separate accounting for the business activities that they carry out.
21. The only exception applies to a participation in a foreign company with a PE in Italy which is subject to the net worth tax. In this case the amount of the reduction will be measured by the PE's net woth.
22. The Ministry of Finance has stated that newly issued shares or quotas subscribed during the three month period within the limits of the option rights attached to shares or quotas complying with the minimum holding period requirement are deemed to be purchased prior to the three month period.
23. The Decree Law does not contain specific requirements as to the legal form of the taxable person which holds a participation in the foreign entity. However, the Implementing Decree provides that the mechanism is applicable only if the taxable person is a company. According to general principles of Italian law, this conflict will be resolved in favour of the Decree Law, which is why reference is generically made to "taxable persons".
24. According to the Decree Law the mechanism is applicable only if the taxable person participates indirectly in the capital of a "company". However, the Implementing Decree extends application of the mechanism to indirect participations in "entities" as well. As stated above, the conflict will be resolved in favour of the Decree Law.
25. As mentioned above the Decree Law does not consider the case where a taxable person participates indirectly in a non-resident entity having a PE in Italy.

© 1993 International Bureau of Fiscal Documentation



Case 1
- Net worth of A 1,000
- Book value of the participation in the foreign company 400
- Net worth of B (net of current profits) 6,000
- Share of B's net worth attributable to A 1,080
- Reduction in A's net worth 400
- Taxable base 600

Case 2
- Net worth of A 1,000
- Book value of the participation in the foreign company 400
- Net worth of B (net of current profits) 2,000
- Share of B's net worth attributable to A 360
- Reduction in A's net worth 360
- Taxable base 640

D. *Determination of the tax*

1. Rate

The net worth tax is levied at the rate of 0.75 percent.[26] However, if the taxable person benefits from the reduction granted with respect to the (direct or indirect) holding of a participation in an Italian company, the actual amount of tax to be paid cannot be lower than 0.1 percent of the net worth, gross of such reduction. Thus in some cases economic double taxation is not avoided at all. Such circumstance is typical of pure holding companies.

Case
- Net worth of A 1,000
- Book value of the participation in B 1,000
- Net worth of B (net of current profits) 1,000
- Share of B's net worth attributable A 1,000
- Reduction in A's net worth 1,000
- Taxable base 0
- Net worth tax due by B 7.5
- Net worth tax due by A 1.0

No deductions are allowed for capital taxes paid abroad.

2. Cases where the net worth tax is not due

The net worth tax is not due if, at the end of the tax period the taxable person is subject to an insolvency procedure, such as bankruptcy, forced administrative liquidation, extraordinary administration or preventive agreement by transfer of business assets; or if the tax to be paid does not exceed 100,000 lire.

E. *Deductibility*

The net worth tax is not deductible in determining taxable income for individual or corporate income tax purposes.

F. *Allocation of the net worth tax for accounting purposes*

The net worth tax may be considered a negative item of the profits and loss account or as an item to be deducted from existing net worth. The net worth tax may be accounted for as a negative item of the net worth of the period to which the tax relates or the period in which the actual payment is made.[27]

In the absence of any requirement regarding reserves or funds to be charged with the net worth tax, taxpayers may elect to reduce the reserve or fund of their choice. Thus it would be convenient to reduce the amount of reserves or funds which:
- in the event of distribution are to be included in the taxable income of the distributing company; or
- in the event of distribution give rise to an equalization tax liability to the charge of the distributing company.

III. THE ROLE OF DOUBLE TAXATION TREATIES

The role of double taxation treaties has not been adequately taken into account in respect of the economic effects of the net worth tax on enterprises. The issue was not addressed by the Ministerial Circular of 21 April 1993. It is difficult to understand the reasons underlying this omission – in all of Italy's treaties only 20 also apply to capital taxes and their application may significantly affect the scope and impact of the net worth tax on enterprises.[28]

A. *Treaties which include capital taxes*

Following the definition in Article 2, paragraph 2 of the OECD model treaty, capital taxes include both taxes on total capital and taxes on elements of capital. As a result, the net worth tax (which, depending upon circumstances, is applica-

26. If the tax period is other than the normal 12 month period, the rate will be modified accordingly. The equalization on a 12-month basis prevents certain distortions which would otherwise arise in cases of merger (or division) by the formation of new companies. Such effects, however, have not been eliminated in cases of merger by acquisition or division effected through a transfer of assets to existing companies. In these circumstances, the transferee existing companies cannot benefit from a reduction of the rate in proportion to the period during which the assets were the property of the transferor company.
27. Pursuant to Decree Law, Art. 4, para. 2-bis (as amended by Art. 62 of Decree Law No. 131 of 28 April 1993).
28. The treaties are with Argentina, Austria, Bulgaria, China, Denmark, Ecuador, Finland, France, Germany, Greece, Hungary, Israel, Luxembourg, Norway, the Netherlands, Romania, Sri Lanka, Sweden, Switzerland and Yugoslavia.

© 1993 International Bureau of Fiscal Documentation

ble on the difference between total assets and total liabilities, or only on some assets) must be regarded as a capital tax for purposes of the application of double tax treaties.[29]

B. *Allocation of the right to tax capital*

With the sole exception of the treaty with the Netherlands, all of Italy's treaties which include capital taxes within their scope of application are drafted along the lines of Article 22 of the OECD model convention, with the result that:

(1) capital represented by immovable property may be taxed in the state where the property is situated but such taxability does not prevent taxation in the state where the owner is resident;
(2) capital represented by movable property forming part of the business property of a PE of an enterprise may be taxed in the state where the PE is situated but such taxation does not prevent taxation in the state where the enterprise is resident;
(3) ships and aircraft operating in international traffic and boats engaged in inland waterways transport may be taxed only in the state in which the place of effective management is situated;
(4) all other elements of capital may be taxed only in the state where the enterprise is resident.

The scope of application of the Italian net worth tax on enterprises complies with the allocation rules listed under (1), (2) and (4).[30] In some cases, the net worth tax seems even more favourable for foreign enterprises since immovable property situated in Italy is taxable there only if the property is attributable to a PE situated in Italy. On the contrary, there is a clear conflict with the allocation rule described under (3) above:

- pursuant to Decree Law No. 394/1992, the Italian net worth tax is applicable to shipping enterprises which are resident in Italy for individual or corporate income tax purposes; an enterprise established in Italy is resident regardless of the place where the seat of effective management is situated. As a result, according to domestic tax law, a shipping enterprise established in Italy but effectively managed abroad would nonetheless be fully subject to the net worth tax on its entire net worth;
- a shipping enterprise, even if not resident in Italy for tax purposes, may be subject to the net worth tax on the net worth attributable to a PE situated in Italy. This is clearly contrary to the allocation rule in Italian treaties.

Although not specifically dealt with by the Decree Law, it is indisputable that treaty provision prevails over domestic rules,[31] and that the net worth tax will not apply to shipping enterprises whose place of effective management is not situated in Italy.

C. *Method for avoidance of double taxation on capital*

With the sole exception of the treaties with the Netherlands and France (which make reference to a further agreement between the competent authorities),[32] all of the Italian treaties which include capital taxes within their scope of application provide for the credit method as the method for the avoidance of double taxation on capital. Consequently, if a resident of Italy has capital which, in accordance with the provisions of the applicable treaty, may be taxed in the other contracting state, Italy will allow as a deduction from the tax on the capital an amount equal to the capital tax paid in the other contracting state, provided that such deduction does not exceed that part of the capital tax as computed before the deduction is given, which is attributable to the capital which may be taxed in the other contracting state (ordinary credit method).

Application of the credit method does not require that the objective scope of application of the Italian and the foreign capital tax (e.g. one tax may be applied on net worth, defined as assets minus liabilities, while the other may be applied on gross total assets or only on certain elements of capital) be identified. What is material is that both taxes qualify as capital taxes for purposes of the treaty.

Italian domestic tax law does not take into account the possibility of deducting foreign taxes from the net worth tax actually due; notwithstanding that, the credit must be allowed since treaty provisions prevail over domestic tax law provisions.

Once it is established that the foreign tax credit provision is applicable, the method of computation of the maximum deduction allowed should be determined.[33] According to the ordinary credit method, the deduction cannot exceed that proportion of the Italian net worth tax which the item of capital that may be taxed in the other contracting state bears to the entire capital. For these purposes, in the author's view, this item of capital will be determined net of relevant liabilities, provided that:[34]

- specific liabilities are taken into account in their full amount; and
- generic liabilities (e.g. total liabilities net of specific liabilities attributable to whatever item of capital) are attributed in the same proportion which the item of capital (net of specific liabilities) bears to total assets (net of specific liabilities).[35]

29. Some treaties, in listing the existing taxes covered by the treaty, make reference to net worth tax applied by the other contracting state (see, for instance, the treaty with Luxembourg). It would make no sense not to consider the same treaties applicable to the Italian net worth tax.
30. The sole exception, which is not very common, is dual resident companies which are deemed to be resident of the other contracting state for treaty purposes. See text below regarding shipping companies.
31. See Italian Constitution Art. 10.
32. Protocol, Art. 11, lett. c).
33. Neither Italian law nor the OECD model convention offer adequate guidance on this point; the mechanism described in the text reflects the personal view of the author.
34. The principle of the computation of the net amount is set out in para. 63 of the Commentary to Art. 23B of the OECD model convention only with respect to the determination of income. In the author's opinion, however, such principle can reasonably be applied to capital as well.
35. The computation of such amounts net of specific liabilities aims to prevent significant amounts of generic liabilities from being attributed to items of capital which bear huge amounts of specific liabilities (the lower the net amount of the item of capital, the lower the amount of generic liabilities attributable thereto).

© 1993 International Bureau of Fiscal Documentation

Example:

(1)	Real property established in the contracting state	100
(2)	Real property established in Italy	200
(3)	Total assets (1 + 2)	300
(4)	Generic liabilities	180
(5)	Specific liabilities attributable to the assets under (1)	30
(6)	Total liabilities (4 + 5)	210
(7)	Net worth (3 – 6)	90
(8)	Net worth tax (0.75% x 7)	0.675
(9)	Amount of the item of capital taxed abroad (1)	100
(10)	Specific liabilities attributable to the item of capital taxed abroad (5)	30
(11)	Other liabilities attributable to the item of capital taxed abroad [(9 – 10) ÷ (3 – 5)] x 4	47
(12)	Net amount of the item of capital which may be taxed abroad (9 – 10 – 11)	23
(13)	Proportion for the application of the foreign tax credit (12:8)	25.5%
(14)	Maximum foreign tax credit allowed (8 x 13)	0.172

D. *Netherlands treaty*

Other potential areas of conflict are raised by the 1957 treaty with the Netherlands. Under Article XVIII:

- capital represented by immovable property may be taxed only in the state where the property is situated;
- capital represented by movable property forming part of the business property of a PE of an enterprise may be taxed only in the state where the PE is situated;
- ships and aircraft operating in international traffic, and boats engaged in inland waterways transport may be taxed only in the state in which the place of effective management is situated;
- shares, bonds and credits may taxed in the state where the owner has his fiscal domicile; such right, however, is not exclusive and the other contracting state may apply capital taxes on the same elements of capital;
- all other elements of capital may be taxed only in the state where the enterprise is resident.

The Netherlands treaty is the only treaty which provides for the exclusive taxation right of immovable property and of property attributable to PEs in one contracting state of a person resident in the other contracting state. Thus Italy is not allowed to tax the share of the net worth attributable either to immovable property situated in the Netherlands or to PEs in the Netherlands of enterprises resident in Italy for tax purposes. In the author's opinion the amount of the items of capital which cannot be taxed will be determined by the same principles set out above, i.e. net of specific liabilities and of the relevant share of generic liabilities.

As to the method for the avoidance of double taxation on capital, Article XIX, paragraph 2 of the treaty sets forth the exemption with progression method. Italy will include all items of capital in the taxable base but will deduct from such tax the amount attributable to items of capital which are taxable in the Netherlands. Since the net worth tax is applicable at a flat rate, the exemption with progression method leads to the same results as the ordinary credit method.

I. INTRODUCTION

Following the 1972/1973 reform, which completely restructured the Italian tax system, many statutes and administrative measures affecting the securities market were adopted in Italy. The process has intensified in recent years for several reasons, including the need to keep up with more developed financial markets (this goal was also pursued by implementing EC legislation).[1] Both the burgeoning state deficit and the consequent need of the Fisc for increased revenue led to the enactment of new tax provisions.[2]

A statute of particular relevance for the securities market is Law No. 1 of 2 January 1991, which introduced Securities Investment Companies (the "SIM Law").[3] Under the SIM Law investment services concerning securities, if performed on a professional basis and *vis-à-vis* the public, are exclusively reserved to SIMs and – to a limited extent – to banks and fiduciary companies.

II. DERIVATIVE PRODUCTS IN GENERAL

The utilization of derivative products in Italy has only recently become popular.[4] Existing instruments which have been successfully tested in more sophisticated financial markets have been imported and adapted to meet the specific needs of the Italian market.

The diffusion of financial instruments started in the absence of specific legal rules, leading scholars and practitioners to try to label any new financial "unidentified object" according to traditional civil law categories, which often lack the necessary flexibility or which do not reflect the real features of the transaction. In particular, it is disputed whether contracts such as swaps, options and futures are to be regarded as aleatory contracts, insurance contracts or wagering contracts. The problem is not merely theoretical: under Article 1933 of the Civil Code obligations arising from wagering contracts are not legally enforceable. Moreover, to construe derivative contracts as wagering contracts may imply application of the 25 percent final withholding tax on the income, as provided by Article 30 of Presidential Decree No. 600 of 29 September 1973 ("Decree 600").

According to authoritative civil law experts, in a wagering contract the risk is artificially created by the parties and it concerns an event which, in the absence of the wager, would be of no interest to the parties. On the contrary, in aleatory contracts (such as insurance contracts), the risk exists before execution of the contract, the purpose of which is often to eliminate or reduce negative effects should the risk materialize. Based on this theory it can be concluded that as a rule derivative products are aleatory contracts and cannot be considered wagering contracts.[5]

1. On 17 May 1991, Law No. 157, which tackles insider trading activities, was enacted in compliance with EC Directive 89/592; undertakings for collective investment in transferable securities ("UCITS") are dealt with by Law No. 77 of 23 March 1983, as amended by Legislative Decree No. 83 of 25 January 1992, implementing EC Directives 85/611 and 88/220. Legislative Decree 83/1992 sets forth, for the first time, the rules for marketing units of foreign investment funds in Italy.
By Legislative Decree No. 84 of 25 January 1992, and in compliance with EC Directive 85/611, SICAVs made their appearance in the Italian legal system.
Law No. 149 of 18 February 1992 introduced the first complete set of rules regarding takeover bids and the public offer of securities.
2. Law No. 102 of 25 March 1991 introduced a capital gains tax applicable to individuals (other than professional entrepreneurs) on the transfer of shares, quotas of limited liability companies, convertible bonds and other securities. Prior to Law 102/91 the capital gains were taxable in the hands of such individuals only in case of a qualified participation.
3. See in general Elisabetta Righini, *I valori mobiliari* (Giuffre, 1993).
4. Among the factors hindering the diffusion of financial instruments based on foreign currency were the exchange control restrictions, which were abolished by a Ministerial Decree of 27 April 1990 (effective from 14 May 1990).
5. This issue was discussed in a report published by the Research Department of the Bank of Italy in August 1987, where it was concluded that derivative products should not be considered wagering contracts based on their economic function, which deserves legal protection. Banca d'Italia, Temi di discussione, "La tassazione e i mercati finanziari", No. 94 (August 1987), at 75.

© 1993 International Bureau of Fiscal Documentation

This article first briefly summarizes the general rules of Italian tax law which are relevant to financial instruments, and then overviews the income tax and VAT aspects of derivative products; other indirect taxes and minor duties are not examined.[6]

III. TAX RULES

The global income received by resident individuals, other than professional entrepreneurs, and by resident non-commercial entities (hereinafter collectively referred to as "non-entrepreneurs") is taxable if its components fall under one of the categories of income in the Italian Income Tax Code ("ITC"). Such categories include income from real property, income from capital, employment income, income from independent services, business income and miscellaneous income. Income received by resident corporate entities and other resident taxpayers engaging in commercial/industrial activities ("entrepreneurs") is deemed to be of a business nature, and is taxed at the ordinary corporate tax rate, or in case of individuals and transparent entities, at the progressive personal income tax rates.

Corporate income is subject to corporate income tax ("IRPEG") at the rate of 36 percent, and to local income tax ("ILOR") at the rate of 16.2 percent; the combined corporate income tax rate is therefore 52.2 percent. Personal income tax ("IRPEF") is levied at progressive rates ranging from 10 to 51 percent. Business income derived by individuals is also subject to the 16.2 percent ILOR. Income received by individuals other than entrepreneurs is taxable at IRPEF progressive rates. ILOR applies only to specific categories of income, i.e. in addition to business income, to income from real property and income from capital. Income derived by non-resident individuals and corporate entities (in the absence of a permanent establishment ("PE") in Italy) is subject to IRPEF and to IRPEG, respectively, if produced in Italy.[7]

Value added tax ("VAT") applies at the ordinary rate of 19 percent to the sale of goods and rendering of services if the transactions take place in Italy and are performed for consideration by entrepreneurs or professionals.

IV. SWAPS

This section deals with the tax treatment of interest rate swaps and currency swaps.[8]

An interest rate swap is a contract where for a certain period of time, the parties exchange a financial position characterized by a fixed interest rate with another financial position characterized by a variable rate.[9] The parties make periodic payments to each other on the basis of notional amounts and predetermined interest rates. As a rule, interest rate swaps are meant to minimize the risk of interest rate fluctuations.[10]

A currency swap is a contract where the parties undertake to initially exchange two principals of equivalent value but in a different currency, and to make a series of payments of a predetermined amount to each other at fixed dates in the currency initially received. At the expiration date the parties must return the capital initially received. In other cases the principal can be merely notional.

Because of the exchange control regulations, until 1990 currency forward agreements, currency agreements in cash and currency options with non-resident counterparties were not allowed. As a result, currency swaps developed in Italy in the form of domestic currency swaps (or indexed lire swaps). Under a domestic currency swap, the Italian-resident parties to the contract undertake to pay or to receive at a predetermined date an amount in Italian lire, calculated on the basis of the difference between the contractual exchange rate and the exchange rate current at the expiration date of the contract.[11] In principle, domestic currency swaps aim at "freezing" the exchange ratio between a foreign currency and Italian currency for a certain period of time. Due to the exchange control deregulation, it is expected that the use of currency swaps other than the domestic ones will develop in Italy in the future.[12]

In a Circular Letter of 12 November 1991, the Italian Banks Association ("ABI") issued two standard swap agreements concerning interest rate swaps and domestic currency swaps. The applicability of the ABI standard agreements is limited to transactions between resident banks and/or financial institutions. In both agreements, emphasis is placed on limiting risks connected with fluctuations in interest rates and/or the exchange rate of the Italian currency in order to exclude a merely speculative purpose which may evoke a wagering contract. The ABI initiative is in line with the international standardization of swaps promoted by a number of organizations, in particular the International Swap Dealers Association.

1. Interest rate swaps

(a) *Entrepreneurs*

As mentioned above, income received by entrepreneurs is automatically included in business income. Any proceeds

6. For instance, registration tax applies at a rate of 3%, calculated on the contractual consideration. The tax does not apply if the contract is concluded through the exchange of business correspondance rather than by an ad hoc deed or when the contract is concluded abroad.
7. ITC Art. 3.
8. See in general Emilio Girini and Cesare Vecchio, *Futures, options, swaps, commercial paper* (Ipsoa Informatica, 1988); see also by the same authors, "Profili civilistici, valutari e fiscali del domestic currency swaps", 20 *Bollettino Tributario* (1989), at 1532; "Profili, civilistici, valutari e fiscali dell'interest rate swaps", 22 *Bollettino Tributario* (1989), at 1700.
9. See *supra* note 5, at 65.
10. Although this definition does not cover all existing forms under which interest rate swaps are structured, it corresponds to one of the most common types, usually called a fixed-floating interest rate swap.
11. Definition of the Bank of Italy in its Instructions for the drafting of the balance sheet of enterprises and for the drafting of the consolidated balance sheet of banks and financial institutions, issued on 15 July 1992.
12. However, the tax monitoring provisions enacted by Law No. 227 of 4 August 1990 (immediately after the deregulation) may represent an obstacle. In fact, such provisions created a burdensome system of control which may turn out to have effects similar to those of the ostensibly abolished exchange control restrictions. Under Art. 2 of Law 227, for instance, banks and other financial institutions and intermediaries must collect evidence, to be kept at the tax authorities' disposal for five years, of any international transfer from or to Italy of cash or securities, whenever the transfer is effected in favour or on behalf of resident non-entrepreneurs, if the relevant amount exceeds 20,000,000 lire (approximately US$ 15,000).
Moreover, non-entrepreneurs must report in their income tax return any such transfer concerning investment abroad effected during the year, if the total amount exceeds 20,000,000 lire. When the transfer of cash and securities to and from abroad is made through non-resident intermediaries, the reporting requirements must be complied with even if the transfer is not connected with any investment abroad, e.g. if it is effected for tourism or health purposes.

© 1993 International Bureau of Fiscal Documentation

gained in connection with the swap must therefore be included in the profit and loss account and are taxed at ordinary income tax rates upon filing the annual tax return. The income is represented by the amounts received by one party from the other, normally calculated as the difference between the interest rates taken as a reference when the dates of payments coincide.

If the duration of the swap contract covers more than one tax period or if the contract is still pending at the close of such period an issue arises about the timing factor, i.e. when does the income/loss become relevant for tax purposes. Under ITC Article 75, paragraph 1, proceeds and costs are taxable/deductible in the tax period in which they accrue. However, if in such period the existence of the proceeds/costs is not certain, or if their amount cannot be determined objectively, the proceeds/costs are taxable/deductible in the tax period in which such conditions (certainty, precise quantification) are realized.

As a rule, the obligation to pay a certain amount under an interest rate swap arises – and the relevant income becomes certain – on the dates indicated in the contract. Therefore payments between the parties represent an income/loss to be accounted for and included in taxable income (or, respectively, deducted) in the fiscal year in which they are due under the contract. In other words, the deduction of deferred expenses, calculated on the basis of the performance of the market at the end of the tax period, appears to be excluded by the ITC.

However, Regulations issued by the Bank of Italy on 31 July 1992, concerning the drafting (for civil law purposes) of the balance sheet of financial institutions, seem to prescribe opposite accounting criteria with respect to the operations "outside the balance sheet" aimed at limiting risks of fluctuations in interest rates, exchange rates or market prices. Hopefully, this discrepancy will be resolved with the expected reform of business income taxation.

(b) *Non-entrepreneurs*

To identify the correct tax treatment of an interest rate swap entered into by a non-entrepreneur, it is necessary to ascertain whether the relevant income fits into one of the categories of income in the ITC. Specifically, it has been discussed whether income from interest rate swaps can be regarded as having the nature of interest. According to prevailing opinion, the answer is no. As a rule, interest rate swaps do not grant to the parties the availability of the amounts set forth in the contract; these amounts are generally treated as "notional amounts" to serve as a basis for the calculation of the payments to be effected at the due dates. Therefore it can reasonably be argued that such payments do not represent interest deriving from the utilization of capital.

This conclusion is confirmed by the wording of ITC Article 41, which lists and defines items of income from capital.[13] None of the items appears to cover income from interest rate swaps. The catch-all provision contained in Article 41(h), which classifies as income from capital "any other income in a defined amount deriving from the utilization of capital" does not apply either, because no utilization of capital takes place in interest rate swaps. Moreover, the predetermination of the amount received is lacking. Finally, income from interest rate swaps does not appear to be covered by any of the items of "Miscellaneous Income" contained in ITC Article 81 examined below. It can reasonably be concluded that such income is not taxable in the hands of non-entrepreneurs.

(c) *Non-residents*

ITC Article 20 lists the cases where income received by non-residents is regarded as being produced in Italy and is therefore taxable there; the provision specifically deals with each of the categories of income in the ITC.

Income from interest rate swaps received by a non-resident company represents business income, taxable in Italy upon filing the tax return only if it is received through a PE.[14] Therefore in the absence of a PE no tax is levied in Italy. If the recipient is an individual, the income cannot be included (as illustrated above) in any of the ITC categories, so it is not taxable in Italy.

2. Domestic currency swaps

(a) *Entrepreneurs*

Proceeds and losses deriving from domestic currency swaps are, respectively taxable and deductible. With respect to the timing factor, the moment at which such proceeds and losses become relevant for tax purposes is normally identified with the expiration date when the obligation of one party to pay arises and can be determined by its amount.

As mentioned, following the exchange control deregulation, it will be possible to utilize currency swaps other than domestic currency swaps. In such case, whenever there is an actual transfer of currency between the parties, their respective obligations will be certain at the time of execution of the contract and will consequently be accounted for.[15]

Under ITC Article 72, certain deductions from business income are allowed to reduce the exchange risk in international transactions carried out in foreign currency. Article 72 does not allow the deduction of losses deriving from credits and debts in foreign currency when the exchange risk is neutralized by ad hoc contracts such as swaps and options.[16]

(b) *Non-entrepreneurs*

Income from currency swaps if received by non-entrepreneurs is dealt with by a recently introduced provision of the ITC. Article 81, paragraph 1 c ter [17] includes among

13. Such items include interest and other income deriving from loans, deposits and current accounts; interest and other income deriving from bonds and similar securities; income deriving from forward sale contracts concerning bonds and similar securities; interest and other income deriving from securities other than shares and similar securities.
14. ITC Art. 20(1)(e).
15. See Umberto Spano, "Currency swaps: aspetti contabili e fiscali", in *Bancaria* (1993) at 58 where it is pointed out that, due to the novelty of the instrument in Italy, the accounting procedures are still not clear.
16. See Ettore Scandale, "Italy creates exchange rate reserve", *International Tax Review* (June 1992), at 28.
17. Para. c ter was introduced by Art. 67 of Law Decree No. 213 of 30 June 1993, not yet converted into law.

© 1993 International Bureau of Fiscal Documentation

taxable capital gains those gains realized on forward sales of currency or through other contracts which, even implicitly, refer to the value of a currency at the expiration date of the contract in order to determine the consideration.[18] Notwithstanding the rather cryptic legislative language, it cannot be doubted that the expression "other contracts which, even implicitly, refer to the value of a currency at the expiration date of a contract to determine the consideration" includes domestic currency swaps; the Government report accompanying the pending bill of conversion is very clear on the point.

Article 67 of Law Decree 213 of 30 June 1993 also provides that entrepreneurs who intervene in any way as payors in the "other contracts" mentioned in Article 81, paragraph 1 c ter must levy a final 12.5 percent withholding tax on the capital gains. These withholding agents must pay the amount net of the withholding tax due. In the absence of consideration on which to effect the withholding, the person who realized the capital gains must pay to the withholding tax agent who intervened in the transaction a sum corresponding to the amount of the withholding tax.

According to Law Decree No. 378 of 17 September 1992 ("Law Decree 378"),[19] such capital gains, when realized on a sale to a non-resident, are regarded as foreign-source income for purposes of Law No. 227 of 4 August 1990 ("Law 227"). Thus, at the time of filing the annual tax return, the capital gains will not be included in total income, but will be taxed separately at the 12.5 percent rate. The taxpayer may, however, elect to include such gains in his total income if he wishes to benefit from the foreign tax credit granted under ITC Article 15.

B. *Value added tax*

1. Interest rate swaps

Presidential Decree No. 633 of 26 October 1972 (the "VAT Decree") does not specifically contemplate interest rate swaps or currency swaps. On one occasion,[20] the Ministry of Finance, which had been requested to provide clarifications on the VAT treatment of swaps, admitted that it was not in a position to give the requested information. In substance, the Ministry stated that swaps are atypical contracts with respect to which the legal aspects relevant for VAT purposes are not well known.

Under the broad definition provided by Article 3 of the VAT Decree, services subject to VAT are those rendered for consideration under independent labour contracts, independent contracts, contracts of transport, mandate, forwarding, agency, brokerage, deposit and, in general, services rendered in connection with obligations to perform or not to perform, and to permit, from any source. At first glance the obligations arising from a swap contract may be regarded as the rendering of services. According to the prevailing interpretation, however, interest paid by one party to the other under a swap contract does not represent consideration for the transaction; on the contrary, the interest is the object of the obligation and the relevant payment an assignment of money. Under Article 2, paragraph 3(a) of the VAT Decree, an assignment of money is not a taxable transaction for VAT purposes.

VAT is, however, levied on commission fees, if any, payable pursuant to the contract. It is common practice to include in the swap contract a fee which specifically aims at remunerating the element of service which is embodied in the swap. This fee should reduce the risk that the entire amount of money exchanged under the agreement may be viewed by the tax authorities as consideration for the service and therefore subject to VAT.

Article 12 of the pending bill of Consolidated Text of VAT exempts many financial transactions from VAT in accordance with Article 13 of Directive No. 77/388. The Ministerial Report accompanying the bill expressly states that the exemption covers swaps and, in general, transactions concerning credits, payments and cash.

2. Domestic currency swaps

As in the case of interest rate swaps, payments effected under domestic currency swaps do not represent consideration but are the object of the obligation; they represent assignments of money, not subject to VAT.

V. REPURCHASE AGREEMENTS

Prior to the legislative changes mentioned below, domestic currency swaps were often utilized in association with currency repurchase agreements ("repos"). In a repo, one party sells a certain amount of securities in currency at a certain price. At the same time, the seller undertakes to repurchase from the buyer, at a predetermined higher price and at a predetermined date, the same amount of the same securities. The expiration date of the repo does not normally exceed 90 or 180 days. An intermediary usually intervenes in the transaction. To avoid the exchange risk, the investor can enter into a domestic currency swap expiring on the same date as the repo.

Until recently, income from repos was not subject to tax in the hands of individuals. Repos were often effected on tax-exempt securities, so that the investor received income higher than that otherwise produced by the securities. In other cases, the intermediary sold to the client foreign securities with respect to which the expiration of the coupon did not take place during the client's period of ownership. The intermediary thus paid to the client, tax-free, the interest accrued (and the exchange gain, if any, deriving from the domestic currency swap).

This coupon washing technique allowed resident individuals and other taxpayers (such as resident investment funds) to

18. In the case of forward sales, capital gains are represented by the difference between the consideration for the sale and the consideration for the purchase of the sold currency if the purchase and the execution of the forward agreement are simultaneous; in other cases, capital gains are represented by the difference between the consideration for the sale and the value of the sold currency at the exchange rate current at the date the contract was executed.
19. Converted with amendments into Law No. 437 of 14 November 1992.
20. Ruling No. 460667 of 30 June 1987.

© 1993 International Bureau of Fiscal Documentation

avoid the 30 percent final withholding tax on interest from foreign bonds. The tax rate has been reduced to 12.5 percent by Law Decree No. 372 of 9 September 1992 ("Law Decree 372").[21]

Repurchase agreements gradually became more and more sophisticated; to meet growing demand, non-resident issuers of exempt securities increased the production of such securities, often tailored to the Italian market. Due to the lack of a sufficient quantity of securities, some intermediaries started to effect more than one repo on the same security. Repos became a serious competitor to domestic state bonds and banks when newly- introduced tax provisions radically modified the situation.

First, Law Decree 372 cancelled the exemption on income (interest as well as gains upon sale) from state bonds and similar securities issued abroad, as well as the exemption on income deriving from bonds issued by institutions such as the World Bank, the European Bank for Investments, etc. Such income is now subject to a 12.5 percent withholding tax, final in the case of non-entrepreneur individuals and UCITS.[22]

Law Decree 372 also amended Article 26, paragraph 3 of Decree 600, with respect to transfers of bonds issued by non-residents. When such a transfer is effected by resident individuals or UCITS, the 12.5 percent withholding tax applies to interest, premiums and any other income reflected in the consideration, both explicitly and implicitly; the seller of the bond must declare the interest, premiums and other income accrued when the bonds were in his possession. This provision obviously aims at preventing the coupon washing operations described above.

A few days after the enactment of Law Decree 372, Law Decree 378 added letter b bis) to ITC Article 41, paragraph 1, thus leading to the taxation of income deriving from repurchase agreements concerning bonds and similar securities as income from capital. Under this provision, income deriving from forward agreements in respect of bonds and similar securities is taxed as income from capital.

As clarified in the government report accompanying Law 437/92, letter b bis was added to ensure that bonds received equal tax treatment to income from bonds (as a rule taxed) and to income from forward sale agreements (such as repurchase agreements) even if income from the bonds which are the object of the forward sale agreement is in itself exempt from income tax (e.g. in case of bonds issued abroad by the state before 9 September 1992).[23] In other words, proceeds from repurchase agreements are subject to taxation with respect to any kind of bonds/similar securities, wherever issued and whoever the issuer, regardless of the tax regime, i.e. exemption or taxation, applicable to the explicit or implicit interest on such bonds/securities.

This may lead to discriminatory treatment of the investment concerning the same kind of securities depending on the form taken by the investment. An investor can obtain various kinds of income from the same securities such as interest, when the investor holds both the security and the coupon at the time the interest is paid; implicit interest, when the investor sells the securities and the coupon prior to expiration of such coupon; or income from negotiation, whenever the investor enters into a repurchase agreement. If the investments concern securities which benefit from a tax exemption on the relevant interest, the exemption applies only in the first two cases above. In the third case, the entire differential is subject to taxation with no relief for the portion attributable to interest.

As such income is classified as income from capital by ITC Article 41, in the absence of a double tax treaty the income should be taxed in the hands of non-residents when paid by the Italian state, by residents or by PEs of non-residents in Italy.[24] For treaty purposes, it is not clear whether such income is in the nature of interest; if so, treaties to which Italy is a party normally also provide for taxation in the source state. If, on the contrary, the income is regarded as not being included in any of the categories of income contemplated by the treaty, as a rule it will be taxed in the state of residence of the recipient.

Generally Italy's treaties apply only to residents of one contracting state. For treaty purposes, a resident of a state means a person who, under the laws of that state, is liable to tax therein by reason of his domicile, residence, place of management or any other criterion of a similar nature. Therefore in principle if the non-resident taxpayer is not subject to taxation in its state of residence (as may be the case of OICVMs and SICAVs) treaty provisions do not apply.

An exception to this principle is contained in Article 10 ter, paragraphs 9 and 10 of Law No. 77 of 23 March 1983.[25] Under Article 10 ter, a non-resident OICVM located in another EC member state which complies with EC Directives can, with respect to its investment in Italy, benefit from Italy's double tax treaties. The application of the treaty provisions is allowed only with respect to the portion of Italian-source income proportionally corresponding to the participation held by the non-resident, and subject to reciprocity.

VI. OPTIONS

Under an option contract one party (holder) acquires, upon payment of a premium, the right (not the obligation) to purchase from or to sell to the other party (writer) a certain amount of assets (securities, currency, interest rates, merchandise, futures) at a predetermined date and price (strike price). If the holder acquires the right to purchase, the option is a "call option"; if he acquires the right to sell, the option is a "put option". Under a European option, the option right must be exercised at the expiration of the contract; under an American option, the right can be exercised at any time between the execution and expiration of the contract.

21. Converted with amendments into Law No. 429 of 5 November 1992.
22. Art. 26 para. 1 of Decree 600, as amended by Law Decree 372. The new provisions apply to securities issued on or after 10 September 1992.
23. See in particular Andrea Manzitti, "Il regime tributario delle cessioni a termine di obbligazioni e valute", *Le Società*, No. 1 (1993), at 38, and "Italy's New Rules on the Taxation of Financial Transactions Examined", *Tax Notes International* (1993), at 371; see also Andrea Manganelli, "New Measures on the Taxation of Income from Capital", *European Taxation* (February 1993), at 64.
24. ITC Art. 20(1)(b).
25. As amended by Art. 13 of Legislative Decree No. 83 of 25 January 1992.

© 1993 International Bureau of Fiscal Documentation

In general, options are regarded as being covered by Civil Code Article 1331, which reads as follows:

> "Whenever the parties agree that one is bound by its declaration, whereas the other has the right to accept or reject it, the declaration of the first party is regarded as an irrevocable proposal to the effect of Article 1329.
>
> If no deadline has been fixed for the acceptance, the deadline can be determined by the court".

Under Article 1329, if the proponent undertakes to hold its proposal during a certain period of time, the revocation produces no effect.

Subject to certain conditions the SIM Law qualifies options and futures as securities for the purposes of securities intermediation activity if the options and futures concern securities listed on the stock exchange, interest rates and currency, and provided the contractual clauses and terms are standardized. Under the Regulations of the Bank of Italy of 2 July 1991 (the "Regulations") implementing the SIM Law, options regarded as securities for purposes of such Law are defined as derivative standardized contracts which grant to one of the parties, against payment of consideration named premium, the right to purchase or sell securities or other financial instruments at a certain price by a given date or upon expiration of the contract.

With respect to standardized options and futures, Article 23 of the SIM Law provides that the National Committee for Companies and Stock Exchange is authorized to issue regulations, aimed at creating a specific market, having regard to the structure of foreign futures and options markets, particularly EC markets.

Whereas a futures market has already been established (see below), the options market (which is currently negotiated over the counter) remains in project form under examination by the competent authorities. The realization of the market is expected at the beginning of 1994.

Article 23, paragraph 4 of the SIM Law expressly provides that options and futures which have to be negotiated by SIMs are not wagering contracts and that Article 1933 of the Civil Code (non-enforceability) does not apply.[26]

A. *Income tax*

1. Entrepreneurs

Prior to the issuance of the Regulations, which concern, *inter alia*, the drafting of the balance sheet of SIMs, no official provision governed the accounting and tax regime of options, and the procedure generally adopted was the following:

- the premium received was taxed in the tax period in which the contract was executed;
- the premium paid was deducted in the same tax period.

The Regulations specifically contemplate the entry of options in the balance sheet of SIMs. Some authors argue that the provisions can be extended to any kind of company, and are also valid for purposes of determining taxable income. Other authors are reluctant to accept such an automatic extension of the principles stated in the Regulations.

According to the Regulations, the premium paid becomes a cost upon expiration of the option if the option is not exercised. If the option is exercised, the premium increases or reduces the acquisition costs or proceeds from the sale of the securities or currency concerned. The premium received is included in the proceeds at the time the contract is executed (although, according to some authors, reference should be made to the time when the premium is actually cashed). When the option contract is executed, no transfer of ownership of the assets takes place; it is only upon the expiration date of the contract that the purchase/sale, if any, will affect the income of the parties.

The premium represents a deductible cost for the holder and a taxable proceed for the writer. With regard to the timing aspect, the taxpayer who receives the premium should include it in taxable income in the tax period in which the option was executed because at that date the writer undertakes the irrevocable obligation for which he receives the premium, so that his right to the premium becomes certain at that time. By paying the premium, the holder acquires a mere right to enter into a sale contract which may hypothetically produce income; the execution of such a contract represents a future possible event.

As mentioned above, in determining business income, the costs relating to the proceeds of a particular tax period are deductible in the period they accrue. Therefore the holder should impute the premium to his income at the date of expiration of the contract. As a consequence, if the option is not exercised a loss takes place. In the case of an option in the money, the premium is included in the cost of the asset for tax purposes; if a negotiation profit is realized, the premium will reduce the gross profit of the transaction.

2. Non-entrepreneurs

If a non-entrepreneur receives the premium for an option, different provisions apply depending on the object of the contract. If the option concerns shares and similar securities, income deriving from the sale of the option is regarded as being covered by ITC Article 81, paragraph 1 c bis. This provision includes among taxable capital gains those realized upon the sale of shares, quotas representing the capital or the assets and other similar participations, certificates representing participation in companies, associations and other entities, resident and non-resident, convertible bonds, option rights and any other right, other than interest, connected with the above-mentioned relationships, even if such sales derive from premium transactions, from sales in cash or from forward sales.[27]

26. It is not clear, however, if the above rule can also be extended to the remaining options and futures. Indeed, it may be argued that if the legislator excluded the wagering nature of the contract in this specific case, a contrariis such nature is present in all other cases. See Augusto Fantozzi, "Note minime sul trattamento fiscale di options, caps, floors and collars", *Diritto e Pratica Tributaria*, I (1992), at 540.

27. If more than 15 years elapse between the date of purchase or the date of the underwriting for an amount higher than that deriving from the option right and the date of sale, no account is taken of the capital gains; the last participations acquired are regarded as first sold.

© 1993 International Bureau of Fiscal Documentation

Although Article 81, paragraph 1 c bis does not specifically deal with premiums for options, it is foreseeable that the Ministry of Finance will regard the provision as applicable to premiums for options on shares and similar securities. This conclusion is reached from the broad meaning given by the Ministry to the expression "premium transactions".[28] With regard to premiums for options concerning goods other than shares, most commentators believe that they should be taxed as miscellaneous income under ITC Article 81; in particular, reference is made to Article 81, paragraph 1 (i), dealing with income deriving from occasional commercial activities, and to Article 81, paragraph 1 (l), concerning income deriving from obligations to perform, not to perform and to permit.

3. Non-residents

As mentioned above with respect to interest rate swaps, if the income is received by a non-resident company, it is taxable in Italy if the company has a PE in Italy. If the recipient is an individual, ITC Article 20, paragraph 1(f) applies, under which the non-resident's income is taxable in Italy if it is derived from activities carried out in Italy or related to goods existing in Italy.

B. *Value added tax*

In the absence of specific legal provisions and official clarifications, the VAT regime for options appears rather dubious. The exemption under Article 10 of the VAT Decree may be challenged if the option is not exercised. In such a case, no transfer of ownership – and therefore no transaction – concerning the securities/foreign currency appears to take place. However, since the Ministry of Finance has in the past broadly interpreted the concept of "transactions concerning securities", it is possible to argue that the exemption also applies in the case of options.[29] Similarly, the sale of an option may be regarded as a transaction concerning securities/foreign currency, therefore VAT exempt. However, options concerning merchandise should be subject to VAT.

VII. CAPS, FLOORS AND COLLARS

Under an interest rate cap one party makes periodic payments at predetermined dates to the other party. The amount of the payments is obtained from the application to a notional amount of the positive difference – if any – between a variable rate taken as a parameter and a contractual rate. The first party receives a premium of fixed amount, agreed upon at the time the contract is executed. The party paying the premium wants to limit the risk of an increase in the interest rate of his debt; the other party intends to receive a fixed amount *vis-à-vis* the possibility of having to make payments in the future.

Under an interest rate floor the amount of the periodic payments is obtained from the application to a notional amount of the positive difference, if any, between the contractual rate and the variable rate taken as a parameter. The payor in this case also receives a premium. The party paying the premium intends to limit a risk of a reduction in the yield of his investment.

An interest rate collar is a combination of a cap and a floor. Under a collar, the purchaser of a cap also sells a floor; at the contractual deadlines, he may receive the difference between the parameter rate and the cap rate, or he may pay the difference between the floor rate and the parameter rate; no payment is due if the reference rate is comprised of the cap rate and the floor rate.

A. *Income tax*

1. Entrepreneurs

The remarks made with respect to the general applicability of the Regulations apply here as well.

According to one theory, the recipient should include the premium in the taxable income of the year in which the contract was executed. Other authors do not agree with this interpretation, based on the fact that such contracts are considered supply contracts, according to which the relevant obligations are performed over a certain period of time. Therefore both the payor and the recipient should include in taxable income and, respectively, deduct the premium according to the duration of the contract, i.e. allocating the income/cost over such period.

B. *Value added tax*

The VAT regime of caps, floors and collars is the subject of discussion among experts. According to one theory, the amounts paid under the contracts represent a supply of goods, i.e. a supply of money, not subject to VAT under Article 2, paragraph 3 a) of the VAT Decree. As a result, the relevant premium is not subject to VAT. Others argue that the obligations arising from caps, floors and collars should be regarded as the rendering of services, so the premium would represent consideration, taxable for VAT purposes. According to a minority opinion, caps, floors and collars are insurance contracts, so the relevant obligations are VAT-exempt under Article 10, paragraph 2 of the VAT Decree. In any event, commission fees, if any, payable under the contract are subject to VAT. The premium is generally considered subject to VAT as consideration for a service; the service is represented by supply of cash.

As mentioned above, the pending bill of the VAT Code lists many exempt financial transactions. The list may be regarded as covering the operations contemplated in the contracts under discussion.

VIII. FUTURES

Under a futures contract, the operator undertakes to buy or sell a certain amount of goods, securities or currency at a predetermined date and price. Futures are therefore forward contracts, the effects of which take place at a date subsequent to the date of execution. This definition does not cover stock index financial futures, where one party undertakes to pay or

28. Ruling No. 22/8 of 22 October 1990 and Ruling No. 14/8/650 of 11 April 1991.
29. Ruling No. 323352 of 7 April 1986.

© 1993 International Bureau of Fiscal Documentation

to receive at a predetermined date an amount obtained by multiplying the difference between the value of the stock index at the date of execution and the value of the same stock index at a subsequent date, agreed upon by the parties. The object of the stock index future is therefore the result of arithmetical averages (compound or simple) calculated with reference to a certain basket of securities or to the stock exchange index. As a result, at the date of expiration there is no exchange of securities between the parties, but rather a cash settlement.[30]

The above-mentioned Regulations of the Bank of Italy, implementing the SIM Law, define futures as standardized derivative contracts, according to which the parties undertake to exchange at a predetermined date certain securities or other financial instruments, or to pay or to receive an amount determined on the basis of a reference index. This definition, although given for purposes of the SIM Law, may be regarded as covering financial futures in general.

Due to the absence of a local market, futures traditionally have been negotiated by Italian operators in foreign markets. In particular, Italian state bonds are negotiated in the LIFFE market, and were also present for a certain period on the MATIF market.

With regard to financial futures, Article 23 of the SIM Law granted to CONSOB the power to establish markets for the negotiation of standardized forward contracts concerning:
- financial instruments linked with securities listed on the authorized markets as well as relevant indexes;
- interest rates as well as relevant indexes;
- currencies as well as relevant indexes.

On 11 September 1992, the Italian market of futures on state bonds (MIF) commenced activities. According to the operators, the progress of such market is satisfactory.

A. *Income tax*

1. Entrepreneurs

According to prevailing opinion, futures do not produce effects relevant for income tax purposes until their expiration when the differential received/paid becomes a taxable income/deductible loss.

2. Non-entrepreneurs

Income deriving to non-entrepreneurs from a futures contract concerning bonds (in particular state bonds) is generally regarded as capital gains on bonds, not taxable under ITC Article 81. If the object of the futures contract is represented by shares, quotas of limited liability companies and similar securities, capital gains are taxable under ITC Article 81, paragraph 1 c bis. Under this provision, capital gains realized through standardized contracts negotiated in the authorized markets are not taxable. Therefore income from futures on state bonds negotiated in the MIF is not subject to taxation.

B. *Value added tax*

The majority of commentators tend to regard financial futures as exempt operations under Article 10, paragraph 1, No. 3 and 4 of the VAT Decree, which lists among VAT-exempt operations those concerning foreign currency and shares, bonds and other securities.

30. See Renato Patemollo, "Il regime fiscale dei futures su titoli obbligazionari", 8 *Corriere Tributario* (1992), at 544; see also by the same author, "Il regime fiscale dei futures su indici di borsa", 17 *Corriere Tributario* (1992), at 1229.

TAXATION OF ITALIAN-BASED FLOWS OF INTEREST AND ROYALTIES IN AN INTERNATIONAL CONTEXT

Giuseppe Marino

Guiseppe Marino obtained a law degree from the State University of Milan. He is a former research associate at the IBFD, and currently is an associate at Studio Uckmar in Milan and the coordinator of the Institute of Tax Research for Enterprises (CERTI) of Bocconi University, Milan.

I. INTRODUCTION

The removal of non-tax barriers (capital and exchange controls) to international capital flows, and the globalization of financial and industrial markets has focused attention on the effect of taxation on foreign direct investment. A general concern has arisen about how taxation may influence inward and outward direct investment flows and the ways in which these investments are financed. Concern has also been expressed about the ways in which revenue from international transactions is shared between countries and the new possibilities for tax avoidance.[1] An examination of these issues requires an analysis of the domestic tax regime and how this regime interacts with existing international tax treaties.

Like most OECD countries, Italy is both an importer and an exporter of capital, and therefore its taxation of international capital income flows reflects its dual role as both a source country and residence country. This role has been emphasized since 1987 when Italy began to take steps to liberalize cross border capital movements.[2]

II. DOMESTIC TAX LAW

A. *General*

Resident companies[3] are subject to two taxes on income, i.e. corporate income tax ("IRPEG") and local income tax ("ILOR"). Resident individuals[4] are subject to individual income tax ("IRPEF") and ILOR. IRPEG is currently levied at a flat rate of 36 percent on worldwide business income, that is all net income derived during a tax period by a resident company, subject to unilateral and treaty relief provisions. IRPEF is levied at progressive rates on the worldwide income of resident individuals, also subject to unilateral and treaty relief provisions. ILOR is levied at the rate of 16.2 percent on both residents and non-residents but only in respect of income arising in Italy.

Non-residents are only subject to tax on Italian-source income. Non-resident companies are subject to IRPEG and ILOR on certain items of Italian-source income, and business income derived by an Italian PE. Dividends, interest and royalties derived by a non-resident are subject to withholding tax, but not to IRPEG. Interest and royalties derived through a PE in Italy must be included in the taxable income of the PE, and in such a case no withholding tax is levied on royalties. Withholding tax on interest may generally be credited against IRPEG and ILOR.

Withholding tax operates as an advance payment of income tax for resident corporations and Italian PE's of foreign companies, and as a final tax in the case of individuals and non-resident entities which do not have a PE in Italy. In cases where the withholding tax is a final tax, the income to which it relates is excluded from the tax base of the recipient.

B. *Foreign-source income*

All foreign-source income, including royalties and interest, must be included in the taxable income of a resident taxpayer, although a tax credit is granted for foreign income tax – including any withholding tax – paid against Italian income tax. The foreign tax credit is granted on a per country basis up to an amount equal to that part of the Italian tax attributable to the foreign income. The credit may not exceed the foreign taxes paid, and is only available in the year such foreign taxes are paid. For purposes of ILOR, an exemption is granted for foreign-source income.

1. See *Taxation and International Capital Flows* (Paris: OECD, 1990) and, more recently, the papers of the Seminar, "The Taxation of Profits in a Global Economy", organized by the OECD in Rome, on 18 and 19 June 1992.
2. See *OECD Economic Surveys: Italy* (Paris: OECD, 1990).
3. Under Income Tax Code ("ITC") Art. 87(3) resident companies are companies whose legal seat, registered office or principal business are located in Italy.
4. Under ITC Art. 2, resident individuals are individuals who for the greater part of the tax period are registered in the Civil Registry or who are resident or domiciled in Italy.

© 1993 International Bureau of Fiscal Documentation

Royalties and interest derived through a PE situated abroad must be included in the PE's taxable income, and are subject to Italian income tax. Again the foreign tax credit mechanism is available to avoid double taxation of the income. ILOR is not levied on the income of a PE situated abroad because it is only imposed on Italian-source income.

C. *Italian-source income*

Article 20(1) of Presidential Decree 917 of 22 December 1986 (Income Tax Code ("ITC")) provides that the following items of income are deemed to be derived in Italy:

(a) income from real property;
(b) income from capital paid by the state, by residents of Italy or by Italian PEs of non-residents;
(c) income from employment for services rendered in Italy;
(d) income from self-employment for services rendered in Italy;
(e) income from business activities carried on in Italy through a PE;
(f) miscellaneous income derived from activities carried on or related to assets located in Italy;
(g) income from partnerships.

Additionally, the following types of income are always deemed to be derived in Italy if paid by the state, by residents of Italy or by PEs of non-residents:

(a) pensions and similar types of income, including termination indemnities related to income mentioned under c, d and e above;
(b) income treated the same as employment income;
(c) compensation for the use of intellectual property, patents and trademarks as well as processes, formulae and information relating to experience acquired in industrial, commercial or scientific fields (know-how);
(d) compensation earned by enterprises, companies or non-resident entities for artistic or professional services performed on their behalf in Italy.

III. ROYALTIES

A. *Definition*

Although royalties are mentioned in several provisions of the ITC, Italian tax law does not provide a specific definition of royalties.[5] Generally speaking, however, royalty income includes income derived from the use by third parties of intellectual property, patents, trademarks, inventions and know-how.

If derived by the author or inventor, ITC Article 49(2)(b) deems royalty income to be professional income if it is not produced in the carrying on of a commercial enterprise. It should be noted that income derived from the use of trademarks is not mentioned in this provision; such income is better classified as business income since the user is the author or inventor.[6] Royalty income derived by an individual who is not the author or inventor is deemed other income.

For purposes of business income ITC Article 68(1) provides that depreciation of "rights to use intellectual property, patents, and trademarks as well as processes, formulae, and information relating to experience acquired in industrial, commercial or scientific fields (know-how)" is limited to an annual amount not higher than one-third of the total cost of the intangible.

ITC Article 20(2)(c) contains an absolute presumption of connection between Italy and the income (hence taxation in Italy on the basis of the source principle) when paid by the state, by residents of Italy or by PEs of non-residents. Article 20(2)(c) is the culmination of a long debate which began under the 1958 ITC when Italy had a pure territorial tax system,[7] and continued under the income tax legislation until 1981. The main issue was whether royalties paid by an Italian company to a non-resident company were exempt from IRPEG and ILOR.[8]

On one hand, non-residents were only subject to IRPEG (or IRPEF depending on the status of the recipient) and ILOR on business income if the income was derived through a PE in Italy. On the other hand, income from independent activities derived from Italian sources was subject to both IRPEG (or IRPEF) and ILOR even in the absence of a fixed base in Italy. Royalty income was deemed to be income from independent activities unless derived by a business enterprise in the course of its business activities.[9] This view was supported by Article 19 of Presidential Decree No. 597 which provided that a royalty is deemed to be income produced in Italy when the payor is a resident of Italy, and by Article 25 of Presidential Decree 600/73[10] which provided that income from independent activities was subject to withholding tax in the case of self-employment and in the case of business establishments.[11]

However, the controversy involved royalties paid from 1 January 1974 to 31 December 1981. For royalties paid after 1981, Presidential Decree No. 897 of 30 December 1980

5. Ministerial Circular No. 42 of 12 December 1981, however, provides that royalties include compensation for "any copyright whether literary or artistic or scientific regardless of the media which is used for the diffusion of these work (books, various publications, records, films, tapes etc.)".
6. See M. Leo, F. Monacchi, M. Schiavo, "Le imposte sui redditi nel nuovo testo unico", (Milano, 1990), at 494.
7. Under the ITC of 1958 the Supreme Court held the payment of royalties by residents was the main criterion for application of the taxation at source principle. See Supreme Court of 24 July 1965 No. 1750 in *Dir. prat. trib.* (1965), II, at 462.
8. This controversy was at issue in a well known case which was finally resolved in 1983 in favour of the non-taxability (because of lack of territoriality) of royalties paid to a non-resident company without a PE in Italy. See decision of the Central Tax Commission of 9 March 1979, No. 3508 in 19 *European Taxation* (August 1979), at 271; decision of the Supreme Court of 17 June 1981, No. 3931 in 21 *European Taxation* (1981), at 227.
Decision of the Supreme Court of 7 July 1983, No. 7184 in 23 *European Taxation* (September 1983), at 300. The Tax Administration itself followed this judicial interpretation in Ministerial Circular No. 9/748 of 16 October 1984 in *Dir. prat. trib.* (1985), I, at 127.
9. See the 1979 decision of the Central Tax Commission, *supra* note 8. The rationale underlying this rule was that royalties were included in revenue derived from independent activities in the provisions dealing with individuals, and under Art. 9(5) of Presidential Decree No. 597 of 29 September 1973 income earned in Italy by non-resident companies was taxable there only when the company maintains a PE in Italy.
10. As defined in Art 49(2)(b) of Presidential Decree 597.
11. See, A. Fantozzi, "Tax Treatment of the Importation and Exportation of Technology, Know-how, Patents, Other Intangibles and Technical Assistance", *Cahiers de droit fiscal international*, Vol. LXa (Rotterdam 1975), at 229, 230.

© 1993 International Bureau of Fiscal Documentation

(effective in 1982) provides that royalties received from an Italian source are subject to a final withholding tax. The amendment was made on the basis that, even in the absence of a PE of the non-resident, the continuous use of intangible assets may create an economic connection to Italy to justify taxation.[12]

B. *Deduction*

The general rule in Italy is that all ordinary business expenses, including royalty payments, are deductible in computing taxable profits. The deduction of royalty payments to associated companies may, however, be deducted subject to certain limitations (see below "Transfer Pricing").

C. *Taxation of royalties under domestic law*

Royalties received by an Italian resident from abroad are subject to IRPEG (or IRPEF). Royalties paid by a resident company to another resident company (or resident individual) or to an Italian PE of a non-resident company are not subject to withholding tax. However, Presidential Decree 600 of 29 September 1973, as amended[13] provides that royalty payments to any non-resident are subject to withholding tax at the rate of 30 percent on 70 percent of gross royalties (resulting in an effective rate of 21 percent), unless reduced by a treaty. The 30 percent abatement of the taxable base relates to assumed lump sum expenses connected with production of the income.

In addition, royalties paid by an entrepreneur resident in Italy to a non-resident company are subject to value added tax at the rate of 19 percent.[14]

D. *Taxation of royalties under Italian treaties*

There is no doubt that the high Italian tax burden applying to royalties paid to non-residents jeopardizes the importation of technology more than it discourages the outflow of taxable income, in terms of royalties, toward entities located in low-tax jurisdictions, as was the intention of the tax legislator in 1980.[15] The protectionist tendency of the Italian tax legislator unfortunately becomes evident at the international level since recent Italian treaty policy is to recognize that the source state may tax royalties, in contrast to the OECD recommendation that royalties arising in a contracting state and paid to a resident of the other contracting state should be taxable only in that other state if such resident is the beneficial owner of the royalties.

The only treaties which provide for a zero rate of withholding tax on the payment of royalties are those concluded with Cyprus, Czechoslovakia,[16] France,[17] Germany,[18] Greece, Hungary, Ireland, Israel, Malta,[19] Netherlands (old treaty still in force) and the former USSR.

Furthermore, among the reservations on Article 12(1) of the OECD model, as revised in September 1992, Italy explicitly reserves the right to tax royalties at source, and is only prepared to grant favourable treatment to certain royalties (i.e. copyright royalties); it also reserves the right to subject the use of, or the right to use, software to a tax regime different from that provided for copyright.[20] However, neither observations nor reservations have been made as regards the definition of "royalties" under Article 12(2) of the OECD model, which is extensively used in treaties concluded by Italy; the term royalties means "payments of any kind received as a consideration for the use of, or the right to use, any copyright or literary, artistic or scientific work including cinematograph films, any patent, trade mark, design or model, plan, secret formula or process, or for information concerning industrial, commercial or scientific experience". In conclusion, it appears that the treaty definition is reasonably compatible with the thrust of Article 20(2) so that no interpretative problems may be expected on the matter.

IV. INTEREST

A. *Definition*

ITC Article 20(1)(b) refers to "income from capital paid by the state, by residents of Italy and by PEs of non-residents". "Income from capital" is defined in ITC Article 41, and includes:

- interest and all other income deriving from loans, deposits and current accounts, including the difference between the sum at expiration and the amount loaned or deposited;
- interest and other income deriving from bonds and similar securities, and from other securities which are not shares, including the difference between the sum or the fair market value of assets received at expiration and the issuing price;
- other income of definite measure derived from the use of capital, excluding interest (other than that indicated above).[21]

12. See A. Noteboom and J.H.Th. Schipper, "Tax Treatment of the Royalties and/or Lump Sums Paid by Enterprises, in Developing Countries for Technical Assistance and Licences under Patents" in *Studies on Taxation and Economic Development* Vol. II (Amsterdam: IBFD, 1973), at 45; S. Mayr, "Una nuova disciplina per i soggetti non residenti: royalties ed altri compensi", *Boll. trib.* (1982), at 112.
13. As amended by Presidential Decree 897 of 30 December 1980.
14. Interest, however, is not subject to value added tax.
15. See Mayr *supra* note 12, at 115.
16. 5% only applies on the gross amount of royalties arising from patents, trademarks, designs or models, plans, secret formulas or processes, or for the use of, or the right to use, industrial, commercial or scientific experience.
17. The rate applies on the gross amount of royalties arising from the use of or the right to use any copyright of a literary, artistic or scientific work.
18. The rate applies on the gross amount of royalties arising from the use of or the right to use any copyright of a literary,
artistic or scientific work, as well as on the gross amount of royalties in respect of payments of any kind received as consideration for the use of, or the right to use, motion pictures and films, tapes or other means of reproduction used for radio or television broadcasting.
19. The rate applies on the gross amount of royalties arising from the use of or the right to use any copyright of a literary, artistic or scientific work, including cinematographic films or tapes for television.
20. This reservation was added on 23 July 1992.
21. The tax legislator would exclude from the taxable base not only" compensative" interest but also "moratory" interest, interest for late payment, and other "correlative" interest other than that deriving from loans, deposits and current accounts, bonds, and similar securities which are not shares. See Leo *supra* note 6, at 385.

© 1993 International Bureau of Fiscal Documentation

According to civil law literature,[22] interest must have the following characteristics:

- the interest obligation to pay must be connected to the main obligation;
- there must be general similarity between the object of the main obligation and the additional obligation, since interest must be "an amount of fungible things";
- it must be periodic, making reference to the "acquisition date" rather than the expiration date of the obligation to pay interest, which could also be determined differently, according to the willingness of parties;
- the amount of interest due must be determined by multiplying the duration by a rate which is proportional to the main obligation (so-called "interest rate").[23]

The first characteristic distinguishes interest from other types of payments such as annuities or annual performances due in perpetuity, which are not associated with an obligation to return capital (or principal). The general equality characteristic distinguishes interest from royalties because royalties represent non-fungible compensation for the use of a specific intangible. The latter two characteristics distinguish interest from dividend distributions. Dividends could be associated with the main obligation of the contribution to the company's capital, but dividends are never determined in advance since they depend on the current economic and financial condition of the company.

B. *Deduction*

As is the case with royalties, interest payable is deductible (regardless of whether it is paid to residents or non-residents) if it is related to business income and, since interest paid by companies is generally deemed connected with their business, interest paid by companies is generally deductible.

Resident companies reporting business income which includes exempt income or income which is subject to final taxation at source cannot deduct the total amount of interest payable because that interest is deemed proportionately connected with all categories of the taxpayer's income. However, under ITC Article 63, interest is deductible in an amount corresponding to the ratio between the amount of gross receipts and other income included in business income and the total amount of all income and receipts, including non-taxable and exempt income.[24] Finally, if a taxpayer derives interest income from tax-exempt state bonds acquired after 28 November 1984, only the interest paid which exceeds the amount of the tax-exempt interest can be deducted.

C. *Taxation of interest under domestic law*

As mentioned above Italy taxes the worldwide income of its residents; non-residents are only subject to tax on Italian-source income.[25] Thus interest income received by Italian residents is subject to IRPEG (or IRPEF depending on the status of the recipient), although as noted above a foreign tax credit is allowed in the year in which the foreign tax was paid.

Article 26 of Presidential Decree 600 of 29 September 1973 sets forth the various withholding tax rates applicable to interest income. The applicable rates are as follows:[26]

- 12.5 percent for interest on state bonds or bonds issued by quoted companies;
- 15 percent for interest on loans; and
- 30 percent for interest on bank deposits and bonds issued by non-quoted companies.

The withholding operates as an advance payment of income tax for resident corporations and Italian PE's of foreign companies, and as a final tax in the case of individuals and non-resident entities which do not have a PE in Italy.

D. *Taxation of interest under Italian treaties*

Generally speaking, tax treaties concluded by Italy have standard clauses similar to Article 11 of the OECD model tax treaty, i.e. interest arising in a contracting state and paid to a resident of the other contracting state may be taxed in that other state. However, such interest may also be taxed in the state of source provided the withholding tax charged does not exceed a flat percentage (the OECD recommends 10 percent).

Treaty regimes for interest are generally more favourable than the domestic regime, i.e. a few treaties provide for a zero withholding tax[27] while most provide for a flat withholding tax ranging between 10 and 15 percent.

It should be noted that Italy made a reservation to Article 11(4) of the OECD model treaty[28] as to the right to subject interest to the taxes imposed by its law whenever the recipient has a PE in Italy, even if the indebtedness in respect of which the interest is paid is not effectively connected with the PE.

V. INTERNATIONAL TAX AVOIDANCE MEASURES

Article 11 of Law 413 of 30 December 1991 amended ITC Article 76 by providing an anti-tax haven measure which dis-

25. ITL Art. 20(1)(b).
26. If the interest is foreign source, a resident individual taxpayer may either pay a 30% final tax on the income and forfeit the right to a foreign tax credit, or alternatively include the interest in his taxable income so that it is taxed at the normal (progressive) rates, and then utilize the foreign tax credit.
27. Treaties concluded with Cyprus, Hungary and the former USSR.
28. "The provisions of paragraphs 1 and 2 shall not apply if the beneficial owner of the interest, being a resident of a Contracting State, carries on business in the other Contracting State in which the interest arises, through a permanent establishment situated therein, or performs in that other State independent personal services from a fixed base situated therein, and the debt-claim in respect of which the interest is paid is effectively connected with such permanent establishment or fixed base. In such case the provisions of Article 7 or Article 14, as the case may be, shall apply."

© 1993 International Bureau of Fiscal Documentation

allows the deductibility of certain expenses.[29] In particular, Article 76(7-bis) disallows the deduction of costs and expenses arising from transactions between resident enterprises and companies domiciled in non-EC states or territories which have a preferred tax regime,[30] if the latter companies directly or indirectly control or are controlled by the enterprise, or are controlled by the same company which controls the enterprise. The deduction may be allowed, however, if the taxpayer can prove that the foreign companies principally carry on a true commercial activity, or that the transactions are carried out for actual economic purposes and were in fact performed.

Outgoing royalties and interest must be included in costs and expenses. However, some doubt about the new legislation may arise regarding interest; explicit reference is made to expenses and other negative items of income "arising from transactions" with companies located in low-tax countries: the aim of the provision appears to be to attack transactions which are clearly described, distinctly individuated and "financially" defined.

If this presents no problem in the case of royalties since they refer to the use of intellectual property, patents and trademarks as well as processes, formulae and information relating to experience acquired in industrial, commercial or scientific fields, the case for interest is slightly different. As stated by a famous Italian economic scholar[31] and confirmed by Italian tax legislation, interest is generally deemed to be connected with a business activity, since a loan, for example, is deemed to serve the business enterprise as a whole. Thus it would not be possible to disallow interest deductions unless the general principle is amended to permit a loan (and the interest accruing) to be associated with the specific activity financed (and the positive items of income which it generates.

VI. TRANSFER PRICING RULES

ITC Article 76(5) contains the rules regulating transactions between affiliated parties – such transactions must conform to the arm's length principle. Transactions between a resident enterprise and non-resident companies which directly or indirectly control the enterprise, which are directly or indirectly controlled by such enterprise, or which are controlled by the same company which controls the enterprise, are valued on the "normal value" of the goods transferred or services rendered or received if there is an increase in the taxable income. The same rules apply in the case of a decrease in taxable income but only if a mutual agreement procedure under a tax treaty is used. The "normal value" essentially means arm's length consideration for the goods or services.

The Minister of Finance in a Circular Letter of 1980[32] prescribed the methods of valuation for various transactions involving intangible property. For interest on loans, the Circular states that in determining the arm's length rate of interest reference must be made to the interest rate prevailing in the lender's country of residence.[33] In the case of royalties, it is agreed that the three basic methods (comparable price method, resale price method and the cost-plus method) will rarely apply to transactions involving intangibles, because the uniqueness of most intangibles makes it difficult to find comparable transactions (or comparable profit mark-ups). The Guidelines in the Circular Letter set parameters which determine the normal value for such transactions, i.e. if the royalties do not exceed 2 percent of sales proceeds they will generally be accepted; more evidence will be necessary to justify royalties ranging from 2 to 5 percent; and royalties higher than 5 percent will only be accepted in exceptional cases (e.g. the highly technological nature of the relevant sector).[34]

VII. CONCLUSION

Much work remains to be done to successfully achieve full integration in the international financial and industrial markets. It is better to hope for external pressure to modify domestic tax legislation than to wait for a domestic initiative.

The proposed EC Directive on interest and royalty payments between parent companies and subsidiaries located in different EC member states may offer a solution in this respect; to ensure equality of tax treatment between national and transnational transactions it is proposed to exempt from withholding tax interest and royalty payments made between parent companies and subsidiaries located in different EC member states.

30. A preferred tax regime is defined in ITC Art. 76 as one which exempts the income of the aforementioned companies from income taxes or charges it to a tax lower than half of the total tax charged on income of the same nature of a resident company.
In a Ministerial Decree of 24 April 1992, the Italian Ministry of Finance issued a "black list" of tax haven countries to which the anti-tax haven provision applies. The list is divided into three sections: countries or territories deemed to be tax havens without limitations; countries which are generally deemed to be tax havens with the exception of certain activities which are subject to taxation at a medium rate and therefore are not affected by the anti-tax haven provision; and countries which are generally deemed not to be tax havens but which, due to certain specific offshore legislation or other tax incentives, are deemed to be tax havens only with respect to specified low-taxed activities.

NEW

Tax HANDBOOK 1•9•9•3

Fast access to European Tax Law in a single volume, neat enough to fit into a briefcase.

The taxation systems in thirty West, Central and East European countries are covered in full including rates.

A common chapter outline facilitates quick reference and easy comparisons

CORPORATE TAXATION
National corporate income tax
Other income taxes
Net worth tax
Social security contributions
Value added tax
Withholding taxes (plus treaty charts listing withholding tax rates)
Non-resident corporations

INDIVIDUAL TAXATION
National income tax
Wages tax
Other income taxes
Social security contributions
Inheritance and gift taxes
Non-residents

All aspects of income taxes applying to corporations and individuals are covered. Particular attention is given to non-residents and relief from international taxation.

A special chapter on the EC is also included.

Price: 295 Dutch Florins *(1992 edition still available @ 285 Dutch Florins)*
Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

TAX INCENTIVES IN ITALY

Andrea Manzitti

Andrea Manzitti obtained a JD from the University of Genoa in 1985; a master's degree in business tax law from Bocconi University in 1986 and a diploma in international contracts from King's College, London in 1987.

Mr Manzitti is the co-author of the Business Law Guide to Italy, and a lecturer in international corporate tax policy at the post-graduate master course in International Management, Business School, Bocconi University.

He is a member of the IFA and the International Bar Association.

I. INTRODUCTION

There are few areas in Italian tax law which manifest such a lack of legislative coordination as tax incentives. The main reason is that for decades the issue of tax incentives has been largely ignored, and no systematic studies are available. However, this area has become increasingly popular in Italy during the last few years – in fact, all programmes of the recent governments have included a comprehensive reform and coordination of the sector. Although Italian tax legislation in fact contains hundreds of tax incentive measures, until recently the sector attracted very little attention, as is evident by the lack of precise estimations of the cost of incentives to the national budget and of any projection or quantification of the actual effects of tax incentives in orienting decisions of investors.

Thus far, however, the only result of the focus on tax incentives is Article 17 of Law No. 408 of 29 December 1990 which authorized the government to enact Legislative Decrees to reform existing rules on exemptions, tax incentives or substitute tax treatments having a tax incentive character.[1] The reform process, which started at the end of 1990, is not yet complete, and probably will not be completed in the near future.

This article summarizes the history of Italian tax incentives, describes the main incentives and offers some thoughts on possible future developments.

V. Conclusion

II. CONCEPT OF TAX INCENTIVES

There is no clear definition of "tax incentive" in Italy, and the terminology used by the legislator in formulating tax laws is ambiguous and indecisive. Scholars have attempted to formulate a definition, primarily by examining the differences between tax exclusions and tax exemptions (the latter comprising the most important form of tax incentive).

Traditional literature[2] made a distinction between tax incentives, tax exclusions and tax exemptions based on their respective structures. In particular, tax exclusions are justified by economic or technical factors based on tax considerations, while tax exemptions are based on non-fiscal political and social factors. However, an alternative theory adhered to the position that fiscal considerations were always the basis of tax exclusions – tax incentives may come in a variety of forms such as exclusions, exemptions, deductions, deferral, tax credits, etc. so the form is not determinative. Under this theory a functional analysis must be made of the rationale underlying the incentives, i.e. tax exclusions[3] are the result of the tax authorities limiting their jurisdiction, while tax exemptions are based on a balancing of the interests of the taxpayers and the tax authorities, which concludes in favour of the taxpayer in certain circumstances. In this sense, tax exemptions are deemed equivalent to tax subsidies, in that as they could be replaced by a cash subsidy from the tax authorities to the taxpayer.[4] In fact, when identifying tax incentives reference is frequently made to "tax expenditures" – special tax preferences constitute implicit payments by the tax authorities effected by way of a reduction in a specific tax liability.

The most recent doctrine[5] expounds a theory according to which tax incentives are tax regimes which derogate from ordinary regimes, serve promotional purposes and are more favourable in certain circumstances. To identify a tax incentive it is necessary to find an "ordinary" regime, characterized by the structural provisions necessary for application of the tax (determination of the entities subject to tax, the rate schedule, tax period, etc.). Once this is established, it is necessary to determine whether a promotional derogation leading to more favourable treatment is provided. Again for classification purposes it is useful to refer to the justification for the

1. The decrees were originally to be enacted by 31 December 1991. The date was extended to 31 December 1992 by Art. 9, para. 1, Law No. 413 of 30 December 1991, yet no reform was enacted. Therefore, a new Delegation Law will have to be approved if the reform is to be effected.
2. A. Fedele, *Profilo dell' imposta sugli incrementi di valore delle aree fabbricabili* (Milan, 1968).
3. For example, certain personal exemptions, the degree of progression in the income tax rate structure, the relationship between corporate income tax and income tax for shareholders, etc.
4. This theory comports with the North American theory that tax incentives are equivalent to subsidies – this is why the concept "tax expenditures" has been developed. See, in this respect S.S. Surrey, *Pathways to Tax Reform* (Cambridge, 1973). German literature reaches the same conclusion, considering tax incentives for hidden subsidies and thus relating more to economics than fiscal law; see K. Tipke, J. Lang, *Steuerrecht, Ein systematischer*, 13th ed. (Vienna: Grundriss, 1991).
5. F. Fichera, *Le agevolazioni fiscali* (Padoa, 1992).

© 1993 International Bureau of Fiscal Documentation

incentive, i.e. if the incentive is justified on the grounds that it encourages particular activities or provides special relief or assistance (thereby achieving a particular economic or social goal), then that special treatment should be classified as a tax incentive.[6]

III. LEGISLATIVE EVOLUTION OF TAX INCENTIVES IN ITALY

The first attempt to rationalize tax incentives was undertaken in the tax reform initiated in 1971. In particular, Law No. 825 of 9 October 1971 contained a general delegation to the government for a comprehensive tax reform. The tax reform, enacted through several Legislative Decrees approved in 1972 and 1973, replaced most (if not all) taxes previously in effect with a reduced number of direct and indirect taxes.

One of the objectives of the tax reform was to drastically limit exemptions and incentives.[7] The Parliamentary Commission set up to study the tax reform was aware of the problems created by exemptions and incentives, and the Commission sharply criticized the existing regime, which was characterized by numerous and uncoordinated legislative provisions. The Commission urged a drastic cut in both the number and importance of tax incentives, and more importantly, a suggestion was made that tax preferences which could still be justified should be substituted to the extent possible by subsidies, tax bonuses or credits. Moreover, tax incentive policy should be coordinated within a comprehensive state policy of tax and non-tax incentives.[8]

However, the legislative evolution of tax incentives after the tax reform was far from satisfactory. In compliance with the Delegation Law, on 29 September 1973, the Government enacted Decree No. 601, "Rules on tax incentives" (the "Tax Incentive Decree"). The Ministry of Finance's Report on the Tax Incentive Decree recognized that the objectives of the Delegation Law were not completely achieved. The Report stated that the Ministry of the Treasury concluded that the substitution of existing tax incentives with subsidies proved to be extremely difficult, and therefore recourse should be made to the traditional method of tax exemptions. Furthermore, the planned reorganization of the entire state incentives policy remained a paper project. Therefore at the outset, the Tax Incentive Decree was deemed to be only a complex of rules to cover the lack of legislative provisions resulting from the repeal of pre-existing tax incentives.

In the final analysis, the sole achievement of the tax reform in this respect was the approval of the Tax Incentives Decree which does not even include all incentives (i.e. some incentives are contained in the laws governing single taxes).

In very general terms, the Tax Incentive Decree is divided into six chapters:

- Chapter 1 (Articles 1-7) concerning tax incentives for specific persons (incentives relating to the buildings of the Vatican, compensation to employees of the Catholic Church, foreign consulates and embassies, etc.);
- Chapter 2 (Articles 8-9) concerning incentives for the agricultural sector;
- Chapter 3 (Articles 10-14) concerning incentives for cooperatives;
- Chapter 4 (Articles 15-22) concerning incentives for the credit sector;
- Chapter 5 (Articles 23-30) concerning incentives with a territorial scope of application (mainly those applicable to the Mezzogiorno area);
- Chapter 6 (Articles 31-34bis), concerning miscellaneous incentives.

However, immediately after enactment of the Tax Incentive Decree, many tax provisions introducing tax preferential treatment were passed, so that by the end of the 1980s, the picture was extremely chaotic.

In 1988, Law No. 362 of 23 August 1988 provided that the Ministry of Finance must indicate in the Preliminary Note on Expected Revenue the financial effects and consequences of all tax incentives introduced during a particular year, together with an indication of the beneficiaries and the goals of the incentive.

In 1989, a special working group was set up within the newly-created Committee for Fiscal and Budget Policy. The working group established criteria for identifying tax incentives, and prepared a questionnaire to be sent to various parties in which all elements of tax incentives were to be separately indicated in order to faciliate a classification of incentives by dividing them in accordance with their goal, economic sector, category of beneficiary, geographic area of application, form and estimate of tax expenditure.

This led to a second attempt to organize the sector, which commenced with Law No. 408 referred to in the introduction. Article 17 of this law authorized the Government to enact one or more Legislative Decrees concerning the revision and modification of existing rules on exemptions, tax incentives or substitute tax treatment having a tax incentive character. Article 17[9] lists the principles the Government must follow in implementing the Legislative Decrees:

(1) exemptions, tax incentives or substitute tax treatment having a tax incentive character must be replaced with expenditure in order to permit, within the amount budgeted, the granting of tax credits or bonuses, the amount of which will be determined on the economic circumstances of the beneficiaries of the incentive;

(2) existing exemptions, tax incentives or substitute tax treatment having a tax incentive character, even if coherent within the structure of the relevant tax, may be maintained, in whole or in part, if they can still be justified (in compliance with constitutional provisions or specific economic, social or cultural goals which are compatible with EC directives); the need for the incentive, in relation to the dimension of the activity and the geographical area

6. See S.S. Surrey, E.M. Sunley, "Tax Incentives as an Instrument for Achievement of Governmental Goals", *Cahiers de droit fiscal international* (Deventer: Kluwer, 1978), at 18.

7. This is clearly stated in several Parliamentary Reports on Law No. 825/71.

8. By non-tax incentives the Commission meant all state incentives which do not have a direct impact on the tax position of the beneficiaries, e.g. grants, contributions, low-interest financing, etc.

9. Modified by Art. 9, para. 1, of Law No. 413 of 30 December 1991.

© 1993 International Bureau of Fiscal Documentation

where it will apply (with particular reference to the Mezzogiorno) must be taken into account;

(3) exemptions, tax incentives or substitute tax treatment having tax incentive character referred to under (1) and (2) are to be applied for only a limited period of time, except those which are created to comply with specific constitutional provisions;

(4) the amount budgeted to reorganize the sector cannot exceed 50 percent of existing tax expenditure, as computed on the basis of estimation made on 31 December 1990.

In May 1991, the Ministry of Finance prepared a list of existing tax incentives in respect of individual income tax, corporate income tax, local income tax and value added tax (the "Incentives List") on the basis of tax legislation enacted up to 31 December 1990, together with an estimate of their cost. The Incentives List contains 370 tax incentives, 190 of which indicate their effect in terms of actual cost.[10]

The agricultural sector enjoys 38 different incentives;[11] the industrial sector enjoys 19 incentives;[12] the service sector, 19 incentives; finance and banking sector, 16 incentives[13]; and the construction industry enjoys five different incentives.[14]

In general, the Incentives List contains all tax rules which deviate from a general tax treatment, without any distinction between the various forms that a tax incentive may take (exclusion, exemption, substitute tax, separate tax, deduction, rate reduction, tax credit, etc.). The List merely indicates, for each incentive, the "general" rules and the rule which derogates from the general rules. This led authors[15] to conclude that the legislator made an implicit determination that a "tax incentive" encompassed all tax treatment which derogates from a rule which is considered to be "general".

Several tax incentives included in the List raise doubts. For instance, the dividend tax credit granted to resident shareholders[16] of resident corporations, which is unanimously considered as a means to eliminate economic double taxation, is considered a tax incentive.[17] Similarly, the 60 percent corporation tax exemption for dividends received by Italian resident corporations from certain non-resident related corporations[18] has been included in the tax incentives list.[19] Clearly, this rule was introduced to (partially) eliminate the international double taxation of dividends.

In June 1991 the Council of Ministers approved a draft Legislative Decree for the revision of tax incentives (the "Draft Decree"). The Draft Decree is divided into five articles and contains four Appendices:

- Article 1 provides that tax incentives in Appendix A1 may be maintained in an amount established annually by the budget law; paragraph 2 provides that the tax incentives listed in Appendix 2A may continue to apply without limitation;[20]
- Article 2 provides that tax incentives in Appendix B must be substituted by tax credits.[21] Such credits are not to be included in the determination of taxable income, and the total amount of the credit may not exceed 50 percent of the increase in revenue deriving from the repeal of such incentives;
- Article 3 provides that tax incentives in Appendix C, i.e. those whose objective is no longer valid, are to be abolished;[22]
- Article 4, paragraph 2 provides that tax incentives in Appendix D may be maintained without the limitations set forth in Article 5 (see below);[23]
- Article 5 establishes a ceiling for direct tax purposes for all tax incentives. In particular the reduction of income taxes, due to the cumulative application of tax incentives other than those mentioned in Appendices B and D may not in any case be higher than a given percentage (to be established annually) of the tax that would have been paid if the incentives were not applicable.[24]

Although it approved the Draft Decree, the Parliamentary Commission expressed several reservations, noting that some provisions of the Draft Decree were not in full compliance with Article 17. In particular, the Commission pointed out conflicting text: although the Delegation Law authorized the Government to revise and modify the existing rules on tax incentives, but only insofar as they derogate from the normal regime, the Draft Decree does not make any distinction and it includes "tax preferences" which are inherent in the structure of the relevant tax. In consideration of the Commission's reservations the Government withdrew the Draft Decree and proposed that Parliament postpone the term for enactment of new legislation.[25]

IV. MAJOR TAX INCENTIVES

Below are some of the major tax incentives which are currently available under Italian tax law.

A. *Mezzogiorno*

Probably the most well known tax incentives are those relating to the Mezzogiorno,[26] which are contained in Presidential

10. This amounts to some 80,800 billion lire.
11. 19 of these incentives generate a tax expenditure of some 3,600 billion lire.
12. 14 of which generate a tax expenditure of 705 billion lire.
13. Four of which generate a tax expenditure of 1,450 billion lire.
14. Generating 1,200 billion lire in tax expenditure.
15. See *supra* note 5, at 277.
16. As well as to Italian permanent establishments of non-resident persons.
17. See Art. 14 of Presidential Decree No. 917 of 1986.
18. Dividends from qualifying non-resident, non-EC, tax-haven corporations are excluded from the 60% exemption.
19. Art. 96 of Presidential Decree No. 917 of 1986.
20. Appendix A1 includes most of the tax incentives granted to the cooperative sector and the film industry. Appendix A2 includes indirect tax breaks for the purchase of a residence.
21. The incentives included in Appendix B are for the most part those provided for the Mezzogiorno and other depressed areas.
22. Appendix C includes incentives for taxpayers in areas which have been hit by earthquakes and several incentives for the energy sector.
23. The incentives in Appendix D are generally those introduced for social purposes.
24. It should be noted that the Governmental Explanatory Report accompanying the Draft Decree clearly indicates that the ceiling mechanism was proposed in order to implement a scheme similar to the US minimum tax.
25. In consideration of the remarks of the Parliamentary Commission the Parliament decided to grant the Government an extension of the term for approval of the reform of the tax incentives sector. See *supra* note 1.
26. The State aid system to the Mezzogiorno area has recently been subject to significant changes. In particular, the aid to the Mezzogiorno has been embodied

© 1993 International Bureau of Fiscal Documentation

Decree No. 218 of 6 March 1978 and Law No. 64 of 1 March 1986. The Mezzogiorno area (Southern Italy) comprises the regions of Abruzzo, Molise, Campania, Puglia, Basilicata, Calabria, Sicilia, Sardegna, the provinces of Latina and Frosinone, as well as certain areas in the provinces of Rieti and Rome. Tax incentives, which take the form of tax concessions, and non-tax incentives, such as grants and low interest loans, are available to both domestic and foreign investors.

1. Tax concessions

A ten-year total exemption from corporate income tax ("IRPEG") is available for companies established in the Mezzogiorno area after 29 March 1986 and engaged in new productive activities.[27] The exemption is applicable from the date of formation of the company.

A ten-year exemption from local income tax ("ILOR")[28] is granted for new or expanding industrial plants located in the Mezzogiorno area. The exemption starts from the first year activities become profitable, and extends to profits generated by the trade of products manufactured in qualifying plants.

A total exemption from ILOR is granted for profits generated by resident companies which are reinvested for the construction, expansion or reconstruction of industrial plants in the Mezzogiorno area.[29] A total exemption is also available for profits generated by resident companies which are directly reinvested in the transformation of agricultural land.
These exemptions are available until 31 December 1993.

2. Low interest loans

In addition to the above concessions, long-term loans are available to qualifying industrial companies at favourable interest rates (from 4.5 to 7.5 percent). These loans are granted by special credit institutions, and the interest and principal generally become payable from the third year of the loan. The amount of the loan may be as high as 70 percent of the total cost incurred in constructing industrial buildings and purchasing machinery.

3. Cash subsidies

Cash subsidies may be granted for the construction, expansion and modernization of industrial plants. The amount of the subsidy is equal to 40 percent of the first 7 billion lire, 30 percent of the next 23 billion lire and 15 percent of amounts exceeding 30 billion lire. The grant is increased by one-fifth for specific priority investments, and for investments in thinly populated areas.

4. Other incentives

In addition, the same Presidential Decree and Law also provide for substantial reductions in social security contributions for the employer and the employee, as well as reductions in consumption charges for electrical power used by industrial facilities.

Finally, all enterprises may deduct from business income donations made to legally recognized entities headquartered in the Mezzogiorno which are engaged solely in scientific research. The total deduction may not exceed 2 percent of reported taxable income.

B. *Other territories*

Law No. 19 of 8 January 1991 contains several measures to attract investment to the Friuli-Venezia Giulia region. Article 3 provides for the creation of a financial centre in the existing free-trade zone of Trieste. Financial companies and institutions (such as branches and subsidiaries of banks, insurance companies, fiduciary companies, financial companies borrowing and lending in foreign markets, etc.) may operate in the financial centre, and will be deemed non-resident for purposes of exchange control regulations and banking laws. Income produced by such enterprises in the financial centre is exempt from IRPEG, and ILOR is levied at a reduced rate of 8.1 percent. Moreover, the enterprises are not subject to tax withholding obligations.

---

in a legislative framework of economic aid which relates to the entire national territory. The areas to which the State aid applies will be divided in accordance with EC directives into three categories, i.e. depressed areas, areas facing an industrial decline and disadvantaged rural area.
These changes do not relate to tax incentives (in the sense that the tax reductions referred to are still in existence). Broadly, the new legislative provisions (Decree No. 415 of 22 October 1992, converted into Law No. 488 of 19 December 1992 and Legislative Decree No. 96 of 3 April 1993) provide for the following:

- The Agency for the Promotion of Development in the Mezzogiorno (Agmez) and the Department for the Extraordinary Intervention in the Mezzogiorno have been abolished as from 15 April 1993; the powers and duties of such entities have been transferred from the Ministry of the Mezzogiorno to the Ministry of Budget;
- the Minister of Budget has been given responsibility for monitoring and coordinating State aid for all economically depressed areas (not only the Mezzogiorno);
- an observatory on regional policies has been set up within the Ministry of Budget to verify the implementation and effectiveness of all action undertaken in the economically depressed areas;
- all competence for granting direct subsidies and concessions has been transferred to the Ministry of Industry, Commerce and Craftsmanship.

The Ministry of Budget recently proposed that financial aid will be granted by way of "tax bonuses" which can be used to pay taxes and social security charges on newly employed individuals. Moreover, the tax bonuses can also be sold (in whole or in part) to other group companies or to banks, provided the receiving enterprise obtains a guarantee in favour of the tax administration of a corresponding amount. Tax bonuses can only be transferred in an amount not exceeding 150% of the capital invested in the business in the qualifying area.

27. The effects of the tax exemption for purposes of IRPEG are also passed on to the shareholders of the Mezzogiorno companies when profits earned by such companies are distributed. As a general rule resident taxpayers receiving dividends from resident corporations are entitled to a dividend tax credit equal to 9/16 (or 56.25%) of the dividend. The amount of the tax credit is included when computing the taxable base of the shareholder and then subtracted from the gross tax. To prevent a shareholder from claiming the dividend tax credit in respect of dividends originating from income which was not subject to tax (in part or in full) at the distributing company's level, an equalization tax is levied on the excess of the amount distributed to the shareholders from the earnings of the tax year over 64% of the net income declared for purposes of IRPEG. However, if the distributed dividends are formed by profits subject to the tax incentives available in the Mezzogiorno, the equalization tax does not apply.

28. ILOR is levied on the same income which is subject to IRPEG. The current rate of ILOR is 16.2%.

29. To obtain the exemption an interested company must make a request in its annual tax return, indicating the amount of profits which it intends to reinvest. A project illustrating the proposed investment, the expected dates of commencement and termination of the construction and the financial plan must also be attached to the tax return. The work must be initiated within one year from the date of filing the tax return and completed within the next two years. If these deadlines are not met, the tax saving must be returned and a penalty of 50% is due.

© 1993 International Bureau of Fiscal Documentation

A ten-year exemption from ILOR applies for artisan and industrial enterprises operating in certain areas of Central and Northern Italy.

Under Law No. 26 of 29 January 1986, the ten year tax exemption from IRPEG applies to corporate enterprises engaged in new productive activities in the provinces of Trieste and Gorizia. Moreover, all enterprises operating in Trieste which are engaged in industrial production, scientific and technological research or port services, as well as all (new or modernized) artisan and industrial enterprises operating in Gorizia may benefit from an exemption from ILOR until 31 December 1995.

C. *Agricultural sector incentives*

The agricultural sector benefits from the more important incentives including the following:

(1) 15 to 40 year exemption from ILOR for land used for reforesting projects;
(2) 5 to 25 year exemption from ILOR for land used for rejuvenation or initial planting of fruit plantations;
(3) 50 percent exemption from ILOR for agricultural income derived from land over 700 meters high, or land included in the list prepared by the Central Census Commission, or land comprising mountain reclamation districts.

D. *Cooperatives*

A full exemption from IRPEG, individual income tax ("IRPEF") and ILOR is granted to agricultural cooperatives and their consortia for income derived from raising animals on feed of which at least one-fourth is obtained from land held by members. The exemption also applies to the processing, transformation and sale of agricultural products and animals contributed by members, and income earned by small-scale fishing cooperatives and related consortia.

A total exemption from IRPEG, IRPEF and ILOR is granted to production and labour cooperatives and consortia, provided the total amount of wages and salaries (including social security contributions) paid to members who are employed on a continuous basis is not less than 60 percent of the total amount of all other costs and expenses (excluding expenses incurred for the purchase of raw materials and semi-finished goods). If the amount of wages and salaries is less than 60 percent but more than 40 percent of the above amount, the exemption is reduced to 50 percent.

A 25 percent exemption from IRPEG and ILOR is granted to all other cooperatives and their consortia. Moreover, that part of the profits earned by cooperatives and their consortia which is used to increase the social capital is excluded from income taxes. This amount becomes taxable for the members (and not for the cooperative or consortium) if and when the capital is reimbursed to them.[30]

1. Consortia

Law No. 240 of 21 May 1981 introduced a full exemption from IRPEG and ILOR for consortia and consortial companies set up, also in cooperative form, by and between small and medium sized enterprises engaged in the industrial, trade and artisan sectors, with the purpose of promoting the development and marketing of products manufactured by the associated enterprises.[31] The exemption is granted with respect to profits which are reinvested, within a period of two years from their realization, in fixed assets.

E. *Incentives for small enterprises*[32]

Small enterprises are eligible for a number of incentives, including tax credits, grants and contributions and low interest loans in order to promote research, innovation and development.[33]

1. Tax credits

Tax credits are available to small enterprises engaged in the manufacturing, trade and service sectors for fiscal years 1991-1993 for investment in research and development, including services relating to increasing production capacity, acquisition of technology, entering new markets, etc. Equity investments in innovative companies made by finance companies whose corporate purpose is to temporarily participate in small corporations facing financial difficulties ("at risk corporations") also give rise to tax credits. These tax credits may be used to offset IRPEG or ILOR; any excess can be carried forward four years, or be offset against value added tax.

The tax credits may also be enjoyed by cooperatives and partnerships, whose members are at least 60 percent women, by corporations whose capital is owned for at least two-thirds by women and two-thirds of the directors of which are woman, as well as by individual enterprises operated by women, and which are engaged in the industrial, artisan, agriculture, trade or service sector.[34] Tax credits may be substituted by contributions equal to 30-50 percent of the costs incurred for the acquisition of machinery, assets, services, research expenses, new production, trade or quality control systems, etc.[35]

2. Grants and contributions

The Ministry of Industry, Commerce and Craftsmanship may allow grants and contributions in lieu of tax credits.

Financial contributions may also be made to joint ventures between small enterprises, which are entered into for the research or acquisition of advanced technologies, purchase of raw materials, creation of a common distribution network, promotion of sales activity, implementation of technological and scientific research, creation of joint trademarks, etc.

30. Art. 7 of Law 31 January 1992, No. 59.
31. Only consortia set up by at least five associated enterprises, none of which may own more than 20% of the capital, qualify for the incentive.
32. According to Art. 1 of Law No. 317 of 5 October 1991, a small enterprise is defined as an enterprise having no more than 200 employees and no more than 20 billion lire in invested capital. A small commercial or service enterprise is an enterprise with no more than 75 employees and no more than 7.5 billion lire in invested capital.
33. Law No. 317 of 5 October 1991.
34. Law No. 215 of 25 February 1992.
35. Id.

© 1993 International Bureau of Fiscal Documentation

3. Low interest loans

Loans granted at favourable rates by specialized credit institutions are also available for such joint ventures.

F. *Relief for the credit sector*

An amount equal to 50 percent of the profits that banks and other credit institutions set aside for legal and statutory reserves in excess of ⅓₀ of year end profits is exempt from ILOR. Moreover, 50 percent of the interest derived from loans granted by banks and other financial institutions to regions, provinces, municipalities, hospitals or public social welfare and educational institutions is exempt from IRPEG.[36]

G. *Tax incentives for profit reinvestment*

Article 12 of Law No. 333 of 11 July 1992[37] contains special provisions aimed at granting tax incentives for all enterprises (individual and corporate) which reinvest part of their profits in "innovative investments". The incentives may be enjoyed by enterprises which, in 1993, 1994 or 1995 earn taxable income at least 15 percent higher than that of the preceding year. If this condition is met, the excess of taxable income over the income of the preceding period is subject to tax (IRPEF, IRPEG and ILOR) of 50 percent of the excess, provided the amount of innovative investments effected in the period is higher than the sum of the excess profit and the amount of tax deductible depreciation taken in such year.[38]

These provisions have been criticized because due to the current economic recession, few enterprises will realize a 15 percent increase of taxable profit in the current and subsequent two tax periods.

V. CONCLUSION

The immense difficulties encountered in Italy in listing tax incentives, quantifying their costs and effects, and drawing up tax expenditure budgets are a strong indication that tax incentives are little understood or studied. In addition, it is highly contradictory that, notwithstanding the "negative image" the public has of tax incentives, their number continues to expand steadily. This phenomenon is accompanied by the "persistence" of tax incentives, i.e. tax incentives are often introduced on a temporary basis but are extended from year to year.

However, the emphasis which has been put on tax incentives during recent years reflects the increasing awareness of their importance and (in particular) their effects on revenue. Another important trend is that of the recognition in the fiscal process that direct expenditures are alternative courses to tax incentives in order to accomplish governmental goals. However, little consideration is given to the criteria that should govern the choice between these courses once a decision is made to provide government financial assistance to achieve a particular goal.

Therefore, it is not unfair to say that the inability of the Italian government to identify and quantify the tax expenditures imbedded in the Italian tax system is an important sign that Italy has probably lost control of an important aspect of its fiscal policy.

---

36. Art. 21 of Presidential Decree No. 610 of 1973.
37. Converted into Law No. 359 of 8 August 1992.
38. An example may be useful to clarify the mechanism:

1992 taxable income	6,000,000 (a)
1993 taxable income	7,000,000 (b)
excess profits [(b)-(a)]	1,000,000 (c)
1993 depreciation (in total)	500,000 (d)

Since the 1993 income exceeds the 1992 income by 16.7 percent, if the innovative investment effected in 1993 is higher than 1,500,000 [(c)+(d)], then the taxable income for 1993 will be 6,500,000 [(b)-50% of (c)].

TAX AVOIDANCE: THE ITALIAN EXPERIENCE

Avv. Bruno Gangemi

I. INTRODUCTION

> "It is practically impossible to counteract tax avoidance by means of a general statutory provision, the interpretation of which would be difficult and not always fair."

So reads the 1963 conclusion of the Commission on the Study of Tax Reform which in 1961 was charged with the task of outlining the basic principles of a comprehensive tax reform (enacted in 1972-73). The Commission thoroughly examined the problem of tax avoidance and the pros and cons of a general provision which would allow the tax authorities and courts to determine whether the sole or main purpose of a transaction was tax avoidance. A majority of the Commission concluded that, notwithstanding the advantages of a general provision, the negative aspects would outweigh its advantages. Factors which played a significant role in the Commission's conclusion included an increase in tax litigation, evidentiary problems associated with showing the taxpayer's intent to avoid tax, and difficulties in interpretation.

The Commission recommended tackling the avoidance problem by ad hoc provisions, identifying the particular transactions which were perceived to constitute tax avoidance. For that purpose, the Commission defined tax avoidance as "a method which the taxpayer may adopt to reduce or avoid the tax burden by artificially structuring his activity or behaviour, but fully complying with the statutes, at least formally, so as not to commit a tax violation". This 30 year old definition is valid today, and my remarks hereunder are based on the definition formulated by the Tax Commission.

In spite of the Commission's recommendation, the Italian Parliament enacted an anti-avoidance provision (limited to corporate reorganizations), which is found in Article 10 of Law 408 of 29 December 1990. Article 10 is the first piece of Italian tax legislation that refers to "business purpose" and provides as follows:

> The tax authorities may disallow the tax benefits realized in mergers, divisions, transfers, reorganizations, demergers and capital reductions when such transactions are carried out without a valid business purpose and for the exclusive purpose of fraudulently obtaining a tax saving.
>
> The tax due on the income assessed by the tax office under Article 10 and the interest thereon are provisionally billed to the taxpayer after the decision of the tax court of first instance or after one year from the taxpayer's appeal, if the tax court has not issued a decision by that date.

The discussion below examines the reasons why the Italian Parliament abandoned its traditional attitude toward tax avoidance and repudiated the approach recommended by the Tax Commission.

II. BACKGROUND

A glance at the process which led to this Copernican revolution in Italian tax philosophy may help to understand how the new provision will be interpreted by the courts. The process may also shed light on future trends in the anti-avoidance campaign.

Certain features of the Italian tax system undeniably foster tax avoidance. For example, the existence of several rates of VAT may induce taxpayers to structure their transactions artificially in order to minimize the tax burden. Tax avoidance schemes may also be encouraged by the numerous tax benefits still available in Italy.[1] Such benefits include local incentives (southern Italy, Trieste, etc.), tax exemptions for specific items of income (e.g. income from state bonds) and bene-

Bruno Gangemi obtained a degree in jurisprudence at the University of Rome. From 1963-1966 he was assistant professor of public finance and tax law at the faculty of jurisprudence, University of Rome.

Mr Gangemi actively participates in the Research Centre on the Law of Enterprises (CERADI) at the "Libera Universita Internazionale degli Studi Sociali de Roma" (LUISS). He also teaches the international tax law seminar of the faculty of political sciences, University "La Sapienza" of Rome. He contributes to several Italian and international journals and is the Italian correspondent for the International Tax Review.

Mr Gangemi is on the board of the "Associazione Nazionale Tributaristi Italiani" and permanent Italian delegate to the technical committee of the "Confédération Fiscale Européenne".

This article is based in part on earlier articles on the same subject. See Gangemi, B., Chapter Italy, in Tax Avoidance, Tax Evasion (London: International Bar Association, 2d ed., 1987) and S. Bellettini of Macchi, Cellere & Gangemi, "Italy intensifies anti-avoidance effort," International Tax Review (February 1992).

fits applicable to certain economic sectors. Finally, the different rates and the technicalities relating to the registration tax provide opportunities for avoiding the higher rates.

In addition, the generally accepted principle of "form over substance" often provides taxpayers with a valid defence to a challenge by the tax authorities, particularly with respect to sophisticated transactions, often inspired by Anglo-Saxon experience. For example, tax avoidance opportunities have increased dramatically by the internationalization of the Italian economy, the proliferation of transactions not specifically covered by the Civil Code and the exchange of experiences and techniques between tax consultants of different jurisdictions.

The tax authorities' dilatory and often clumsy reaction to the ingenious schemes devised by taxpayers and the commonly shared opinion that certain "sophisticated" taxpayers can successfully escape the ever-increasing tax burden constitute the technical and political background which made it possible for the Government to enact Article 10 of Law 408.

III. METHODS TO COUNTER TAX AVOIDANCE

A discussion of the Italian tax avoidance industry must start with the registration tax, which dates back to 1862 and represented a major source of revenue until the end of World War II.[2] For decades, the tax has created the legal arena in which taxpayers and tax authorities demonstrated their skill in inventing and combating tax avoidance schemes.

The early schemes aimed at reducing or escaping the heavy burden of the death and gift taxes, making recourse to "ante mortem" agreements and arrangements which were subject to the lighter burden of the registration tax. A common countermeasure consisted of "juris et de jure" presumptions (i.e. legal presumptions which a taxpayer cannot rebut). For instance, the transfer of real estate to relatives in direct line is taxed as a gift if the registration tax applicable to the transfer is lower than the gift tax. Similarly, goods and rights disposed of in the last six months of a person's life are, subject to certain exceptions, included in the taxable basis for death tax purposes.

The same approach has been adopted in the income tax area. According to income tax rules, now superseded, capital gains resulting from the disposition of shares or real estate were subject to personal income tax only if the seller's intent was speculative. However, in certain instances, a speculative intent was presumed by law, i.e. the taxpayer could not rebut the tax authorities' claim, even though he might be able to demonstrate the absence of a speculative intent.

This was the case with regard to capital gains resulting from the disposition of shares in Italian companies if the shares disposed of in a 12-month period exceeded 2 percent of the capital of a company listed on a stock exchange or 10 percent if the company is not listed; with respect to limited liability companies, the tax on the gain was levied if the quotas (participations) exceeded 25 percent of the company's capital. As to real estate, a speculative intent was presumed if the purchase or sale of real estate not used by the taxpayer or his family occurred within five years of the last disposition or if, in the case of land zoned for construction, the sale was preceded by construction work.

It is the common belief, however, that the most effective way to defeat tax avoidance is through ad hoc rules "tailored" to specific schemes. Parliament has passed a variety of countermeasures to fill in gaps and loopholes found by taxpayers.

Starting with earlier examples, an irrevocable mandate, without the necessity of rendering account, granted to a person to sell one's property is subject to registration tax at the rate applicable to the transfer of the property in question. In the absence of such provision, the mandate might have been tax exempt. Article 1201 of the Civil Code provides that a creditor receiving payment from a third party may subrogate the latter to his rights; under the Registration Tax Law, the deed of subrogation is subject to the rate of registration tax which applies to the transfer of the rights belonging to the new creditor.

Another example relates to VAT. In order to circumvent the non-deductibility of the 38 percent VAT on sales of luxury cars, taxpayers made extensive use of leasing contracts (taxed at 19 percent). A 1978 decree put a stop to such an easy and lucrative scheme by providing that VAT applies to the amounts payable under a leasing contract at the same rates that apply to sales of the leased goods.

Other examples pertain to the income tax. Since 1 January 1979, taxpayers have not been entitled to elect to pay personal income tax on dividends at a flat rate of 30 percent. The opportunity to be taxed at this flat rate had been regarded as an easy way to avoid the progressivity of the personal income tax.

Finally, Presidential Decree 643 of 26 October 1972 concerning the tax on increases in value of real estate has also been regarded as a measure to discourage tax avoidance (particularly with respect to the personal income tax and death tax) effected by transferring the title of personally owned real estate to real estate companies wholly owned by the transferor. Decree 643 provides that tax applies at progressive rates to the difference between the value of real estate at the time of purchase and the value at the time of sale. In the case of real estate owned by companies, the tax also applies at ten-

2. The Registration Tax Law was substantially amended in 1923, 1972 and 1986. The Law provides that all written agreements and other instruments executed in Italy are, as a rule, subject to the tax. All written agreements executed abroad providing for the transfer or lease of real property located in Italy are also subject to registration tax. The tax is also due on the formation or dissolution of a company, increases in capital, and judgments of Italian courts, including judgments to enforce foreign judgments or awards. Agreements which are not subject to the tax upon execution may become subject to it later if related documents or instruments are used (i.e. deposited with certain Italian authorities) or if they are quoted fully or in part in instruments or judgments subject to registration tax. The tax is usually levied on the value of the agreement, i.e. the value of the rights which are disposed of or the obligation in the agreement, irrespective of the consideration indicated by the parties. The rate of the tax, which may vary from 0.25% to 15%, depends on the nature of the agreement. Certain agreements are subject to tax at nominal rates. Since 1973 most of the agreements reached by, or transactions entered into by, companies which had been subject to registration tax are subject only to VAT; thus, the importance of the registration tax has been reduced somewhat.

© 1993 International Bureau of Fiscal Documentation

year intervals to the difference in value realized during the ten years of uninterrupted ownership.

IV. CIVIL LAW NOT EFFECTIVE TO COUNTER TAX AVOIDANCE

Although specific provisions have traditionally been regarded as the most effective method of discouraging tax avoidance, the inadequacy of this method is unquestionable and was pointed out 30 years ago by the Commission on the Study of Tax Reform.

In some civil law countries, the principles of the Civil Code, suitably developed and interpreted in the courts, have been used to counter tax avoidance, in the absence of a broad statutory anti-avoidance provision. Thus, the principles of abuse of rights, simulation, *fraus legis*, etc. often function as the general anti-avoidance rules and "business purpose" doctrine developed in common law countries. In this regard, the Italian Civil Code has a variety of "tools" in its arsenal comparable to those available in, for example, France or Belgium where they have also been used in the area of taxation.

The tools in Italy, however, have not been effective in the tax area. The few attempts to use the Civil Code principles have been frustrated because the relevant legal principles have not been properly or sufficiently developed. Under Article 1344 of the Civil Code, a contract in fraud (i.e. for circumventing the application of a mandatory provision) is null and void. Based on a broad interpretation of Article 1344, the tax authorities tried to disregard the tax consequences of avoidance schemes without prejudice to their civil law effects. The courts have never accepted this approach on grounds that the concept of fraus legis means the circumvention of a specific mandatory provision; in contrast, tax avoidance (as defined in Section I, above) is technically in compliance with the statutes and is effected without formally violating the law. Based on this kind of reasoning, the Court of Cassation has repeatedly stated that civil law sanctions (such as the nullity of contracts) cannot be used to strike down tax schemes and related benefits; the tax system contemplates ad hoc provisions to prevent and penalize tax fraud.

The *fraus legis* doctrine would not, unless properly developed, be very effective or beneficial to the tax authorities. Indeed, a court decision nullifying a contract will not allow the tax authorities to collect any tax, much less the tax which is deemed to have been avoided.[3]

Tax avoidance can hardly be attacked under Article 1414 of the Civil Code concerning simulated contracts (e.g. sales contracts which conceal a gift or contracts where the actual circumstances do not correspond to the legal form). Scholars distinguish between absolute simulation and relative simulation. In the former, the parties pretend to have entered into an agreement which they do not actually want and which is never executed (e.g. in order to defraud his creditors, a debtor simulates a sales agreement with a third party). In relative simulation, the parties pretend to enter into a certain agreement, but actually perform a different one (e.g. a sham sales agreement which conceals a gift), or a person pretends to enter into an agreement with one party while actually entering into the agreement with another. In this connection, Article 1415(2) of the Civil Code provides that "third persons may plead simulation against the contracting parties when it is prejudicial to their rights".

On this basis, the tax authorities, when they prove that an agreement is simulated and that the government has suffered a loss as a result, can argue that (a) the simulated agreement will not have any effect as between the parties, or (b) tax should be levied on the transaction actually intended and performed by the parties. For example, in Decision 3,927 of 20 December 1958, the Court of Cassation ruled that the tax authorities may impose the death tax with respect to assets which were the object of a simulated sales agreement. Obviously, the tax authorities must demonstrate that the sales agreement was simulated, i.e. that no sales agreement had actually been executed.

A careful analysis of the matter leads to the conclusion that, under Italian law, a simulated agreement entered into for the purpose of reducing or avoiding tax constitutes tax evasion rather than tax avoidance. As a practical matter, in both absolute simulation and relative simulation, the parties hide some or all of the elements of the agreement from the tax authorities, or the parties create a legal appearance which does not correspond to the actual circumstances. In neither case are the transactions real or within the law.

Turning to the abuse of rights doctrine, it is important to stress that the only Civil Code provision dealing with this doctrine is Article 833 concerning the right of owners of real estate. Article 833 provides that "the owner may not carry out acts which have no purpose other than to harass or cause annoyance to others".

It is surprising how little scholars and judges have contributed to the doctrine of abuse of rights in Italy. For example, a well respected scholar argued that the concept is *per se* self-contradictory and pertains to the study of sociology rather than the law. The few court decisions dealing with this doctrine do not add to the development of the doctrine. Without further comment, it can be concluded that the abuse of rights doctrine in Italy is a "dry well".[4]

V. FORM OVER SUBSTANCE

A. *General application*

The failure to develop the doctrines of fraus legis and abuse of rights and to extend them to the tax area deserves comment. Article 12 of the "Provisions on Law in General", preliminary to the Italian Civil Code, provides that:

3. For sake of completeness, it should be added that a few scholars have attempted to develop the fraus legis doctrine claiming, inter alia, that the provisions circumvented by a tax avoidance scheme are embodied in Art. 53 of the Constitution ("Each one must contribute to the public expenditure in proportion to his financial ability"). This highly technical issue has been interestingly developed by F. Santonastaso, "I negozi in frode alla legge fiscale", *Diritto e Pratica Tributaria* 1970 I, and by U. Morello, "Frode alla legge", Collana degli Annali della Facoltà di Giurisprudenza dell'Università (Milan: Giuffre, 1969).

4. An exception is the elaborate analysis of Prof. P. Rescigno ("L'abuso del Diritto", *Rivista di Diritto Civile*, 1965) which does not deal with the tax aspects of the doctrine.

© 1993 International Bureau of Fiscal Documentation

> "In applying statutes, no meaning may be attributed to them other than that made clear by the actual meaning of the words, according to their context, *and by the legislative intent*." [Emphasis added]

It may be argued that this fundamental principle of interpretation allows the courts to consider the "spirit of the law". Indeed, there is no question of the legitimacy of restrictive and *extensive* interpretation of the law. The maxim "minus dixit quam voluit" is a generally accepted approach to statutory interpretation.

The second paragraph of Article 12 provides that:

> "If a controversy cannot be decided under a specific provision, consideration shall be given to the provisions governing similar cases or analogous matters; if the uncertainty remains, the case shall be decided according to the general principles of the legal system of the State."

It is generally understood and agreed that this paragraph defines the limits of the judge's authority: he has broad discretion, but may not decide a case by "supplementing" legal principles when they do not precisely fit that case.

As to taxation, Article 23 of the Italian Constitution provides that "no personal or patrimonial obligation shall be imposed other than by law".

In summary, it may be argued that the basic principles of the Italian legal system do not constitute an insurmountable barrier to the interpretation and evolution of legal principles so as to extend them to tax avoidance.

The theory that a tax should be levied according to the economic results of taxpayers' behaviour was developed 50 years ago by Professor Grizotti. His theory was based, inter alia, on the language of Article 8 of the Registration Tax Law of 1923 stating that "taxes are levied according to the actual nature and effects of the deeds or conveyances, even though the name or form does not correspond to them". This principle, in view of its general character, is valid for all taxes. It may be argued that Professor's Griziotti's theory represents the Italian version of the step-transaction doctrine. Indeed, the theory is based on the notion that, in a complex transaction or a preordained series of transactions, the tax should be levied on the end result.

The negative reaction of scholars precluded further development of this theory. Their criticisms were based on sound orthodox legal arguments and generally reflected the concern that Professor Griziotti's theory would broaden the fisc's discretion to such an extent as to put at risk the certainty of the tax rules. The Court of Cassation, sharing this concern, has repeatedly ruled that the tax authorities may not investigate the economic results intended and obtained by a taxpayer; the tax authorities' analysis is limited to the legal consequences of the taxpayer's behaviour. This was the end of a short-lived but intelligent theory which, as stated, seldom received the court's support.

B. *Exceptions: substance over form*

In a few cases, the courts deviated from the generally accepted principle of "form over substance" and seem to have adhered to the step-transaction doctrine. In one case, a father gave to his sons, by a duly registered deed, state bonds which were exempt from all taxes, including the gift tax. By a separate deed, also duly registered, the father and sons exchanged the state bonds for real property and paid the registration tax. The tax authorities claimed that the two transactions constituted a de facto gift of real property, which was subject to a higher tax than the registration tax paid.

The Court of Cassation, in Decision 2,658 of 9 May 1979, reversed the decision of the Milan Court of Appeals and ruled that the two transactions (the gift of the state bonds and their exchange for real property) were designed to achieve a result different from that typical of such transactions, i.e. gift of real property, and that consequently the gift tax was due. Although the transactions used by the parties were legitimate, they attained a fraudulent purpose which allowed the tax authorities to tax the final result of the transactions. The Court of Cassation, however, did not identify the provisions which empowered the tax authorities to tax the "final result"; such provisions, in fact, do not exist.

In Decision 5,563 of 6 October 1980, the Court of Cassation used a similar interpretation. In that case, A, B and C, owners of a building, obtained a licence from the competent authorities to demolish the existing building and construct a new one on the same site. A and B reserved the "right of superficie"[5] with regard to their portion of the building (i.e. two out of ten apartments in the building). By a separate agreement with A and B, D undertook to construct the two apartments with respect to which A and B had reserved their right. Both agreements were duly registered, and the registration tax was levied at a nominal amount pursuant to special legislation concerning low-cost housing programmes.

The tax office claimed that the registration tax should have been levied at the normal rates since, by entering into the two agreements, the parties had in effect undertaken to exchange ownership of the land on which the original building stood for the new apartments; such a transaction did not qualify for the registration tax benefit. The Court of Cassation accepted the tax office's claim and found it possible to assume a link between the two transactions. On this basis, the Court interpreted the text of the agreements, not literally, but taking into account the effect of the two agreements, so as to determine the final result intended by the parties. In this case as well, the Court of Cassation did not indicate the legal provision which justified its decision. Indeed, it would appear that these decisions were written, and the Court's arguments presented, as if the Italian tax system had a general anti-avoidance provision.

A meaningful, though isolated, extension of this attitude to the income tax is represented by the case involving an Italian company whose Board of Directors, in submitting the balance sheet to the shareholders for approval, proposed to distribute as dividends the year's profits amounting to 525,000,000 lire. The shareholders' meeting did not adopt the Board's recommendation and transferred the profits to a special reserve; the shareholders' meeting also resolved to

5. According to Art. 952 of the Italian Civil Code, the owner of land on which a building has been erected may dispose of the right to the land separately from the right to the building (or part thereof and vice versa). This means that the owner of land on which a building has been erected can sell the land and reserve the property rights ("right of superficie") to the building.

© 1993 International Bureau of Fiscal Documentation

distribute to the shareholders 500,000,000 lire out of the existing reserve consisting of premiums paid by the shareholders during prior capital increases. Premiums are not subject to income tax or withholding tax pursuant to a certain law, since they are deemed to be in the nature of capital.

The Milan Revenue Office claimed that the resolution concealed an "indirect" distribution of profits by using the scheme in which premiums were distributed. By Decision 2,115 of 5 May 1978, the Court of Cassation, reversing the Central Tax Commission's decision, agreed with the Milan Revenue Office. The Court of Cassation took the same view in Decision 5,264 of 7 October 1981 in which it reaffirmed that the distribution to shareholders of the reserves consisting of premiums is tantamount to a distribution of dividends if the profits of the year are transferred to a reserve rather than distributed.

In all of these cases, the Court of Cassation appears to have disregarded the "form" of the transactions in favour of their "substance". Needless to say, this approach does not fit in the framework of Italian legislation and, in the absence of specific provisions governing the issue, the approach may create embarrassing consequences. For instance, with regard to Decision 2,115, one could ask about the subsequent tax treatment of the distribution of the profits transferred to the reserve and, in particular, whether the withholding tax should apply at the time of distribution. If this question is answered in the affirmative, the Court's interpretation would in effect nullify the exemption granted by law. If the question is answered in the negative, the same interpretation would exempt the distribution of dividends from the withholding tax, which the law requires to be levied.

As indicated earlier, these cases are exceptions to the established principle which the Court of Cassation has reaffirmed on several occasions. On 24 April 1979, the Court, in ruling on a case involving tax avoidance, held that a tax may be levied only in the cases provided for by law, even though instances may occur which escape tax due to loopholes in the legislation; only Parliament, and not the judge, is empowered to eliminate such loopholes.

VI. MERGERS UNDER SURVEILLANCE

It is well known that mergers, reorganizations, split-ups and similar transactions offer opportunities for tax saving, and tax specialists throughout the world devote special attention to these transactions. The few attacks by the Italian fisc, based on arguments such as simulation and fraud on the law, were rejected by the courts. Under the pressure of the State's ever-growing financial deficit and the awareness that "ad hoc" provisions would have reduced, but not eliminated, tax avoidance connected with mergers and similar transactions, the tax authorities claimed a more powerful tool.

Since 1986 the Government or Members of Parliament have drafted numerous bills containing different versions of a general anti-avoidance provision. The latest proposal, subsequently dropped, provided:

> "Contracts and unilateral deeds, whether or not related, which are executed with the primary aim of avoiding wholly or partly the payment of tax and which represent an adequate means for achieving that aim, shall be regarded as tax avoidance transactions.
>
> Such contracts and deeds shall be disregarded by the tax authorities, who shall for tax purposes apply the rules of law which are being circumvented.
>
> Subject to the opinion of the State attorney, the tax authorities shall assess the avoided tax. Any assessment of the avoided tax which is not adequately supported shall be null and void."

Parliament did not approve any of these bills. One of their main concerns, which played a decisive role, was that the vague and ambiguous wording of the proposed rules would increase the uncertainty regarding tax enforcement.

The hectic and very troublesome process by which the tax authorities tried to limit the abuses connected with mergers and reorganizations produced some results. Parliament set the first restriction in 1986. This reduced the tax losses deductible in a merger transaction: the total loss eligible to be carried by the surviving company may not exceed the net worth of the companies involved in the merger.

This provision stopped the retail business involving "coffin corporations", i.e. corporations whose only assets were accumulated losses. In order to further restrict the abuses which were still possible, other prerequisites for the deductibility of losses of merged companies were introduced effective 1 January 1988. For example, the amount of salaries and sales of the merged companies in the year of merger must exceed 40 percent of the average salaries and sales of the two preceding fiscal years.

These provisions made recourse to mergers much less attractive than in the past, but did not totally frustrate the ingenuity of taxpayers. Indeed, the provisions may easily be circumvented by other types of corporate reorganization, e.g. contribution of profitable going concerns to companies with accumulated losses.

The tax authorities' awareness of the limited scope of the amendments approved by Parliament induced them to make another attempt for a broad anti-avoidance provision. This time, however, alerted by Parliament's reaction to the previous versions, the fisc submitted a more precise proposal, now embodied in Article 10 of Law 408 (quoted in Section I, above). Article 10 has particular relevance to mergers and similar transactions and permits the tax authorities to disallow, for tax purposes, part of the cost of shares and in general the tax benefits of such transactions, if they are carried out without a valid business purpose and for the exclusive purpose of fraudulently obtaining a tax saving. Article 10 also provides, however, that it does not apply to mergers, reorganizations, demergers and capital reduction resolved by 30 October 1990.

The process of enacting Article 10 attracted the resistance and criticism which traditionally accompany attempts to introduce such legislation. The Government eventually succeeded by claiming that the proposed legislation had a limited purport (i.e. the defeat of tax schemes realized through corporate reorganization) and that a similar provision could be found in the recently enacted EC merger directive (90/434 of 23 July 1990). In this regard, it should be noted that the statute implementing the directive (Decree 544 of 30 Decem-

© 1993 International Bureau of Fiscal Documentation

ber 1992) does not contain an anti-avoidance provision. The Government apparently assumed that the anti-avoidance aspect was already dealt with by Article 10 of Law 408. This conclusion may be correct, except that Article 10 does not cover transactions involving an exchange of shares.

Due to the novelty of Article 10, neither the Ministry of Finance nor the tax courts have yet had an opportunity to comment on its meaning; nor have legal scholars devoted the necessary attention to the rule. The reference to a "valid business purpose" introduces a concept which is new to Italian tax law. Its interpretation will certainly give rise to endless disputes, which will be encouraged by the somewhat vague wording of Article 10.

For instance, "tax benefits" disallowed by the tax authorities certainly refers to income tax advantages, but may very well also include indirect taxes. If the avoidance scheme extends its effects to numerous taxpayers, it is not clear to what extent and at which level the "disallowance" will operate. Moreover, it is disputable whether the taxes (direct and indirect) paid in implementing an avoidance scheme are refundable or creditable against the higher tax liability claimed by the fisc.

Uncertainties also exist as to the identification of the benefits attainable through "transformation" or "reduction of capital". As to the "business purpose", the merger directive allows a member state to withdraw a tax benefit whenever it appears that the transaction "has, as its *principal* objective, tax avoidance". The directive further provides that the lack of valid commercial reasons may constitute a presumption that tax avoidance is the principle objective.

Article 10 allows the fisc to withdraw a benefit if the transaction is carried out "without valid economic reasons" *and* "for the *exclusive* purpose of fraudulently obtaining a tax saving". It may be questioned whether the different language is just a matter of semantics or whether it will result in different interpretations regarding the application of the provision.

In the debate which accompanied the approval of Article 10, the opponents reiterated the traditional arguments against a broad anti-avoidance provision and emphasized again the risks of granting uncontrolled discretion to the tax authorities. The criticism induced Parliament to pass the "Interpellation Procedure" (Article 21 of Law 413 of 30 December 1991) whereby a taxpayer who intends to carry out an operation contemplated under Article 10 may request an advance ruling from the competent Directorate of the Ministry of Finance. If the taxpayer does not receive an answer or if the answer is unsatisfactory, he may submit his request to an ad hoc "Committee on Anti-Avoidance Provisions", composed of high-ranking ministerial officers and three experts appointed by the Ministry of Finance. If the taxpayer does not comply with the Committee's opinion, he must rebut in court the presumption that the transaction is illegal.

VII. RECENT DEVELOPMENTS

The business purpose test is directly or indirectly used in other recently enacted rules. Article 11 of Law 413 of 13 December 1992 has severely restricted the use of tax haven companies to carry out avoidance (and evasion) schemes. Article 11 disallows all payments (including those for the purchase of goods and equipment) made by Italian resident entrepreneurs to related companies resident in tax haven jurisdictions. This provision does not apply if the Italian resident taxpayer demonstrates that the transaction has a valid economic purpose. As a practical matter, the avoidance (evasion) purpose and the absence of a business purpose are assumed to exist if the recipient is a related company in a tax haven jurisdiction.

The Government adopted a similar approach to reduce possible abuses resulting from the implementation of the parent-subsidiary directive. The benefits under the directive (e.g. withholding tax and affiliation exemption for dividends which Italian companies distribute to, or receive from, EC parents and subsidiaries) are granted to EC companies directly or indirectly controlled by non-EC parents, provided the taxpayer demonstrates that the companies were not interposed for the sole or principal purpose of taking advantage of the directive. As in mergers and reorganizations, a taxpayer may request an advance ruling from the administration regarding tax haven transactions and dividends distributions under the parent-subsidiary directive.

The step-transaction doctrine seems to have been taken into account by the Ministry of Finance in Ruling 26 of 20 February 1992.

Leasing transactions are, as a rule, subject to 19 percent VAT which is not recoverable by private individuals, but interest on loans and financial transactions is exempt from VAT. A recent case illustrating the application of these rules involved a financial company, a leasing company and an individual. Financial Company A granted a loan to Mr Smith. The relevant amount was credited directly to the bank account of Leasing Company B, which entered into a car leasing contract with Mr Smith. The amount credited to Company B was labelled as "caution money"; in addition, Company A gave a guarantee to Company B for Mr Smith's obligation to Company B. Mr Smith paid interest (exempt from VAT) to B and rental fees (subject to VAT) to A. The rental fees charged to Mr Smith were below the normal market fee, since they did not include cost of financing. Company A agreed to pay Company B a fee for its role as an intermediary, and Company B agreed that, if Mr Smith defaulted, it would sell the car on the market and reimburse Company A.

The tax authorities claimed that the various transactions and covenants among the parties should be construed as a single contract, i.e. a car leasing transaction, which was artificially split up in order to reduce VAT liability ("each of the three parties achieved its/his contractual purpose by coordinating the different and distinct agreements"). This case has not been taken to court, and it is not known how a court would construe the transactions involved.

VIII. CONCLUSION

This article has demonstrated that the basic principles of the Italian legal system do not constitute an insurmountable barrier to extending the doctrines of fraus legis and abuse of rights to tax avoidance. The article has also shown that the

© 1993 International Bureau of Fiscal Documentation

courts and scholars have frustrated the attempts to develop these doctrines. The arguments put forward, based on fine distinctions and inferences, have a common denominator: the concern that the fisc's power to "pierce" the legal form of a transaction would result in a broad discretion to interpret that transaction. This consideration is the key to understanding the reasons why the former attempts to enact tax avoidance legislation were defeated. If this is still the case, the question is how to reconcile the concern with the business purpose approach taken in the recent statutes.

The answer probably lies in a domain other than legal doctrines. The undeniable fact that tax evasion opportunities have decreased dramatically in the past 20 years has also contributed to changing the traditionally sympathetic attitude of the average taxpayer toward tax evasion and avoidance. Without embarking on a sociological analysis, the Italian approach to the business purpose doctrine may be the political answer to a new, commonly shared desire for greater fiscal fairness.

It may be interesting to look into the reasons why this change in attitude resulted in introducing the business purpose doctrine into the legal system rather than in developing well-known legal principles. The over-emphasized Anglo-Saxon successes in defeating tax avoidance and the language of the EC directive have surely played a role. However, a careful analysis of this matter would probably lead to minimizing the legal implications of adopting one approach over the other.

It will be interesting to see how the legal community reacts to the new doctrine. It should be stressed again that the wording of Article 10 of Law 408 is far from satisfactory. Such an important innovation deserves a more careful explanation. It may also be wondered whether the interpellation process, in its present form, will contribute to reducing the disputes which will inevitably arise.

TAX TREATY DEVELOPMENTS

Andrea Manganelli

Andrea Manganelli has a degree in economics from the University of Rome. In 1990 he contributed to the drafting of the IFA Congress General Report on exchange of information and cooperation between tax administrations. He was appointed IFA researcher for 1991. From 1991-1993 he was a research associate at the IBFD. He is currently working in the international tax department at the Rome office of the firm of Professor Fantozzi.

I. INTRODUCTION

Italy has concluded 51 double tax treaties for the elimination of double taxation on income, 22 of which extend the scope to taxes on capital. Neither Italian tax treaty policy nor domestic legislation are particularly aimed at the attraction of movable capital of multinational enterprises, but rather they aim to make the realization of transnational activities less burdensome.[1]

After the comprehensive tax reform of 1973, new treaties were negotiated with all 11 partners of the EC. These treaties are all in force, with the exception of the Netherlands treaty, which should enter into force by the end of 1993. The four most recently signed treaties with EC partners (France, Germany, the Netherlands and the United Kingdom) present some innovative aspects which are worth comment. After looking at the efficacy of tax treaties in national legislation, this article will focus on key provisions of these four treaties, explaining how the deviations from the OECD model constitute, in some respects, an important evolution of the relationship between the Italian tax system and other tax systems.

The following treaty clauses will be analysed:
- Personal scope
- Taxes covered
- Residence
- Permanent establishment
- Business profits
- Associated enterprises
- Dividends
- Elimination of double taxation.

II. EFFICACY OF TAX TREATIES UNDER ITALIAN LAW

The relevance of tax treaties to a country's international relations, and the ability of investors to rely on treaty provisions for determination of the fiscal consequences of a transnational investment are affected by the relationship of treaty provisions to domestic rules. In particular, it is interesting to analyse whether treaty provisions may be overridden by conflicting domestic provisions.

Thus far treaty override has only been used by the United States, although recently Germany and France have utilized it. Italian legislation on the topic is generally not clear, and many questions arise about whether tax treaty provisions supersede domestic legislation.[2] For example, Article 10 of the Constitution provides that the Italian legal system must conform to the recognized rules of international law. According to the majority of commentators, the effectiveness of this provision is limited to the applicability (under Italian law) of the international principles deriving from customary law.[3] Although some commentators have extended the scope of this provision to bilateral treaty rules, an analysis of the discussions held at the time the Constitution was drafted leads to the conclusion that the provision may not be interpreted to allow treaty rules to supersede domestic rules.

Article 75 of Presidential Decree No. 600 of 29 September 1973 (the Income Taxes Assessment Code ("ITAC")) provides that in applying national tax rules in the area of income taxes, international bilateral agreements, if ratified by the Italian Parliament, remain unprejudiced. Finally, Article 128 of Presidential Decree No. 917 of 31 December 1986 (the Income Tax Code ("ITC")) provides that ITC provisions which derogate from rules in international treaties remain applicable, but only if the ITC rules are more advantageous for the taxpayer. The reverse implications of ITC Article 128 would lead to the conclusion that if the treaty provision grants a tax-

1. However, tax treaties are important because Italy is a substantial market, and foreign investments in Italy are mandatory for foreign enterprises which intend to penetrate the market; and because Italy is one of the seven most industrialized countries in the world, Italian investments abroad are significant.
2. In particular, a few recently enacted provisions may raise issues about their relationship with treaties.
3. See A. Cassese, "Il contributo degli internazionalisti ai lavori del Ministero per la costituente", *Rivista di Diritto Internazionale* (1977), at 47-58. For an opposing view which includes in the term "provisions of international law" the provisions contained in bilateral treaties, see Quadri, "Diritto Internazionale Publico" (Palermo, 1968) at 68.

© 1993 International Bureau of Fiscal Documentation

payer treatment which is more favourable than treatment under the ITC, the treaty provision should prevail.

It should also be noted that treaty provisions may be deemed to prevail over domestic rules because treaties should be considered special laws, since they are put into effect through a specific ratification procedure.[4]

The effectiveness of treaty rules which conflict with domestic provisions adopted after ratification of the treaty is also an issue.[5] No provision addresses this issue. If we follow the approach whereby a subsequent provision supersedes an existing one, and the treaty provision is considered to be equal to ordinary parliamentary provisions, then the new domestic provision legitimately violates the treaty provision, so that the domestic provision should prevail. If, however, the special law approach is taken (as should be the case in the author's opinion), then the law which ratifies the treaty might be overridden only by another special law.

An unfortunate shortcoming derives from the fact that the applicability of treaty provisions over domestic provisions is not specifically addressed, nor is a solution offered in any court decision, so the uncertainty will remain until a clear interpretation is provided.[6]

III. RECENT TAX TREATY DEVELOPMENTS

A. *General*

Under the ongoing process of harmonization of direct taxes in the EC, many treaty clauses may be affected by the contemporaneous applicability of domestic rules which have been adopted in the member states as a result of implementation of EC directives. This is particularly the case with respect to the parent-subsidiary directive, but the problem also arises in treaty rules which address transfer pricing problems.

These are two areas in which the Italian efforts to eliminate international taxation problems by conclusion of new tax treaties have been more significant. Similar problems have also been addressed by the EC Council, and the relation of these rules raises some interesting issues. In addition to examining the latter, this article will also look at provisions which are more relevant for the Italian or foreign economic community (i.e. mainly multinational enterprises), i.e. provisions concerning the residence of persons entitled to treaty benefits, the permanent establishment ("PE") provision, the dividend article and the elimination of double taxation provision.

The following treaties will be analysed:

- the Italy–UK treaty of 21 October 1988, which entered into force on 31 December 1990;
- the Italy–France treaty of 5 October 1989, which entered into force on 1 May 1992;
- the Italy–Germany treaty of 18 October 1989, which entered into force on 24 December 1992;
- the Italy–Netherlands treaty of 8 May 1990, not yet in force.

B. *Objective scope of application*

The treaties with France, Germany and the Netherlands apply to taxes on income and on capital, while the UK treaty is limited to taxes on income. The extension of the scope of application to taxes on capital appears to have more significance nowadays, because in 1992, in order to realize an increase in revenue, the Italian Government introduced several extraordinary measures which provide for the taxation of items of movable or immovable capital.[7] Moreover, only the treaty with France aims at the prevention of fraud – the other treaties are limited to the prevention of fiscal evasion.[8]

C. *Taxes covered*

The four treaties consistently take into account the individual income tax ("IRPEF"), the corporate income tax ("IRPEG")

4. This approach derives from the principle "*lex posterior generalis non derogat priori speciali*". Accordingly, a subsequent domestic provision may not supersede a treaty provision because of the special nature of the latter. The special nature may derive from three aspects of the provision: first, the provision is addressed to specific persons; second, it regulates specific matters; and third, the special provision is put into effect by a distinct provision, e.g. a ratification law.

5. The issue is not merely theoretical. A recent example of a domestic rule which might violate a treaty rule is the anti-tax haven legislation introduced by the Finance Act for 1992. The most significant provision of the anti-avoidance rules now embodied in ITC Art. 76(7)bis denies the deductibility of costs and expenses incurred by an Italian enterprise and paid to companies resident in a tax haven which belong to the same group.
The Italian treaties with Malta, Malaysia, Philippines, Singapore and Switzerland (countries deemed to be "tax havens") contain a non-discrimination article which follows the wording of Art. 24(5) of the 1977 OECD model treaty, which provides that, except for the cases referred to in Arts. 9, 11(6) and 12(6), interest, royalties and other disbursements paid by an enterprise of one of the contracting states (i.e. the Italian enterprise) to a resident of the other state (i.e. a Swiss company) will, for the purpose of determining the taxable profits of such enterprise, be deductible under the same conditions as if they had been paid to a resident of the first-mentioned state (i.e. a hypothetical Italian company). Therefore, in the event of a disallowance by the Italian tax authorities, the taxpayer can argue that such disallowance violates the treaty provision.
Since any decision as to whether a treaty provision should prevail over domestic law has to be made at the time the Italian enterprise files its tax return, it would have been reasonable to issue an interpretative document to clarify the matter. The Ministerial commentary drafted along with the Ministerial Decree which listed the countries deemed to be tax havens for purposes of the anti-tax haven legislation specifically referred to the non-applicability of the restrictive rules with respect to companies which could invoke the application of the tax treaty non-discrimination rule. This document, however, was not made public, and therefore it cannot help the present research.

6. The Constitutional Court has on many occasions affirmed the right of the Parliament to override provisions of international treaties (see e.g. decision of 20 May 1982, No. 96, stating that domestic provisions concerning turnover tax conflicting with Art. 111 of the GATT treaty are not in conflict with Art. 10 of the Constitution. However, the conclusion is different if the treaty override is not done intentionally, i.e. the discrepancy between the treaty and the domestic provision is not specifically intended. In such cases, scholars and court cases as a rule give the treaty provision priority.

7. In particular, Art. 7(6) of Decree Law No. 333 of 11 July 1992 introduced an extraordinary tax on bank deposits, which is also applicable to non-residents who are the beneficial owners of an Italian bank or postal account. For a detailed explanation of the exemption provided by some treaties with respect to this tax, see Andrea Manganelli, 33 *European Taxation* (February 1993), at 64.
The application of treaties which include taxes on capital within their scope is particularly relevant for the new tax on net worth of enterprises which was introduced by the Finance Bill for 1993 (Law No. 394/92). For a comprehensive description of the net worth tax, see in this issue Paolo Ludovici, "The Tax on the Net Worth of Enterprises".

8. For an explanation of the importance of the extension of tax treaties to the prevention of tax fraud, see Bruno Gangemi, "General Report on International mutual assistance through exchange of information", in *Cahiers de droit fiscal international*, Volume LXXVb, at 27.

© 1993 International Bureau of Fiscal Documentation

and the local income tax ("ILOR"). In the treaties which include taxes on capital, no reference is made to the new tax on the net worth of enterprises, which was incorporated in the tax system through Law Decree No. 394/1992.[9]

D. *Residence*

The definition of the persons entitled to treaty protection follows the "subject to tax approach" of the OECD model. Therefore only persons who are fully subject to the taxes listed in the treaty may invoke application of the treaty provisions. As the taxes covered do not take into account the lump-sum taxes which are paid by mutual investment funds and pension funds,[10] these major investors are not entitled to treaty benefits. That is, dividends and interest which may be derived by these entities from abroad will still suffer the burden of higher withholding taxes because the reduced withholding tax rates under the treaties do not apply. The ultimate consequence of this exclusion is a reduced profitability of the investments in the funds, a negative effect which should be removed. One solution may be the extension of treaty protection to investment and pension funds by negotiating a protocol to the treaties.[11]

For treaty purposes, the residence of corporate entities is determined according to the ordinary criteria contained in Article 4 of the OECD model. The tiebreaker rule in the four treaties provides that dual resident companies will be deemed to be resident in the state of their effective management. ITC Article 87(3) determines company residence according to three criteria, i.e. the place of incorporation, the place of effective management and the place in which the principal activities of the company are located. The treaties only refer to cases of dual residence, while possible triple residence cases are not dealt with in Italian treaties, nor are they examined in the OECD model.[12]

E. *Permanent establishment*

Italian tax provisions do not define a PE despite the fact that under domestic law the concept is used in the same way that it is used in tax treaties.[13] The definition of PE for application of domestic rules with respect to foreign persons who are resident in a non-treaty country is contained in Ministerial Circular No. 7/1496 of 30 April 1977. This definition is similar to the definition of PE in the 1963 OECD model. This is probably the reason why the Italian treaty definition of PE also follows the 1963 OECD definition. Among the treaties under analysis, only the new treaty with France uses the 1977 OECD model definition – the treaties with Germany, the Netherlands and the United Kingdom follow the 1963 model.

F. *Business profits and associated enterprises*

Article 7 of the treaties follows the wording of the OECD model in the case of Germany, France and the Netherlands, laying down an "existence of a PE" condition (Article 7, paragraph 1 of the OECD model), a "distinct enterprise" provision (Article 7, paragraph 2 of the OECD model), an "expenses deduction" requirement (Article 7, paragraph 2 of the OECD model), a "purchase of goods and merchandise" condition (Article 7, paragraph 5 of the OECD model), a "separate article" provision (Article 7, paragraph 7 of the OECD model), an "apportionment of total profits" clause (Article 7, paragraph 4 of the OECD model) and a "maintenance of method" condition (Article 7, paragraph 6 of the OECD model). The last two paragraphs are not included in Article 7 of the Italy–UK treaty. Under the Italian system, profits of Italian PEs of foreign enterprises are always determined through separate accounts, and no modification of the profits determination criteria is permitted.

The treaty rules governing the determination of profits of the PE find a better explanation in the clarifying provisions of the protocols in the treaties with France, Germany and the Netherlands. In the French and Netherlands treaties such rules limit the force of attraction of the PE with respect to positive and negative items of income when the PE sells goods on behalf of the head office and executes contracts for the supply of commercial, industrial or scientific equipment. The protocol to the treaty with Germany only excludes the force of attraction with respect to the supply of equipment contracts and to the PE which consists of a building site or an installation project.

In these cases the exclusion of the force of attraction also takes into consideration the deduction of expenses of the PE. For this purpose, "expenses incurred for the purposes of that PE, in paragraph 3 of Article 7 are to be interpreted to include only expenses relating directly to the activity of the PE".

The protocol to the Italy–France treaty also provides that if the laws of one of the states authorize companies resident in that state to determine taxable profits on the basis of consolidated accounts which include especially the profits of the subsidiaries resident in the other state, such group relief benefit is not to be affected by the provisions of the entire treaty and particularly the provisions of Article 7. This provision is probably related to the desire to maintain the consolidated accounts regime granted to French companies under French domestic legislation even in the presence of a mandatory distinction (according to the treaty) of accounts between the parent company and its subsidiary.

As regards the associated enterprises article, the treaties deviate significantly from the OECD model, mainly due to the

9. The treaties with France, Germany and the Netherlands should also apply to this new tax under Art. 23 of those treaties.
10. Both mutual investment funds and pension funds are subject to a flat rate tax which is levied on the net worth of the fund, and do not pay any tax on the income actually produced.
11. Extension of treaty benefits to investment funds has been provided for in the France–Switzerland treaty and the France–UK treaty.
12. One situation is where a company is incorporated in France, managed in the United Kingdom and carries out its activities in Italy. In this case, the tiebreaker rule would resolve the situation only with respect to the application of the Italy–UK and France–UK treaties. It would not provide any solution with respect to the Italy-France relationship, nor would it deal with income derived from a fourth state. For instance, if the company receives interest from a fourth state, it would in principle be entitled to application of the treaties between one of the three states and the fourth state.
13. ITC Art. 20(1)(e), which deals with the application of IRPEF to non-resident individuals, provides that business income of such non-residents is subject to IRPEF only if, and to the extent that, such income is produced through a PE located in Italy. The principle embodied in Art. 20 is also referred to in ITC Art. 112(2) for purposes of IRPEG, and by Art. 117(3) for ILOR purposes.

© 1993 International Bureau of Fiscal Documentation

absence of a complete "correlative adjustments" clause. Article 9, following the wording of Article 9, paragraph 1 of the OECD model, only includes the provision which requires that associated enterprises respect the arm's length principle in their contractual relationships.[14] The absence of the correlative adjustment clause is partially solved by the inclusion of a similar clause in the protocol to some of the treaties. The effectiveness of these modified correlative adjustments clause is extremely limited if compared to Article 9, paragraph 2 of the OECD model.

In the Italy–Germany treaty, the protocol provides that correlative adjustments should only take place if the contracting state that is to make the adjustments agrees that the redetermination of the profits of the enterprise resident in the other state reflects conditions that would be agreed to between independent enterprises. The adjustments should in any event be carried out in accordance with the mutual agreement procedure in Article 26 of the treaty. The Italy–Netherlands treaty follows the same lines, referring to the need for a mutual agreement procedure, while the Italy–France treaty provides that the state which should make the correlative adjustment is bound to do so only if it deems such adjustment to be appropriate, and the adjustment should be agreed upon through a consultation between the competent authorities of the two states.

It is evident from the above that the modified correlative adjustments clause does not settle an obligation to make the adjustment on the other state, as is the case in the OECD model, but leaves open the possibility that such state disagrees with the adjustment carried out in the first state. Moreover, the consultation procedure is deemed to be mandatory in the protocol clauses, while, according to the OECD model, it should take place only if necessary. As a result, the correlative adjustment clause in the treaties under examination does not adequately solve the problems of double taxation connected to uncoordinated transfer pricing adjustments. The necessity of initiating a mutual agreement procedure in order to resolve the double taxation problem does not produce any significant improvement with respect to the situation where the modified correlative adjustment clause is missing. Double taxation must in any event be resolved by the mutual agreement procedure.

There is no modified correlative adjustment clause in the Italy–UK treaty, which adopts a more practical approach. The problems related to double taxation in the event of uncoordinated transfer pricing adjustments should soon be resolved by the arbitration procedure set forth in the 1990 EC arbitration convention. Since Italy, France, Germany and the United Kingdom all belong to the EC, enterprises resident in those states should be able to make recourse to this alternative solution.[15] However, the Convention will be applicable only after ratification by all member states. Thus far, it has only been ratified by Denmark, France, Italy and the United Kingdom.

G. *Dividends*

Article 10 of the treaties probably contains the most relevant deviations from the OECD model. The rules which govern the taxation of transnational dividends under the OECD model are, by express recognition of the Commentary to the model, aimed at eliminating juridical double taxation, and do not pursue the elimination of economic double taxation. The provisions of Article 10 of the treaties follow the general criteria adopted in the OECD model, i.e. taxation of the dividends in the country of residence of the recipient, taxation also in the state of residence of the distributing company, but limited to the levy of a withholding tax.

The Commentary on Article 23 A) and B) of the 1977 OECD model is clear in stating that "these articles deal with the so-called juridical double taxation where the same income is taxable in the hands of the same person by more than one state. This case is to be distinguished especially from the so-called economic double taxation, i.e. where two different persons are taxable in respect of the same income or capital. If two states wish to solve problems of economic double taxation, they must do so in bilateral agreements".[16]

This suggestion has been followed by the negotiating parties in the treaties between Italy, France and the United Kingdom. In France, Italy, Germany and the United Kingdom domestic legislation, through an imputation system, eliminates or mit-

14. The criteria for determination of the arm's length price in transactions between associated enterprises have been better outlined in the 1979 and 1984 OECD Reports on transfer pricing. As far as the detailed principles on transfer pricing adopted in Italy are concerned, reference is to be made to the Ministerial Circular No. 2267 of 22 September 1980 which is substantially based on the 1979 OECD Report. The contents of the Ministerial Circular are explained in G. Maisto, Chapter "Italy" *The Tax Treatment of Transfer Pricing* (Amsterdam: IBFD).

15. Art. 6(1) of the Convention provides that where an adjustment of profits is believed to result in double taxation, an enterprise may submit a claim to the competent authority of its state of residence. Other states involved are then notified by this authority.
If the authorities concerned cannot agree on how to eliminate double taxation within two years, an advisory commission is directed to decide the issue within six months (Art. 7). Following that decision the countries involved may enter into additional consultation for up to an additional six months. The national tax authorities may agree to deviate from the commission's ruling, provided that any double taxation is eliminated. However, if the national tax authorities cannot agree on an alternative settlement within the six-month consultation period, the opinion of the advisory commission becomes binding (Art. 12).

16. With respect to intra-group profit distributions, juridical double taxation occurs when dividends are subject to withholding taxes in the country of source and corporate taxation in the country of residence of the beneficial owner of the dividends. Economic double taxation occurs when the business income from which dividends have originated has been subject to corporate income tax in the hands of the distributing company, and the dividends are also subject to tax in the hands of the beneficial owner, in the form of withholding taxes at source or of corporate income tax in the residence country.
Under tax treaties, the exemption method eliminates juridical double taxation by exempting the dividends when they are received by the beneficial owner. It does not help to avoid economic double taxation, as the profits of the distributing company are subject to corporate income tax in the hands of the distributing company and to withholding taxes in the hands of the receiving company.
The tax credit method eliminates juridical double taxation by allowing the beneficial owner of the dividends to credit the withholding taxes levied in the source country. The business profits, after having been taxed in the hands of the distributing company, are taxed also as dividends in the hands of the beneficial owner.
Under these two alternatives, the exemption method usually grants a lower transnational global burden, due to the fact that the treaty already provides for a reduced withholding tax rate. Accordingly, the net double burden amounts to the withholding tax levied in the source country. In the case of the credit method, the withholding tax is fully recovered, but the profits may be taxed at the rate of the corporate income tax in force in the country of residence, which is usually higher than the rate of the withholding tax provided for in the treaty.

© 1993 International Bureau of Fiscal Documentation

igates economic double taxation of dividends distributed by resident companies to resident shareholders. The imputation credit is not extended by domestic legislation to non–resident shareholders. In the Italy-France and the Italy–UK treaties, the benefit of the underlying tax credit is granted to shareholders resident in the other contracting state when the distributing company is resident in the first state.

In particular, Article 10(4) of the Italy–UK treaty provides that a resident of the United Kingdom who receives dividends from a company resident in Italy is entitled, if he is the beneficial owner of the dividends, to the tax credit to which an individual resident in Italy would have been entitled had he received those dividends. However, if the recipient is a UK company which alone or together with one or more associated companies[17] controls directly or indirectly 10 percent or more of the voting rights in the company paying the dividends, the UK company is only entitled to a tax credit equal to one-half of the ordinary credit (subject to the treaty withholding taxes of 5 or 15 percent). In both cases the person receiving the dividends and tax credit must be subject to UK tax on such dividends. The tax credit is considered a dividend, and withholding taxes are levied on the grossed-up amount. Under similar conditions, an Italian shareholder who receives dividends from a UK company is granted the tax credit to which a UK resident shareholder would be entitled had he received those dividends.

The Italy–France treaty provides, in Article 10(4)(a), that a resident of France who receives dividends from a company resident in Italy which would entitle a resident of Italy receiving such dividends to a tax credit, is entitled to a payment from the Italian Treasury equal to such credit, reduced by the 15 percent withholding tax, provided the gross amount of such dividends is added to the taxable base of the recipient determined for purposes of the French income tax. If the shareholder receiving the dividends is a company which is subject to corporate tax in France and which holds, directly or indirectly, for a period of at least 12 months preceding the date the dividends were declared, at least 10 percent of the capital of the Italian company paying the dividends, or which is subject to the French tax regime applicable to parent companies, the amount of the tax credit paid by the Italian treasury will be reduced by one-half. Such payment is deemed to be a remittance of dividends, and therefore it will be subject to a 5 percent withholding tax.[18] When the shareholder resident in France is not entitled to payment of the full tax credit, he is entitled to a refund of an amount equal to the equalization tax pertaining to such dividends, provided the equalization tax has in fact been paid by the distributing company on account of those dividends. This refund is also subject to the levy of the 5 or 15 percent withholding tax. Under similar circumstances, an Italian shareholder of a French company is entitled to repayment of the tax credit on the part of the French Treasury, or, alternatively, to a refund of the French equalization tax.

In the domestic legislation of countries which adopt an imputation system, an equalization tax is normally levied when the company distributes dividends which derive from exempted or non-fully taxed profits. This equalization tax is also normally due if the distribution is effected in favour of non-resident shareholders, which somehow represents an unreasonable levy, as the non-resident shareholder does not benefit from the tax credit granted to the resident shareholder.

In Italy the question of application of the equalization tax on dividends distributed to non-resident shareholders of Italian resident companies has been examined by the Constitutional Court. The judgement of the Court was influenced by the Central Tax Commission of Rome, which brought into question the constitutionality of the equalization tax on such dividends. The Court held that the equalization tax levy on distributions to non-resident shareholders does not infringe the principles laid down in the Constitution. However, the Court stated that the levy of the equalization tax on distributions to subjects who are not entitled to the imputation credit is unreasonable, and should be resolved by way of bilateral agreements.

As mentioned above, refund of the equalization tax is provided for in the Italy–France treaty as an alternative to repayment of the full tax credit, provided the tax has been effectively paid by the Italian company. The possibility of a refund of the equalization tax is also provided for in the Italy–Netherlands treaty and the Italy–Germany treaty.

Dutch domestic legislation uses the classical system rather than the imputation system, so the equalization tax problem only arises with respect to distributions from Italian companies to Dutch resident shareholders. Article 10(3) of the Italy–Netherlands treaty provides that a resident of the Netherlands who receives dividends distributed by a company resident in Italy is entitled to a refund of the amount corresponding to the equalization tax owed, if applicable, by that company in respect of those dividends. The refund is permitted on condition that the Dutch shareholder is the beneficial owner of the dividends on the date the dividends are declared by the Italian distributing company. The refund is subject to the deduction of a 5, 10 or 15 percent withholding tax. The rate of withholding tax depends on the nature of the Dutch recipient and the extent of its participation. Where the recipient is a Dutch company with a participation of more than 50 percent the rate is 5 percent, where it is a Dutch company with a participation of no more than 50 percent but at least 10 percent the rate is 10 percent. In all other cases the rate is 15 percent. To qualify for one of the two reduced withholding rates on the refund (5 or 10 percent) a further condition must be satisfied, i.e. that the participation has been held for a minimum period of 12 months. As mentioned above, no provision for repayment of the equalization tax is required in the

17. Art. 10(4)(b) of the Italy–UK treaty provides that for purposes of this provision "two companies shall be deemed to be associated if one controls, directly or indirectly, more than 50% of the voting power in the other company, or a third company controls more than 50% of the voting power in both of them".

18. However, Art. 10(8) of the treaty provides that where the beneficial owner of the dividends is a company resident in a state, and more than half of its capital is owned by one or more persons who are not resident in that state, the provisions regarding the tax credit payment will apply only if such company furnishes the competent authorities of the other state (if so requested by that competent authority) information permitting the authority to determine whether the company acquired the holding in good faith for business reasons or in the normal framework of investment operations, and not primarily to benefit from the tax credit.

© 1993 International Bureau of Fiscal Documentation

reverse situation, as no equalization tax is levied in the Netherlands.

The German system also provides for an imputation system of taxation of dividends in the domestic context, but the extension of the tax credit to a shareholder resident in the other state has not been included in the treaty by the express decision of the German authorities and, due to the absence of reciprocity, it is not granted by the Italian authorities to the German shareholders. A refund of the equalization tax is, however, contained in the treaty.

Article 10(5) provides that a German company which directly owns at least 25 percent of the capital of a company resident in Italy and which receives dividends distributed by such company is entitled to a refund of the equalization tax attributable to those dividends, provided the equalization tax has been actually paid by the Italian company and subject to the deduction of a 10 percent withholding tax. The refund is also subject to the condition that the German company is the beneficial owner of the dividends, and has held the shares in the Italian company for at least 12 months preceding the date the dividends were declared.

H. *Elimination of double taxation*

Article 24 of the four treaties provides the criteria to be used for the elimination of double taxation on items of income whose right to taxation is granted to the source state. The treaty criteria are similar to the foreign tax credit system under the Italian ITC.[19]. The general rule is subject to an exception with respect to dividends which an Italian resident company derives from its German subsidiary. ITC Article 24(2)(b) provides that income from dividends is excluded from the base upon which Italian tax is levied if the dividends are paid to an Italian company by a German company where at least 25 percent of the capital is owned directly by the Italian company.

The adoption of this exemption rule is strange in all the Italian treaty relationships, the tax credit system being the one consistently adopted.[20]

IV. CONCLUSION

Italian tax treaty policy displays few new developments for the elimination of double taxation. This is particularly true if the methods of elimination of double taxation of transnational flows of profits are taken into consideration. In other areas, for example the elimination on double taxation of transfer pricing adjustments, the methods adopted are weaker than methods in the OECD model, and they reflect the inadequate desire, also on the part of the other contracting states, to solve double taxation problems normally faced by multinational enterprises.

As a part of the Government's international economic policy, the role of double tax treaties is not the facilitation of Italian investments abroad or attraction of foreign investments to Italy. Treaties only serve to realize transnational activities in a less burdensome atmosphere, and this goal is quite satisfactorily accomplished.

---

19. Under ITC Art. 15, a credit for foreign taxes is allowed up to an amount equal to that part of the Italian tax which is proportional to the ratio between foreign-source income and gross income. The credit may be claimed only in the tax return for the year in which the foreign taxes are paid; otherwise the right to the credit is lost.
If income is produced in more than one state, the credit is calculated separately with respect to each state. If the Italian tax has been finalized for the year in which the foreign-source income was included in the taxable base and the taxpayer later receives a refund for foreign tax, a new calculation is made, taking into consideration any subsequent increase in taxable income. In any event, the tax credit is accorded in the year in which it is claimed.
For an explanation of the Italian foreign tax credit system, see B. Gangemi, "Credito d'imposta e redditi esteri", 4 *Bollettino Tributario d'Informazioni* (28 February 1990).

20. The only other exception in an Italian treaty is the exemption from Italian taxes for dividends received by an Italian company from a Brazilian company. See Italy–Brazil treaty Art. 24.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

ASIA & THE PACIFIC

Australia

TOPICAL TAX CASES FOR
Australians. 1991
Edition. By the CCH Tax Editors.
North Ryde, CCH Australia Limited, 1991, pp. 571. 63.- A$.
The book covers over 1600 income tax cases which have been summarized and arranged alphabetically under 48 topic headings. The most significant cases are highlighted and cross referenced where necessary. Precedent-setting decisions from foreign jurisdictions have been included at the end of each topic.
(B. 57.842)

China (People's Rep.)

BUSINESS PROFILE SERIES: CHINA.
10th Edition.
Hong Kong, The Hongkong and Shanghai Banking
Corporation Limited, 1993, pp. 60.
Revised and updated guide giving information on foreign investment, selling to and buying from China, exchange controls, financing of foreign trade and investment, licensing, employment insurance, taxation, patents and trade marks, copyrights, etc.
(B. 57.852)

India

IMPORT – EXPORT POLICY AND
procedures 1992-97
(as amended up to July 1992). 2nd Edition.
New Delhi, Nabhi Publications, P.O. Box 37, New Delhi 110001, 1992, pp. 500.
Second revised and enlarged edition of a compilation on India's import and export policy and procedure.
(B. 57.850)

Macau

BUSINESS PROFILE SERIES:
Macau. 5th Edition.
Hong Kong, The Hongkong and Shanghai Banking
Corporation Limited, 1992, pp. 43.
Revised and updated guide on how to do business in Macau. Information is given on advantages and incentives for businessmen, company registration, industrial licences, taxation, investment incentives, import and export regulations, insurance, shipping documents, exchange controls, patents and trade marks, etc.
(B. 57.851)

Malaysia

SINGH, Veerinderjeet.
Malaysia Taxation. Administrative & Technical aspects.
Selangor, Longman Malaysia Sdn. Bhd., 3 Jalan Kilang A, 46050 Petaling Jaya, Selangor Darul
Ehsan, Malaysia, 1992, pp. 856.
The book provides an in-depth review of the various issues connected with Malaysian tax legislation. It not only discusses the technical aspects but also provides numerous examples to illustrate the law at work. The emphasis is on income taxation, legal provisions, case law decisions, Inland Revenue Department practice and guidelines, as well as administrative aspects relating to tax systems and reforms.
(B. 57.839)

1993 MALAYSIAN MASTER TAX
Guide. 10th Edition.
By CCH Tax Editors.
Singapore, CCH Asia Limited, 1993, pp. 1300
Practical, accurate and reliable presentation of the structure, features and ambit of Malaysian income tax law. The book explains the law relevant to individuals, partnerships, corporations and other taxable entities. Real property gains tax, development tax and double taxation are also covered. The law in the book stands as at 15 February 1993.
(B. 57.845)

New Zealand

McKENZIE, Alastair.
GST. A practical guide. 5th Edition.
Beach Haven, CCH New Zealand Limited, 1993, pp. 226.
Explanation of goods and services tax. Based on the Goods and Services Tax Act 1985, this edition includes legislative developments, Court decisions and rulings by the Commissioner of Inland Revenue to 1 January 1993.
(B. 57.846)

CARIBBEAN

CARIBBEAN BASIN EXPORTER'S
guide.
Washington, US Department of Commerce/-International Trade Administration, U.S. Agency for International Development, 1992, pp. 84.
The Caribbean Basin Initiative (CBI) is a broad program to promote economic development through private sector initiative in the Central American and Caribbean countries. Subjects dealt with are preferential trade opportunities, customs procedures, U.S. regulatory requirements.
(B. 18.750)

Netherlands Antilles

F. DAMIAN LEO; JOSEPHINA, Geraldine C.
Business operations in The Netherlands Antilles.
Washington, Tax Management Inc. 1993 Tax Management Foreign Income Portfolios, No. 974., pp. 135.
Portfolio analyzing the existing legal framework affecting foreign investment in The Netherlands Antilles. The detailed analysis discusses investment facilities, taxation of individuals and businesses, both onshore and offshore and forms of doing business in the Netherlands Antilles. Additionally, there is discussion of tax treaties, with special attention given to the tax treaty with Norway and avoidance of double taxation within the Kingdom of The Netherlands.

Austria

HAMMERER, Gerda.
Die Pensionskasse. Steuerliche Aspekte.
Vienna, Linde Verlag Wien AG, 1992, pp. 96. 212.- AS.
Book in which the author deals with Austrian tax law on pension funds for businessmen as well as employees.
(B. 112.281)

KOHLER, Gerhard; KOHLER, Dagmar.
Arbeitstabellen fr den Steuerpraktiker. Stand 1. März 1992.
Vienna, Linde Verlag Wien AG, 1992, pp. 140. 397.- AS.
Working charts for the tax practitioner. Compilation of the most important provisions of the Austrian 1992 VAT Law, the 1989 Income Tax Law, the 1989 Corporate Income Tax Law, the 1954 Net Worth Tax Law, the 1953 Substitute Inheritance Tax, Real Estate Acquisition Tax Law and other taxes in chart form. Current as at 1 March 1992.
(B. 111.970)

LAMPERT, Wolfgang.
Wirtschaftspartner österreich. Austrian partner. 2. Auflage.
Vienna, Linde Verlag Wien AG, 1992, pp. 233. 398.- AS.
The book gives the basic information which is necessary to set up an enterprise in Austria. Many calculated examples help make the right decision. The appendix contains a list of important addresses.
(B. 111.972)

LANG, MICHAEL.
Hybride Finanzierungen im Internationalen Steuerrecht. Rechtsgrundlagen der Doppelbesteuerungsabkommen zur Beurteiligung von Mischformen zwischen Eigen- und Fremdkapital.
Vienna, Wirtschaftsverlag Dr. Anton Orac. 1991.
Schriften zum österreichischen Abgabenrecht, Band 30., pp. 204. 590.- AS.
Hybrid financing in international tax law. Legal basis of tax treaties in relation to mixed kinds of personal and outside capital. The author introduces the problems of innovative kinds of financing. First he explains the interpretation of tax treaties, then he explains the decisive attribution provisions and terms. In the fourth chapter he reflects the hybrid focus of financing to the OECD and the Austrian tax treaties.
(B. 111.088)

CSOKLICH, Peter; GRÖHS, Bernhard.
Stiftungen. Ein Praxisleitfaden.
Vienna, Linde Verlag Wien AG. 1993.
Schriftenreihe der Steuer- und Wirtschaftskartei No. 56., pp. 100. 297.- AS.
Foundations, a practical guide. Booklet which addresses consultants dealing with problems of management of property, thereby focussing on the possibilities of using Austrian foundations in Liechtenstein, Switzerland or Germany. It also deals with the planned new law on private foundations.
(B. 112.647)

BARTHOLNER, Wilfried; KOBAN, Robert.
Handbuch für Einnahmen-Ausgaben-Rechner. Gewinnermittlung – Besteuerung – Aufzeichnungen für die Praxis. 3. Auflage.
Vienna, Linde Verlag Wien AG, 1991, pp. 364. 398.- AS.
Third revised and updated edition of handbook for income and expenditure accountants. The book describes the nature and practice of income and expenditure account as well as all relevant taxes. The author describes the specifics of branches and the VAT abatements in relation to taxation. In addition to that they describe the discussions with the Ministry of Finance.
(B. 111.443)

HOSKIN, Ernest.
VAT case digest. UK & Community Law.
London, Sweet & Maxwell. 1992 £ 105.-.
Loose-leaf publication divided into five sections, including a case of tables and a brief index. The first section "Appeals to the European Court of Justice" refers only to the reference for a preliminary ruling procedure under Article 177 of the EEC Treaty. The second section covers VAT cases heard by the European Court of Justice in summary form. In the decided Article 177 actions, the book presents the question sent to the Court for preliminary ruling, the facts of the case, a reference to the Community law provisions; the advocate-general's opinion; the judgement of the Court and a brief comment. The third section covers VAT cases heard by UK tribunals and courts, also in summary form setting out the facts, the UK and Community law provisions and the decision of the VAT Tribunal or court which heard the matter. The fourth section, VAT cases heard outside the UK is very brief and includes but a few entries. The fifth section covers relevant non-VAT cases.

HUSSEY, Ward M.; LUBICK, Donald C.
Basic World Tax Code and Commentary.
Arlington, Tax Analysts, 6830 North Fairfax Drive, Arlington, Virginia 22213, USA, 1992, pp. 267. $ 19.95.
This book has been prepared primarily for the use of tax policy makers and administrators in countries with developing economies, or in transition to a market economy. The book consists of 2 parts: 1) the BTC – the text of a comprehensive law establishing an income tax, a value added tax, excise taxes, a real property tax, and the necessary machinery to enforce and collect these taxes; 2) a commentary explaining the text of the law. The commentary gives special attention to those areas of the laws's text that are either novel or not the traditional approach to the problem at hand.

10th Asian-Pacific Tax Conference

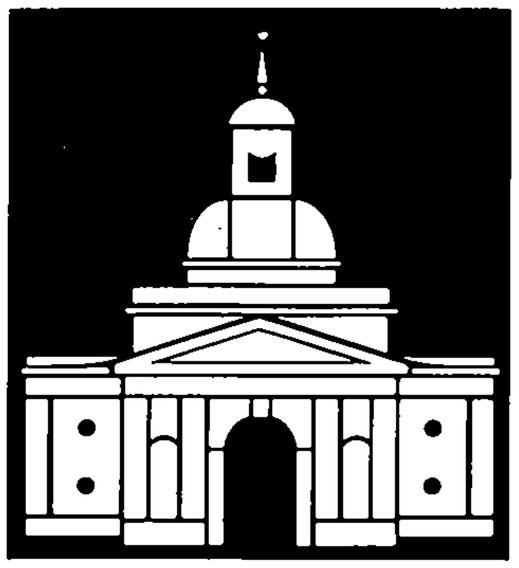
New Places – New Opportunities
New Taxes – New Problems

18 & 19 November 1993 **Hilton Hotel, Singapore**

An exploration of new investment opportunities in Vietnam, Laos, Myanmar & Kampuchea, Thailand and China, including:

- Recent developments in legislation and their application in practice
- Future legislative developments

New taxes in prospect in the Area, including:



- Value Added Tax: The European experience and an overview of the current state of affairs in Indonesia, Singapore and Malaysia
- New Taxes under the Clinton Regime: how will potential US Tax results affect international investment and, more particularly, investments in South East Asian Countries.

The panel of speakers includes John Dick, Alex Sanford, Saroyo Admosudarmo and Frank Ramaizel. The conference will be chaired by Sydney Rolt. Questions and discussion are encouraged throughout. An invaluable opportunity for anyone involved in international business.

Costs: APTIRC Members: S$1,250 (US$780), Others: S$1,450 (US$900)
Includes conference facilities, documentation and daily breakfast, lunch and refreshments. Discount for early registration or group bookings.

INTERNATIONAL POLICY CONSIDERATIONS IN THE TAXATION OF FOREIGN SOURCE INCOME — 547 — *John Azzi*
The way in which a capital exporting nation chooses to tax earnings derived from foreign investments affects the interests of the nation as a whole, as well as the interests of the resident taxpayers who are affected by such measures, as well as the capital importing country. This article outlines the policy issues involved in the taxation of foreign source income and examines the economic effect of the foreign source income rules recently introduced in Australia.

NEW ZEALAND: COMPREHENSIVE DIVIDEND IMPUTATION, NEUTRALITY AND DOUBLE TAXATION OF CORPORATE PROFITS — 568 — *Andrew M.C. Smith*
To mitigate the double taxation of corporate income arising under the classical system of taxation, New Zealand introduced a comprehensive dividend imputation system in 1988. This article examines the imputation regime adopted in New Zealand and looks at whether the regime is capable of achieving the stated objectives when first introduced.

UNITED STATES: REVENUE RECONCILIATION ACT OF 1993 — 581 — *John G. Rienstra*
The United States has enacted the Revenue Reconciliation Act of 1993. The Act is the first major tax legislation to be enacted since 1990, and represents the most significant change in the US tax laws since the Tax Reform Act of 1986. The author discusses the increased tax rates under the Act and other provisions of interest to international businesses and investors.

NETHERLANDS: PROPOSED TAX HAVEN LEGISLATION — 589 — *Ebel Magnin*
On 16 July 1993 the Dutch Ministry of Finance published a draft bill concerning the amendment of the Corporate Income Tax Act. The draft bill proposes to amend the exemption of intercorporate dividends (participation exemption) where such dividends are received from tax haven companies. The draft bill also introduces a form of earnings stripping provision where interest is paid to affiliated tax haven companies.

GERMANY: NEW THIN CAPITALIZATION RULES — 594 — *Dr Klaus Sieker and Adrian Yeeles*
After years of discussion and a number of unsuccessful attempts a thin capitalization rule has finally been enacted in Germany. This article examines the new rule, analyses the tax consequences of reclassified interest expense and presents some practical considerations.

UNITED KINGDOM: HOLDING COMPANY REGIMES	599	*Eric Tomsett* As a location for an international holding company the United Kingdom is notable for some very significant advantages sharply contrasted by major disadvantages. This article takes a look at both.
BANGLADESH: SALIENT FEATURES OF THE 1993/94 BUDGET	601	*K.A. Gofran* This article highlights a number of tax measures included in the new budget.

POLICY CONSIDERATIONS IN THE TAXATION OF FOREIGN-SOURCE INCOME

John Azzi
(B Ec., LL B), ATAX, Faculty of Law, University of New South Wales

This paper was presented during the 5th Annual Conference of the Australasian Tax Teachers' Association, held in Christchurch, New Zealand 17-19 January 1993.

Contents

I. Introduction
II. Objectives of a Good Tax System
A. Appropriate tax policy objectives
B. Conclusion
III. Economic Consequences Arising from the Removal of Tax Biases in Favour of Foreign Source Income
A. Introduction
B. An account of the development and principles of accruals basis taxation
C. Arguments for and against eliminating tax biases in favour of foreign investment income
D. Conclusion

I. INTRODUCTION

The recent spate of legislative reform in the area of taxation, in particular the taxation of international flows of income, provided the necessary impetus for this paper. The focus of the paper particularly in Part III will be the appraisal of the economic effect of the foreign-source income rules (i.e. the accruals rules) which were recently introduced by the Australian Government. It is noted that the way in which Australia, or for that matter any capital exporting nation, chooses to tax earnings derived from foreign investments affects the interests of the nation as a whole, as well as the interests of the resident taxpayers who are affected by such measures, as well as the capital importing country. However, before we turn to such a discussion, it is necessary to outline the policy issues involved in the taxation of foreign-source income. This task will be undertaken in Part II. In this area of taxation, there is the complex problem of shaping tax policy to be consistent with the principle of taxpayer equity when income is generated abroad and subject to tax in a foreign jurisdiction.

II. OBJECTIVES OF A GOOD TAX SYSTEM

Generally, we need to discuss tax policy considerations as a means of evaluating our present tax system. Change, no matter how theoretically desirable, will not come without costs. We have to be concerned with the projected benefits and transition costs in deciding whether there is a clear net benefit with any suggested reform.

Specifically, in formulating tax policy toward investment abroad, the Australian Government must look at the interests and opinions of the private investor but it must also look beyond them. Policy makers must concern themselves with the economic welfare of the nation as a whole, and thus with the extent to which Australian foreign investment conflicts with or contributes to the achievement of various national goals, and to ensure that its tax policy reflects that.

There have been numerous theories propounded as to what constitutes a "good" tax system (see for example, theories propounded by such eminent economists as Adam Smith,[1] John Stuart Mill,[2] and Henry Simons,[3] who propounded theories on how the system of taxation should be utilized, and the justification for such a system in "modern" economic society). The authors of one of the more respected modern textbooks on the theory of taxation have summarized six criteria which they suggest may be used to appraise the quality of a tax structure. They are:

(1) The distribution of the tax burden should be equitable ("Equity").
(2) Taxes should be chosen so as to minimize interference with economic decisions in otherwise efficient markets ("Neutrality").

1. Smith A., *The Wealth of Nations*, Vol. 2 (London: J.M. Dent & Sons Ltd, 1958), specifically at 307, where Smith postulates four principles of tax design.
2. Mill, J.S., *Principles of Political Economy* (London: Longmans, Green and Co, 1848, 1909 reprint), at 357 in particular where Mill comments on the inherent inequity associated with tax policies aimed at introducing a progressive tax system.
3. Simons, H.C., *Personal Income Taxation: The Definition of Income as a Problem of Fiscal Policy* (Chicago: University of Chicago Press, 1938), at 18 where Simons propounds a theory that taxation always affects the distribution of income.

© 1993 International Bureau of Fiscal Documentation

(3) Where tax policy is used to achieve other objectives, such as to grant investment incentives, this should be done so as to minimize interference with the equity of the system ("Efficiency").
(4) The tax structure should facilitate the use of fiscal policy for stabilization and growth objectives ("Revenue").
(5) The tax system should permit fair and non-arbitrary administration and it should be understandable to the taxpayer ("Simplicity").
(6) Administration and compliance costs should be as low as is compatible with the other objectives ("Administration and Compliance").[4]

In many cases there will have to be "trade-offs" between the various objectives. For example, the promotion of equity may require administrative complexity and may interfere with neutrality and so forth.

Concerns expressed over a number of years regarding the activities of multinationals and the exercise of domestic control over these activities carry with them a suggestion that these activities could have a significant impact on the effectiveness of national tax regimes. Therefore, consideration of the six criteria mentioned arise, which can only be appreciated by looking at the domestic tax system in its international setting.

If we were to confine the consideration of a "good" tax system to a "good" international tax system then it could be easily argued that the goal of any country's tax system with respect to international income flows must be to maximize the net economic benefit derived from foreign investment in the country and from investment abroad by its residents. However, since Australia is a net capital importer with a relatively small economy, it must ensure that its policies do not greatly offend against the current rules of the international tax game, otherwise it may well lose in the end. The interplay of the laws of different countries creates an international pattern or system of taxation from which important economic, moral and political considerations arise. Professor Bird notes that:

> 'Small' countries like Australia are in general advised by tax experts not to attempt to tax international capital flows above the norm prevailing in the dominant capital exporting countries, since by doing so they tend more to penalize the less mobile factors in their own country than to reap any national (or sectoral) gain.[5]

However, Bird distinguishes between portfolio investment and mature direct investment. With respect to the latter the appropriate policy, he suggests, would be for a country like Australia (or for that matter, New Zealand), which is both a capital exporter as well as a capital importer, to implement relatively low domestic corporate tax rates and relatively high withholding taxes.[6] Such a policy would distort capital flows by providing incentives for capital to be attracted to the low tax jurisdiction whilst providing a disincentive for exporting capital in the form of high withholding taxes.

The discussion in the preceding paragraphs concisely illustrates the dilemma between national and international interests which policy makers must confront each time they introduce policy measures to tax international capital flows. That is, no country (especially ones as small as Australia and New Zealand) can have its own way in any aspect of international taxation. This is particularly so in the case of foreign-source income where the source country has the primary taxing rights over such income. In formulating tax policies for combating manipulation of source and residence rules, and particularly, *deferral*[7] of domestic tax in respect of foreign-source income, the capital exporting nation must also consider whether the expansion of foreign investment is an appropriate and effective means of enlarging the market shares of domestic investors abroad. This aspect of the discussion will be pursued in Part III.

The purpose of this section is to examine the appropriate tax policy objectives (i.e. the six criteria of a "good" tax system outlined above) that should underlie taxation of foreign source income. As indicated above, those objectives also underlie the objectives for taxing income generally. Therefore, we will begin with a discussion of tax policies which promote equity in the tax system. Consideration is then given to policies which promote neutrality in the system, and so forth.

A. *Appropriate tax policy objectives*

1. Equity

There are three aspects of equity – horizontal equity (which requires that taxpayers in like positions be treated alike); vertical equity (which requires that those in different positions be treated differently) and inter-nation equity (which requires that distribution of revenues between different states be relatively fair).

Unlike horizontal and vertical equity, the question of inter-nation equity raises the question of what justifies a state in imposing its taxation laws on an individual or a company. This question relates back to the fundamental issue relating to a state's jurisdictional competence to levy taxes in the first place (i.e. source and residence principles). The role of double taxation agreements ("DTAs") could be very significant in this respect. This aspect of equity was the subject of a joint paper by Professors Musgrave and Musgrave "Inter-nation equity",[8] and will not be discussed in any detail here.

Everyone agrees that each taxpayer should contribute his "fair share" to the cost of Government. But there is no such agreement about how the term "fair share" should be defined. There are two main theories propounded for evaluating the basis of equity between the individual taxpayer and the state:

4. Musgrave, R.A. and Musgrave, P.B., *Public Finance in Theory and Practice* (4th ed.) (New York: McGraw-Hill Book Company, 1985), at 225.
5. See Bird, R., "International Aspects of Tax Reform in Australia", in Head J.G. (ed.) *Australian Tax Reform in Retrospect and Prospect* (Australian Tax Research Foundation, 1989), at 173.
6. Id.
7. Prior to the introduction of the accruals legislation, *deferral* of domestic taxes occurred through the simple interposing of a foreign subsidiary in order to earn or receive foreign-source income. Such manipulation was effective by reason of the fact that under general law, a subsidiary is treated as a separate legal entity from its parent; see *Salomon v. Salomon & Co. Ltd* [1897] AC 22.
8. In Bird, R. and Head, J. (eds.), *Modern Fiscal Issues* (Toronto: University of Toronto Press, 1972), at chapter 4.

© 1993 International Bureau of Fiscal Documentation

(i) the "benefit" principle (as propounded by Adam Smith), or (ii) the "sacrifice" or "ability-to-pay" principle (as propounded by J.S. Mill). The rationale underlying the "ability-to-pay" approach is that people with equal capacity should pay the same tax (i.e. "horizontal" equity), while people with greater ability should pay more tax (i.e. "vertical" equity). Income has been the most widely accepted measure of ability to pay.[9]

Both theories suffer from drawbacks. For example, what benefits are to be considered in relation to the first theory – "status based benefits" or "economic benefits"? With respect to the sacrifice theory, it is argued that such criterion as the moral obligation to the state to contribute to its revenues is not appropriate to determine the taxation of highly individualistic internationally mobile taxpayers whose activities and transactions are difficult to tie to a particular state or community. Additional criteria may be necessary to identify the link between state and individual or company which justifies the extension of the state's tax regime to that individual.

> "For benefit taxation to be equitable, it must be assumed that a 'proper' state of distribution exists to begin with. This is a serious shortcoming since, in practice, there is no separation between the taxes used to finance public services and the taxes used to redistribute income. The ability-to-pay approach better meets the redistribution problem but it leaves the provision for public services undetermined."[10]

In an attempt to overcome the drawbacks of the two approaches to equity mentioned above, Vogel[11] has resurrected the notion of "economic allegiance" as first propounded by Harding in 1933, where he rationalized the right of a state to impose tax on goods and services that are identified with the economic structure of the state.

> "It appears that the State may tax all property, goods, labour, services, and the like, which have become identified with the economic structure of the State, by incorporation into or integration with the business mechanism so defined ... The right to tax then depends upon the fact that the economic wealth is being used in the coordinated economic task of the social group; that it is producing utility or wealth or service in connection with, as part of, and because of the economic transaction of the social group."[12]

The "economic allegiance" theory appears to be an appeal to an element of benefit theory since it relies on the notion that an individual is bound to the state through participation in and enjoyment of the economic benefits provided by that state, whether by virtue of residence, investment, consumption or whatever. Therefore, the same drawbacks present with the benefit theory are implicitly present with the economic allegiance theory. Moreover, it is not certain how the economic allegiance theory could justify one particular state asserting its fiscal jurisdiction over the activities of a taxpayer with various processing and manufacturing plants in a number of countries. The role of DTAs, if there are any, should come into play here in order to restrict the right of the source state to levy taxes up to a particular level, leaving the residue for taxation by the residence state. But this is an imperfect solution.

Whichever theory is applied, it is suggested that the results under both theories should not differ significantly in the international arena. Either of the two fundamental approaches would suggest that an individual or corporation should be liable to tax in each country in which they operate, to the extent of their economic involvement there.

In identifying the shortcomings of both approaches, Musgrave and Musgrave nevertheless concede that the "ability-to-pay" principle is to be preferred to the "benefit" principle. The Asprey Committee, on the other hand, suggested that the "benefit" principle has its place in the discussion of Australian-origin income of non-residents.[13]

If governments were to implement equitable taxation in line with ability-to-pay then, as mentioned earlier, there would need to be certain adjustments and assumptions made before such an approach may be usefully applied.[14] The problem is further exacerbated by the existence of tax preferences and incentives for special interest groups. In fact, tax preferences and incentives, coupled with the complexity of modern tax legislation and the often inadequate administrative arsenal to monitor such complex rules, afford many opportunities for legitimate (as well as illegitimate) tax planning. This fact should not, however, detract from adhering to or at least striving for greater equity whenever tax reform measures are contemplated or implemented. Within the sphere of the specific topic of this paper, the application of the concept of equity (i.e. both horizontal and vertical) as developed from the "ability-to-pay" principle involves several special problems which were alluded to earlier. These problems may be summarized as follows:[15]

(i) Which persons should be treated equally? Usually this question is resolved in favour of treating residents (or citizens in the case of the United States) who are taxable on their worldwide income equally. It is noted that there are two concepts of individual equity – national and international equity. Under the latter concept of equity residents or citizens should include any foreign source income on a current basis in their income for domestic tax purposes, so that they are treated the same as residents who have only domestic source income. Whereas, under the national equity concept, only net income (net of all foreign taxes) repatriated to the individual investor should be subject to domestic taxation.[16]

(ii) A problem which is linked to the first problem lies in the definition of a "resident" (or "citizen" in the case of the United States). In terms of the general principles of equity, a nec-

9. This fact is not beyond controversy. Some commentators would hold that "consumption" would be a superior base. In fact, John Hobbes, in his philosophical treatise, *Leviathan* , argued that a person should pay tax on what he or she uses and not on the fruits of labour which are saved.

essary assumption is that if you are a resident of one country you cannot also be a resident of another. If this were the case, then scope for international double taxation would exist, and the ability-to-pay approach would be imperceptibly distorted. Another difficulty which is related to this problem is the issue of whether equal treatment should be judged from the perspective of only domestic taxation or with respect to the total burden, foreign and domestic.

(iii) Should equitable principles differ when corporations rather than individuals are involved? This question, it is suggested, depends on whether a country has a "classical" system or an imputation system. Without embarking on a detailed discussion of either the classical or imputation systems, broadly, under a classical system, a corporation is a separate taxable entity in substance; therefore foreign corporations should arguably be treated the same as other corporations and individuals. Since tax is ultimately paid only by individuals (who receive dividends), however, this view of equity and corporations is not very satisfactory. On the other hand, under an imputation system, a corporation is treated as a conduit, and the corporate tax is a means for currently taxing the undistributed income of a corporation.[17] Consequently, it is suggested that equity is relevant only with respect to individual shareholders.

(iv) Under the principles of equity, the tax consequences of doing business overseas through either a branch or a subsidiary should be exactly the same. However, by extending the principles of equity to the corporate investor, it is necessary to distinguish between the various forms of offshore investments – that is, branch, subsidiary or portfolio investments. The principles of international equity with respect to the corporate investor dictate that the following should be observed:[18]

(a) Foreign branch profits gross of foreign tax should be taxed as earned to the domestic parent, with a direct credit given for the foreign taxes paid.
(b) What constitutes equitable tax treatment of corporations that invest abroad through foreign incorporated subsidiaries depends largely on whether the parent and foreign subsidiary are regarded as separate entities or as a single entity:
    (i) if the single entity approach is taken, then profits of the foreign subsidiary accruing to the domestic parent should be taxed in the same manner as foreign branch profits;
    (ii) if the separate entity approach is taken, then it is suggested that the parent company should only be taxed on investment income received. Therefore, foreign taxes should be treated as a credit against domestic tax under the international equity approach or as a deduction under the national equity approach.
(c) Equitable tax treatment of portfolio investments corresponds to the tax treatment of investments in foreign subsidiaries under the separate entity approach.

(v) Another difficulty which arises only with respect to the taxation of foreign-source income is the equitable allocation of tax revenues between the country of source and the country of residence to be calculated (i.e. "inter-nation equity"). This issue involves the assertion of jurisdiction to tax, the selection of a tax base and the method of providing relief from international double taxation. In this respect, the role of DTAs has most significance, and as such the principles of equity usually take a secondary role to the political processes that go into negotiating DTAs.

(vi) Perhaps the most hotly contested issue so far is the adoption of a system of "*unitary*" taxation by a number of American states to overcome the ability of multinational corporations to manipulate the "arm's length" provisions designed to deal with transfer pricing by diverting income from high tax to low tax jurisdictions.[19] The controversy has been developing for some years now, with Australian authorities refusing to recognize or credit US taxes imposed under a system of unitary taxation, the result being that serious double taxation of particular corporations can arise, especially in respect of those corporations established, for example, in California (i.e. which adopts a unitary taxation system) as well as having a subsidiary in Australia.[20]

The problems outlined in the preceding paragraphs demonstrate some of the conceptual difficulties that drafters of any new tax legislation must grapple with. These problems are further compounded when we come to consider the other criteria for evaluating the design of a "good" tax system.

2. Neutrality

In general, if a tax does not distort private decisions it is said to be "neutral". Given the close link between efficiency and neutrality it becomes easier to assess distortions caused by taxes. Capital is allocated efficiently if pre-tax marginal returns on alternative investments are equal. Accordingly, taxation will not distort allocative decisions involving investments as long as alternative investments are taxed at the same rate. Despite the apparent simplicity of this criterion for neutrality, the question takes on considerable complexity in the international realm. For one thing, neutrality cannot be defined unless, from the national perspective, one defines the alternative investments at issue, being domestic versus foreign investment undertaken by domestic investors, and those undertaken by investors abroad. In the international tax sphere two concepts of neutrality exist – "capital import neutrality" and "capital export neutrality".

Capital import neutrality exists when firms of all nations pay the same rate of tax on capital earnings in the particular country for which capital import neutrality is said to apply. Domestic tax law must not discriminate among investors according to nationality.[21] In applying the concept of capital

17. For a discussion of the policy objectives in introducing an imputation system, see Bird *supra* note 5, at 168-172.
18. See Musgrave *supra* note 16, at 122-124.
19. Corporations that are established in the state and are part of a multinational group are taxable on a portion of the entire group's worldwide income determined in accordance with a formula usually based on payroll, assets and sales. The District Court of California has held that the worldwide unitary tax method, as applied by the State of California, was unconstitutional; see *Colgate Palmolive v. Franchise Tax Board* (unreported, 12 December 1988).
20. In Australia, unitary tax is not recognized as a foreign tax; see Sec. 6AB(2).
21. The most straightforward way to accomplish capital import neutrality is to exempt foreign-source income from domestic taxation.

© 1993 International Bureau of Fiscal Documentation

import neutrality in an Australian context, it is noted that this concept dictates that in order to create a competitive environment for Australian firms investing abroad, foreign-source income should only be taxed at the rate facing other investors in that source, arguably the rate of the capital importing country.[22] However, the difficulty with the capital import neutrality argument is in identifying the nature of the competitive disadvantage which arguably would arise from the Australian Government imposing tax on those Australian firms investing abroad.

Some commentators cast doubts on whether, in fact, a competitive disadvantage in the form of higher prices for goods produced offshore by those Australian firms investing offshore would arise where the Australian Government did not adhere to the principles of capital import neutrality. It is argued that the burden of tax in the form of higher prices will not be borne by consumers since such a result will be contrary to the generally accepted assumption that company tax is borne by the shareholders and as such should not affect the firms' pricing policies.[23]

On the other hand, it is suggested that if the nature of the competition lies in the competition for share capital, then it does not help to resort to the capital import neutrality argument to support the proposition that Australian firms investing abroad should be taxed at the rate facing other investors in the capital importing country. Firms investing overseas are in most cases competing in domestic capital markets, and as such, will only be competitive where they can offer the same rate of return as other firms competing in those markets.[24] Another commentator has discredited consideration of this concept of neutrality in the case of genuine income earned abroad on the basis that there is no organized evidence tending to show that the costs in foregone revenue of allowing deferral in respect of genuine business income are commensurate with the benefits.[25]

Capital export neutrality, on the other hand, prevails if equal pre-tax returns on domestic and foreign investments provide equal after-tax returns. This view of taxation is favoured most by those advocating the credit method of taxing foreign-source income for reasons both of equity and efficient resource allocation.[26] However, economic evidence supporting either view of taxation of foreign-source income (i.e. capital import or capital export neutrality) cannot provide definitive answers to resolve the debate as to which principle of neutrality should be followed, as the results depend on assumptions which need to be made about the values of critical parameters for which there is little or no empirical evidence. It has been observed that capital exporting countries are forced to establish capital export neutrality because of tax planning opportunities arising from manipulation of foreign tax credit system ("FTCS") rules by multinationals.[27]

Logically, policies to achieve capital export neutrality or to achieve capital import neutrality need not be and, indeed, generally are not consistent with each other. However, for both capital export and capital import neutrality, the focus of policy is the overall tax rate on foreign investments inclusive of levies of both source and residence countries. The policies differ in regard to which tax rate, domestic or foreign, predominates: for capital export neutrality it is the domestic rate, while for capital import neutrality it is the foreign rates.[28]

Without reproducing the formulae which were used by Thomas Horst to test which view of neutrality gave rise to the optimal rate of tax, it is sufficient to merely note the results. It was found by Horst that the optimal rate of tax levied by the capital exporting country on foreign-source income depends on the elasticity of demand and supply for capital in the capital exporting country and the capital importing country as well as on the tax rates in both countries. He was able to show that where it is assumed that the supply of capital in both countries was fixed, then the tax on the foreign-source income should equal the tax on income in the capital exporting country. This would tend to reflect the capital export neutrality result. On the other hand, where the demand for capital is fixed in both countries, then when the combined tax on international income equals the tax on domestic income in the capital importing country, "*capital import neutrality* obtains".[29]

Another view of tax neutrality, "*national neutrality*" (which is also referred to as the national welfare criterion), is propounded. This criterion has been defined as characterizing a regime in which total returns on capital in the domestic country, which are shared between the domestic investor and the Treasury, are the same whether the capital is invested at home or abroad.[30] It is argued that under this standard, the domestic country's capital will be invested abroad up to the point at which before-tax profits at home equal after-tax profits abroad, thereby promoting the viewpoint of the capital exporting country. This, it is submitted, results in maximum national product. This is because the foreign tax levied on foreign investment is not being received by either the domestic Government or the investor, and therefore represents a deadweight loss to the domestic economy. Moreover, it is suggested that national neutrality may be regarded as equitable because it requires taxpayers with equal worldwide incomes to pay the same domestic taxes.[31]

However, in defining this criterion in terms of the Australian economy, it is noted that as both a capital importer and exporter, Australia should tax foreign-source income as earned with a *deduction* for foreign taxes. Where this is the

case then it is suggested that as far as the treatment of Australian residents who invest abroad is concerned "the 'nationally efficient' as well as the revenue-maximizing solution ... [is] to allow only the deduction of foreign taxes, but then to give full imputation credits on all foreign source income".[32] However, since the Federal Government has decided to adopt a foreign tax credit system similar to that adopted by most other OECD countries, it is suggested that no imputation credits should be granted for foreign tax paid on foreign-source income.

The Australian Government defended its intention not to allow imputation credits for foreign taxes paid as follows:[33]

- no other OECD country explicitly provides imputation credits for foreign taxes paid;[34]
- such a method would collect less Australian tax than the previous exemption method that was abolished from 1 July 1987;
- it would in some cases require Australia to refund to shareholders taxes paid to foreign governments; and
- there is no evidence that it would be in Australia's economic interest to provide such credits.

The Government's justifications for the "non-neutrality"[35] in the tax system which is created by not allowing imputation credits for foreign tax paid seems to also draw some qualified support from Professor Bird where, after analysing the economic effects resulting from extending the imputation system to foreign-source income, he observed that it may be better on efficiency as well as revenue grounds, where a FTCS is adopted, not to give imputation credits on foreign-source income.[36] Although, from the foregoing discussion, it would appear that this is only a second best alternative to allowing a deduction for foreign tax paid with a full imputation credit.

However, tax policies directed at promoting the welfare of the host country cannot be viewed in isolation. In the case of Australia and New Zealand, the reactions of their major trading partners who are all dominant capital exporters in the world economy (i.e. the United States, United Kingdom, Japan, France and Germany) to any policies introduced to tax international capital flows must be taken into account. Consequently, the design of policies to tax international capital flows should not generally deviate too much from the norm prevailing in those dominant countries; not to do so would make little sense in terms of international political economy.

Clearly, the question of which view of neutrality is more persuasive has been the subject of much controversy.[37] There are two aspects to the controversy. The first relates to which concept of neutrality should be preferred, national or international.[38] The second is in deciding whether capital export or capital import neutrality is more important in formulating policies to tax foreign-source income.

As indicated above, the achievement of national neutrality is facilitated by taxing all foreign-source income on a current basis with a deduction for foreign taxes paid. On the other hand, the achievement of international neutrality is facilitated by the taxation of all foreign-source income on a current basis with the provision of a foreign tax credit for foreign taxes paid by the foreign subsidiary.

In addition, the norm of international practice is to incorporate elements of both capital export and capital import neutrality into the tax policy of capital exporting countries. That is, residents are taxed on their worldwide income with a credit for foreign taxes. Perhaps the major departure from international tax neutrality occurs where there is *deferral* of domestic taxation on the foreign-source income of foreign corporations.

Therefore, for corporate investments in a foreign subsidiary, both neutrality and international equity may be achieved under the single entity approach, which calls for taxation of foreign profits as earned and a full credit for foreign taxes. To this extent, the New Zealand international tax model which currently taxes foreign-source income of controlled foreign corporations ("CFCs") without allowing deferral in respect of genuine foreign business income comes closest of all to achieving this goal.[39] It is noted that of all the other nations which have introduced CFC-type legislation, all but the New Zealand CFC regime contain an exemption for genuine business income.

3. Efficiency[40]

The Asprey Committee took the view that economic efficiency is generally best served by a neutral tax system (where the "tax system" must be understood to refer to all the taxes, Australian and overseas, that bear on the operations). They noted that "a more equitable way of taxing foreign-source income is likely to be more efficient. But the emphasis in considering equity is on income taxation viewed in isolation from other taxes, whereas an appraisal in terms of efficiency must be made of the tax system as a whole".[41]

National interests are adversely affected to the extent that there are certain externalities associated with foreign investment. Efficiency will be compromised if the profitability of operating abroad, rather than at home, is affected by other tax differences (such as those in the area of customs duties) although the same amount of income tax is paid on income from Australian sources as on income from foreign sources.

32. Bird *supra* note 5, at 172.
33. See *Taxation of Foreign-Source Income: A Consultative Document* (Canberra: AGPS, 1988), at 31-32 [hereinafter referred to as the Consultative Document].
34. Canada comes close to providing full imputation credits on distributions out of foreign-source income.
35. The non-neutrality in this case occurs because by not allowing imputation credits in respect of foreign taxes paid will mean that total tax (Australian plus foreign) paid on the foreign income will be greater than that paid on domestic income.
36. See Bird *supra* note 5, at 172.
37. See generally, Anderson *supra* note 22, at 403; Arnold *supra* note 15, at 55; Brean *supra* note 27, at 43; and Gumpel *supra* note 30, at 395-401.
38. The importance of achieving national neutrality or international neutrality also impact, as will be seen below, on the efficient allocation of resources.
39. Recently, the New Zealand Government enacted measures to change the definition of a CFC to mean a foreign company of which five or fewer New Zealand residents own *more than 50%*. As well, a *de facto* control test (similar to that contained in the Australian CFC regime) was added to the definition of a CFC. Sec 245C(1) Income Tax Act.
40. "Efficiency", or more precisely "pareto optimality", refers to an allocation of economic resources that maximizes production or economic growth.
41. Asprey Committee Report *supra* note 13, at paras. 17.29-17.30.

© 1993 International Bureau of Fiscal Documentation

Other externalities include the loss of development and growth increasing elements customarily generated in the country of investment.[42]

The Asprey Committee were, however, quick to point out that the objective of complete efficiency (in regard to the effect of Australian and foreign taxes on the activities of Australian residents) is clearly outside the competence of the Australian tax system in relation to the effect of Australian and foreign taxes on the activities of Australian residents. For example, there will be instances, depending on the political and economic climate at the time, where non-neutrality and therefore interference, is deliberately instigated where a country wishes to encourage its residents to operate abroad.[43]

A capital exporting nation may depart from the principles of efficiency by taxing foreign investment more heavily than domestic investment for fear that capital outflow will result in national income losses, or in undue income distribution effects, or a desire to increase the rate of domestic growth, by implementing special tax measures which, for example, could assist in stemming the outflow of capital. It is suggested that in the interests of national efficiency, a capital exporting country's tax system should discourage foreign investment beyond the point of national profitability (i.e. where the net return on foreign investment after foreign taxes exceeds the gross return on domestic investment before residence country tax). This can be achieved by allowing a deduction for the foreign tax, thus effectively treating foreign taxes as an expense of business.

4. Revenue

Although it is difficult to obtain reliable data on the incidence of the revenue loss from international tax avoidance, it has been suggested that it is very high.[44] A similar conclusion may be drawn from the data cited by Mr Woodward Jr., US Internal Revenue Service (IRS) Assistant Commissioner, who stated that in March 1987 foreign-owned US firms doing business in the United States paid 16-19 percent less tax than their US counterparts.[45] Mr Woodward's findings were recently confirmed as a result of US Congress study of the tax gap created by transfer pricing practices of foreign controlled US businesses. Hearings relating to transfer pricing issues began on 10 July 1990.[46] The cornerstone of the hearings was a nine-month investigation that focused on 36 foreign-owned US distributors of automobiles, motorcycles and electronics equipment. The investigation resulted from allegations that significant numbers of multinational corporations were avoiding US tax through artificial transfer pricing schemes.

The Subcommittee examined 212 returns filed over a ten-year period by the 36 target foreign companies, finding that more than one-half of the companies paid little or no federal income tax. To stress the point, the Subcommittee cited one example in which a foreign company paid US$ 500 in income tax on sales of US$ 3.5 billion.[47]

Commissioner Goldberg[48] of the IRS testified that foreign-controlled businesses report significantly lower taxable income as a proportion of gross receipts than domestic corporations. The Subcommittee's staff alleged that the primary mechanism by which foreign-owned companies are able to keep taxable profits at a minimal level is through the use of artificial transfer pricing. Such artificial transfer pricing schemes may also achieve the desired tax effect where the US corporation exports its product to a controlled foreign importer. In the latter case, the US corporation would sell its products at an artificially low price thereby incurring a loss in the United States and shifting the profit to the foreign importer which is usually resident in a tax haven country.

An important consideration for states in devising a taxation policy is whether the tax can be implemented effectively, that is, whether it will be sufficiently efficient as a means of raising revenue and provide relatively limited scope for avoidance or evasion which would detract substantially from its effectiveness. Evaluation of this criterion in an international tax sphere is complicated by the fact that there is much more scope for taxpayers to reduce or minimize their liability to taxation by moving assets, relocating or reorganizing economic activity or manipulating their accounts. The opportunities for avoidance of domestic tax are assisted by the territorial limitations on state jurisdiction (in particular enforcement jurisdiction) which limit the ability of the state to control such activities and to ensure that any new policies which are aimed at such activities are implemented in full. This explains the Government's inability to predict accurately the amount of revenue it is expected to raise directly from the new accruals measures.

Taxing authorities tend to raise revenue with respect to international income flows by taxing residents on income derived from foreign sources and non-residents on income from domestic sources. However, the revenue raised by this process is arguably small when compared with revenue raised from taxing transactions which do not cross national borders. One commentator has argued that capital exporting countries are virtually forced to take fiscal responsibility for establishing capital export neutrality, and therefore, although such

42. Musgrave *supra* note 16, at 99. It is suggested that the national interest would be best served in light of these externalities by tax policy that is somewhat selective among the various kinds of foreign investment.

45. Id., citing Woodward Jr., P., 24 *Tax Notes* (1987), at 17-19.
46. Tax Underpayments by US Subsidiaries of Foreign Companies: Hearings Before the Subcommittee on Oversight of the Committee on House Ways and Means (House of Representatives, 101st Congress, Second Session, 10 and 12 July 1990, Serial 101-123). In pursuance to such Hearings the Subcommittee heard submissions regarding the "Present Law and Certain Issues Relating to Transfer Pricing (Code Section 482): Hearings before the Subcommittee on Oversight of the House Committee on Ways and Means on July 10 and 12, 1990" (Prepared by the Staff of the Joint Committee on Taxation, US Government Printing Office, Washington: 1990).
47. It should be noted that although the study by the House Ways and Means Subcommittee was more concerned with transfer pricing between foreign corporations and foreign controlled US corporations, the findings of the study are also relevant to cases of transfer pricing occurring between US corporations and US controlled foreign corporations.
48. The submissions of Mr Fred Goldberg (IRS Commissioner) before the House Ways and Means Oversight Subcommittee were reprinted in *Daily Tax Report* (BNA) No 133 (11 July 1990).

© 1993 International Bureau of Fiscal Documentation

countries (notably the United States) tout jurisdictional claims to the worldwide income of their national corporations, in practice the foreign tax credit coupled with sophisticated tax planning by corporations usually results in little tax revenue collected at home.[49] That is, most foreign taxed income will be exempt from domestic taxes in light of the generous operation of the FTCS in recognition of the source jurisdiction's primary taxing right. Moreover, the separate entity approach coupled with some sophisticated tax planning, until recently, enabled multinational corporations to minimize their exposure to the residence country's tax by diverting such income to foreign subsidiaries in low tax jurisdictions. Hence, the need for anti-tax haven legislation in order to protect the domestic tax base (i.e. domestic-source income).

Even where a capital exporting country has in place anti-tax-haven legislation (i.e. accruals legislation), judging from the comments and submissions made to the Treasurer at the time the Australian accruals legislation was being proposed, such legislation is not viewed as a major revenue raiser. In fact, some commentators have tried to downplay the importance of such legislation by suggesting that it would involve more costs (both administrative and compliance) than such legislation would raise in revenue. That is, the purpose for bringing such anti-tax-haven measures is defeated from the outset since it theoretically is not economically viable.[50] However, it is broadly estimated that the likely direct revenue gain from accruals legislation in 1991/92 will be $ 85 million,[51] but the Government's latest estimate for the 1993/94 financial year is a much more conservative $ 60 million to $ 70 million.[52]

Alternatively, a case may be put forward in reconciling the existence of accruals legislation with the objectives of a "good" international tax system (i.e. the revenue criterion) by highlighting the deterrent aspect of such legislation.[53] Although, from the foregoing comments, it is suggested that the direct revenue raised by introducing accruals legislation will not outweigh the costs (both administrative and compliance costs) associated with such legislation, the accruals legislation is nevertheless justifiable on the basis that it will substantially contribute to the reduction of tax haven use by those corporations resident in capital exporting countries. The validity of this justification is inextricably tied in with the economic and other consequences arising to the capital exporting country from such tax haven use, and as will be seen from the discussion in Part III, this is still very much a hotly debated area.

5. Simplicity

As desirable as this policy objective may be, regretfully, with respect to taxation, this objective may (or will) never be realized. This is especially so with respect to taxation of international income flows. The manner in which tax legislation has developed is that it is formulated in most instances as a response (anticipatory in some instances) to tax planning "schemes". The more complex the arrangement or scheme the more complex the tax legislation devised to countervail the arrangement. Evidence has shown that arrangements which cross national boundaries are anything but straightforward. In fact, the accruals legislation which was recently introduced into Australia has been unanimously referred to as one of the most difficult and complex pieces of legislation ever to be passed by an Australian parliament.[54] These comments have been echoed by those persons in Treasury and the Australian Taxation Office who were responsible for drafting the accruals legislation.[55]

6. Administration and compliance

A further important objective which necessarily must underlie any tax policy is that persons who are subject to any tax measures should be able to understand them and to comply with them without undue cost. Similarly, revenue authorities responsible for the administration, collection and enforcement of the tax must be able to understand it so that they may carry out their functions efficiently and to adopt consistent policies when carrying out such functions.

Musgrave and Musgrave concluded that "[c]ompliance cost is substantially larger than administration cost".[56] They estimated that in all, total compliance cost (for both US individuals and corporations) in 1980, of US$ 10 billion would not be surprising.[57] From a postal survey in August/October 1988 of 314 public companies throughout Australia it was estimated that the total compliance costs of public companies' income taxation in Australia for the tax year 1986/87 was between $ 646 million and $ 1,341 million, or 11.4 to 23.7 percent of public companies' tax revenue of $ 5,650 million, as compared with the estimated (gross) compliance costs of UK corporation tax in 1986/87 of 2.2 percent of tax rev-

49. Brean *supra* note 27, at 131. More recently, the Minister of Finance, the Honourable Ruth Richardson, noted that although the changes to the CFC regime are expected to increase revenues, nevertheless, "the primary reason for the proposed changes is to pursue greater fairness and maintain the tax base by applying to income earned through foreign entities the principle of taxing residents on their world-wide income". *The New Zealand Budget 1992* (B.6A, at 84).

enue.[58] The compliance costs for individuals is a little better, being 7.9 to 10.8 percent of tax revenue.[59]

Despite the relatively high compliance costs for public companies when compared with tax revenues, it was estimated that compliance costs per dollar of turnover fell as company size increased. This figure varied from just under $ 2 for every $ 100 of turnover for companies with a turnover of over $ 5 million per annum to about four cents for every $ 100 of turnover for companies with a turnover of $ 100 million per annum or over.[60]

On the other hand, the cost of federal tax administrations as reflected in the budget of the IRS for the fiscal year 1983 was US$ 2.7 billion, or 0.5 cent per dollar of federal tax revenue.[61] In contrast, the cost of collecting tax in Australia has been estimated to be one cent in the dollar.[62]

Comments made in the section on simplicity above with respect to the complexity of legislative provisions dealing with the taxation of foreign-source income (e.g. FTCS and accruals legislation) are equally applicable when evaluating the administration and compliance costs associated with the same legislative provisions. It is noted that taxpayers must deal with differences between domestic and foreign tax and accounting rules that are often extensive. Moreover, compliance problems are frequently exacerbated by different languages and the necessity to translate amounts from a foreign currency into the domestic currency. Added to these problems are the problems of inadequate staffing coupled with the complexity of the legislative provisions which make it extremely difficult for revenue authorities to collect tax on foreign-source income in a fair, effective and efficient manner.

The difficulty with the collection of tax raised through the accruals legislation (and the recently introduced FIF measures) principally arises from the lack of adequately trained staff who have a workable knowledge of such complex legislation, as well as the inability of revenue authorities to unilaterally gain access to information abroad due mainly to secrecy laws in existence in the foreign country.

From a social perspective, an argument may be mounted along the lines that the significant compliance costs which are associated with such complex legislation as the accruals rules and the FIF measures could easily be absorbed by the large multinational corporations,[63] since it is the large companies to which such rules are principally directed. However, the argument quickly loses force if we analyse the deterrent effect such costs may have on the international operations of smaller multinational corporations, or even those national corporations wishing to operate (i.e. set up subsidiaries or branches) overseas. It appears that Australian practitioners are unanimous in their belief that the accruals rules and the introduction of the FIF measures will cause many Australian firms to "collapse" their offshore subsidiaries.[64]

B. *Conclusion*

Ultimately, in evaluating any reform of the tax system of a country it should be borne in mind that the proposals for reform should be structured to achieve the "over-riding requirement" that the tax system's intended and actual effects should be the same, which in turn requires that opportunities for avoidance, evasion and other manipulations be minimized.[65]

In concluding this part of the discussion, it is noted that the six tax policy objectives discussed above sometimes conflict.[66] An instance where the above objectives could conflict occurs between revenue and equity when a tax system provides inadequate relief for international double taxation. Such a system may produce additional tax revenue but at the cost of significant loss in equity. However, despite such conflicts and inconsistencies, it is the role of government authorities to clearly set priorities between, say, maintaining international neutrality in favour of say, compliance and administration, and to implement measures which reflect such priorities. Invariably, there will be critics whatever the ultimate design of the system turns out to be, especially in light of the fact that the achievement of international neutrality may have to occur at the expense of other important policy objectives. Therefore, in the end, it is more a political decision as to which policy objectives will be followed and which will be disregarded or at least neglected.

The policy objectives of the Australian Government have been set to achieve world efficiency whilst at the same time deviating from such a policy in order to promote national interests, namely the protection of the domestic tax base. Hence, the policy behind the FTCS which does not fully credit foreign taxes. In line with that objective, the Australian Government has adopted an accruals regime of taxation in order to further the objects of the credit system, by eliminating deferral of domestic taxes in certain circumstances. The implicit costs arising from such a commitment to the credit system occurs at the expense of such policy objectives as simplicity which in turn should mean that administration and compliance costs become unnecessarily high.

III. ECONOMIC CONSEQUENCES ARISING FROM THE REMOVAL OF TAX BIASES IN FAVOUR OF FOREIGN-SOURCE INCOME

A. *Introduction*

As mentioned in Part II, it is difficult to coordinate the intended and actual effects of taxation policy, particularly policy which has an international dimension. This part of the paper is an extension of Part II, in that the main purpose is to ascertain whether governments are justified from an economic perspective in pursuing policies that seek to remove the tax benefit arising from the deferral advantage which can be exploited by resident taxpayers in relation to foreign-source income (i.e. through transfer pricing or by giving income an artificial foreign-source). The theme of this discussion will be an evaluation of the effect of the removal of such tax benefits arising from the deferral advantage through accruals taxation on the capital exporting country, the sectoral groups and interests within that country as well as the capital importing country.

The term "deferral" as it is referred to throughout this paper is necessarily a value-laden term, because it suggests that a special concession has been granted, an implication not made when the rule is applied to domestic corporations.[67] Nevertheless, despite the inconclusive evidence as to the economic effects of this value-laden term (see discussion below), those governments which have introduced legislation aimed at combating deferral cling to the view that such legislation is necessary in curtailing inappropriate tax benefits accruing to movable income earned through a foreign corporation, and consequently, to level out the playing field. This objective was recently summed up by the Staff of the Joint Committee on Taxation as follows:

> It has long been the policy of the United States to impose current tax when a significant purpose of earning income through a foreign corporation is the avoidance of tax. Such a policy serves to limit the role that tax considerations play in the structuring of US persons' operations and investment. Because movable income earned through a foreign corporation could often be earned through a domestic corporation instead, Congress believed that a major motivation of US persons in earning such income through foreign corporate vehicles often was the tax benefit expected to be gained thereby. Congress believed that it was generally appropriate to impose current US tax on such income earned through a controlled foreign corporation, since there is likely to be limited economic reason for the US persons' use of a foreign corporation. Congress believed that by eliminating the US tax benefits of such transactions, US and foreign investment choices would be placed on a more even footing thus encouraging more efficient (rather than more tax-favoured) uses of capital.[68]

The objective of "levelling out the playing field" may also be gleaned from the Treasurer's economic statement delivered on 25 May 1988, where he foreshadowed the introduction of the accruals legislation in the following terms:

> The present system for taxing foreign-source income can lead to serious inequities and economic distortions. Taxpayers deriving similar income may be subject to widely differing rates of tax depending on whether they derive income in Australia, in a comparable tax jurisdiction or in a low-tax country. Investment decisions may be made not on the basis of sound commercial criteria, but on the availability of tax minimization opportunities.
>
> The deferral advantage of foreign-source income can be exploited by Australian residents ... through transfer pricing practices or by giving income an artificial tax-haven source. In such cases, little or no activity at all is conducted in the tax haven country but large amounts of profit are recorded there. Very little tax is paid and the income is reinvested, creating more income and wealth for the beneficial owners of the foreign entity without their paying much or any Australian or other tax on the income.[69]

The desire to create conditions conducive to a "level playing field" by removing tax concessions available to Australian resident taxpayers that earn income through a foreign corporation, especially one which is resident in a tax haven should go a long way to upholding the integrity of Australia's fiscal jurisdiction. The Australian Government's attempts at tightening its FTCS rules and transfer pricing rules prior to the introduction of the accruals legislation (and the FIF measures) had been rendered to some extent useless in view of the deferral advantage that was available to resident taxpayers who were able to avoid the operation of such rules by the diversion of investment income to, or the accumulation of investment income in a foreign corporation.

B. *An account of the development and principles of accruals basis taxation*

It was revealed in Part II that the primary reason why it is possible for Australian companies to defer payment of domestic tax on foreign-source income earned by foreign subsidiaries is because of the separate treatment of the subsidiary from its parent company. Accordingly, governments of some of the most industrialized countries in the world have introduced tax measures which disregard the corporate personality of the foreign subsidiary and tax the domestic parent corporation on its proportionate share of the undistributed profits of the foreign company.

The United States was the first nation to introduce measures to tax profits of a foreign subsidiary that was controlled by a US shareholder.[70] Canada did so in 1971, West Germany (as it then was) in 1972, Japan in 1978, France in 1980, the United Kingdom in 1984, New Zealand in 1988 and Australia in 1990. Sweden recently introduced similar accruals legislation. The attractiveness of the accrual basis regime of taxation is that it does not violate any jurisdictional principles of international law, since the tax liability is imposed on the

> Consistent with the general approach to taxation, aimed at generating a 'level playing field', facilitation does not extend as far as providing encouragement via taxation concessions. The aim of policy is to encourage investment of capital in areas where it will be most productive ... the present system of taxing foreign source income does not ensure this outcome.

"controlling resident shareholders" of the foreign subsidiary who are subject directly to the taxing country's jurisdiction. Although the shareholder may not have actually received income, there has in theory been an accretion to its wealth which is arguably under its command, and thus subject to the taxing jurisdiction of the country in which it resides (or is a citizen, in the case of the United States).[71] Such measures, it is submitted, protect the resident country's source jurisdiction.[72]

However, it should be noted that the operation of the accruals rules may be subordinated to the exclusive taxing rights given to certain treaty partners in respect of some items of income.[73] The argument propounded here is that there are a number of DTAs which contain provisions specifying the source of income derived by a person who is a resident of both treaty countries under the respective domestic laws (i.e. a dual resident company). The usual manner in which the relevant DTA deals with such a company is to allocate residence of the particular company exclusively to one of the treaty countries by virtue of a tiebreaker provision. The effect of this is to ensure that the company is only taxable in the deemed residence jurisdiction if the income is from a source in that jurisdiction or from sources outside both treaty countries. There is a strong argument which suggests that items of income received by such a company are not caught by Australia's accruals rules (i.e. they do not enter the calculation of attributable income for "foreign income" tax purposes), because attributable income is taxed by Australia making such items not exempt from Australian tax. In the event that a court of law asked to consider this issue upholds the argument put forward in this paragraph, then Australia's domestic-source jurisdiction may be subject to manipulation despite the existence of accruals measures. The possibility of such a situation having a significant impact on the integrity of Australia's domestic-source rules is somewhat overstated since Australia has only negotiated DTAs with 34 other nations, and in respect of the Australia/Japan DTA there is no tiebreaker provision. Moreover, in respect of the Australia/US DTA, a tiebreaker provision exists only in respect of natural persons who are dual residents.

It was also revealed in Part II that the system of full taxation of foreign profits by the country of residence on a current basis with credits for foreign taxes is consistent with the principle of tax neutrality and international equity, since it effectively places such income for tax purposes on an equal footing with income earned through a domestic corporation. However, it is this latter policy which has given rise to the most controversy, since, prima facie, it advocates the complete elimination of deferral.

The controversy surrounding the policy option for complete elimination of deferral stems primarily from the inconclusive empirical evidence available regarding the economic effects of deferral. It is those arguments which we will be concerned to analyse with the aim of reaching some conclusion with regards to the perceived "harm" said to be caused by deferral. The economic impact of deferral of domestic tax on foreign-source income is intricately tied to the controversy surrounding the economic impact of foreign investment. The crux of the controversy appears to depend on the assumptions that are made about foreign investment. That is, it could be argued that (i) foreign investment is a substitute for domestic investment, or (ii) foreign investment supplements domestic investment.[74] Foreign investment is a substitute for domestic investment if it displaces domestic investment that otherwise would have been made. Foreign investment is supplemental to domestic investment if there is no alternative domestic use of the funds that are invested abroad.

Originally, the proposals in the Consultative Document which foreshadowed the introduction of the accruals legislation in Australia did not distinguish between income derived from conducting genuine businesses offshore – "active income" (e.g. manufacturing, mining, etc.) and those merely deriving investment income – "passive income" (e.g. interest, dividends, etc.), thus providing for the complete elimination of deferral.

After intensive lobbying from the business community, the Federal Government agreed to include an exemption for active income in the Information Paper, which was released in April 1989. The Federal Government, it seemed, was persuaded by the "competition argument", that is, that Australian interests overseas will be seriously hampered if income derived in the foreign jurisdiction was taxed at Australian rates. As a result, the goal of the accruals legislation had changed within the space of one year. The fact that partial deferral of active income was now allowed meant that the goal of the Australian accruals regime had shifted from one of complete elimination of deferral in favour of a goal of eliminating deferral in cases of "blatant tax avoidance and tax-motivated investments".[75]

The US Congress rejected proposals by President John Kennedy to end tax deferral for foreign subsidiaries, and instead enacted Subpart F provisions for the taxation of CFCs and gave strong support for more active enforcement of controls over transfer pricing. By enacting Subpart F and the related PFIC provisions Congress had asserted that its goal is to prevent tax avoidance. In his 1961 tax message, President Kennedy had advocated a regime of taxation which would completely eliminate deferral of US tax by US resident multi-

71. See Park *supra* note 67, at 1611. Ignoring the corporate identity of the foreign corporation does, however, increase the number of rival claims to jurisdiction over the same pot of income.

72. See also McIntyre *supra* note 25, at 6-84 to 85; and McIntyre, J., "Australian Measures to Curb Tax Haven Abuses: A United States Perspective", 4 *Australian Tax Forum* (1988), at 419, 422.

73. Switzerland has placed on record its formal objections to CFC-type taxes as being in breach of DTAs "as they result in effect in extra-territorial application of domestic tax legislation", OECD, *International Tax Avoidance and Evasion* (Paris: OECD, 1987), at 84.

74. For a full analysis of the choices of assumptions that can be made in assessing the relation between foreign investment and the domestic economy of the United States, see Musgrave *supra* note 16, at 10-14. However, after assessing the relation between foreign investment and domestic investment, Professor Musgrave (at 32) concludes:

> Foreign investment that replaces, or substitutes for, domestic investment must be considered the predominant form of foreign investment. Yet, there may be some amount of that substitutes for domestic consumption, and a further, limited amount that supplements domestic investment during periods of widespread slack in domestic business activity.

75. *Taxation of Foreign-Source Income: An Information Paper* (AGPS: Canberra, 1989), at 5.

© 1993 International Bureau of Fiscal Documentation

national corporations. However, due to strong opposition by multinational corporations, the provisions of Subpart F were only extended, inter alia, to passive income and "base company income".[76] President Carter in 1978 tried to revive President Kennedy's original proposal for complete elimination of deferral but without any success.

In light of the fact that both the US and Australian Governments have experienced and succumbed to intense pressure from industry groups regarding the extent to which deferral should be eliminated, it is now intended to examine more fully the arguments for and against eliminating deferral completely. The arguments to be canvassed below proceed on the premise that accruals basis taxation implies a system of full taxation of foreign profits by the country of residence on a current basis with credits for foreign taxes.

C. *Arguments for and against eliminating tax biases in favour of foreign investment income*

1. Arguments for eliminating deferral completely

After examining the general principles that US tax policy should follow in the field of foreign investment, Professor Peggy Musgrave concluded that there is little reason for giving tax incentives to foreign investment, on the basis that to do so would be contrary to the basic principle which should underlie US taxation of foreign investment income, that is, neutrality.[77] Moreover, she noted that the measures designed to eradicate tax incentives for foreign investment (i.e. deferral of domestic tax) may lead to conflicts and incompatibilities between the various criteria of a good tax system.[78] The differences in size and nature between the Australian and New Zealand economies on the one hand, and the US economy, on the other, may be so significant as to require some qualifications when applying Professor Musgrave's conclusions to the Australian or New Zealand economy. As noted earlier, Australia and New Zealand are "price-takers" in the international arena whereas, the United States is still regarded as a "price-maker", and hence can afford to adopt aggressive tax policies.

As early as 1961, President Kennedy in his tax message for that year said:

> Changing economic conditions at home and abroad, the desire to achieve greater equity in taxation, and the strains which have developed in our balance of payments position in the last few years, compel us to examine critically certain features of our tax system which in conjunction with the tax system of other countries, consistently favour United States private investment abroad compared with investment in our own economy ...
>
> [T]he ability to defer the payment of United States tax by retaining income in the subsidiary companies provides a tax advantage for companies operating through overseas subsidiaries that is not available to companies operating solely in the United States ...
>
> To the extent that ... tax deferral privileges result in United States firms investing or locating abroad largely for tax reasons, the efficient allocation of international resources is upset, the initial drain on our already adverse balance of payments is never fully compensated, and profits are retained and reinvested abroad which would otherwise be invested in the United States...
>
> [W]e can no longer afford existing tax treatment of foreign income.

The termination of deferral was also proposed by President Carter in 1978 and was hotly debated before being withdrawn. The President's 1978 Tax Program provided five arguments in favour of ending deferral:

- it would remove the situation whereby substantial tax benefits hinged on whether a foreign company was interposed between the foreign income and the domestic taxpayer;
- it would terminate an incentive to invest abroad rather than in the domestic economy;
- it would permit simplification of the rules relating to the taxation of foreign-source income;
- termination would help stimulate competition between large multinational corporations and their smaller competitors by removing tax benefits which accrue principally to the large multinationals; and
- it would strengthen the law aimed at preventing the shifting of profits by transfer pricing.[79]

Reproducing part of President Kennedy's 1961 Tax Message serves a useful purpose in that it provides an insight into the type of arguments to be discussed more fully below, which have been propounded in favour of eliminating tax deferral. For example, the President was concerned as to the taxation inequity between those companies with solely domestic operations and those with foreign operations and the strains on the balance of payments created by the taxation benefits that could be derived by earning foreign investment income.

In terms of the policy objectives discussed in Part II, it appears that both President Kennedy and President Carter were, inter alia, propounding a tax system which promoted capital export neutrality at the expense of international equity, since it was argued by both Presidents that introducing tax measures to eliminate deferral would remove the incentive to invest offshore and would introduce the "single entity" approach into the tax system. As well, President Carter argued that such tax measures would promote the principles of simplicity. In addition, he said that these measures would strengthen the anti-avoidance measures aimed at profit shifting by transfer pricing.

In light of the foregoing, it is surprising to note that the Asprey Committee in 1975 rejected a recommendation to eliminate tax deferral and felt that other means than the accruals legislation drawn along the lines of the US model be used to ensure that Australian resident taxpayers are not unfairly advantaged by deferral of Australian tax. They were very conscious of the complexities and administrative and compliance costs of attempting to tax foreign-source income

76. Broadly, base company income is US-source income which is diverted to a US CFC.
77. Musgrave *supra* note 16, at 107.

of tax haven companies and trusts. The Committee based this conclusion on the difficulties experienced in the United States with the accruals legislation contained in Subpart F. They noted: "United States experience has not been encouraging. Its provisions are extremely complex and impose great difficulties in enforcing compliance."[80]

Instead the Committee preferred an approach which ensured that the existing source rules are strengthened. They were of the view that the source rules should be effective in reconstructing Australian origin income of non-residents, and preventing the diversion of Australian income to non-residents.[81]

(a) *Capital export neutrality*

Australia and New Zealand both adopt a foreign tax credit regime. This means that Australian and New Zealand corporation tax is generally applied to repatriated profits of foreign subsidiaries of domestic corporations, and a credit given for foreign taxes paid up to the amount of Australian and New Zealand tax due. Accordingly, an incentive to foreign investment (especially in those countries with lower corporate tax rates than Australia and New Zealand) arose by the mere fact that the deferral of domestic tax on the foreign-source income (i.e. by accumulating the profits offshore) meant that domestic companies could ensure a higher after-tax return on those accumulated profits than could otherwise be attained if the profits were repatriated back to Australia or New Zealand, or simply earned in Australia or New Zealand.

Put another way, deferral of domestic taxes on foreign subsidiary profits creates a situation where domestic taxes on accumulated profits are lower than domestic taxes on repatriated profits, thus the incentive to foreign investment. However, it is argued that a tax on retained earnings which is lower than the tax on repatriated earnings will have both an "income" and a "substitution" effect on reinvestment. It will leave a larger volume of after-tax earnings available for reinvestment (the income effect), and it will induce reinvestment rather than distribution (the substitution effect).

> "In all, it seems that deferral combined with a low foreign tax on profits lead to a larger volume of new investment outflow and the reinvestment of a somewhat higher *proportion* of a larger *volume* of after-tax profits. The stimulus to capital outflow is probably not as great as that to reinvestment because affiliates already established abroad may substitute retained earnings for funds of [domestic] origin."[82]

Therefore, by introducing policies to eliminate the deferral advantage for certain foreign investment, Australia and New Zealand share a common goal in that they are attempting to ensure that foreign investment is motivated by genuine economic factors and not by taxation considerations which, even if only in a small way, undermine endeavours to raise revenue, say, to fund public spending programmes. Accordingly, the removal of deferral has been justified on the basis that (i) it reduces the inequities, distortions and revenue losses arising from the present law, and (ii) by ensuring all income earned by domestic multinationals is taxed at rates comparable to that in country of residence, the incentives for the manipulation of transfer pricing will also be greatly reduced.[83]

Another argument in favour of eliminating tax deferral alluded to by President Kennedy and President Carter, is the need to ensure that corporations with domestic operations do not suffer loss of competition as a result of the high tax bills they face compared with the low tax bills which corporations operating in tax haven countries must meet. The crux of this argument is based on the efficient allocation of resources objective (which is a variant of the neutrality objective) from the national perspective, and requires consideration of the best policy mix for achieving this objective.

The Treasurer at the time, Mr Paul Keating, echoed the earlier tax messages of Presidents Kennedy and Carter in his May Economic Statement, delivered on 25 May 1988. The Treasurer's justification for introducing accruals legislation was couched in such policy terms as one of promoting capital export neutrality.

> "Although the economic evidence supporting complete removal of the deferral advantage in all cases is inconclusive and vigorously debated, little can be said against the removal of deferral in cases of blatant tax avoidance and tax-motivated investments. Further, the inequities, distortions and revenue losses arising from the present law give weight to the case for removal of deferral in most other foreign investment situations involving low-tax countries."[84]

(b) *Balance of payments*

By eliminating or reducing the advantage sought from lower foreign tax rates, accrual basis taxation may be expected to discourage capital movement abroad, at least to the extent that tax rate differentials affect the investment policies of multinational corporations. It is this factor, amongst others, it is suggested, that may improve the national balance of payments account in the short run. The downside of this is that it would also diminish foreign earnings and hence repatriation of those funds which would give the capital exporting state potential foreign currency claims. That is, foreign investment leads to increased exports of goods, services and labour by the country of residence, and when the foreign investment matures, dividends will be repatriated to the country of residence, thus improving the balance of payments position in the long run.

The net effect of removing the deferral advantage on the capital exporting country's balance of payments will ultimately depend on the displacement of exports and the rate of repatriation of earnings. Moreover, as indicated above, there are too

80. Asprey Committee Report *supra* note 13, at para. 17.51.
81. Id. at paras. 17.52-17.55.
The Committee is not persuaded that it is an appropriate policy to seek to tax foreign-origin income of tax haven companies and trusts and is very conscious of the complexities and administrative and compliance costs of attempting to do so. It prefers to ensure that the general provisions of the Australian law as to source of income in Australia are effective; that there are adequate provisions in regard to the reconstruction of Australian-origin income of non-residents; and that there are also adequate provisions to prevent the diversion of Australian income to non-residents (at para. 17.55).

84. Id. at 5.

© 1993 International Bureau of Fiscal Documentation

many other variables which also need to be accounted for before a proper study of the effect of accrual basis taxation on the movement of capital may be undertaken. It is beyond the scope of this paper to deal with those variables.

(c) *Labour market effects*

The inconclusive nature of the evidence in relation to the economic impact of eliminating deferral on the domestic economy's balance of payments is even more significant when considering the domestic labour market. In the United States, unions have supported anti-deferral legislation on the basis that domestic production levels will be preserved by use of an accrual basis regime that discourages foreign investment. This argument, it is suggested, assumes that domestic investment opportunities are available and that domestic management will become more attentive to existing domestic activity. Moreover, this also ignores the argument that domestic manufacturers may go abroad in order to obtain access to foreign markets protected by tariff barriers, or in reaction to a threat by foreign manufacturers to an already established export market. Consequently, it is unlikely that accrual basis taxation will safeguard domestic jobs, it is argued, unless markets in the same or similar product lines are found for displaced domestic production.[85]

In a major study by Professor Musgrave it was suggested that tax deferral resulted in a capital exporting bias which in turn reduced the level of income originating in the United States as well as reducing the labour share in national income. This led Musgrave to conclude that there would be a substantial distributional effect adverse to the labour share.[86] Admittedly, the results of this study would have had little bearing on Australia, since Australia is regarded as a net capital importer and at the time of the study the United States was regarded as a net capital exporter.[87] Therefore, prima facie, Australia stood to benefit from the capital exporting bias of other countries. However, the differences in the corporate tax rates between United States and Australia (i.e. 34 percent[88] and 39 percent, respectively) are such as to eliminate any significant US capital export bias *vis-à-vis* investment in Australia.

(d) *Domestic growth*

From the foregoing analyses it is arguable that foreign investment which supplements domestic investment contributes to the growth of the domestic economy, and that tax measures that may distort the flow of foreign investments would be contrary to national growth. However, it is suggested that since domestic investment could be increased by appropriate fiscal action, foreign investment may be a weak alternative to domestic investment as an "engine of growth". Moreover, the national return on most capital invested abroad is lower than that on domestic investment. Thus, to the extent that foreign investment substitutes for domestic investment, it inhibits the rate of growth of national income.[89]

This view of the negative role of foreign investment as an "engine" for domestic growth is confirmed by the Treasurer in the Consultative Statement:

> For investments generating similar rates of return, Australia as a whole benefits more from domestic investments than from foreign investments. Foreign taxation reduces the return to Australia as a whole whereas Australian taxation does not (except for any 'dead-weight' loss associated with tax distortions).[90]

2. Arguments for retaining the tax bias in favour of foreign source income

The above analyses of the arguments raised in support of eliminating the tax bias in favour of foreign-source income (i.e. the beneficial effects that the change would have on domestic investment, employment, exports and the balance of payments) are also relevant in arguing the opposite case.

> "There would no doubt be some dispute about the economic effects of taxing all foreign-source income of Australian residents on an accruals basis and at the same rate as domestic-source income. Those who argue in favour of removing the tax bias for foreign-source income stress the beneficial effects that the change would have on domestic investment, employment, exports and the balance of payments. Those who argue the opposite stress the same points but reach different conclusions about the effects of the changes."[91]

Those who argue against eliminating deferral concur that the objectives of tax neutrality should be the minimum distortion by the domestic tax system of the economic flow of investment funds between, as well as within, countries. This equates to promoting a dual policy of capital import neutrality together with inter-nation equity. Yet, they differ considerably on the rules and policies that promote that objective.[92]

The principal argument of the business community against eliminating deferral is capital import neutrality. This view of neutrality dictates that foreign investors be taxed equally in the source jurisdiction. Accordingly, under the capital import neutrality principles it is suggested that the domestic country should tax income according to source principles or exempt foreign source income from domestic taxation.

Other factors which the business community points out as worthy of consideration when implementing policies that

promote international neutrality are the special risks and institutional burdens associated with foreign investment that are not associated with domestic investment. Moreover, the relevant concept of international neutrality should be the equal treatment of domestic investors abroad and not domestic investors with solely domestic operations and those with foreign operations.[93]

(a) *Capital import neutrality*

For the purposes of the discussion to follow it is necessary to briefly describe the manner in which accruals basis taxation seeks to eliminate deferral. The central theme underpinning accruals basis taxation is the concept of "control". It is this factor which gives the accruals legislation its overreaching effect. The gist of this requirement is that foreign income derived by a foreign entity will be "attributed" to those domestic shareholders who are in a position to cause the foreign entity to distribute the same in accordance with their proportionate share in the foreign entity. Therefore, domestic taxes will, pursuant to such legislation, be levied on the foreign-source income regardless of whether or not the income is distributed. It is this aspect of the legislation which has been the subject of most criticism, particularly where the genuine business activities of foreign entities operating in tax havens are affected.

The attitude of the Business and Industry Advisory Committee (BIAC), which was conveyed to the OECD Committee preparing the 1987 Report on the use of tax havens, was highly critical of CFC-type legislation which was extended to cover all businesses in tax havens, regardless of the nature of the business. The BIAC gave examples of situations where, in its view, economic factors could be advanced for making use of tax havens, and where industry would regard the use of tax havens as legitimate, provided that all the arrangements were operated on a commercial basis and were not artificial contrivances. However, the BIAC accepted that fiscal authorities have a proper reason for concern where transactions are carried out at prices which cannot be justified on "arm's length" criteria or where profits are otherwise diverted without genuine business purposes or objectives.[94]

The BIAC submission also contained the usual arguments in support of companies setting up in tax havens. That is, that much of the use of tax havens was not motivated by a desire to pay no, or little, tax so much as an economic necessity to reduce costs to a "bearable level" in circumstances where the laws of countries are "uncoordinated". They listed instances where they felt it was considered useful or necessary to use tax havens. They included:

- fund-raising companies for international investments – to raise funds competitively on international markets and reduce financing costs (including taxes);
- subsidiary shareholding companies – to receive income from dispersed overseas operations in the form of dividends. Such companies are particularly significant in (i) avoiding costs and delays in repatriating funds which were destined only to be re-exported; (ii) avoiding the high risk of devaluation in some source countries; (iii) correcting misalignments between source and residence countries where the total tax burden varies year by year but is on average the same over a period of years; and finally (iv) protecting investment incentives offered by some source countries.[95]

The other objectionable features of a CFC-type legislation which the BIAC referred to were the compliance burden on taxpayers and the enforcement burdens on tax authorities resulting from the overly restrictive and complicated legislation required to effectively counteract the practice of tax haven use. The BIAC concluded their submission by stating that it would be more beneficial and fair to all taxpayers involved if specific abuses were singled out and legislated against. This, they argued, would ensure that "the cure is not worse than the disease".[96]

The OECD Committee on Fiscal Affairs in a report produced in response to the BIAC submission cited above, attempted to balance revenue raising considerations against business attitudes. They stated that there is no justification for the use of tax haven companies to shelter income from the residence country's tax net. Moreover, the strong secrecy laws present in most tax haven countries are an inducement in themselves to conduct activities in tax havens.

> "The OECD Committee on Fiscal Affairs appreciates some of the problems raised by the BIAC and recognizes that minimizing costs is a legitimate concern of business. However, the Committee considers that these problems do not justify the use of tax havens to shelter income from taxation in the country of residence which bears no relation to the activities carried out in the tax haven. Another important point is that one of the main tax haven characteristics, confidentiality and secrecy, can itself be significant inducement to use tax havens".[97]

The Committee, in supporting CFC-type legislation, referred to the primary objectives which should underlie any comprehensive international tax regime, capital export neutrality and equity. They stressed the point that the use of tax havens itself distorts competition and that the BIAC and other businesses should not use such an argument to undermine the policy objectives underlying such counteracting legislation. They remarked that (i) the use of tax havens affects the neutrality of taxation in economic decisions, and (ii) competition between taxpayers is seriously distorted by the fact that some taxpayers can use tax havens to avoid or reduce tax, while others do not or cannot.

Similarly, the views of the business sector in Australia have understandably concentrated on the capital import neutrality argument. It has been suggested that our regulated labour market, the cost and availability of resources and our distance from export markets makes Australia uncompetitive. Thus, as the argument runs, it is not surprising that Australian companies would wish to establish overseas operations. The availability of cheaper labour and resources, as well as the proximity to markets, offers the initial impetus. The prospect of lower taxes and tax holidays in some countries also allows

for start-up costs to be recovered quickly. Mr Peter Fraser concisely summed up the dislike that most Australian businesses and economists have to the accruals legislation as follows:

> The reality is that our regulated labour market, the cost and availability of resources and our distance from export markets makes Australia uncompetitive. We need foreign capital. Our corporate tax rates are still relatively high and bureaucratic red tape makes the cost of carrying on business in Australia very high. In many cases it is simply not possible for Australian manufacturers to produce widgets at the same price as most manufacturers located in Asia, the United States and Europe. In many cases Australian manufacturers can only compete domestically because of tariff and non-tariff barriers to trade.
>
> Should there be any surprise that Australian companies wish to establish overseas operations. The availability of cheaper labour and resources, as well as the proximity to markets, offers the initial impetus. The prospect of lower taxes, and tax holidays in some countries, also allows for start-up costs to be recovered quickly.[98]

Mr Fraser also reiterated the assertion made by US businessmen some 23 years ago, which is that the relevant concept of neutrality should be equal treatment of domestic investors abroad. He stated that a taxation system which achieves equity and neutrality when viewed only by comparing the position of overseas entities with other home country manufacturers is not a perfect system.[99] Moreover, one of the world's largest accounting firms recently noted that for many multinationals, international taxation continues to be one of the largest single costs:

> The current economic climate has put great pressure on multinationals which expanded rapidly during the 1980s and focused attention on optimizing efficiency by cutting costs and maximizing profits. For many multinationals, international taxation continues to be the largest single costs.[100]

The preceding analysis states that subjecting domestic firms operating abroad to domestic taxation slows their expansion, and thus reduces their capacity to compete with foreign firms by increasing their costs. It has been observed that such an assertion implies the existence of economies of scale. Under the assumptions of economies of scale, market control is gained by the more rapidly expanding firm. However, some people would argue that this assertion alone is not sufficient to warrant exemption of foreign-source income, since it is possible to take advantage of economies of scale in the domestic economy. Moreover, there seems to be no reason why firms operating abroad could not expand out of borrowed funds.[101]

In proposing the new accruals measures, the Australian Government was mindful of the non-tax factors which attract Australian companies to invest in low tax jurisdictions. Such factors include the ability to obtain a supply of natural resources not available in Australia, to obtain low unit labour costs for labour-intensive work or to obtain access to certain markets. They suggested that the level of investment in these low tax jurisdictions by such Australian companies will be unaffected by the new accruals measures. It is only tax-induced investments in low tax jurisdictions that will be affected by the new measures.[102] The New Zealand Government, by contrast, has refused to succumb to the capital import neutrality arguments by not providing an active income exemption in its accruals rules.

Other commentators have similarly found it difficult to be persuaded by the competition argument. For instance, Professor McIntyre noted that there is no organized evidence that would tend to support this theory in the case of genuine businesses abroad.[103] Professor Vann, similarly, was not persuaded by the competition argument for retaining a tax bias in favour of foreign investment income. He observed that if the nature of the competition lies in the competition for share capital, it did not help to resort to the capital import neutrality argument. Firms investing overseas, he noted, are in most cases competing in domestic capital markets, and as such, will only be competitive where they can offer the same rate of return as other firms competing in those markets.[104] Moreover, two of the leading commentators on US international taxation have recently admitted to a complete reversal in opinion by advocating for the complete elimination of tax deferral instead of supporting the current state of play under Subpart F which exempts active income and certain other distributions from current taxation.[105] Such a change in opinion would indicate to some extent, it is submitted, an abandonment of the competition theory in favour of international neutrality.

In light of the foregoing, it appears that the business community's justification for tax haven use is somewhat lacking in credibility by reason of the fact that it implies that by establishing offshore subsidiaries to take advantage of the cheaper labour and resources as well as the tax differential between the foreign country and country of residence, a domestic company will become more competitive internationally. This, it was suggested, will have a marked positive impact on the domestic economy by increasing foreign capital. Such an interpretation of the state of affairs is not conclusively supported by evidence. The debate in the United States, over this very point, is still raging 30 years after Subpart F was first introduced into the Internal Revenue Code. Moreover, the OECD refused to accept such an argument as validly undermining the credibility of CFC-type legislation. Consequently, it would appear that by not providing an active income exemption, the New Zealand Government has avoided the "soul-searching" exercise that the United States finds itself confronting at the moment. The call for change in the Subpart F rules has become stronger with the election of a new President who has promised substantial tax reforms in order to curtail the burgeoning budget deficit.

(b) *Effects on the labour market*

Contrary to popularly held views deferral, it has been submitted, has a positive effect on the domestic labour market. The number of jobs in the residence country increase because the foreign subsidiaries tend to use domestically produced products, and market acceptance of goods produced by the foreign subsidiary in most cases promotes acceptance and even sales of the domestically produced goods by the parent company. The argument has been articulated in a US context as follows:

> [T]he number of jobs in the United States is increased as a result of the operations of successful foreign subsidiaries, since (a) in many cases those subsidiaries use United States-produced components and other goods, (b) a large United States-based infrastructure is required to manage the worldwide operations and (c) the market acceptance of the goods produced by the subsidiaries promotes greater worldwide acceptance and in many cases increases domestic sales of the same goods in and exports from the United States.[106]

Others have concentrated on the beneficial effects that multinationals have on employment levels in the country where they have their headquarters (i.e. the home or residence country). In particular, by increasing exports, multinationals increase jobs in the home country. On the other hand, it is observed that the creation of unfavourable conditions for a multinational corporation by the home country which cause the multinational to collapse its foreign affiliates and subsidiaries would lead to a reduction in the output levels of the home country. This is because the demand for raw materials and other goods produced by the home country and used by the multinational's foreign affiliates will disappear. Such employment effects were highlighted in a statement made on 26 February 1973 to the Senate Subcommittee on International Trade, by Peter Flanigan, the Executive Director of the Council on International Economic Policy and Special Assistant to the President of the United States. Mr Flanigan referred to the creation of jobs which are linked directly to the creation of export markets by US multinationals. He said:

> In considering the impact of multinationals on employment in the United States, it is important to note the following facts that are sometimes ignored:
>
> First, regarding exports and jobs created by exports, multinational corporations do not reduce exports but rather increase both exports and jobs ...
>
> Second, regarding imports, US import competition mostly comes not from US multinational corporations but from foreign owned companies. This is especially true in the sensitive cases of textiles, steel, and automobiles. Indeed, the top three US automobile importers by value are Volkswagen, Datsun, and Toyota ... Indeed, the 1970 Commerce Department survey indicates that about 70 percent of the output of foreign subsidiaries of US companies is sold in the country where it is produced, and an additional 23 percent is exported to third countries. Only 7 percent of the multinational corporation production returns as imports to the United States to compete here at home with domestic production ....
>
> Third, in most of the few cases where US and third countries are supplied by American affiliates abroad ... elimination of these plants would not result in increased US output and employment, but in replacement of our output by foreign competitors. Such replacement would probably reduce US employment further since foreign competitors would be less likely to rely on the United States for machinery, supplies, research or marketing requirements...
>
> Fourth, ... evidence indicates that businesses do not normally move abroad to take advantage of low labor costs 60 per cent of US direct investments abroad in 1970 were in Canada and Western Europe, not countries with notably low wage rates.[107]

It should be noted that the fourth point raised by Mr Flanigan regarding evidence as to businesses not moving abroad to take advantage of low labour costs, must be qualified to the extent that subsequent statistics produced by the Gordon Report,[108] indicate a marked growth in the use of tax havens by US corporations. Such statistics, it is submitted, contradict Mr Flanigan's evidence to the extent that labour costs are normally lowest in tax haven countries.

In 1980, the Department of the Treasury, the Department of Justice and the IRS requested that the Special Counsel for International Taxation, Mr Richard Gordon, review and advise them as to the use of tax havens by US persons and present options to be considered for problems this created. In the Gordon Report, it was noted that "[u]se of tax havens by United States persons is large and apparently growing".[109] This conclusion was based on the evidence that between 1968 and 1978 the data showed an increase of almost fivefold in US direct investment in business formed in tax havens and about a two and a half fold increase in investment in non-tax haven businesses.[110]

The statistics produced by the Gordon Report in support of the above conclusion showed that in 1976, 17.6 percent of the total assets of US-owned CFCs were reported as belonging to CFCs incorporated in tax havens. The comparable percentage for 1972 was 16.4 percent; for 1968 it was 12.1 percent. Consequently, at least in this respect the report stated that multinational business use of havens had intensified by over 45 percent in eight years. In some industries, particularly in finance and insurance, CFC assets in the havens as a percent of similar assets in all areas were considerably larger.[111]

Gordon, R.A., *Tax Havens and Their Use by United States Taxpayers – An Overview*, a report to the Commissioner of Internal Revenue, the Assistant Attorney-General (Tax Division) and the Assistant Secretary of the Treasury (Tax Policy) (Washington, DC, Department of the Treasury, 12 January 1981), 32041 [hereinafter the Gordon Report].
109. Id. at 32.
110. Id.
111. Id. The tax haven areas covered by the report were the Bahamas, Bermuda, Costa Rica, Netherlands Antilles, other British West Indies (other than Cayman Islands), Panama, Bahrain, Hong Kong, Liberia, Liechtenstein, Luxembourg, Singapore and Switzerland. It is interesting to note that although Luxembourg, Singapore and Switzerland are characterized as tax havens in the Gordon Report, in the Regulations accompanying the Australian CFC legislation, they are characterized as "listed countries". However, Schedule 9 of the Regulations sets out the list of circumstances (i.e. concessions) in those countries which would effectively cause such countries to lose their "listed country" status with respect to such circumstances.

© 1993 International Bureau of Fiscal Documentation

Taking the analysis one step further, as was pointed out above, if accruals basis taxation creates the catalyst for collapsing foreign subsidiaries, then the domestic labour market could experience a downturn. This is because the source of foreign earnings which could have been repatriated to the domestic economy diminishes as a result of the liquidation of foreign subsidiaries. Moreover, it is unlikely that such collapsed offshore operations would be able to successfully set up domestically because it is unlikely that an investment in a similar domestic industry will generate the same return as that generated in the foreign country, given the high level of labour costs, resource and general start-up costs in Australia.

Consequently, it has been suggested that the risk of accruals basis taxation is that it may "misfire" or "over-kill", and substantially increase the bargaining power of unions. This is because, by taxing foreign investments at the same rate as domestic investment, the option of relocating domestic operations offshore is effectively lost. Therefore, managements lose their flexibility when negotiating with difficult union leaders or even government leaders.[112]

As revealed above, resolution of the above issues turns on the role foreign investment plays in the domestic economy. Proper assessment of the economic effects of foreign investment may also vary in accordance with the type of industry, the firm, the product or service under scrutiny. Thus, it cannot be said with any conviction that foreign investment by Australian companies will in fact assist Australia's domestic economy. By the same token, it is not possible to conclusively state that foreign investment will be discouraged by the operation of the accruals legislation or the FIF measures. This fact was acknowledged in the Consultative Document where it was stated that the reason why the economic analyses reach contrary conclusions is partly because they are based on differing assumptions about the effect of foreign investment on the level of direct investment in Australia.

(c) *Growth in world production*

It has been argued by some that, to the extent that accruals basis taxation creates fiscal barriers to transnational investment, then depending on the alternate domestic use to which such capital could be put, a loss in world production could result because there will be many instances where the investment and its attendant management and technology (commonly referred to as the "dynamic externalities of investment") cannot be employed as efficiently at home as abroad.[113]

The Treasurer in the Consultative Document was mindful of the likely possibility that accruals basis taxation will discourage foreign investment by Australians at Australia's cost. This is because there is a possibility that the total tax (foreign plus Australian) paid on foreign income under the accruals legislation is greater than that paid on similar domestic income. Notwithstanding such a potentially disastrous possibility, the Treasurer refused to extend the operation of the imputation system to the FTCS. Consequently, the current position is that no imputation credits will arise in respect of foreign taxes paid. It was felt that international equity and efficiency principles were best served by the FTCS coupled with the new accruals taxation regime and no imputation credits. The Federal Government, it appears, were not convinced that the additional benefits derived from foreign investments are sufficient to outweigh the loss in revenues by allowing shareholders the benefit of imputation credits in respect of foreign taxes paid.

> "Notwithstanding the economic arguments in favour of a deduction system, international norms have generally favoured a foreign tax credit system (or exemption system for income from comparable-tax jurisdictions) when profits are derived by a company from overseas sources. Australia has followed this practice with the result that Australian companies can choose between domestic and foreign investment opportunities on the basis of before-tax rates of return.
>
> This credit approach can be justified if foreign investment is seen as providing some additional benefits, e.g. by enabling Australian companies to obtain economies of scale or to further develop skills originally acquired in the Australian market. However, no evidence is available to suggest that such benefits are sufficiently great to warrant providing imputation credits for foreign tax paid. Thus, Australia, along with virtually all developed countries, follows the deduction system at the level of the individual shareholder."[114]

(d) *Balance of payments*

Reflecting the reservations of the Asprey Committee expressed in relation to the introduction in Australia of similar rules as Subpart F provisions, one commentator noted that as a net capital importer Australia could benefit from not having accruals rules. This is because the capital export bias created by the lack of accruals legislation could assist in redressing the inevitable long term drain on our balance of payments.

> "[T]ax deferral provides a significant capital export bias. Australia, as a net importer of capital, would have more probability of economic gain in the long term by encouraging its residents to undertake foreign investment. The capital export bias could assist in redressing the inevitable long term drain on our balance of payment."[115]

However, this argument suffers from the same flaws present with other arguments raised in support of the retention of the tax bias in favour of foreign-source income. That is, there are too many variables which have not been accounted for and which would need to be resolved before such an assertion may be proved one way or the other. One such variable is the interrelationship of foreign investment with domestic investment. Another is the repatriation policy of foreign subsidiaries.

It is not surprising to note that the debate over the economic impact of deferral of domestic tax has centred on the country introducing the accruals legislation (i.e. the capital exporting

115. Cohen, G., "Controlled Foreign Corporations..." (Pt II), in *Taxation in Australia* (1985) Vol XIX, at 1034. Mr Cohen concluded:

> If one were to weigh up the likely benefits to Australia from the elimination of deferral against the costs of implementing and enforcing such a legislative scheme, one would conclude that there is no net benefit in the wholesale elimination of deferral. See also *Butterworths Weekly Tax Bulletin* Issue No. 41 (13 September 1990), at 647.

© 1993 International Bureau of Fiscal Documentation

country) and not on the host country that may also be affected by the introduction of such legislation (i.e. the capital importing country). In order to alleviate such an imbalance it is intended to examine the economic impact on the capital importing country arising from the introduction of tax measures aimed at eliminating deferral by the capital exporting country.

3. Effects of full current taxation on the host country

It is suggested that an accruals regime of taxation would reduce or eliminate the value of the incentives granted by the capital importing state to the domestic shareholder of the CFC (which is resident in the capital importing state). Such incentives (commonly referred to as "tax sparing") are normally offered by the host country with the intention of encouraging reinvestment of profits in the country of income origin. As indicated above, under the accruals regime the country where the shareholders reside will subject the domestic shareholders (who control the foreign corporation) to tax in respect of their proportionate share of the CFC's undistributed profits. The tax foregone by the country of origin is effectively collected by the capital exporting state.[116] Therefore, with or without tax incentives, the foreign enterprise will be taxed at the same rate, if not a greater one.

The preceding discussion raises some interesting questions with regard to the political economics of international taxation, public international law and the sovereignty of states. William Park claims that the United States has always claimed extra-territorial jurisdiction in non-tax matters and that it is unlikely, in the near future at least, that the interests of other states will be acknowledged by the United States as imposing limits on its taxing power.[117] The same author makes the added remark that the affront to sovereignty resulting from an extension of accruals basis taxation would be not unlike that resulting from foreign direct investment controls. The exercise of extra-territorial jurisdiction by the capital exporting state, Park claims, would thwart the host state policy for the economic growth of its corporate creatures.[118] As interesting as this aspect of accrual basis taxation may be, it is unfortunately beyond the scope of this paper.[119]

The other significant effect of an accruals regime of taxation on the capital importing state relates to the effect on direct foreign investment and national welfare. It is generally accepted that direct foreign investment creates an economic benefit for the host country. Among the benefits cited are mobilization of resources, more efficient production of goods and services, and in some cases, a better balance of payments position by reason of increased exports.

In terms of foreign investment in Australia, by way of either debt or equity, the evidence available clearly illustrates that three of our most important sources of investment funds have been the United States, United Kingdom and Japan. In the year to 30 June 1986 investment statistics[120] indicate that about 23 percent of total foreign investment came into Australia from the United States, 21 percent from the United Kingdom and about 15 percent from Japan. More recent data, appearing daily in the financial press, would confirm the emergence of a trend away from reliance on the traditional sources of investment from the United States and the United Kingdom and an increasing dependence on Japan.

Although the source of the foreign investment may have changed, the increase in total foreign investment has not. The total amount of foreign investment into Australia in 1981 was $ 47,343 million, and in 1986 it had increased to $ 138,599 million, i.e. an increase of almost 300 percent over the same period. The Australian accruals legislation should, it is submitted, not have any bearing on foreign investment into Australia, since such legislation is designed to affect capital exports as opposed to capital imports. In addition, it is suggested that business investment spending depends not only on the tax policy of the country, but also on exchange rate policy, government attitudes, labour unions, inflation, proximity to market and a host of other factors.[121]

A further comment on the effects of foreign investment on the host country is pertinent at this stage. In terms of the Australian experience, statistics show that foreign investment in the manufacturing industry over the period 1981-1986 increased by 45 percent whereas foreign investment in the mining industry over the same period increased by 56 percent. The increase over the same period in other industries was only 27 percent.

A country in the position of Australia, with its balance of payments problems, should be looking at encouraging the development of the manufacturing and even mineral processing industries, since it is through the increased activity in those industries that we may begin to reverse the vicious cycle of dependency on imported products, and even create exporting opportunities. To that extent the principles of neutrality may have to be compromised in order to achieve our ultimate goal, i.e. an improvement in the balance of payments situation. Therefore, it may be that the Australian Government will have to discriminate between industries by providing tax preferences (or tax holidays) for those who wish to invest in manufacturing and mineral processing industries. Such discriminatory practices have been installed successfully in various countries around the world (e.g. Singapore and Ireland).

However, there are two sides to the equation. The success or otherwise of a preference system, of the type described above, ultimately depends on the type of tax system which the capital exporting country has in place. It is suggested that the effect of an accruals legislation in the capital exporting country will have a great bearing on whether the Australian Government's decision to encourage investment in manufac-

116. It is not possible to determine exactly whether the tax foregone by the capital-importing state is collected by the capital-exporting state which has CFC-type legislation.

turing by providing a tax holiday for those who do invest in such industry, will succeed or not.

Putting the current state of international affairs in perspective, it is noted that out of the eight other OECD countries that have implemented accruals taxation, seven include a genuine business exemption in their rules. New Zealand is the only country without such an exemption. Therefore, this is good news for the Australian Government if they decide to introduce tax preferences or incentives to the manufacturing industry.

The preceding discussion illustrates that a country's interests as an exporter of capital conflict with its interests as an importer of capital, and therefore, to a certain extent, a country like Australia, which is a net capital importer (i.e. a policy taker) should take into account the policies of its trading partners, especially, those which are large capital exporters. The success or otherwise of Australia's international tax reforms depends largely on whether such reforms would cause other countries (especially the large capital exporting countries) to retaliate.

4. Other relevant considerations

The above discussion explored only the economic impact of accrual basis taxation on the movement of capital, from the point of view of the capital exporting nation, the sectoral groups and interest within that nation, as well as the capital importing nation. There was very little discussion of the political and constitutional aspects of accrual basis legislation;[122] the political issues[123] being concerned with the concept of "sovereignty", whereas the constitutional issues (which are closely linked with the political issues), being concerned with the question of "territoriality". The significance of such aspects springs from the fact that there are jurisdictional matters which limit the power of revenue authorities to tax the income derived by a foreign corporation. Basically, a sovereign state may only tax its own residents (or citizens in the case of the United States) who are shareholders of a foreign corporation, but *not* the foreign shareholders of the foreign corporation. The Australian Government recognizes that it has no tax jurisdiction over foreign subsidiaries of Australian companies. Accordingly, it has introduced measures to circumvent the threshold question of jurisdiction by introducing an accruals basis of taxation which taxes the domestic residents with interests in the foreign entities on their proportionate share of the entity's income.

One further problem which results from the growing use of accruals basis taxation is the potential for double taxation where the use of indirect ownership rules by countries that adopt accruals legislation could include the income of a particular foreign entity being subject to more than one country's legislation. At the time the accruals basis regime was being proposed for Australia in May 1988, a real solution to such a dilemma had not been propounded. It was merely suggested that if such a situation were to occur, primary taxation rights would need to be considered in order to prevent the multiple taxation of the income of a foreign entity.[124] It was not until December 1990 that a statutory solution to the problem was proposed in Taxation Laws Amendment Bill (No. 6) 1990 (which received Royal assent from the Governor General on 24 April 1991) in the form of Section 456A. That section provides relief from double taxation where amounts derived by a CFC have been taxed under the accruals system of another country.

D. *Conclusion*

Clearly, more work is needed to determine the role of foreign investment on the domestic economy and the effect accruals taxation would have on the international flow of capital. However, at this stage it appears that the international dimensions of the Australian Government's taxation policies are set at a level which promote national interests at the expense perhaps of international ones. This is evidenced by the fact that the Government has adopted a credit method without extending the operation of the imputation credits system to foreign taxes paid.

As far as the competition theory goes, this is still very much an open question. Proponents of this theory have claimed victory in the form of the active income exemption which was inserted into the accruals legislation after the Consultative Document was released. However, it is not clear whether the insertion of such an exemption amounts to the Australian Government backing down from its original proposal of not including such an exemption, as much as a concession that genuine business income does not undermine the integrity of Australia's source principle of taxation. In view of the New Zealand Government's refusal to include such an exemption in its CFC rules, and recent comments made by some prominent American commentators to the effect that Subpart F rules should be thoroughly overhauled in order to, inter alia, remove the deferral advantage that may be sought in relation to active income, the decision of the Australian Government would appear to be somewhat questionable.

The conclusion (if any) that may be drawn from the arguments discussed above in relation to the removal or retention of tax bias in favour of foreign investment income, is that there are still many unresolved issues. A major issue which has occupied the thoughts of many commentators is defining the exact relationship between foreign investment and the domestic economy. Defining this relationship, it is observed, rests on the implicit assumption of whether foreign investment is a substitute for or a supplement to domestic investment. This is a very complex question to which there is no clear answer.

However, in view of the above discussion it could not be said with any conviction that deferral of domestic taxes in all cases (not just anti-avoidance cases) is harmful to the national interest in the sense that the revenue authorities in all cases

would have been entitled to collect revenue where deferral of domestic tax is made possible by use of foreign subsidiaries. Hence, the suggestion that the term deferral is value laden. The mere fact that the economic evidence is inconclusive does not justify any tax preferences for foreign investment. Moreover, given that Australia is committed to a FTCS, then to that extent, it would make sense to have accruals basis taxation. Few people would dispute the fact that accruals basis taxation should be an integral part of the tax arsenal available to revenue authorities in a country which has substantial offshore investments, since it is one of the most powerful (if not the most powerful) arsenal available to revenue authorities in their pursuit of international profit shifting activities. The live issue which is destined to occupy a great deal of time in the future is the question of whether in light of the major amendments to the FTCS, an active business exemption (which is very difficult to comply with and administer) is warranted.

THE TAXATION OF COMPANIES IN EUROPE

Country-by-country survey, systematically examining the taxes applicable at each stage of the life of a company in the 12 EC countries, Austria, Cyprus, Finland, Norway, Sweden, Switzerland and Turkey.
Each country chapter follows the same outline to allow country comparisons:

- Basic company and accounting law
- Taxes on the establishment and expansion of a business
- Corporate income taxation: types of taxes, types of company taxpayers and taxable income, including computation of taxable income, anti-avoidance measures, exclusions, deductions, depreciation, incentives and disincentives, valuation, reserves and provisions, capital gains, losses and rates
- Miscellaneous taxes based on income, capital, payroll etc.
- Taxes on transactions and services
- International aspects
- Group taxation
- Mergers, spin-offs and divisions
- Full English texts of EC Directives (including drafts) on corporate and tax law, plus extensive bibliography.

NEW ZEALAND:

COMPREHENSIVE DIVIDEND IMPUTATION, NEUTRALITY AND DOUBLE TAXATION OF CORPORATE PROFITS

Andrew M.C. Smith

Accountancy Group, Faculty of Commerce & Administration,
Victoria University of Wellington, Wellington, New Zealand.

I. INTRODUCTION

For nearly 30 years New Zealand companies were taxed on a "classical" basis. In an Economic Statement to Parliament on 20 August 1985,[1] the Minister of Finance, Sir Roger Douglas, announced that the Government had decided to introduce dividend imputation to mitigate the double taxation of corporate income arising under the "classical" approach. After considerable consultation, comprehensive dividend imputation was introduced from 1 April 1988.

The objective of this paper is to examine the imputation regime adopted in New Zealand, and to determine whether the regime is capable of achieving the stated objectives when first introduced.

II. RATIONALES FOR INTRODUCING DIVIDEND IMPUTATION

The Government's statement of 20 August 1985 stated that the classical approach to company taxation gave rise to the double taxation of corporate earnings resulting in higher overall tax rates. This was held to be "unfair as it imposes excessive tax on individuals, especially those on low incomes".[2] Double taxation of corporate income made it more attractive for companies to retain earnings rather than distribute them, resulting in capital being locked into "less productive activities within existing companies".[3] This also gave rise to opportunities for takeover and asset-stripping by other companies resulting "in the accumulation of capital in fewer companies".[4] The classical approach was also held to encourage firms to expand by borrowing, giving rise to higher debt/equity ratios than would otherwise be desirable. It penalized "smaller, innovative companies which, under a more neutral tax system, would have better growth prospects".

By relieving the double taxation of corporate income the mobility of capital will be increased and thus "remove artificial incentives for takeovers". Other benefits cited were:

> It will remove the relative over-taxation of shareholders on low marginal rates of tax. This will promote a widespread ownership of corporate equity in the community. The introduction of full imputation will encourage more firms to seek equity rather than debt finance. Disadvantages faced by new ventures will be reduced, leading to higher investment and employment.[5]

In a subsequent discussion document[6] further problems of the classical approach were identified as follows:

A. *Financial distress and agency costs from high debt level*

The classical approach raises the cost of equity and thus favours the use of debt. As debt levels are raised extra bankruptcy and agency costs arise. Financially distressed companies may by-pass profitable investments because the benefits will accrue to debt rather than their equity holders. Agency costs may also increase from costs incurred in complying with covenants required by lenders, which are likely to become greater when debt levels arise which may constrain a company's operating and investment flexibility. As the cost of new equity is higher than the cost of

retained earnings, classical taxation imposes the greatest burden on rapidly growing companies which need to obtain new equity finance.

B. *Agency costs associated with non-corporate business vehicles*

The classical approach increases incentives for adopting other forms of business organizations such as partnerships, sole traderships and trusts. However, such business vehicles may suffer from increased agency costs associated with monitoring performance and contract compliance.

C. *Increased portfolio diversification costs to investors*

A diversified portfolio would include both debt and equity instruments. If an investor's marginal tax rate is below the corporate rate, diversification into equity securities will incur the cost of lower after-tax returns (adjusted for risk) on equity than would apply to returns from debt.

In the 1987 Consultative Document it was concluded that it was "impossible to measure the magnitude of the efficiency costs arising from tax-induced investment and financing decisions".[7] But it was believed the costs associated with the then corporate tax regime were "likely to be substantial".

Benge and Robinson (1986) also identified similar problems with the classical approach. They concluded "the tax system is likely to provide incentives for economically wasteful activities associated with minimizing taxes which result in a cost to the economy without compensating benefits".

III. THE NEW ZEALAND IMPUTATION SYSTEM

A. *Historical background*

Prior to 1958, dividends received by individual shareholders were exempt from tax, but were taken into account when determining the marginal rates applying to a taxpayer's other assessable income. Assessable non-dividend income was deemed to have been derived after exempt dividend income and was hence taxed at a taxpayer's highest marginal rates.

In 1958 New Zealand adopted the classical approach to corporate taxation and dividends became fully taxable in the hands of non-corporate shareholders. While an intercompany dividend exemption was retained, a number of anti-avoidance provisions were enacted to reduce opportunities to avoid the double taxation of corporate income. Excess retention tax was introduced which imposed additional tax on companies which distributed insufficient income as dividends to shareholders, and other provisions were enacted to tax certain debt securities with equity characteristics as equity securities. Deductions for interest paid on certain convertible debentures,[8] on debentures issued in substitution for equity shares,[9] and on debentures issued on which the rate of interest payable was made with reference to the profitability of the borrower (rather than to arm's length factors),[10] were disallowed in certain cases.[11] Despite opportunities for tax avoidance by substituting pure debt for equity finance under the classical approach there were no tax sanctions based on the debt/equity ratios of taxpayer companies.

The use of trusts in substitution for limited liability companies was addressed by taxing unit trusts as companies. In the 1960s some of these anti-avoidance measures were relaxed. The scope of the excess retention tax was reduced and a more liberal attitude was taken towards the use of convertible notes and other convertible securities.

On a practical level the classical approach had the greatest effect on widely-held companies. Closely-held companies with shareholders/employees could avoid the impact of double taxation by distributing their assessable income to director/shareholders in the form of salaries and directors' fees, which were deductible to the company. This method of "earnings stripping" was accepted by New Zealand revenue authorities subject to only limited legislative restraints.[12]

By the late 1970s widely-held companies had adopted new strategies to mitigate the taxation of distributed earnings. Under the dividend regime then in force, companies could selectively distribute non-assessable capital reserves in lieu of assessable dividends paid from retained profits. These non-assessable capital reserves arose from realized capital profits and share premiums.[13] Distributions from such sources in lieu of assessable dividends became widespread by the early 1980s.

The ability to make such non-assessable capital distributions gave rise to artificial incentives for companies to sell capital assets in order to realize capital gains and to issue shares with low par values and high share premiums.[14] This favoured companies in certain types of businesses, such as those with large real estate holdings and those involved with takeovers and corporate rationalization. In the early 1980s it was common to see new equity share issues being made with artificially low par values and a high share premium to create reserves for non-assessable distributions in later years.

A notable feature of these non-assessable capital distributions was the absence of any restrictions on dividend streaming. By streaming capital distributions to those shareholders who would benefit and paying dividends from revenue reserves for those who would not (e.g. tax-exempts, non-residents) the value of the capital reserves for non-assessable distributions was maximized. Companies were only limited

12. Mainly Sec. 190 which allows the Commissioner to disallow a deduction for excessive remuneration or director's fees paid to shareholders, directors or relatives of the shareholders or directors of "proprietary" companies..
13. Provided the share premiums were paid in cash.
14. Court approval was required to make distributions from the share premium account and the applicant company had to create an undistributable reserve (commonly called the capital maintenance reserve) from retained earnings equal to the amount of the share premium approved for distribution.

© 1993 International Bureau of Fiscal Documentation

in their capacity to make non-assessable capital distributions by their ability to generate capital profits and cash share premium reserves. It seems reasonable to conclude that these non-assessable capital distributions in lieu of dividends until 1985 helped to mitigate the excesses of double taxation of company earnings for widely-held companies.

As part of the Economic Statement of 20 August 1985 all distributions (whether from capital or revenue sources) were deemed assessable from 21 August 1985 except on winding up. The statement said this would apply "as a short-term measure, until the introduction of a full imputation system".[15] This suggested that non-assessable capital distributions would be permitted again when dividend imputation was introduced but, however, did not occur when imputation was introduced in 1988.[16]

Mainly as a response to the taxation of capital distributions in August 1985, many widely-held companies began to offer shareholders the option of receiving a bonus issue of shares instead of a cash dividend (termed a "bonus issue-in-lieu"). Under the law then applying, such bonus issues were non-assessable. With this option (essentially a selective bonus issue) shareholders could obtain cash by selling their bonus shares on the secondary market. Thus the bonus issue schemes were perhaps an application of the Modigliani and Miller argument that it would be better for companies not to pay taxable dividends but for shareholders to liquidate part of their investments realizing cash in the tax preferred form of a capital gain. Such bonus issues-in-lieu remained non-assessable until 1 April 1988 when a new definition of "dividend" was introduced as part of the dividend imputation legislation which deemed bonus issues in lieu of dividends as assessable income.

B. *The New Zealand imputation regime*

The 20 August 1985 statement was the first indication to taxpayers that the Government intended to address the problem of the double taxation of corporate earnings. In December 1987 a Consultative Document was released outlining proposals for the scheme of dividend imputation, followed by a Comprehensive Report in April 1988. After taking public submissions a final report was released in July 1988 with draft legislation, and later that year legislation was passed with retrospective effect back to 1 April 1988. It is important to note that the same Committee was contemporaneously working on international tax reforms[17] and thus reforms in this area along with the imputation regime can arguably be seen as part of an overall package. The same Committee as part of its report on international tax reform also "endorsed the Government's decision to give priority to the investigation of a capital gains tax".[18]

New Zealand has chosen to mitigate the double taxation of distributed corporate earnings by operating an imputation system, whereby companies paying dividends can attribute the income tax they have paid on their earnings to shareholders when dividends are paid. Thus the shareholders' assessable income comprises not only the cash dividend[19] but the imputation credits as well.[20] Such imputation credits are then credited against the shareholders' tax liability in a similar way as PAYE from salary or wage income.[21]

The ability to attach such credits to dividend payments is determined by the amount of income tax the company has paid on its income and is monitored by a memorandum account called the imputation credit account (ICA), which is required to be kept by all corporate taxpayers for tax purposes.[22] Payments of income tax by a company or the receipt of dividends by the company with imputation credits attached give rise to credits in the ICA, while debits are entered when dividends are paid with credits attached.[23] If a debit balance is obtained at the end of the financial year, income tax for the following financial year must be paid in advance to clear the debit balance.[24]

The amount of credits attached to a dividend is solely left to the discretion of the company. There is no obligation to attach imputation credits even if a credit balance exists in the ICA.[25] The imputation rate can be varied between zero percent up to the top marginal corporate tax rate.[26] If a taxpayer receives a dividend which has imputation credits attached at a higher rate than his/her marginal rate, the excess tax can be used to offset tax liabilities on other income. If there is still an excess of imputation credits left, these can be converted into a tax loss and carried forward to future years.

The New Zealand imputation regime is characterized by complex anti-streaming rules. The intention of the streaming rules is to prevent companies from directing dividends with credits attached to those who can use them while paying dividends without credits to those who cannot, such as tax-exempt shareholders (e.g. charities) and non-residents.[27] A cynic would conclude the New Zealand Parliament wished imputation credits to be "wasted" as much as possible on shareholders who cannot benefit from them. Thus there is an obligation to maintain a constant imputation ratio within an income year; otherwise a penalty debit applies to deem the imputation credits up to the highest rate used during the peri-

15. Douglas (1985), at 6443.
16. This statement plus proposals in Benge & Robinson (1986) suggested in the initial stages provision for non-assessable capital distributions would be preserved. Benge and Robinson at the time their study was published were Treasury officials.
17. Affecting offshore trusts; controlled foreign companies (CFCs) and foreign investment funds (FIFs).
18. Consultative Committee (April 1988), at 6.
19. Ignoring for the moment dividend PAYE.
20. Sec. 394ZC(1).
21. It must be noted that an imputation credit and a PAYE credit are not *exactly* the same as the former cannot be refunded in cash.
22. Sec. 394B;
23. Sec. 394C, D and E.
24. Sec. 394L.
25. This is the major difference between the Australian and New Zealand imputation regimes. Australian companies must frank dividends if they have credits in their imputation accounts.
26. Under Sec. 394G, the maximum imputation rate is determined by the following formula: $\frac{a}{(1-a)}$ where A is the corporate tax rate. If the top individual and corporate tax rates differ at some future time then the maximum imputation rate will be set by the corporate rate not the individual rate. Thus an individual shareholder could have some additional tax to pay, as is currently the case in Australia.
27. New Zealand imputation credits cannot be credited against New Zealand non-resident withholding tax on dividends paid to non-residents (as in Australia), nor can imputation credits be refunded in cash (as in the United Kingdom).

© 1993 International Bureau of Fiscal Documentation

od.[28] An exemption from this penalty can be obtained on application to the Commissioner provided he is certain that the variation is not part of a tax avoidance arrangement.[29] If the imputation rate varies more than 20 percent between years an explanation must be provided to the Commissioner.[30] In addition, there are provisions to prevent share sale and buy-back arrangements,[31] as well as shareholding continuity requirements where a credit balance exists in the ICA.[32]

A significant feature of the imputation regime is that any income tax paid outside New Zealand cannot give rise to credits in the ICA. This is at variance to the general principle of foreign tax credits for foreign income tax which would apply to the company's income tax assessment under Sections 293(2) and 304.

The OECD (1991)[33] categorizes the methods used by member countries to mitigate double taxation of corporate earnings:

Partial Relief Of Double Taxation				Total Elimination of Double Taxation	
Company Level		Shareholder Level		Corporate Level	Shareholder Level
Split Rate	Partial Dedn	Partial Imptn	Partial Relief	Zero Rate	Full Imputation
Germany*	Iceland*	France	Austria	Greece	Australia
	Spain	Ireland	Canada	Norway	Finland
	Sweden	UK	Denmark		Germany*
			Iceland*		Italy
			Japan		New Zealand
			Portugal		Turkey*
			Turkey*		

* These countries have company taxing regimes which incorporate more than one approach to relieve double taxation.

Thus it can be seen there is no international consensus on the most appropriate method to relieve double taxation of corporate earnings. A number of countries have adopted methods other than tax imputation such as dividend deductions, split corporate rate (depending on whether corporate income is distributed or not) and specific shareholder relief (such as rebates, exemptions). New Zealand's imputation system is classified as "totally eliminating" double taxation by the OECD. Unlike some other countries, New Zealand's corporate rate and top personal marginal rate are essentially the same although this is not recognized in the OECD's study.[34]

The OECD study also shows changes to the corporate tax regimes in OECD countries since 1962.[35] It is interesting to note that some OECD countries (Japan, Belgium, Austria) have moved recently in the opposite direction from relieving double taxation to classical models or partial relief models.

IV. ANALYSIS OF THE NEW ZEALAND IMPUTATION MODEL

A. *Criteria to assess imputation regime*

In both the 1985 Parliamentary Statement and the 1987 Consultative Document a large number of problems were attributed to the classical system of corporate taxation as discussed earlier in this paper. In the 1987 Consultative Document these deficiencies were attributed to two factors:

(1) the taxation of company income at the company rate rather than the shareholders' marginal rate;
(2) additional tax when corporate earnings were distributed.[36]

The OECD (1991) stated the double taxation of dividends accentuated three types of non-neutralities. These were a bias against companies towards other business vehicles, a bias against equity in favour of debt, and lastly a bias against companies using new equity to finance new investments.[37]

Benge & Robinson (1986) identified three basic criteria for the design of an imputation scheme. They were:

(1) Imputation credits should not be given on dividends paid out of income which has not borne domestic company tax.
(2) The benefit of tax preferences should be preserved under imputation. It would be inconsistent with the objective of full imputation to attempt to claw back tax preferences.
(3) When the after-tax income of a company is fully distributed, the total company and personal tax burden levied on it should be the same as that levied on unincorporated business income.[38]

In summary these criteria emphasize the taxation of income derived by companies at their shareholders' rather than the company's marginal rate and that there should be no additional tax impost on income derived through a company and distributed to shareholders when compared to unincorporated enterprises. In the following section the imputation regime adopted in New Zealand will be examined to see whether the regime adopted will meet the objectives sought, and secondly will address the problems identified with the classical approach.

B. *Review of New Zealand imputation model*

The first issue is whether a tax bias remains against companies towards other business vehicles after the introduction of dividend imputation. A theoretical model developed by Mervyn King and refined by the Ruding Committee[39] can be used to assess such regimes. The model is known as the

28. Sec. 394G(3).

"attempted corporate integration of dividend taxation test" (ACID) which is as follows:

$$ACID = \frac{[1 - m^D]\,[1 - t^D] / [1 - c]}{[1 - m^E]}$$

where:

t^D = tax rate on corporate income if distributed to shareholders.
m^D = individual tax rate on dividends received by a shareholder.
c = gross-up factor of dividends due to dividend imputation provisions.
m^E = individual income tax rate on unincorporated business income.

Applying this to New Zealand a value of 1.0 is obtained indicating no bias against companies in favour of incorporated businesses. This figure compares favourably with other countries as shown in the following table for 1991 data:[40]

EEC Countries		Other Countries	
Belgium	0.61	Australia	1.00
Denmark	0.62	Austria	0.61
France	0.87	Canada	0.80
Germany	0.88	Japan	0.50
Greece	1.00	**New Zealand**	1.00
Ireland	0.90	Sweden	0.70
Italy	1.00	Switzerland	0.70
Luxembourg	0.61	USA	0.63
Netherlands	0.65		
Portugal	0.60		
Spain	0.65		
UK	0.88		

These results suggest that New Zealand has achieved a neutral system of corporate taxation which few other countries have matched. A limitation of the ACID test is that it only considers the tax and tax rates applying to distributions not the actual tax base. While New Zealand taxes business income on the same basis whether earned by company, trust, partnership or sole trader, some other jurisdictions do not and have different tax bases for different business vehicles.[41] Thus the relative neutrality of the New Zealand approach *vis-à-vis* other countries may be better than the results above suggest.

If assessable income is derived from a New Zealand source by a New Zealand company and is taxed accordingly, any subsequent distribution of that income with maximum imputation credits attached will not give rise to any additional tax impost when received by shareholders. Given that the imputation credit and the net dividend are grossed up in the hands of the shareholder and assessed at the taxpayer's marginal rate, then corporate income is effectively taxed at the recipient's marginal tax rate. Thus the taxation is equivalent[42] to the tax payable if the income was derived through other business vehicles. The following example has often been used to illustrate how dividend imputation effectively eliminates double taxation of corporate earnings. The results obtained are consistent with the ACID test ratio of 1.00.

In this example, pre-tax business income of $ 1,000 is derived through a company and distributed to shareholders in the first column and directly by an individual in the second column.

	Income Derived Via Company	Income Derived Directly
Income of NZ Co	$1,000	
less NZ Co Tax	330	
Net Income To Be Distributed	$ 670	
Income of NZ Owner	$ 670	$1,000
+ Imputation Credit	330	
Total Income	$1,000	$1,000
less Imputation credit NZ Tax	$ 330	330
Net Return To NZ Investor	$ 670	$ 670

If the marginal tax rate of the shareholder is in the mid-range (24 percent)[43] the following results are obtained:

	Income Derived Via Company	Income Derived Directly
Income of NZ Co	$1,000	
less NZ Co Tax	330	
Net Income To Be Distributed	$ 670	
Income of NZ Owner	$ 670	$1,000
+ Imputation Credit	330	
Total Income	$1,000	$1,000
less Imputation credit NZ Tax	$ 330 (90)	240
Loss of Low Income Rebate	40	40
Net Return To NZ Investor	$ 720	$ 720

The refund of $ 90 in the first column is dependent upon the taxpayer having other tax liabilities which the excess imputation credits can be offset against. However, business income will be taxed at the shareholder's marginal tax rate.

However, if certain assumptions are changed the neutrality of the New Zealand imputation regime is lost and the ACID ratio will fall below 1.00.[44] These conditions are:

(a) if foreign sourced business income is derived on which foreign income taxes have been paid;
(b) income is distributed which has not borne the full rate of New Zealand income tax.

Firstly, the ACID model assumes a closed-economy model where the income is earned and distributed to shareholders within one jurisdiction. As cross-border investment is common such an assumption is not representative of real world conditions.

Derivation of foreign source income on which foreign income taxes have been paid will place shareholders at a dis-

40. Id. at 177. The figures for Australia and New Zealand were determined by the author.
41. E.g. a capital gain may be taxable if derived by a company but not if derived by an individual.
42. If the shareholder's marginal rate is below the 33% level excess imputation credits can be used to offset other tax liabilities and if excesses still remain, converted into a tax loss.
43. This assumes their total assessable income is between NZ$ 9,500-$ 30,875. While the 24% rate applies from NZ$ 0-$ 30,875 due to a low-income earner tax rebate, a different result will occur if the taxpayer's assessable income is below $ 9,500. In this case income earned through a company and distributed will be liable for more tax than if it was earned directly.
44. The actual extent to which the ratio would fall below 1.00 depends on the specific circumstances of taxpayers.

© 1993 International Bureau of Fiscal Documentation

advantage if distributed compared to the position if the income had been derived through other vehicles. This is because while all taxpayers obtain a credit against their New Zealand income tax liability for foreign taxes paid[45] foreign taxes are not credited in the dividend imputation account. Similarly, if business income is earned by a New Zealand controlled foreign company (CFC) to which the branch equivalent regime applies,[46] the income will also be assessable to the New Zealand shareholder with a credit given in the same way. If foreign dividends paid to a New Zealand company are subject to withholding taxes in the source country no credits can be passed on to New Zealand shareholders for the withholding tax deducted from the foreign dividend.

The following example illustrates the effect of foreign tax credits:

Pre-tax net business income of $ 1,000 is earned by a foreign branch of a New Zealand taxpayer and $ 250 of foreign income tax is paid.

		Income Derived Via Company	Income Derived Directly
Income of NZ Co		$1,000	
less NZ Co Tax	$ 80		
less Foreign Tax Credit	250	330	
Net Income To Be Distributed		$ 670	
Income of NZ Owner		$ 670	$1,000
+ Imputation Credit		80	
Total Income		$ 750	$1,000
less New Zealand Tax	$ 168		$ 80
Imputation credit	80	248	
Foreign Tax Credit			250 330
Net Return To NZ Investor		$ 502	$ 670

It can be argued that the additional tax burden on shareholders could have been avoided if the New Zealand company had not distributed the earnings. However, the crux of the matter is that considerably more tax is required to be paid as a result of the derivation of foreign earnings through a company structure and despite the imputation provisions, double taxation remains.[47]

It is a deliberate policy decision not to give credit for any foreign taxes paid in the imputation credit account.[48] The reason for this is that by granting credits for foreign tax paid the New Zealand Government believes taxpayers will be indifferent as to what jurisdiction they pay tax in. By granting foreign credits it will result in the New Zealand Government sharing tax revenue with foreign governments which provides no revenue (benefit) to the New Zealand Treasury. Thus incentives are provided for companies to substitute the payment of New Zealand taxes for foreign taxes.[49]

Secondly, the ACID Test Model assumes that all income distributed has already borne the standard corporate tax rate. This assumption may not always be valid and thus again the dividend imputation regime will discriminate against corporate structures in favour of unincorporated entities. Distributions to shareholders may not have borne full income tax at the corporate level due to three main factors:

(1) the existence of tax preferences and timing provisions. These include incentives (forestry) and the loss carry-forward provisions;
(2) differences in the way income is defined for financial reporting and taxation purposes;
(3) derivation of non-assessable capital gains.

Most widely-held companies prepare accounts using accounting standards issued by the New Zealand Society of Accountants. Income determination using these accounting standards will normally produce higher income than is reported for income tax purposes. This is mainly due to differences in depreciation, inventory valuation methods and the reporting of non-assessable capital gains and unrealized gains and losses. While companies are required to use tax effect accounting under New Zealand Society of Accountants' standards,[50] this is only in respect of certain timing differences which are believed to be likely to reverse in a relatively short period of time.

A company's ability to declare dividends is governed by company law rather than tax law. Under company law, companies declare dividends out of earnings determined using financial accounting standards rather than tax accounting rules. Thus, dividends may be declared in a year where tax losses have been reported or the taxable income is less than the aggregate of dividends declared. As a result there will be insufficient credits in the company's ICA to attach imputation credits.[51] Therefore such dividends are subject to further tax in shareholders' hands.

In such cases assessable income is created upon distribution where it did not exist before and thus highlights the differential treatment between companies and unincorporated businesses. The current dividend definition in the ITA uses a transactional regime under which dividends arise when a distribution (or deemed distribution) takes place to a shareholder. There is no requirement for the company to identify which reserves were used to source the dividend payment unlike that for financial reporting and the source of the dividend payment may have little relevance to the assessability of the

45. Up to the level of NZ tax payable on a source-by-source basis.
46. Sec. 245A-P.
47. The differences between publicly and closely-held companies may in practice make a difference. A publicly-held company typically distributes only part of its earnings. Thus if it derives both New Zealand and foreign source income there may be sufficient imputation credits available due to New Zealand tax paid on New Zealand sourced income to attach maximum imputation credits to a partial distribution of earnings.
48. Originally in the *Consultative Document on Full Imputation* (New Zealand Government (1987)) it was proposed to allow a credit in the ICA for foreign dividend withholding tax but that was excluded in the *Full Imputation Report Of The Consultative Committee* (Consultative Committee (April 1988)), upon direction from the Government, at page 9, para. 1.5.4.
49. This policy is best described as "national revenue maximization" although often misleadingly and disarmingly called "national welfare maximization". The policy ignores the double taxation imposed on taxpayers in favour of increasing national tax revenues. See Bird (1987), at 9; Rigby (1991), at 415.
50. Under New Zealand Statement of Standard Accounting Practice No. 12.
51. A company could voluntarily attach imputation credits even if it had no income tax liability but unfortunately this would leave a debit balance in the company's imputation account which would have to be cleared by 31 March. The payment of tax to clear the debit balance would be an advance payment of tax for future income years. No interest would accrue on such tax prepayments.

© 1993 International Bureau of Fiscal Documentation

dividend.[52] In contrast, unincorporated businesses can distribute both capital and tax-paid income to their owners without incurring any additional tax impost.

The effects of this different treatment for companies and unincorporated entities can be shown by comparing how distributions of realized capital gains and share premiums[53] from companies are taxed in comparison to similar distributions to the owners of unincorporated entities. The following example assumes pre-tax business income of $ 800 and tax-preferred income (non-assessable capital gain) of $ 200 is derived and distributed:

		Income Derived Via Company	Income Derived Directly
Income of NZ Co		$ 800	
+ Capital Gain		200	
less NZ Co Tax		(264)	
Net Income To Be Distributed		$ 736	
Income of NZ Owner		736	$ 800
+ Imputation Credit		264	
+ Capital Gain			200
Total Income		$1,000	$1,000
less	New Zealand Tax	$ 66	$ 264
	Imputation Credit	264	330
Net Return To NZ Investor		$ 670	$ 736

The derivation of capital gains via a company has resulted in a greater tax burden than if such gains had been derived through an unincorporated entity and thus again the company is found to be disadvantaged *vis-à-vis* unincorporated entities.

The next issue is whether imputation has resulted in corporate income being taxed at the shareholders' marginal tax rates rather than at the corporate rate. This issue was given considerable prominence in the 1985 and 1987 discussion documents as well by Benge & Robinson (1986). This issue may be less important given that the top individual marginal tax rate is now relatively low (33 percent) and is the same as the corporate rate. The difference between the individual mid-point and the corporate rate is only 5 percent (33 to 28 percent).[54] The difference between marginal rates when imputation was introduced was higher at approximately 18 percent (being 48 percent to the mid-point on the individual scale of 30 percent).

The top individual rate of 33 percent applies from NZ$ 30,875 per annum, which is fairly low. Persons with lower incomes are unlikely to own large portfolios of equity shares (except possibly for retirees who would face a higher marginal rate anyway with pension tax surcharges) and the improved tax status is not likely to encourage equity ownership to any large degree except in one or two situations.[55] Also, persons controlling private companies have always had the opportunity to have their income taxed at individual marginal rates by paying directors' fees which were deductible against the company's income.

On examination this objective of taxing corporate income at a shareholder's marginal rate has been met in its strictest sense. If the income bears imputation credits in excess of the taxpayer's marginal tax rate the excess credits can be used to satisfy the taxpayer's tax liability in respect of other income. However, in certain cases dividend income is discriminated against and is taxed at a higher marginal rate than is other income for persons with total income under NZ$ 9,500. However, tax-exempts are not so well treated. While charities can wholly carry on business activities which are exempt from tax,[56] in many cases if they derive business income through corporate structures it will result in income being taxed at 33 percent rather than zero percent. There is no scope for tax-exempt entities to obtain refund of imputation credits.

The second and third criteria developed by the OECD are whether the imputation regime has overcome the bias towards debt over equity finance that arises with the double taxation of dividends, and whether neutrality between retained earnings and new equity has been maintained.

As to whether the bias in favour of debt over equity under the double taxation of corporate income has been reduced, the answer is not simple for the reason that debt and equity finance are not equivalent nor are their tax treatments. The answer partly depends on the importance placed on the taxation of dividends and its relevancy to determining the cost of capital. The literature is not conclusive on this issue and two main schools of thought have emerged – the "old" and "new" approaches.[57] Under both approaches it is generally accepted that taxes affect new equity raising and thus imputation will in that case improve neutrality (risk adjusted) between equity and debt finance. However, there is not the same agreement in respect of the tax effects on retained earnings.

Where imputation may improve neutrality is where capital is invested in the legal form of debt while in economic substance the investment bears the risks of equity. For example, an owner of a business may chose to invest capital by way of a shareholder loan rather than by issuing new shares.[58] In some circumstances a range of hybrid-type securities may be used where they are debt convertible into equity at a subsequent date. In these circumstances the double taxation of corporate earnings does give rise to substantial incentives for shareholders to provide capital in the form of a loan rather than equity, and to the extent that this bias is mitigated by imputation, neutrality between debt and equity finance is improved.

52. Companies should be careful to source assessable dividends from revenue sources rather than from capital sources. In certain cases (winding-ups, reductions of capital) companies can return capital reserves as non-assessable distributions and companies should attempt to preserve their capital reserves for those types of distribution.
53. In the case of companies this would be repayment of the par values of the shares and from the share premium account.
54. While the mid marginal tax rate is 24%, due to the abatement of a low income earner rebate the marginal rate is 28% for income between NZ$ 9,500-$ 30,875.
55. Possibly on equities with very high dividend yields which may be regarded as a substitute for debt investments. Several recent share floatations (e.g. Telecom Corporation of New Zealand) have been promoted to small investors on this basis.
56. Sec. 61(27).
57. See Zodrow (1991).
58. It is recognized that non-resident investors can save considerable amounts of income tax by thinly capitalizing foreign subsidiaries using substantial shareholder provided loans.

© 1993 International Bureau of Fiscal Documentation

An Australian study[59] as to whether the Australian tax system favoured debt concluded with the introduction of imputation that the bias in favour of debt had been reduced although it did comment that this depended on dividends being fully franked and investors were not tax-exempt or preferred. In the Australian context, where superannuation funds were exempt and more recently taxed lightly meant there remained some bias towards debt. The status of non-resident investors would detract from the neutrality between debt and equity finance.

The last of the three OECD criteria was whether there was neutrality between retained earnings and new equity being used to finance new investments. Again it depends on the view one adopts with respect to the taxation of dividends. The new view of dividend taxation advocates that taxes affect new equity raising rather than financing from retained earnings, while the traditional view advocates that both are affected by taxation. In the 1987 discussion document the new position appears to be accepted. Whatever approach is adopted, to the extent that taxes are reduced on dividend distributions the attractiveness of new equity raising will be improved.

In conclusion, only the first of the two deficiencies outlined by the Government has been corrected, i.e. corporate income (income which is assessable at the corporate level) is now taxed at the marginal rate of shareholders, although it must be recognized that additional tax burdens can still arise where non-assessable gains or capital sums are distributed which become assessable to shareholders. Under the OECD's three criteria, two have been met to a partial extent although the exact extent is not quantifiable. Of the three criteria proposed by Benge & Robinson (1986) only the first has been met. The New Zealand imputation regime does not give credits for taxes which have not been paid. Tax preferences cannot be passed on to shareholders and the tax burden of distributed corporate income is not equivalent to the tax payable on the same income earned in the unincorporated sector.

The reality of the current regime is that if companies minimize or avoid the payment of tax at the corporate level, the liability is in essence passed on to shareholders. While it ensures that income which is assessable to income tax at the corporate level does not bear additional tax upon distribution, it does result in additional tax burdens upon distributions which were funded from sources which did not otherwise give rise to assessable income. Proponents of the current regime would argue that this clawback is an advantage and counters the ability of large corporate taxpayers to avoid tax. This theme is developed in the 1987 Consultative Document which states:

> .... any statutory exemption places a great deal of pressure on the tax system by providing incentives to convert other forms of income into the exempt form. Thus, the exemption of tax-preferred dividends may increase the attractiveness of tax avoidance since income exempt from tax at the company level could pass through to shareholders tax-exempt.[60]

It is the author's view that this is a "political" excuse to justify a discriminatory regime. The explicit and implicit preferences mentioned in the 1987 Consultative Document are also available to unincorporated businesses. Clawing back tax preferences available to companies in this way is selective and discriminatory. In the New Zealand context it represents a politically soft option to tax capital gains in an indirect way to avoid enacting an unpopular broadly-based capital gains tax. It is a poor substitute for appropriate anti-avoidance provisions and merely penalizes organizations requiring to aggregate large amounts of capital through limited liability companies to carry on their businesses.

In essence under the imputation regime double taxation is only mitigated if the company has paid company tax and therefore is selective. If the company has tax losses or has enjoyed tax preferences there may not be sufficient ICA credits to extend to shareholders and thus the company's taxation is in effect passed on to shareholders if dividends are declared. In such cases the taxes paid by the shareholders cannot be retrospectively credited back to the company when the company incurs a tax liability in a subsequent year.[61] The importance of this tax "pass-on" phenomenon has not yet been recognized in the literature nor the principal/agency relationships flowing from this. Unfortunately some major publicly-owned companies seem unaware that taxes avoided at the corporate level are now passed on to their shareholders.

While dividend imputation relieves the double taxation of corporate income, it ensures that distributed corporate income is taxed at least once at either the company or shareholder stage. In this regard there was no intention to tax companies on a consistent basis as unincorporated businesses. It is clear the Government intended companies to bear higher tax burdens than unincorporated businesses and to place tax obstacles between companies and their shareholders. It is consistent with the stated objective of "widening the tax base" but not with the "level playing field" principle which has been used to justify many economic reforms in New Zealand. As far as tax policy goes, "level playing fields" are only used to justify increases in tax burdens.

V. DIVIDEND IMPUTATION WITH NON-RESIDENT SHAREHOLDERS

The analysis of the imputation regime in this paper has only considered New Zealand resident shareholders. It is now relevant to consider how imputation affects non-resident investors. The tax treatment of non-resident shareholders is a complex issue and has been widely examined in the literature.[62]

The issue for non-resident investors is how they are to be taxed on distributions from New Zealand companies. In the context of imputation this involves two matters:

59. Bureau Of Industry Economics (1990).
60. Id. at 9.
61. The company does have the choice of attaching imputation credits to dividends when it does not have the capacity to do so and make advance payments of income tax at the end of the imputation year which can be carried forward and offset against future income tax liabilities. Only non-resident shareholders and tax exempts would be worse off. Virtually no listed companies have adopted this practice.
62. E.g. Vann (1989), OECD (1991), Committee of Independent Experts (1992).

© 1993 International Bureau of Fiscal Documentation

(1) imposition of Non-Resident Withholding Tax (NRWT) on dividends with imputation credits attached; and/or
(2) foreign recognition of New Zealand imputation credits.

The treatment of cross-border dividend flows is probably one of the major problem areas in international tax and one where harmonization has least been achieved. While in many international tax matters the OECD has provided an important role (such as with the Model Double Taxation Agreement) there is little consensus about the mitigation of double taxation of corporate income and the tax treatments of cross-border dividend flows. There are few similarities between any of the corporate tax regimes in the EEC or OECD countries with extremes from purely classical systems (United States, the Netherlands) to full imputation models (Italy, Australia, New Zealand). The recent report of the Ruding Committee in 1992 clearly shows the difficulties in integrating corporate taxation among a group of countries which are already in principle committed to economic integration.[63]

Reform in the area is difficult to undertake unilaterally. Most countries are wary about giving unilateral tax relief to non-resident investors at the dividend level because the tax revenue lost may be clawed back in another state and may not provide the recipient with any advantage. For source countries such a concession is pointless.[64] Further, once unilateral relief has been provided there remains little leverage to obtain similar concessions from other countries.

Corporate taxing regimes often differentiate between cross-border dividend flows from portfolio and direct investments. New Zealand has avoided making such a distinction in its domestic law and double taxation agreements; however, many countries provide for intercompany dividend flows from direct investments to be taxed more leniently than portfolio ones. Source countries may reduce dividend withholding taxes and recipient countries may provide a "grossing-up" provision for intercorporate dividends from direct investments. Under the grossing up provision, dividends received by companies are "grossed-up" by the foreign tax paid in respect of the business income used to fund the dividend distribution. This represents the practice of taxing foreign subsidiaries' income on a deferred basis when income is remitted.

At the portfolio level, few countries have entered into arrangements which allow non-resident shareholders to receive advantage of dividend imputation credits. The United Kingdom and France are the main exceptions, and the UK arrangements are relatively generous given UK investors do not usually receive reciprocal treatment.

The New Zealand treatment of non-residents under the imputation system deliberately denies any benefits to non-resident investors.[65] In New Zealand imputation credits cannot be used to credit against dividend NRWT. This was done partly because such offset (as made in Australia) would not necessarily reduce the tax burden of non-resident investors because residence countries may claw back any tax savings through reduced foreign tax credits. The continued imposition of NRWT in New Zealand may have also been driven by revenue concerns and the knowledge that a review of the international tax regime as it applies to non-residents was still to be undertaken.

Under the current treatment the continued imposition of NRWT is more suitable for non-resident portfolio investors who receive foreign tax credits in their home countries. However, for direct investors (particularly corporate investors) imposition of NRWT is a significant impost which is unlikely to be creditable in their home countries even in those with gross-up provisions for intercompany dividends from direct investments.

Beyond the level of allowing domestic imputation credits to remove liability for NRWT, the more fundamental issue arises of whether foreign jurisdictions should allow foreign imputation credits to be creditable not only to portfolio shareholders (as is the case with UK Advance Corporation Tax) but to allow direct corporate investors to pass foreign imputation credits on to their domestic shareholders. Such cross-border treatment of imputation credits would require specific bilateral arrangements which are not common.

The absence of comprehensive cross-border imputation provisions is likely to be due to a number of factors. These include the wide variations in approaches to the taxation of foreign sourced income and corporate tax regimes. Revenue is likely to be foregone which is a critical factor. Non-discrimination undertakings in many double taxation agreements restrict the scope of countries to enter into bilateral imputation agreements. It becomes difficult to target concessional tax treatment to taxpayers from certain countries without extending it to other treaty countries. In particular the US record on demanding that their investors receive the advantage of foreign imputation systems while maintaining a classical system of corporate taxation themselves is a major impediment in this regard.

The extent to which a country can use unilateral enactments to improve the international interface of their corporate tax regime is best shown by recent changes in the Singaporean corporate tax regime. Until 1991 the Singaporean imputation regime required dividends paid from Singaporean companies to have full imputation credits attached in similar manner to the UK Advance Corporation Tax. Foreign tax credits, capital gains and non-remitted foreign income (which is exempt) was claw backed under the imputation system. However, from January 1991 dividends paid by a Singaporean company will be exempt from tax where they have been paid out of foreign income for which there was insufficient Singaporean tax paid to allow full imputation crediting. These changes are designed to enhance Singapore's position as a centre for regional headquarters and holding companies. The Hong

63. Major cross-border tax problems also arise with investment between Australia and New Zealand. See Shewan (1990).
64. For example, Australia does not impose Non-Resident Withholding Tax on dividends bearing imputation credits. This provides no advantage to New Zealand individual portfolio investors because the Australian tax saved (15% NRWT) requires payment of extra tax in New Zealand of the same amount.
65. To the extent that source countries can unilaterally determine the overall tax regime applying to non-residents. The tax regime applying to non-residents is also determined by their home country although if foreign-sourced income is exempted then in effect their tax liability on that income will be determined by the source country.

© 1993 International Bureau of Fiscal Documentation

Kong corporate tax regime is also attractive for holding company structures given that the Hong Kong tax system is essentially sourced based.

A number of theoretical studies on imputation in the context of an open economy suggest for widely-held companies dividend imputation may not achieve the objectives sought. An Australian study by Officer (1987) suggests in the context of an imputation regime which benefits only resident taxpayers and with the Australian economy open to world capital markets that imputation will encourage companies to increase their dividend payouts and increase their equity sourced finance, with an increased number of dividend re-investment schemes, rights issues and equity placements. However, because imputation does not give rise to benefits for tax-exempts and non-residents a "client effect" will develop whereby either imputation benefits will be arbitraged or streamed, or that there will be an rearrangement of portfolios by different classes of investors. Officer concludes imputation will bring little benefit to companies. Later Officer (1988) notes that imputation benefits can be traded by non-residents and tax-exempts[66] so that the tax effect will be reflected into share prices.

Bowan, Cliffe and Navissi (1992) completed a theoretical analysis of dividend imputation in the New Zealand context. Under the New Zealand scheme it is difficult for non-residents to benefit from imputation credits attached to dividends received. They conclude if New Zealand share prices are determined by New Zealand investors, imputation will cause equity prices to rise decreasing returns to non-residents. If equity prices are set by non-resident investors prices will not change due to imputation but increase returns to domestic investors leading to a fall in domestically priced non-equity investments which will attract investments from non-resident investors.

Boadway and Bruce (1992) undertake a theoretical study into imputation in an open economy to examine how the arguments used in support of imputation stand up in a small open economy where domestic capital markets are fully exposed. They conclude while dividend imputation is the best way of overcoming the double taxation of corporate income in a closed economy it is not achieved due to the international tax provisions which result in the company tax acting as a de facto source tax.

In summary little has been done to improve the cross-border interface of corporate income flows. These initial theoretical studies suggest that imputation will not provide significant benefits to equity issuers until reforms are made in the international context.

VI. OPTIONS FOR REFORM

It would not be difficult to design a corporate tax regime which would overcome the weaknesses of the current imputation regime highlighted in the earlier analysis. Benge & Robinson (1986) in their study on imputation proposed a regime (called the "Qualifying Dividend Approach" (QDA)) which would overcome many of these deficiencies. Secondly, in 1992 the New Zealand Government enacted the Qualifying Companies (QC) regime for closely-held companies which is very similar to the Benge & Robinson QDA model.

The Benge & Robinson QDA model is designed to meet three basic criteria. These criteria are that imputation credits will not be given on income which has not borne domestic company tax, tax preferences be preserved and the total tax burden on the income of a company when distributed should be equal to that levied on unincorporated businesses.[67]

The QDA works by firstly allowing companies to pay dividends with imputation credits attached at the maximum imputation rate only partial imputation would not be permitted. Any dividends paid in excess of those dividends with full imputation credits would be exempt from tax in the shareholders' hands. Benge & Robinson state that dividend streaming rules would be required so that the ratio of imputed dividends to exempt dividends would be equal across all shareholders. However, they do not require that all dividends be firstly paid with imputation credits attached. They say "so long as the imputation rate equals or exceeds the top personal tax rate, it is not necessary to determine the amount available for tax-free distribution or the order in which taxable and non-taxable dividends must be paid. Shareholders would always prefer qualifying (taxable) dividends and there would be no incentive to distribute non-taxable dividends until the QDA was exhausted".[68] As this is not the case and opportunities for dividend streaming exist, an ordering rule is necessary as has been incorporated in the QC regime.

The QC regime was introduced from 1 April 1992 to improve the taxing regime applying to closely-held companies recognizing that they are in close substitution for partnerships and should be taxed accordingly. It also was the recognition that closely-held companies could more easily overcome some of the restrictions of the imputation regime by regular winding-ups or through income stripping. The regime is very close to Benge & Robinson's QDA approach except that the dividend streaming rules are more stringent which is appropriate given that Benge & Robinson's earlier assumption does not hold.

As with the Benge & Robinson QDA model, only two types of dividend can be paid by qualifying companies.[69] These will either be assessable to shareholders with full imputation credits attached or exempt ones with no imputation credits. There is a requirement to pay imputed dividends where there is capacity to do so ahead of exempt ones. The effect of this segregation is that capital gains, returns of capital and share premium can be returned to shareholders in most cases as exempt dividends. It substantially removes the disadvantage associated with the company vehicle and places it on a similar footing as other business vehicles.[70] There is a restriction

66. Initially permitted in Australia but not New Zealand.
67. Benge & Robinson (1986), at 104.
68. Id. at 94-5.
69. For a detailed discussion of the Qualifying Companies Regime see K. Holmes; "Taxation of Closely Held Companies: The New Zealand Model", 46 *Bulletin For International Fiscal Documentation* (October 1992), at 506-513.
70. The QC regime also has provision for company losses to be directly attributed to the owners of the business in certain cases. Company loss attribution to shareholders is a difficult issue for widely-held companies and is not considered in this article. Certain types of partnerships (ordinary) and sole tradership can offset losses directly while trusts and special partnerships cannot.

© 1993 International Bureau of Fiscal Documentation

on the amount of foreign sourced income a QC may earn and thus the benefits of foreign tax credits will be preserved in the hands of shareholders only on a limited amount of foreign income. The exact rationale for this restriction is not clear.

Returning to the earlier example where net business income of $ 1,000 is earned by a branch of a New Zealand taxpayer off-shore and $ 250 of foreign income tax is paid under the Benge & Robinson approach and the QC regime the following results are obtained:

	Income Derived Via Company		Income Derived Directly
Income of NZ Co		$1,000	
less NZ Co Tax	$ 80		
less Foreign Tax Credit	250	330	
Net Income To Be Distributed		$ 670	
Income of NZ Owner *		162	$1,000
+ Imputation Credit		80	
+ Exempt Dividend **		508	
Total Income		$ 750	$1,000
less New Zealand Tax***	$ 0		$ 80
Imputation credit	80	80	
Foreign Tax Credit			250 330
Net Return To NZ Investor		$ 670	$ 670

* ($80/0.33) – $80 = $162
** $670 – $162 = $508
*** Assessable Income $242 ($162 + $80) x 33% = $80 less I/C $80 = $0

The next example considers the case where pre-tax business income is $ 800 and tax preferred income (non-assessable) capital gain of $ 200 is derived:

	Income Derived Via Company		Income Derived Directly
Income of NZ Co		$ 800	
+ Capital Gain		200	
less NZ Co Tax		(264)	
Net Income To Be Distributed		$ 736	
Income of NZ Owner *		536	$ 800
+ Imputation Credit		264	
+ Exempt Dividend **		200	
+ Capital Gain			200
Total Income		$1,000	$1,000
less New Zealand Tax***	$ 0		$ 264
Imputation Credit	264	264	
Net Return To NZ Investor		$ 736	$ 736

* ($264/0.33) – $264 = $536
** $736 – $536 = $200
*** Assessable Income $800 ($536 + $264) x 33% = $264 less I/C $264 = $0

Both approaches put companies on a similar taxing basis to the unincorporated sector and thus mitigate the double taxation of business income.

In the context of non-resident investors the above regimes would from a source country perspective reduce the incidence of double taxation of corporate earnings. Ultimately it would depend on the tax regime of the recipient country.

VII. CONCLUSION

At the time dividend imputation was proposed a number of benefits were claimed from the introduction of such a regime. This paper set out to examine the imputation model adopted in New Zealand, whether it is capable of achieving the objectives outlined and overcoming the deficiencies identified with the classical approach.

It is clear that some of the objectives have been met. The regime does allow corporate income to be taxed at a shareholder's marginal tax rate in most cases. It further ensures that income earned by a company is subject to *New Zealand income tax* only once. While the importance of dividend taxation to the cost of equity is subject to considerable debate in the literature it is certain that a reduction of dividend taxes will assist in reducing the cost of equity capital *vis-à-vis* debt. Tests such as the "ACID" test also support a conclusion that the New Zealand imputation regime is comprehensive.

Despite these findings, there are substantial shortcomings in the current imputation regime. The inability to grant imputation credits in respect of foreign taxes paid and limitations on the non-assessable distributions of capital results in a greater tax burden being imposed on distributed income from companies than would have been imposed had the income been derived via non-corporate entities.

It is unrealistic to conclude the failings of the current imputation regime identified in this paper were unintended. The publication of a book through the Victoria University Institute of Policy Studies by Benge & Robinson[71] in 1986 contained a comprehensive analysis of imputation options and identified how the deficiencies highlighted in this paper could be addressed. Thus policy-makers must have consciously decided to digress from the model advocated by Benge and Robinson.

The current imputation regime can be explained in two ways. Firstly, the introduction of imputation would reduce tax revenues and thus this loss would have to be minimized. Secondly, the imputation regime was designed to be part of other tax reform objectives such as denying foreign tax credits to New Zealand residents and extending the tax base – such as to capital gains.

The first explanation must have some validity. Imputation was first mentioned in a Parliamentary statement restricting the ability of companies to make non-assessable distributions to shareholders from capital sources. It is likely that the two were tied together for political reasons to justify an unpopular change in the tax laws and to mitigate the negative political impact of that change. There was considerable delay in enacting imputation after the first announcement in August 1985 and it did not take effect until 1 April 1988 which is consistent with the revenue cost theory. Australia by way of contrast announced its decision to adopt imputation after New Zealand in 1986 but introduced it in 1987 a much shorter period. There has also been considerable delay in reviewing the tax regime as it affects non-resident investors.

There exists other evidence in support of the revenue theory. The imputation regime contains extremely complex stream-

71. The authors at the time of publication were New Zealand Treasury officials and are likely to have been involved with many of the recommendations to Government on imputation.

© 1993 International Bureau of Fiscal Documentation

ing rules which in essence are designed to make companies "waste" imputation credits on shareholders who cannot use them. Despite the major emphasis placed on the benefits of taxing of corporate income at shareholders' individual marginal tax rates in a number of official documents on imputation, the Government was not prepared to extend this to tax-exempts – a deliberate inconsistency. The continued imposition of NRWT on dividends with full imputation credits attached is another factor particularly when contrasted with the Australian provisions. A large number of adverse changes to the streaming rules in the 1991 Budget is also consistent with the revenue theory.

The second explanation is also valid. The imputation proposals were developed contemporaneously by the same Committee who were developing the international tax regime. There were also expectations in 1988 that future tax reforms would include a capital gains tax and the Committee working on the imputation proposals had also recommended in another report for the government to introduce such a tax.

Therefore policy-makers had an excellent opportunity to design the imputation regime to support other tax reform objectives particularly the "broadening the tax base" and to provide foundations for future reforms such as a capital gains tax.[72] Secondly, under the imputation regime credits for foreign income taxes granted to corporate taxpayers are clawed back resulting in foreign tax credits being a tax deferral rather than a credit. Once corporate earnings are distributed the foreign tax credit is turned into a deduction which is consistent with the national revenue maximization policies mentioned in more recent announcements.[73] Given existing undertakings for New Zealand to give foreign tax credits in current double taxation agreements the imputation scheme is a permissible way of unilaterally revoking foreign tax credits for corporate taxpayers.

The wisdom of such international tax policies are questionable but are beyond the scope of this paper. It is sufficient to say that the imputation regime has important implications for the treatment of foreign taxes and to make foreign investment less attractive for New Zealand investors.

The current imputation regime also claws back tax preferences and taxes capital gains as ordinary income if distributed to shareholders. A statement in the 1987 document (at page 9) supports this analysis:

> It is the Government's long-term objective to continue to broaden the tax base and reduce the importance of tax preferences. In the light of the above considerations, all dividends will be assessable...

The imputation scheme is less effective at enforcing a capital gains tax because the gains are still not taxed when earned but only if distributed. Primarily it prevents distribution of capital gains in substitution for dividends. A recent change in 1992 to the dividend definition allows repayments of certain capital reserves to be non-assessable to shareholders upon redemption or cancellation of shares[74] but these must still not be in substitution for dividends.

Despite the introduction of imputation, the corporate tax regime still imposes a greater tax burden on businesses operated as corporations than on businesses operated as partnerships, trusts or sole traderships. The regime is sustainable because a widely-held limited liability company is the only way large amounts of capital can be aggregated from a large number of investors to fund a large enterprise. Therefore sole traderships and partnerships cannot be substituted for companies in such cases as these are only suitable for smaller owner/operator businesses. A unit trust structure can be substituted for a company but since 1960 unit trusts have been taxed as companies so no tax advantage results. This analysis is also supported by the recent introduction of the "qualifying companies" regime for closely-held companies which recognized that the restrictive aspects of the company tax regime could be overcome by small businesses not incorporating or undertaking winding-ups to distribute capital gains tax-free. Under the QC regime only closely-held companies are eligible to use the QC regime.

While the New Zealand imputation regime has overcome some of the deficiencies of the classical approach, a number of difficulties remain. The analysis in this paper shows that other objectives were sought when the imputation regime was designed, none of which were intended to mitigate the double taxation of corporate income. Many of the wider benefits sought from dividend imputation are not likely to be realized until further changes are made to the regime, a greater international consensus emerges as to the taxation of corporate earnings and more appropriate cross-border imputation provisions are in place. Ultimately this may lie with the United States adopting some approach to mitigate the double taxation of corporate earnings.

UNITED STATES:

REVENUE RECONCILIATION ACT OF 1993

J.G. Rienstra
Research staff, IBFD

I. INTRODUCTION

Congress has enacted the Revenue Reconciliation Act of 1993. The Act was agreed to by a joint House-Senate Conference Committee and passed by both houses of Congress in early August. It was signed into law by President Clinton on 10 August. The Act is the first major tax legislation to be enacted by the United States since 1990, and represents the most significant change in the US tax laws since the Tax Reform Act of 1986.

The major change made by the Act is the substantial increase in the tax rates applicable to individuals, estates and trusts, most of which are retroactive to 1 January 1993. The Act also broadens the tax base for corporations and businesses, and includes a number of provisions that will affect multinational groups. The impact on multinationals will be felt primarily on US-inbound transactions, but a number of the provisions will affect US-outbound transactions as well.

II. INDIVIDUALS, ESTATES AND TRUSTS

A. *Income tax rates*

The Act increases the top income tax rate from 31 to 36 percent and imposes a new 10 percent surtax on higher income individuals, estates and trusts. Although denominated as a surtax, the Act contains no expiration date for the 10 percent tax and it will thus function for practical purposes to create a top marginal rate of 39.6 percent. The thresholds for the 36 percent rate and the 10 percent surtax are as follows:

Type of return	*36% tax rate*	*10% surtax*
Single taxpayers	$ 115,000	$ 250,000
Married taxpayers filing jointly	$ 140,000	$ 250,000
Married taxpayers filing separately	$ 70,000	$ 125,000
Estates and trusts	$ 5,500	$ 7,500

The new rates are effective retroactive to 1 January 1993. Under the Act, however, the thresholds for the 36 percent rate and the 10 percent surtax will not be adjusted for changes in the US consumer price index (CPI) until the 1995 tax year. Individual taxpayers, but not estates and trusts, may elect to pay any increases in their 1993 taxes caused by the new rates in three annual instalments.

In order to backstop the higher individual rates, the Act increases the accumulated earnings tax (AET) and personal holding company (PHC) tax imposed on corporations from 28 to 39.6 percent. The AET prevents taxpayers from retaining earnings in corporate entities rather than distributing such earnings as dividends. The PHC tax performs a similar function with respect to passive income and income from personal services.

The Act also modifies the estimated tax rules for individuals, estates and trusts that have adjusted gross income (AGI) in excess of $ 150,000 for a taxable year. These taxpayers will be required to make quarterly payments in the succeeding year equal

to at least 110 percent of the prior year's tax liability or 90 percent of the current year's tax liability. This modification will take effect for taxable years beginning after 31 December 1993. Taxpayers with AGI of less than $ 150,000 in a tax year can continue to base their succeeding year estimated tax payments on either 100 percent of the prior year's liability or 90 percent of the current year's liability. The Act repeals the special rule that applies to taxpayers who have AGI above $ 75,000 and a net annual AGI increase of $ 40,000 or more.

B. *Social security benefits*

The Act increases the portion of social security benefits that can be subject to income tax. The House proposed an across-the-board increase from 50 to 85 percent, but the Conference Committee agreed to a two-tier structure that increases the inclusion rate to 85 percent only for taxpayers who have provisional income above new thresholds of $ 44,000 for married taxpayers filing a joint return and $ 34,000 for single taxpayers. The provisional income on which the inclusion rate is determined is a modified form of AGI that includes tax-exempt interest, certain foreign-source income and one-half of the social security benefits. The Act retains the 50 percent inclusion rate for taxpayers with provisional income below the new thresholds but above the current thresholds ($ 32,000 for married taxpayers filing a joint return and $ 25,000 for single taxpayers). The two-tier structure is effective for taxable years beginning after 31 December 1993.

C. *Exemptions and deductions*

Upper income individuals are required under current law to phase out the benefit derived from claiming personal exemptions. For 1993 each personal exemption equates to a deduction of $ 2300, and this is phased out by 2 percent for each $ 2500 (or portion thereof) by which AGI exceeds a threshold amount. In addition, upper income individuals are required to reduce certain itemized deductions by 3 percent of the amount by which their AGI exceeds a specified threshold. These provisions were due to expire after 1995 and 1996, respectively, but have been made permanent by the Act. It is estimated that the phase-outs can cause the highest marginal tax rate for upper income taxpayers to exceed 41 percent. The exact percentage depends on individual circumstances.

The Act also places new limitations on the deduction for moving expenses incurred by employees and self-employed individuals in connection with the commencement of work. The deduction will no longer be allowed for meal expenses during the move, for the cost of temporary lodging or house-hunting trips, or for the costs of selling an old residence or purchasing the new one (or for the costs of terminating leases or acquiring a new lease). The minimum mileage threshold for the move is increased from 35 miles to 50 miles. The changes in the moving expense deduction apply to expenses incurred after 31 December 1993.

D. *Capital gains provisions*

The maximum tax rate on long-term capital gains (gains from the sale or exchange of capital assets held for longer than one year) realized by individuals, estates and trusts is not changed by the Act. It thus remains at 28 percent. However, because of the increased differential between the capital gains rate and the higher personal income tax rates, i.e. 28 percent versus 36 or 39.6 percent, the Act adds a number of provisions that are designed to prevent the conversion of ordinary income into capital gains. These are discussed in Part IV below.

In addition, because of the favourable capital gains rate, the Act adds a special rule regarding the treatment of net capital gains (i.e. the excess of net long-term capital gains over net short-term capital losses) under the investment interest rule. This rule limits the deduction of investment interest to the amount of the taxpayer's net investment income for the taxable year. Any excess interest can be carried forward to the next taxable year. Under the special rule added by the Act, net capital gains on investment property are not treated as investment income effective for taxable years commencing after 31 December 1992. Such gains thus cannot increase the amount of the taxpayer's investment interest limitation. This is to prevent low-taxed capital gains from absorbing otherwise disallowed interest expenses. The taxpayer may, however, include net capital gains in investment income if he elects to have such gains taxed at ordinary income rates.

E. *Alternative minimum tax*

The Act increases the alternative minimum tax (AMT) rate applicable to individuals, estates and trusts, and changes the AMT from a flat-rate tax to a two-tier graduated tax. The new AMT rates are 26 percent for alternative minimum taxable income (AMTI) up to $ 175,000 above the exemption amount and 28 percent for AMTI more than $ 175,000 above the exemption amount. The exemption amounts are increased by the Act to $ 45,000 for married taxpayers filing joint returns, $ 33,750 for single taxpayers and $ 22,500 for estates and trusts. The exemption amount for married persons filing separate returns, such as non-resident individuals who are not entitled to file a joint return with their non-resident spouses, is also $ 22,500. The changes in the AMT are effective retroactively to 1 January 1993.

F. *Social security taxes*

The US social security taxes (FICA) paid by employers and employees consist of two separate taxes: a 6.2 percent old age, survivor and disability insurance tax (OASDI), and a 1.45 percent Medicare hospital insurance tax (HI). Both OASDI and HI are currently subject to a wage ceiling above which they do not apply. The Act eliminates the $ 135,000 ceiling for the HI tax, thus imposing the tax on the full amount of salary and wages received. The $ 57,600 ceiling for OASDI is not changed. The HI ceiling will be removed effective for salary and wages received after 31 December 1993.

© 1993 International Bureau of Fiscal Documentation

G. *Estate and gift taxes*

The Act reinstates the maximum estate and gift tax rate at 55 percent. This repeals the reduction of the maximum rate to 50 percent that took place on 31 December 1992. The reinstated rates are 53 percent for transfers over $ 2.5 million and up to $ 3 million, and 55 percent for transfers over $ 3 million. The tax benefit of the lower graduated rates and the unified credit are phased out at a 5 percent rate for transfers above $ 10 million, with the phase-out completed at $ 21,040,000. The maximum rate on generation skipping transfers is also reinstated at 55 percent. The increased rates apply retroactively to estates of decedents dying after 31 December 1992, and to gifts and generation skipping transfers made after such date.

III. CORPORATE AND BUSINESS TAXPAYERS

A. *Corporate income tax rates*

The Act increases the maximum rate of corporate income tax from 34 to 35 percent for corporations with taxable income in excess of $ 10 million. An additional 3 percent tax is imposed on income in excess of $ 15 million in order to recapture the tax benefit of the 34 percent rate on taxable income below $ 10 million. The 35 percent rate is effective as of 1 January 1993. Corporations whose tax year straddles this date will be required to use blended rates to take into account the portions of the tax year that fall before and after 1 January.

The Act also modifies the estimated tax payment rules for large corporations, i.e. those corporations with taxable income in any of the three preceding years in excess of $ 1 million computed without regard to net operating loss carryovers and capital loss carry-backs. Large corporations are required by the Act to make quarterly estimated payments equal to 100 percent of the current year's tax liability in order to avoid underpayment penalties. Such payments could formerly be based on 97 percent of the current year's liability. The Act also modifies the annualization method used to determine the current year's tax liability. Corporations other than large corporations may continue to make estimated tax payments based on either 90 percent of the current year's liability or 100 percent of the prior year's liability. The corporate estimated tax changes are effective for taxable years beginning after 31 December 1993.

B. *Business deductions and credits*

The Act makes a number of changes in the deductions available to corporations and businesses, including the following:

- the deduction for business meals and entertainment expenses is reduced from 80 to 50 percent;
- the deduction for salaries of the chief executive and the next four highest compensated officers of publicly-held companies is limited annually to $ 1,000,000 each. Exceptions are permitted for commission income and certain performance-based payments. In general, publicly-held companies are defined as those whose equity shares are registered under the Securities Exchange Act;
- the deduction for club dues, including dues for airline and hotel clubs, is eliminated;
- the deduction for lobbying expenses is eliminated.

The last two of the foregoing are effective for expenses incurred after 31 December 1993; the first two are effective for taxable years beginning after such date. Payments pursuant to written compensation agreements that were in effect on 17 February 1993 and all times thereafter, are grandfathered from the $ 1,000,000 salary limitation.

The Act also extends the tax credit for businesses that increase research and development (R&D) expenditures during the taxable year. This credit previously expired on 30 June 1992. The credit is equal to 20 percent of the taxpayer's current year R&D expenses over a baseline amount. The Act extends the credit forward for R&D expenses paid or incurred after 30 June 1992 and through 30 June 1995. The Act adds new rules for determining the baseline amount of R&D expenses for start-up companies.

C. *Investment tax credit proposal*

The investment credit proposal put forward by the Administration for new purchases of business property was dropped from the House version of the bill and thus did not become part of the Act. The proposal was for temporary and permanent credits of up to 7 percent of the cost of new property, with the amount of the credit varying with the property's useful life. The proposal was deleted as part of a trade-off to limit the increase in the top corporate tax rate to 35 percent.

D. *Small business expensing*

The Act increases the amount that small businesses may deduct with respect to purchases of qualifying business property. The current limitation is a deduction for up to $ 10,000 of the cost of new depreciable property placed in service during a taxable year. This deduction is claimed in lieu of depreciation on the new property. The Act increases the annual deduction limit to $ 17,500, effective for property placed in service in taxable years beginning after 31 December 1992.

E. *Amortization of business intangibles*

Treasury Regulations under current law prohibit the depreciation of goodwill. Other intangible assets are also excluded from cost recovery unless the taxpayer can demonstrate that such assets have a reasonably ascertainable useful life. This standard is difficult to meet in practice and has generated considerable controversy between taxpayers and the IRS. In order to eliminate these controversies in future, the Act mandates a 15-year recovery period for most categories of intangible assets. The committee reports recognize that some intangibles covered by the Act will have useful lives shorter than the 15-year recovery period, and that other assets will have useful lives that are longer. Nevertheless, the 15-year period will be mandatory.

© 1993 International Bureau of Fiscal Documentation

The Act contains extensive definitions of the types of property covered by the new provision. These are referred to as "Section 197 intangibles". In general, they constitute intangibles that are acquired as part of a business rather than self-created or self-generated by the taxpayer. Included are traditional items such as goodwill, going concern value, covenants not to compete, franchises, trade marks, trade names, patents and copyrights. Also included are more esoteric intangibles such as "customer-based intangibles" (market share and customer lists), "supplier-based intangibles" (the value of contractual relationships in place for supply of goods and services), "workforce in place" (the value of an existing skilled or trained workforce) and "information bases" (books, records and operating systems).

A number of intangibles are specifically excluded from the new provision, including off-the-shelf computer software, financial instruments, interests in land and interests in corporations, partnerships, estates and trusts. Also excluded from the Act are certain "separately acquired assets", i.e. assets that would normally be included but which are not acquired by the taxpayer as part of a trade or business. This includes mortgage servicing rights, patents and copyrights, and films, sound recordings, videos and books. The IRS is also permitted to issue regulations for contract rights and governmental licences that are not acquired as part of a business and that have fixed terms of less than 15 years or are subject to cost recovery under a unit of production or similar method. These intangibles can be excluded from the new provision. The committee reports illustrate this with the example of a fixed-term licence that is either non-renewable or renewable on a competitive bid basis that produces an arm's length price. The result of the exclusion in such case is that the taxpayer can amortize the licence over its fixed term rather than the 15-year period required by the Act.

The new amortization rules are effective for property acquired after 10 August 1993. Property acquired after such date is grandfathered if it is acquired pursuant to an earlier binding written contract. Taxpayers may elect, however, to apply the new rules to all intangibles acquired after 25 July 1991. Special anti-churning provisions are included to prevent non-amortizable property acquired prior to the Act's effective date from being converted into post-Act amortizable property. The committee reports to the Act note that there is a severe backlog of cases dealing with intangibles that are pending on audit with the IRS and in the courts. Since these cases will no longer have precedential value, the reports urge the IRS "in the strongest possible terms" to expedite a settlement with the taxpayers. The IRS is to use the principles of the new rules in doing so.

IV. INVESTMENT PROVISIONS

A. *Capital gains exclusion*

In order to target investments in small businesses and new ventures, the Act adopts a capital gains exclusion for "qualified small business stock". A qualified small business (QSB) is defined as a domestic corporation (subchapter C corporation) that meets an 80 percent active business assets requirement and a $ 50 million capitalization limitation. The exclusion permits individuals and other non-corporate taxpayers to exclude 50 percent of the gain realized from a disposition of QSB stock if the stock has been held for at least five years.

A QSB is required to be engaged in a qualified business, which is defined generally as any business other than a professional service business (i.e. health care, engineering, architecture, law, accounting, etc.) or a banking, insurance and finance related business. The QSB may not invest more than 10 percent of its gross assets in real property or more than 10 percent of its net assets in portfolio stocks or securities. Additionally, the stock must be newly issued by the QSB to the taxpayer in order to be qualified for investment. Primary offerings through underwriters are permitted, but secondary offerings by existing shareholders are not. The total amount of capital gain eligible for the exclusion is limited to ten times the tax basis of the stock or $ 10 million from each QSB. One-half of any excluded gain is treated as a tax preference item for purposes of the AMT. The new provision is effective for QSB stock issued after 10 August 1993.

B. *Capital gains rollover*

The Act also permits corporations and individuals a tax-free rollover of capital gains realized from the sale of publicly-traded securities if such gains are reinvested in common stock or partnership interests of a "specialized small business investment company" (SSBIC). The reinvestment in the SSBIC must take place within 60 days after the sale of the publicly-traded securities, and the maximum gain that can be rolled over is $ 50,000 per year for individuals ($ 500,000 lifetime) and $ 250,000 per year for corporations ($ 1,000,000 lifetime). An SSBIC is defined as any corporation or partnership that is licensed under Section 301(d) of the Small Business Investment Act of 1958. The new provision is effective for sales of publicly-traded securities made on or after 10 August 1993.

C. *Capital gains conversion transactions*

As a result of the increased differential between the maximum capital gains rate and the new personal income tax rates, i.e. 28 percent versus 36 or 39.6 percent, taxpayers will have a strong incentive to structure transactions in a manner to realize capital gains whenever possible. In recognition of this, the Act adds a new provision to require capital gains to be recharacterized as ordinary income in transactions that are equivalent to loans in terms of anticipated return and risk. These are referred to as conversion transactions, the hallmark of which is that substantially all the taxpayer's return is attributable to the time value of the investment. Examples are (1) transactions involving off-setting positions with respect to the same or similar property, such as forward stock sales, (2) straddle transactions and (3) transactions that are marketed or sold on the basis that an interest-like return will be taxed as capital gain. The IRS is authorized to issue regula-

© 1993 International Bureau of Fiscal Documentation

tions specifying other transactions covered by the new provision.

The Act requires gain equal to 120 percent of the applicable federal rate (AFR) on the investment be recharacterized as ordinary income at the time the investment is disposed of. The committee reports illustrate this with the example of stock with a value of $ 100 that is sold forward for delivery two years later at a price of $ 115. If the two-year AFR on the date of the sale is 5 percent, then $ 12.36 of the $ 15 capital gain will be recharacterized as ordinary income (i.e. 120% x 5% compounded on an investment of $ 100 for two years). The Act permits the IRS to reduce the ordinary income amount in appropriate circumstances. There are also special rules for options dealers and commodities traders. The new provision is effective for transactions entered into after 30 April 1993.

D. *Stripped preferred stock transactions*

The Act also adds a provision to prevent the conversion of ordinary income to capital gain on investments in preferred stock that have been stripped of their dividend rights. Such stock functions in a manner similar to stripped bonds or original issue discount (OID) obligations in that the holder receives a yield to maturity that includes an interest component attributable to the discount. However, under current law stripped preferred stock is not subject to the rules that require the discount component to be accrued into income on a current basis. Under the new provision, a holder of stripped preferred stock, including a holder who himself strips and sells the dividend rights, will be required to accrue the discount component into income over the term of the investment. The accrued amounts are to be treated as ordinary income and not as interest or dividends. The accrual formula is similar to that for OID, i.e. the constant yield to maturity of the instrument applied to its compounding issue price. The provision is effective for preferred stock purchased or stripped after 30 April 1993.

E. *Market discount obligations*

Market discount bonds (i.e. bonds acquired in the market after original issuance at a price less than their redemption value) are subject to special rules under current law that require gain on sale or maturity to be treated as ordinary income instead of capital gain to the extent such gain is attributable to the discount component. However, bonds issued on or before 18 July 1984, are grandfathered from this requirement. Purchasers of such bonds may therefore hold them to maturity, or dispose of them in the market, and recognize capital gain. Municipal bonds are also exempt from the market discount rules under current law and thus yield capital gain at maturity or sale.

To further backstop the new higher rates on ordinary income, the Act repeals the grandfather exception for market discount bonds and makes all municipal bonds, regardless of issue date, subject to the market discount rules. This provision is effective for bonds purchased after 30 April 1993. Thus, holders of pre-18 July 1984 market discount bonds who purchased their bonds on or prior to 30 April 1993 will continue to receive capital gain treatment, as will holders of municipal bonds who purchased their bonds on or prior to such date.

F. *Mark-to-market for securities dealers*

Securities dealers are permitted under current law to value their inventory based on cost, market value or the lower of the two – "lower of cost or market" (LCM). Because the cost and LCM methods, together with the exemption that securities dealers enjoy from the wash sale rules, can cause income to be understated, Congress determined that these methods should no longer be available. The Act therefore requires that securities dealers value their inventories at fair market value and that other securities held by dealers outside of inventory be marked to market at year-end and gain or loss recognized accordingly. Exceptions are provided for securities held for investment purposes or as part of certain hedging transactions. The new rules are effective for taxable years ending after 31 December 1993. Income and loss adjustments from the revaluations required by the Act will be deemed to result from a change in accounting method approved by the IRS, and the income or loss taken into account ratably over a five-year period.

V. INTERNATIONAL BUSINESSES

A. *Transfer pricing initiative*

In order to bolster taxpayer compliance in the transfer pricing area, the Act reinforces the penalty provisions that can apply when the transfer price of a transaction is misreported. Two significant changes are made, both effective for taxable years beginning after 31 December 1993. First, the thresholds at which penalties can be imposed are lowered to levels that will impact a greater number of taxpayers than in the past. The new threshold of the 20 percent penalty for "substantial valuation misstatements" is an IRS adjustment of either $ 5 million of taxable income or 10 percent of gross receipts, and the new threshold of the 40 percent penalty for "gross valuation misstatements" is an IRS adjustment of either $ 20 million of taxable income or 20 percent of gross receipts.

These penalties can be avoided if the taxpayer complies with the second change made by the Act, which is that the taxpayer be able to provide the IRS with "contemporaneous documentation" supporting the transfer price reported on the tax return. Formerly, taxpayers only needed to show that they acted with reasonable cause and in good faith in order to avoid the penalties. Congress believed this standard to be too low, as evidenced by a Treasury Department report that the IRS has not attempted to apply the penalties since they were first enacted in 1990. Congress also believed that taxpayers were using *post hoc* arguments to justify tax reporting positions that were taken without regard to appropriate Section 482 standards. The Act therefore requires that taxpayers under audit provide the IRS with documentation showing that the transfer price on the tax return was determined in

© 1993 International Bureau of Fiscal Documentation

accordance with a methodology approved by the regulations under Section 482 and that the taxpayer's use of that method was reasonable. The contemporaneous aspect refers to the requirement that the documentation must have been in existence at the time the tax return was filed.

If the methodology used by the taxpayer is not a method specified in the regulations, i.e. a method other than the four approved – comparable uncontrolled price method, resale price method, cost plus method or comparable profits method – then the Act requires the taxpayer to demonstrate not only that the use of the unspecified method resulted in a price that clearly reflects income, but also that none of the specified methods would have done so. Thus, taxpayers that use an unspecified method, a so-called "other method", will have an especially onerous requirement as far as the degree of contemporaneous documentation that will be required. The documentation will have to prove that the four specified methods do not produce a transfer price that clearly reflects income, and that the method used by the taxpayer does. For transactions of a type not subject to any of the transfer pricing methods specified in the regulations, the Conference Committee report provides that the taxpayer needs only to establish that no method in the regulations is applicable.

B. *Controlled foreign corporations*

The Act adds a new category of income inclusion for US shareholders of controlled foreign corporations (CFCs). Under current rules, shareholders with a 10 percent or greater interest in a CFC are required to include their pro rata share the CFC's Subpart F income and the CFC's earnings invested in US property. The Act adds a third category, which is retained earnings of the CFC that are deemed to be invested in excess passive assets. The amount required to be included in income and taxed currently is the lesser of (1) the CFC's excess passive assets or (2) the earnings of the CFC that have not been previously taxed as excess passive assets or as earnings invested in US property. Excess passive assets are defined as those that exceed 25 percent of the total assets held by the CFC. Assets are valued for this purpose at their adjusted tax basis used in calculating corporate earnings and profits. Under the Conference Committee agreement, the Act will apply only to earnings of CFCs for taxable years beginning after 30 September 1993. CFCs within one or more chains of ownership of the same corporate group are required to compute excess passive assets on a consolidated basis and apportion the total among the separate members based on their respective earnings. The Act is structured to prevent CFC earnings from being taxed more than once under the different inclusion rules of Subpart F.

The Act also amends a number of the rules for CFCs that are subject to the passive foreign investment company (PFIC) provisions. Such CFCs will now be required to value their assets at adjusted tax basis for purposes of the 50 percent passive asset test. This was formerly elective, but is now mandatory. In addition, CFCs registered in the United States as securities brokers or dealers will now treat securities income as active income purposes of the 75 percent passive income test. This change is intended to make it easier for foreign securities dealers to avoid PFIC status. Experience in this area has shown that foreign brokers and dealers are meeting the 75 percent passive income test with greater frequency than was anticipated at the time the PFIC rules were enacted. Banks and financial institutions enjoy a similar exception under current law, and the committee reports note that they and securities dealers engage in many of the same types of transactions, for example, foreign exchange, interest rate swaps, currency swaps and hedging transactions. The modifications will thus conform the rules for the banking and securities industries.

The Act also amends the same-country exception to Subpart F for dividends received from related foreign corporations. Under the amendment, the exception is not available for dividends paid out of earnings accumulated during periods the CFC did not hold the stock in the distributing corporation either directly or through a chain of ownership. The CFC changes are effective for tax years that begin after 30 September 1993, and for tax years of US shareholders in which or with which such CFC tax years end.

C. *Earnings stripping provisions*

The United States enacted earnings stripping rules in the Omnibus Budget Reconciliation Act of 1989. The purpose of these rules is to prevent the erosion of the US tax base by the use of over-leveraged corporate entities. One aspect that was reserved on, however, was the status of guaranteed debt. The Act removes this reservation and provides that interest on third-party debt guaranteed by a related party will now be treated as disqualified interest. Such treatment will apply even if the unrelated lender is subject to net basis US taxation on its interest income.

The Act broadly defines a guarantee to include any arrangement, direct or indirect, whereby a related foreign person or tax-exempt entity "assures" payment of the indebtedness. The committee reports give an expansive view of the arrangements that are intended to be covered by the new provision, stating that all types of credit support, whether legally enforceable or not, and whether conditional or not, are included if a related party undertakes thereby to maintain the financial viability of the debtor. Comfort letters are specifically included. The committee reports note that even though the impact of the new rules will fall primarily on foreign-based multinational enterprises, it is the view of the Congress that the rules do not conflict with US treaty obligations.

The requirements of a debt-to-equity ratio in excess of 1.5 to 1 and the payment of disqualified interest in excess of 50 percent of the debtor corporation's taxable income are not changed by the Act. The earnings stripping amendments are effective for interest paid or accrued in taxable years beginning after 31 December 1993. Moreover, because the Act repeals the grandfather provision in the 1989 Act (i.e. debt issued on or before 10 July 1989 was exempt), the new rules will apply to interest on all indebtedness outstanding after the close of 1993 regardless of its original date of issuance. The

© 1993 International Bureau of Fiscal Documentation

effective date provisions denote a particular reversal of the 1989 Act with respect to guaranteed debt. The legislative history to the 1989 Act, which authorized the IRS to write regulations dealing with guarantees, provided that such regulations would be expected to be effective only after the date of publication. Taxpayers who entered into guaranteed debt arrangements in reliance on this proviso will find themselves caught by the new rules.

D. *Multiparty financing arrangements*

The Act grants broad authority to the IRS to draft regulations for the proper treatment of multiparty financing transactions. Such transactions normally include the use intermediate or conduit companies to reduce cross-border withholding taxes, for example where payments are intended to come to rest in non-treaty country jurisdictions. The regulations will address not only back-to-back loans, such as those present in *Aiken Industries, Inc. v. Commissioner*, 56 T.C. 925 (1971), but also other multiparty arrangements that the IRS views as having tax avoidance consequences. The committee reports state that the regulations can also apply to debt guarantees and equity investments and cite with approval the IRS's 1991 technical advice memorandum that applied the conduit theory to a loan backed by equity rather than a second loan. This provision is effective on 10 August 1993.

E. *Portfolio interest exemption*

Present law grants an exemption from withholding tax for interest paid on portfolio obligations of US issuers. The exemption is provided by US domestic law and applies regardless of the availability of a tax treaty. In general, portfolio obligations are corporate and partnership debt issued in registered form and held by persons who own less than 10 percent of the issuing entity. Bearer instruments may also qualify if applicable guidelines are met.

The Act amends the portfolio interest exemption to exclude contingent interest. The committee reports indicate that Congress was particularly concerned about real estate investments structured as debt but carrying an equity interest, i.e. shared appreciation rights or profits participations. Investments of this nature are subject to tax on disposition under the Foreign Investment in Real Property Tax Act of 1980 (FIRPTA), but payments of the interest related to the equity component can escape taxation under the portfolio interest exception. Congress believed this to be an anomaly and amended the rules accordingly.

Contingent interest is defined by the Act as interest calculated by reference to the receipts, sales, income, profits, assets or dividends of the debtor or a related party. The Treasury is authorized to identify other types of contingent interest by regulations. The new provision is effective for interest received after 31 December 1993, subject to a grandfather provision for fixed-term portfolio obligations issued on or before 7 April 1993, or after such date pursuant to a binding written contract in effect on such date and at all times thereafter. The committee reports state that the provision is not intended to override existing US tax treaties that eliminate or reduce withholding tax on cross-border interest payments.

The Conference Committee made two changes in the Act as approved by the House and Senate. These apply to portfolio obligations that pay both contingent and non-contingent interest. First, only the portion of the contingent payment that exceeds the non-contingent amount will be disqualified from portfolio treatment. The example given is that of an instrument that provides for contingent interest equal to 10 percent of gross profits, subject to a minimum floor of 6 percent fixed interest on the principal amount. In such case, only the contingent interest in excess of the fixed-rate amount will be subject to withholding. Second, for estate tax purposes, the contingent component of the instrument will be deemed to constitute property located within the United States and thus includible in the estate of non-resident taxpayers. The Conference Committee report provides that until the IRS issues appropriate guidance, taxpayers may use any reasonable method to apportion the value of the instrument between its contingent and non-contingent components. The estate tax provision is effective for the decedents dying after 31 December 1993, subject to a grandfather provision for pre-7 April 1993 debt as described above.

F. *Foreign tax credit baskets*

The US foreign tax credit regime relies on a basket system to prevent the cross-crediting of taxes on high and low-taxed foreign source income. Under current regulations, taxpayers in the oil and gas and shipping industries enjoy a special exception which allows them to exclude interest received on working capital from the passive income basket. Such interest instead falls into baskets that function as general limitation baskets for these industries. This allows the cross-crediting of low-taxed interest income with high-taxed extraction or operating income within the framework of the overall 34 percent limitation. Believing that the working capital interest exception unfairly advantages the oil and gas and shipping industries *vis-à-vis* other industries, Congress eliminated it in the Act. The repeal is effective for income earned in tax years beginning after 31 December 1992.

The House version of the Act contained a provision that would have placed royalty income from intangibles in the passive income basket even if such income was derived in the active conduct of a trade or business. This proposal met with wide opposition from industry groups and was dropped from the Act in the House.

G. *Possessions tax credit*

Current law allows a tax credit under Section 936 for income from businesses and investment carried on in US possessions. The Act imposes two new limitations on this credit. The first limitation, referred to as the economic activity limitation, is that the Section 936 credit cannot exceed an amount determined by reference to set percentages of the wages paid in the possession, the depreciation claimed on assets used in the possession, and unless the taxpayer elects to use the prof-

© 1993 International Bureau of Fiscal Documentation

it-split method for allocating income from intangible property, the income taxes paid or accrued in the possession.

The second limitation, referred to as the percentage limitation, is that the Section 936 credit cannot exceed a fixed percentage of the credit as determined under current law. The fixed percentage is phased in over five years, starting at 60 percent for tax years beginning in 1994 and declining by 5 percent each year thereafter until it reaches 40 percent in 1998. The percentage limitation is in lieu of the economic activity limitation. A taxpayer who chooses to use it must make an election to do so in the tax return for its first taxable year beginning after 31 December 1993. Possession taxes allocable to income in excess of the percentage limitation can be claimed as a tax deduction. The Act permits affiliated taxpayers to compute the new Section 936 limitations on a consolidated basis if they so elect. The aspect of the Section 936 credit that relates to qualified possessions source investment income is not changed by the Act. The new provision is effective for tax years beginning after 31 December 1993.

H. *R&D source rules*

Subject to certain exceptions, current law requires R&D expenditures to be allocated 64 percent to the situs where the R&D activities are performed. That is, 64 percent of the expenditures are allocated to US sources if the R&D activities are performed in the United States, and 64 percent are allocated to foreign sources if the R&D is performed outside the United States. The 36 percent balance is apportioned between US and foreign sources based on either a gross sales or gross income methodology. The Act makes a temporary amendment to these rules by changing the basic and residual allocation to 50 percent each for a one-year period. The new provision will be effective for the first taxable year of the taxpayer that begins after the expiration of the 18-month transition period permitted by Revenue Procedure 92-56. Such taxable year must begin on or before 1 August 1994. The Act does not specify what R&D source rules are to take effect when the temporary period expires.

VI. ENERGY TAXES

The Act imposes a permanent federal excise tax of 4.3 cents per gallon on transportation fuels. An exemption is provided for jet fuels used in commercial aviation. The Administration originally sought to impose a broad-based energy tax on the thermal content of all fuels, but this proved too politically controversial and was dropped.

IN-DEPTH JOURNAL FOR TRANSFER PRICING EXPERTS WORLDWIDE

NEW

THE INTERNATIONAL TRANSFER PRICING JOURNAL

Each edition of this specialized magazine confronts a major current issue in transfer pricing. Different perspectives are given in substantial country reports written by respected local specialists. These reports serve the dual purpose of setting out individual country approaches and building a complete international picture on a single issue.

The journal also includes detailed articles on topical issues and reports on worldwide developments (including translations of, and comment on, recent documents, case reports and assessments of events in transfer pricing).

Editors and contributors are transfer pricing specialists from throughout the world. Input from OECD and other countries ensures worldwide coverage.

I. Introduction
II. Amendment to the Participation Exemption
III. Earnings stripping Provisions
IV. Preliminary Conclusion

On 16 July 1993 the Ministry of Finance published a draft bill concerning the amendment of the Corporate Income Tax Act (CITA).[1] The objective of this amendment is to achieve a balanced treatment of the international fiscal relationships.

This draft bill was already announced at the time the Ministry of Finance published its memorandum concerning the competitive position of the Netherlands in respect of the tax incentives offered to foreign investors.[2] In this memorandum the Under Minister of Finance ventilated his concern that in maintaining its competitive position the Netherlands was not always receiving its fair share of the total tax take.

The Under Minister's statement is of course not surprising. During the parliamentary debate in respect of the previous amendment of the CITA a motion was adopted to investigate the possibility of introducing tax haven legislation.[3] Additionally, treaty partners have put the Netherlands under pressure to address the issue of the use of tax haven companies. The new tax treaty between the United States and the Netherlands is an example of such pressure.

The draft bill proposes to restrict the exemption method for the avoidance of international double taxation where multinational companies are using tax haven companies. It also attacks the use of finance companies based in tax havens. Furthermore, the draft bill proposes to amend the tax residency rules.

To dispel the anxiety which might be caused by this drastic change in attitude by the Netherlands the Under Minister hastened to add that the Netherlands was not putting an end to its principal choice of the exemption method to avoid double taxation and that the draft bill was to be seen as a consultative document. Comments are therefore welcome and should preferably be submitted before 1 November 1993. The draft bill has already received much criticism indicating that there is indeed anxiety among tax practitioners and multinational companies.

This article describes in broad terms the two most important elements of the draft bill which seem to tackle the use of group companies based in tax haven countries.

I. INTRODUCTION

The Netherlands is often used as the country to place the (intermediary) holding company of multinational companies and as a country to hold group service, finance and/or royalty companies. The reasons for this are fourfold:

- the CITA provides for an exemption of intercorporate dividends and capital gains arising from qualifying participations;
- the Netherlands has an extensive and favourable treaty network;
- the Netherlands does not levy withholding tax on interest and royalties; and
- the tax authorities are willing to issue advance rulings at short notice.

These four – as I would call – tax incentives have in the past afforded the Netherlands a competitive advantage over other jurisdictions. Nowadays this position has been eroded by various measures taken by other jurisdictions and will be further eroded if the draft bill is enacted as proposed.

II. AMENDMENT TO THE PARTICIPATION EXEMPTION

The Netherlands has made the principal choice in adopting the exemption method to avoid double taxation on intercorporate dividends. This method is applied not only in the case of intercorporate dividends but also in the case of intercorporate

future dividends the value of which is reflected in the sales price of the subsidiary to be sold. In other words, a capital gain arising from the sale of a subsidiary is also tax exempt. This exemption of corporate dividends is laid down in the CITA and is known as the participation exemption.[4]

The draft bill proposes to amend the participation exemption. The current participation exemption covers not only participations in Dutch corporate entities but also foreign-based corporate entities. The conditions under which a foreign participation is eligible for the participation exemption are as follows:

- the parent company should hold at least 5 percent of the (voting) shares of the foreign company; and
- the parent company should hold the shares of the foreign company other than as inventory; and
- the parent company should hold the shares of the foreign company other than as portfolio investment;[5] and
- the foreign company should be subject to a form of profits tax.

With respect to the last condition, to date the foreign company should only be subject to a form of profits tax. Whether the foreign company actually pays such tax is irrelevant. Thus participations held in companies based in Jersey, the Netherlands Antilles, Cyprus, etc. which are subject to an offshore tax regime all qualify for the participation exemption if the other conditions are also met. I agree that all of these jurisdictions are known as tax haven countries and are seen by many treaty partners of the Netherlands as suspect. But jurisdictions such as Italy, Belgium and Ireland which also provide for low effective tax rates can hardly be called tax haven countries. Nonetheless, the tax incentives they offer to attract foreign investors and which have been agreed by the EC Commission might be taken away again by the Netherlands under the proposed amendment to the participation exemption.

The Under Minister of Finance states that the principal choice of the exemption method to avoid international double taxation will be maintained. If one indeed subscribes to the principle that double taxation should be avoided by applying the exemption method it is irrelevant whether or not the operation in the other jurisdiction is subject to a high or a low tax rate or whether in fact tax is levied at all. Consequently, the dividend policy of the subsidiary resident in a low tax jurisdiction is not influenced by the tax treatment of such dividends in the hands of the parent company.

Where the principal choice is the credit method to avoid international double taxation it is also irrelevant whether or not tax is levied in the other jurisdiction. However, under a credit system the dividend policy of a company based in a low tax jurisdiction might be such that no dividend is declared at all so as to avoid additional tax take by the tax authorities of the parent company. This incentive not to declare dividends has spurred some of the tax credit countries to introduce tax haven or CFC legislation where undistributed income from controlled foreign corporations is nonetheless subjected to tax in the hands of the controlling company.[6]

In the draft bill the Dutch government has demonstrated a willingness to sacrifice the principal choice of the exemption method. In the bill the Under Minister of Finance is introducing a form of tax haven legislation or CFC legislation which should attack the use of tax haven companies by amending the subject-to-tax test. The way the proposed tax haven rules work is as follows.

The foreign participation is subject to tax if:

- the foreign company is subject to a form of profits tax the effective rate of which is at least 15 percent; or
- the foreign company is subject to a form of profits tax the effective rate of which is less than 15 percent provided the company is carrying on a business as a credit institution or is carrying on a business other than providing group finance, investment activities or activities for which royalties are received.

As can be seen the subject-to-tax test is a test which looks at the effective tax rate. If such rate is at least 15 percent the foreign subsidiary is not a tax haven company. Therefore an annual test will have to be made whether the effective tax rate is at least 15 percent. If the test result is negative then a second test is applied which looks at the activities. If the foreign subsidiary is providing group finance other than as a credit institution then the test result is also negative. Moreover, captive insurance companies or royalty companies will be deemed to be tax haven companies too if the effective tax rate is lower than 15 percent. The captive and royalty company have been thrown in to prevent finance activities being combined with these activities to avoid the tax haven rule.

Therefore, where a Dutch holding company is holding an Antilles finance company operating under the offshore tax regime any dividend received by the Dutch holding company will be subject to tax in the hand of the Dutch parent company. This is also the case for Irish and Belgian finance companies.[7]

The fact that the dividends received would not be eligible for the participation exemption means that there clearly would be international double taxation which could be substantial. The draft bill therefore stipulates that a tax credit can be taken which is equal to 20 percent of the dividend received net of costs. The tax credit is limited to the tax due in the Netherlands, but any unutilized tax credits can be carried forward for eight years.

The example 1 may illustrate the above.

The example demonstrates (column I) that the effective tax rate in the Netherlands is limited to 15 percent on the income received from the Netherlands Antilles, bringing the overall effective tax rate to 18 percent. Under a "pure" tax credit system[8] the overall effective tax rate would have resulted in 35

4. CITA Art. 13.
5. This condition does not apply for subsidiaries resident in one of the EC member states.
6. For instance the United Kingdom, the United States and Japan.
7. The Irish finance company is subject to a 10% special rate, whilst the Belgian finance company acting as a coordination centre will be subject to an even lower effective tax rate.
8. Under a "pure" tax credit system the dividend received is grossed-up with the underlying tax to arrive at a pre-tax figure. This pre-tax figure is then subject to tax in the hands of the parent company against which the underlying tax credit is taken.

percent. It further demonstrates the carry forward rules of any tax credit not utilized in prior years due to losses incurred from other operations.[9]

There might, however, be instances where the tax haven company holds subsidiaries in other jurisdictions which are also subject to a form of profits tax. Dividends received by the tax haven company from those subsidiaries may be taxable or exempt from tax. Where the tax haven company would redistribute these dividends to its Dutch parent company the 20 percent tax credit might prove to be insufficient to take account of the income tax already levied. Therefore, the taxpayer may elect for a tax credit equal to the amount of tax actually paid on the profits from which the dividends have been sourced if he can demonstrate that the effective underlying tax is higher than 20 percent. Underlying tax means income tax indirectly incurred by the tax haven company through a foreign subsidiary held by the tax haven company. It is important to note that the underlying tax credit for lower tier subsidiaries does not take into account any withholding tax levied. Moreover, the credit calculated on this basis is limited to 35 percent[10] of the dividend received net of associated costs and is applicable on a per country basis. Mixing of underlying taxes to achieve an effective tax rate of 35 percent is not possible and therefore any excess credit cannot be carried forward.

The example 2 may demonstrate the effects of the proposed rules.

In this example the Dutch parent company would obviously benefit from the 20 percent deemed income tax paid where the subsidiary of the Antilles finance/holding company is hardly paying any tax (column I). Under a "pure" tax credit system the overall effective tax rate would be 35 percent. Where the foreign subsidiary of the Antilles finance/holding company is subject to an effective rate of tax of 15 percent the proposed rules show an overkill. The use of the Antilles finance/holding company is now being penalized despite the fact that the proposed cutoff rate of 15 percent is met (column II). The Dutch parent company would in this case elect for a tax credit equal to the underlying tax. The system becomes even more penalizing where the foreign subsidiary of the Antilles finance/holding company not only pays a corporate income tax of 15 percent, but also has to withhold a tax on the dividend declared to the Antilles finance/holding company. The combined effective underlying tax rate associated with the dividend received by the Dutch parent company is 35 percent which is equal to the Dutch statutory rate! Again the Dutch parent company will elect for a tax credit which is equal to the tax paid by the foreign subsidiary on the income from which the dividend is sourced. Under a "pure" tax credit system like the UK system no UK tax would have been due. Full account would have been taken of the tax paid on the income generated and distributed.

III. EARNINGS STRIPPING PROVISION

It will be clear that the above described amendment to the participation exemption will have an impact on the dividend policy of the tax haven companies. Instead of using dividends as source of finance for future investments of the group, the funds available could also be used in the form of loans. Where these loans are used to generate Dutch taxable income the interest would be a tax deductible item. To circumvent this possibility the bill also introduces a form of an earnings stripping provision.

The bill proposes to limit the deductibility of interest where such interest is being paid to an affiliated tax haven company which does not meet certain tests as follows:

- the first test is to determine whether the interest paid to affiliated companies exceeds the interest received from affiliated companies. If this is the case then the second test applies;

9. The example ignores the carry back of losses to prior years.
10. The Dutch statutory corporate income tax rate. The 40% income tax bracket on the first NLG 250,000 is ignored.

Interest paid	(100.00)	(100.00)	(100.00)
Disallowed interest	NA	(51.13)	(100.50)

– the second test is to determine whether the interest is paid to affiliated companies resident in tax havens. The same tax haven test is applied as described under II above, albeit the "legitimate" activities test is mitigated. Only in the case where the business mainly consists of providing group finance, investment activities or royalty activities is the third test triggered. Loans provided by recognized insurance companies are not affected. If the test result shows that the interest is paid to a tax haven company then the third test applies;
– the third test determines whether the interest paid to the tax haven company exceeds 50 percent of the profits before interest paid to tax haven companies. If this is the case the excess interest paid cannot be deducted but must be carried forward.

Only interest paid to affiliated tax haven companies is being attacked. A company is affiliated if:
– the Dutch company holds (directly or indirectly) at least one-third of the shares of the tax haven company;
– the tax haven company holds (directly or indirectly) at least one-third of the shares of the Dutch company;
– a third party holds (directly or indirectly) at least one-third of the shares of the tax haven company and the Dutch company.

The proposed earnings stripping rule is therefore triggered if the Dutch company is in a negative interest position, pays such interest to an affiliated tax haven company and the interest paid exceeds 50 percent of the earnings before the interest paid to the affiliated tax company. Any excess must be carried forward.

The example 3 may demonstrate the earnings stripping provision.

In Case I no interest is disallowed because the interest paid is less than 50 percent of adjusted EBT. In Case II part of the interest is disallowed and is carried forward to the following year. Case III demonstrates that interest carried forward can only be used where either more interest income is generated or where the profitability of the company increases.

Although the first test appears to be directed at Dutch companies which finance their Dutch investments with group loans the well-known Dutch finance companies are also covered by this test. Where the borrowing position exceeds the onlending position and (part of) the borrowed funds are provided by affiliated tax haven companies the 50 percent test might prove to be negative such that part of the interest is disallowed. The example 4 may demonstrate this.

In Case I the Dutch finance company has taken up a loan from an affiliated tax haven company and has extended loans to other affiliated companies. Because the Dutch finance company applies a spread of 1/8 of a percent the interest position is positive and consequently the earnings stripping provision is not triggered. However, in Case II one of the group companies has repaid the loan provided and the funds so received have been placed on a deposit accruing a lower interest rate than on the repaid loan. Now the earnings stripping provision is triggered and a large part of the interest paid to the affiliated tax haven company is disallowed. In Case III it is shown that such disallowed interest will increase and will be carried forward indefinitely where the Dutch finance company is again in a balance position. This example clearly demonstrates that the rules have unwanted (?) effects.[11]

11. I have ignored the fact that under the Dutch tax ruling practice of conduit finance companies a matched position is deemed to exist all the time.

© 1993 International Bureau of Fiscal Documentation

IV. PRELIMINARY CONCLUSION

The proposed amendment to the participation exemption and the earnings stripping provision demonstrates the willingness of the Dutch government to attack the use of group finance companies, captive insurance companies and royalty companies operating in jurisdictions where the effective tax rate is lower than 15 percent. Not only the traditional tax haven countries are attacked but also some of the EC members states such as Belgium (coordination centres) and Ireland (financial services centre) which introduced this special legislation with authorization of the EC Commission. It is interesting to see that the Netherlands has no hesitation to override EC law in this respect.

As demonstrated above the draft bill ventilates a drastic change in attitude by the Netherlands towards multinational companies operating in or via the Netherlands and which make use of companies resident in tax haven countries or in countries with special tax regimes. This change in attitude is caused by a perceived loss of the Dutch "fair" tax share in international relationships and exerted pressure by treaty partners. If the proposed bill is accepted by Parliament it is certain that the competitive tax position of the Netherlands will definitely be lost.

GERMANY:
NEW THIN CAPITALIZATION RULE

Dr Klaus Sieker and Adrian Yeeles
Coopers & Lybrand, Hamburg

I. INTRODUCTION

After more than 13 years of extensive discussion and numerous unsuccessful attempts, the German tax authorities finally succeeded in convincing the legislative bodies to enact a thin capitalization rule.[1] It is contained in new Section 8a Corporation Tax Act (Körperschaftsteuergesetz), was passed on 9 July 1993, as part of the Investment Preservation Location Act (Standortsicherungsgesetz) and enters into force on 1 January 1994. Section 8a's principal objective is to counteract the perceived abuse of shareholder debt-financing. The additional revenue generated by Section 8a is estimated at DM 150 million per year. In practice, Section 8a will in particular adversely impact foreign shareholders operating in Germany through a German resident corporate entity. Astonishingly, the thin capitalization rule comes together with further significant changes in the taxation of German businesses aimed at attracting foreign investment to Germany.

This article discusses the objective of the new rule, examines its main elements, analyses the tax consequences of reclassified interest expense and presents some practical considerations.

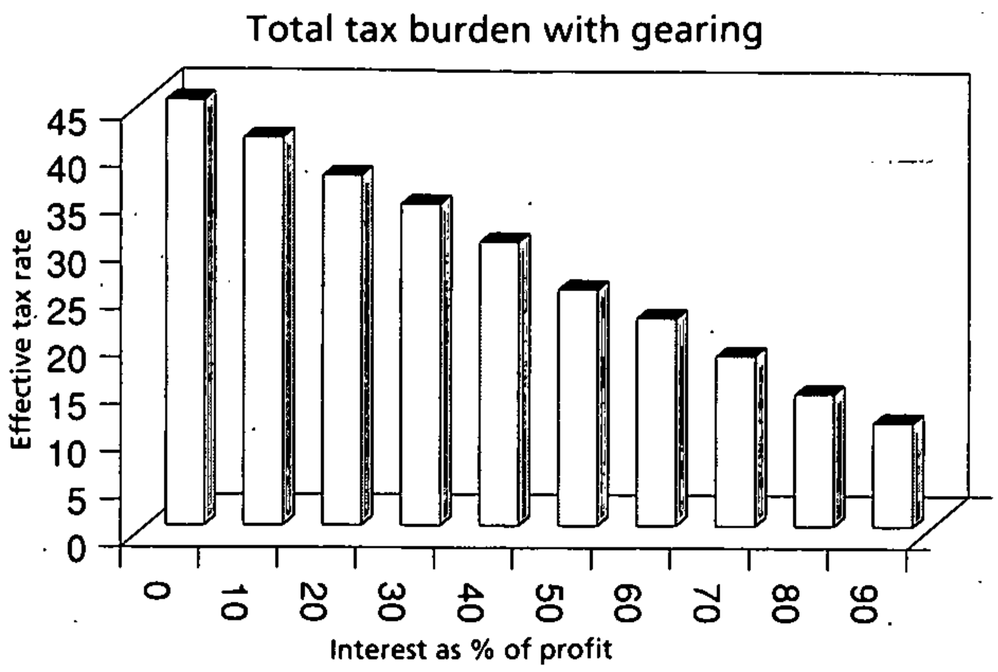
VI. Final Remark



II. OBJECTIVE OF SECTION 8A

The intention is to stop foreign shareholders avoiding tax on their German corporate profits by receiving them as interest which is tax-deductible, rather than dividends which are not.

Under the German imputation system, most domestic shareholders are entitled to a credit for the corporation tax underlying their dividends. They can set this credit against their own tax liability, and if their marginal tax rate is lower than the corporation tax rate, they will receive a repayment of the difference.

Foreign shareholders are not entitled to the imputation credit, so they are unable to reduce the corporation tax burden. In many cases dividends will also be taxed in the shareholder's state of residence and even if credit is given for the German tax suffered, the shareholder often remains stuck with the comparatively high German tax. Thus, foreign shareholders often funded their German subsidiary with debt rather than with equity. Besides the corporate tax savings, debt-financing provides trade tax (Gewerbesteuer), net worth tax (Vermögensteuer) and withholding tax savings.

The table below illustrates the potential income tax savings:

1. Actually, Sec. 8a was drafted by a special experts' working party formed by the Finance Committee of the Bundestag. The working party consisted of professors and representatives of industry associations. Their meetings were attended by representatives of the Federal Ministry of Finance as consultative members.

© 1993 International Bureau of Fiscal Documentation

Note: The effective tax rate equals the combined 30% corporation tax, 17% trade income tax and 5% dividend withholding tax. The table assumes that interest is fully deductible and is paid without withholding tax.

The 30% corporation tax rate applies on profits distributed on or after 1 January 1994. The trade tax rate depends on the municipality in which the entity operates. 17% is a working average.

III. MAIN ELEMENTS OF SECTION 8A

A. *Structure*

Section 8a consists of five subsections. The first subsection contains the basic principle, i.e. interest expenses on loans from shareholders having a significant interest in the borrower are treated as dividends to the extent the funds on loan from the shareholder exceed a certain proportion of the borrower's equity. Subsection 2 governs the determination of borrower's equity, subsection 3 deals with the significant interest requirement, subsection 4 grants to holding companies as defined a privileged treatment. Finally, subsection 5 extends the application of dividend treatment in situations where the stock in the borrowing corporation is held in a German business or through a partnership.

B. *Scope*

The borrower is a corporation subject to unlimited tax liability. The lender is either

- a shareholder with a significant interest in the corporation, or a person connected with the shareholder, and not entitled to an imputation tax credit; or
- a third party which can have recourse to the shareholder or person connected with the shareholder on the same terms.

The interest is either

- not based on the nominal amount of the loan and the loan exceeds 50 percent of the shareholder's equity in the borrowing corporation; or
- is based on the nominal amount of the loan and the loan exceeds 300 percent of the shareholder's equity in the borrowing corporation, unless the borrower could have obtained the same funds from an unrelated third party on the same terms; or
- the loan is drawn to finance ordinary banking business.

C. *Safe harbours*

Loans up to certain percentages of equity ("safe harbours") are allowed without adverse consequences. These safe harbour amounts are determined by reference to the type of company borrowing the funds and the type of interest payable. The basic distinctions are between qualifying holding companies and other companies, and between fixed-interest loans and loans with profit/turnover related interest payments.

The safe harbours are basically as follows:

Maximum level of debt as a proportion of equity

	Type of interest	
Type of company	Fixed	Dependent on profit/turnover
Non-holding company	300%	50%
Holding company	900%	50%

The calculation of the safe harbour is more complex in situations where a shareholder has made both fixed-interest and profit-dependent loans. In determining the maximum safe harbours, the profit-dependent loan takes priority. Any unused element of the profit-dependent element is available for fixed-interest loans. This allows for very different safe gearing levels, depending on how much profit-dependent loan is advanced.

The legislator intended the profit-dependent loan to take priority, and any unused element of the safe harbour for that loan to be available for calculating the fixed-interest levels. In other words, the difference between 50 percent of the equity and the actual profit-dependent loan should be multiplied by six to calculate the fixed-interest safe harbour.

A few examples:

	Loans-maximum safe harbours		
Equity	profit dependent	fixed-interest	total loan
100	50	–	50
100	–	300	300
100	25	150	175
100	37.50	75	112.50

D. *Third party test*

Payments under fixed-interest loans which exceed the safe harbour limits will not be treated as Section 8a dividends if it can be shown that the company could have obtained the loaned funds on the same terms from an unrelated party or if the loan was drawn to finance ordinary banking business. There is no such third party safe harbour for non-fixed interest loans, so that interest paid on loans exceeding the safe harbour of 50 percent will always be treated as Section 8a hidden distributions.

The third party test applying for fixed interest loans looks at whether the borrower could have obtained the funds under "otherwise equal conditions" from an unrelated third party. The expert's working party commented that the contractual terms will need to be checked in each case together with other relevant circumstances (e.g. the company's liquidity). An interest rate below an arm's length level will lead to no adjustment. An interest rate above an arm's length rate will lead to a requalification of the excess as a hidden profit distribution under Section 8(3) Corporation Tax Act to the extent the funds are within the safe harbour, and under Section 8a(1) if they exceed the safe harbour. Notice that a hidden distribution under Section 8(3) is fully subject to trade tax, whereas at least 50 percent of a distribution under Section 8a is not.

© 1993 International Bureau of Fiscal Documentation

Whether or not a loan is arm's length will depend on the circumstances in each individual case, and so only general guidance on satisfying the requirements is possible. The shareholders' loan note should be very carefully drafted to correspond as closely as possible with a third party loan. It should preferably be made in circumstances where the borrower is in a position to offer collateral.

If third party evidence is required, it could be obtained from a number of lending institutions; for example, in addition to banks, pension funds, venture capitalists and even private investors (in certain instances) could provide evidence. The evidence will need to be based on normal lending conditions prevailing in the market at the time the loan was made and in the particular capital market from which the funds come. For example, German lending conditions may vary to those in the United States in the amount of gearing offered and security required.

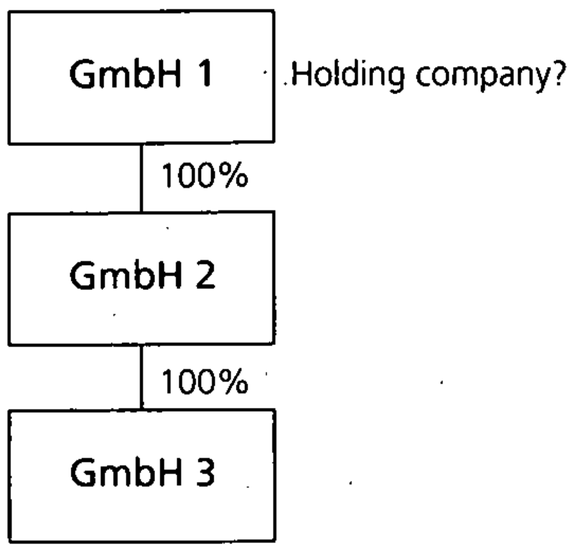
E. *Borrowed funds*

Although not defined in Section 8a, the working party of experts which produced the new section provided some guidance on what it was intended to cover, saying short-term credit (for example, credit for goods purchased and on deliveries) is excluded. The section is therefore open to very wide interpretation.

It seems clear from the text that the borrowed funds in question are only those obtained from the shareholder or connected party or third party with recourse. Genuine third party borrowings are not included for the purposes of calculating safe harbours.

F. *Holding company privilege*

Subsection 4 containing the holding company privilege has three elements:

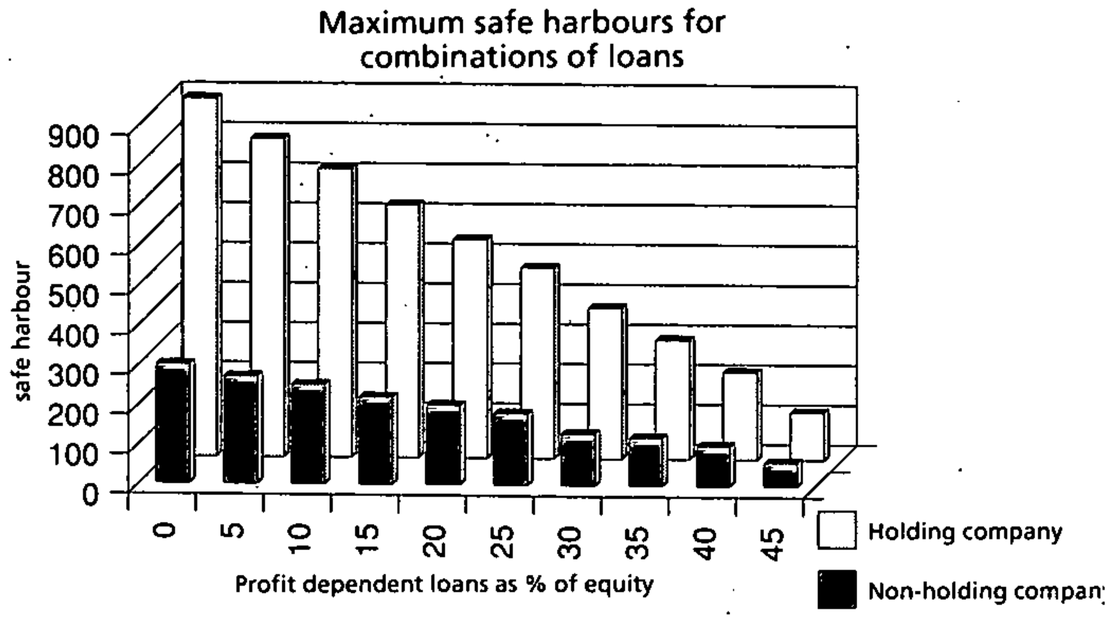


- it provides more generous safe harbours for holding companies;
- it denies safe harbours to subsidiaries of German holding companies;
- it reduces the equity element for calculating safe harbours for corporations which hold participations but are not holding companies.

(1) Holding companies and safe harbours

A safe harbour of 900 percent of equity is granted to corporations where either their main activity consists in holding and financing participations in corporations, or more than 75 percent of their balance sheet assets consist of participations in corporations.

Participation is not defined in the Act, but there is a definition in Section 271 Commercial Code (Handelsgesetzbuch). The central meaning is shareholding, but it is capable of being extended to include partnership interests and possibly also investments. A degree of permanence is required, so shareholding might not be a participation if there is an intention to dispose of it at the time of acquisition or shortly thereafter. The degree of participation is similarly not defined in the Act. Section 271 Commercial Code provides a rebuttable presumption that an interest of 20 percent or more is a participation, but it is clear that in some cases 5 or 10 percent will also suffice. We will have to wait and see how the tax authorities interpret this.



The requirement for participations plural should be noted. It is not clear whether this will also cover three tier situations:

If a qualifying holding company draws both profit-dependent and fixed-interest loans from the lender, the maximum safe harbour is calculated as 18 times the difference between the participating loan and half the shareholder's equity. Taking the same example as before:

		Loans-maximum safe harbours	
equity	profit-dependent	fixed interest	total
100	50	–	50
100	–	900	900
100	25	450	475
100	37.5	225	262.50

The table below illustrates the maximum gearing possibilities:

(2) Subsidiaries of qualifying holding companies

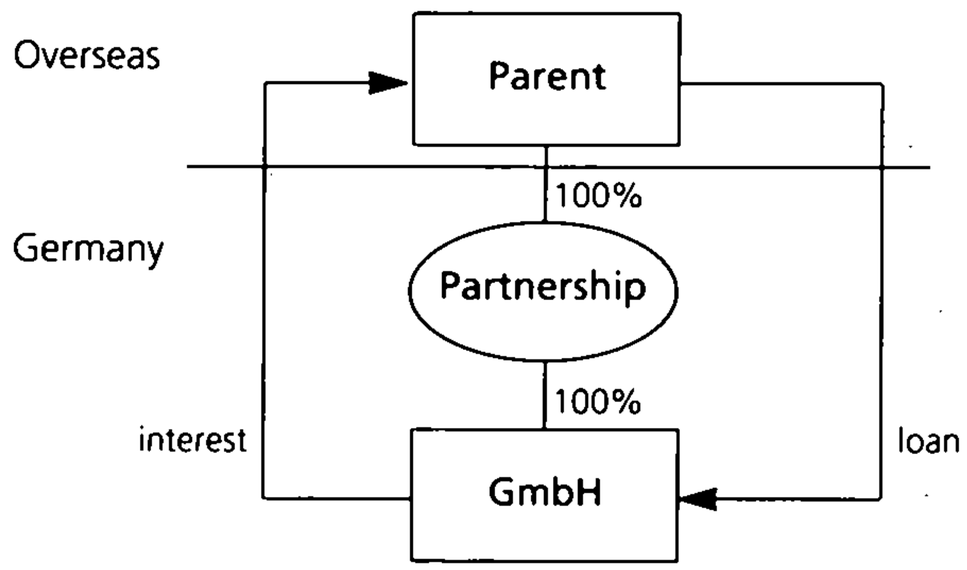
Subsidiaries of a company entitled to the 900 percent safe harbour are granted no safe harbour of their own. Loans granted to them by foreign shareholders, foreign connected persons or unrelated third parties with recourse (regardless of their state of residence) must satisfy an arm's length test; otherwise the interest payments will be treated as hidden profit distributions (excluding normal banking business).

The text does not make this treatment dependent on the debt: equity ratio of the German parent, so for example it would be quite feasible for the parent to be purely equity financed and nevertheless for payments made by the subsidiary to a foreign group company to be treated as hidden profit distributions.

© 1993 International Bureau of Fiscal Documentation

(3) Non-qualifying holding companies

A holding company does not qualify as a Section 8a holding company if:
- it only has one corporate subsidiary; or
- it has two or more corporate subsidiaries, but its main activity is not the holding and financing of participations in corporations (for example, because it is an active trading company) or the book value of its participations in corporations does not account for more than 75 percent of its balance sheet assets.

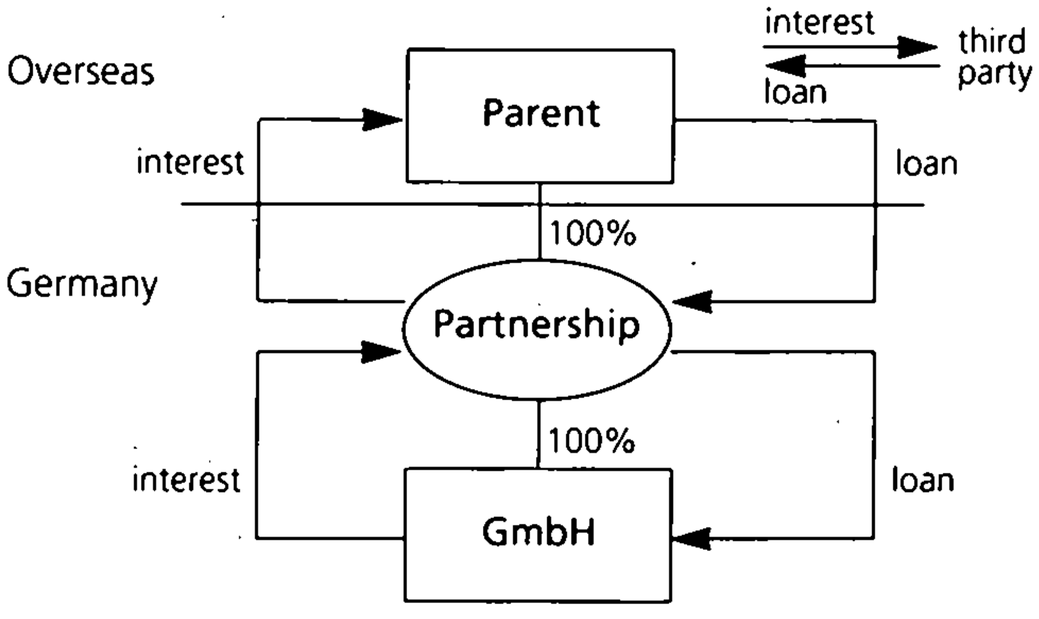


Where this is the case, the equity must be reduced by the book value of the participations in corporations in computing the safe harbour. For German groups consisting of a parent and a single subsidiary, this will usually mean a drastic reduction in the safe harbour.

G. *Subsection 5 – anti-avoidance*

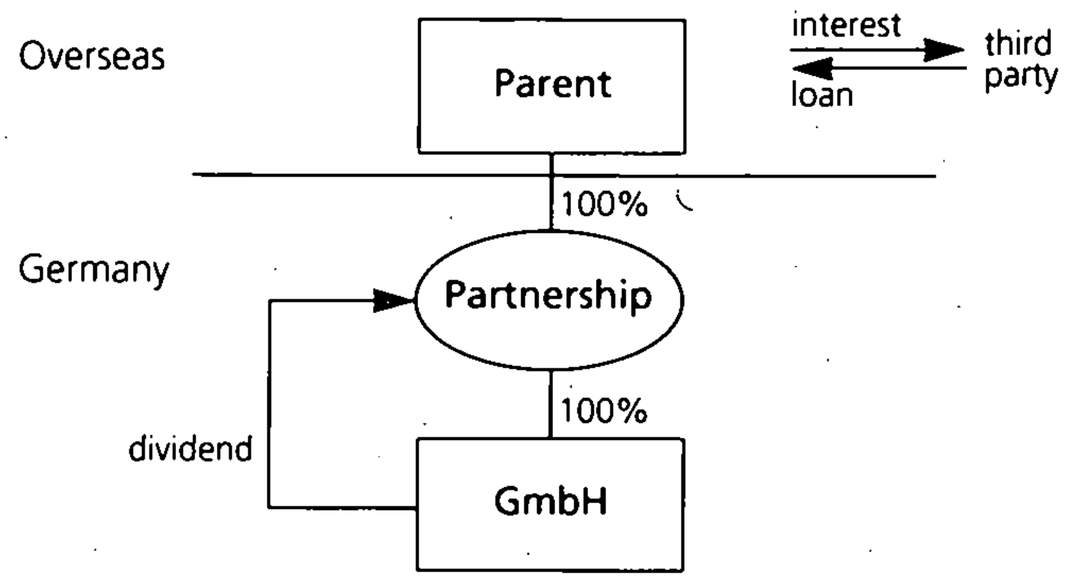
Subsection 5 extends the provisions of Section 8a to cases where foreign shareholders try to avoid the rules by using intermediate non-corporate holding entities.

(1) Partnership or permanent establishment (PE) owning the shares (paragraph 1)



This deals principally with this case:

Dividends paid by the GmbH to the partnership are taxable income of the parent under Section 49(5) Income Tax Act (limited tax liability – effectively taxed as a PE at the branch tax rate of 42 percent (1993: 46 percent)), thus entitling the parent to an imputaton credit under Section 50 Corporation Tax Act.



(2) Partnerships owning the shares and debt financed

This deals principally with this case:

The interest received is taxable income of the partnership, and is treated as business income of a German PE under Section 49(1) paragraph 2a Income Tax Act. The parent is allowed to set off any interest cost it incurs on loans taken out to finance the acquisition of partnership assets when computing its German tax liability. Since the interest coupon on the third party loan will usually be higher (or at least the same) than the group financing, this will normally ensure that the interest flows out of Germany without being taxed.

The following structure remains outside the scope of Section 8a:

Again, the dividend received from the GmbH is taxable at the partnership level, but a deduction for the third party interest cost is given, resulting in a part repayment of German tax.

H. *Effective dates*

Section 8a applies to every accounting period in which the German company has outstanding foreign shareholder loans. The rules will first affect accounting periods which begin after 31 December 1993. Special transitional rules apply for profit-dependent loans made before 9 December 1992, but only for accounting periods ending before 31 December 1997. Apart from this exception, all existing loans are caught.

IV. CONSEQUENCES OF DIVIDEND TREATMENT

To the extent interest expense is treated as Section 8a dividend, the consequences will be as follows:
- the borrowing corporation's taxable income is increased by the amount reclassified;
- the additional income together with income from other sources earned in the same year constitutes the taxable income for the year and is subject to tax at a rate of 45 percent;
- an amount equalling the disallowed interest expense is deemed as being distributed net of corporation tax at the 30 percent rate for distributed earnings;
- the deemed dividend is subject to withholding tax at 25 percent or at reduced tax treaty rates.

Noteworthy, the interest expense caught by Section 8a remains deductible for trade income tax purposes. Also, the underlying debt retains its character for trade capital and net worth tax purposes. Thus, debt-financing even caught by

© 1993 International Bureau of Fiscal Documentation

Section 8a continues to offer potential trade tax and net worth tax savings.

Despite these potential savings, a Section 8a dividend might cost more income tax than a normal dividend. In particular, an extra cost is likely to arise in situations where the taxpayer originally claimed a deduction for the interest expense, but a subsequent examination found the interest as a Section 8a dividend. The level of extra cost depends on the exact composition of the German company's equity capital ("verwendbares Eigenkapital") for tax purposes. In the worst case, a Section 8a dividend will cost 20 percent more withholding and corporate tax than a normal dividend.

Most of the more recently concluded German tax treaties treat income from profit-dependent loan arrangements as dividends for country of source taxation purposes. In addition, Germany reserves the right to impose a withholding tax on such dividends at its domestic rate, currently 25 percent, in case the income from such arrangements is deductible in determining the profits of the German borrower.[2] To the extent this deduction is denied because of Section 8a the borrower will be entitled to reduced withholding tax rates applicable for ordinary dividends. Thus, for instance, a Section 8a dividend to a US corporate lender of a profit-dependent loan also holding directly at least 10 percent of the voting shares of the borrowing company suffers only 5 percent instead of 25 percent withholding tax. If the borrower would not meet the minimum participation requirement, the rate will be 15 percent.[3]

V. PRACTICAL CONSIDERATIONS

A. *Exposure analysis*

As the new rules will apply shortly, all foreign investors with German companies should begin to review their position, assess their potential exposure and consider actions to mitigate adverse impact. This exercise must be repeated for each accounting period. It involves the following steps:

- Identify the borrower: is it a German corporation? If so, is it a qualifying holding company or a subsidiary of a qualifying holding company?
- Identify the lender: is it
  (i) a foreign shareholder?
  (ii) a foreign person connected with a shareholder?
  (iii) a third party?
  (iv) a German resident partnership which also holds the shares?
- Identify the borrowings: are they
  (i) fixed interest?
  (ii) profit-participating?
- Identify available equity for Section 8a purposes, based on the opening balance sheet for the period in question. If the corporation owns participation(s) in other corporations and is not a qualifying holding company, deduct the book value of the participation(s).
- Calculate the safe harbour amount.
- Compare the safe harbour with the maximum amount of borrowings at any time during the year in question.
- If the safe harbour is exceeded and the borrowings are profit-dependent, calculate interest on the excess borrowings and tax exposure.
- If the safe harbour is exceeded and the borrowings are fixed-interest, review whether the loans are at arm's length and gather evidence to support this.
- Determine whether the risk of a requalification of interest is a substantial risk. If so, take avoiding action.

B. *Exposure management*

Obviously, a reclassification of interest according to Section 8a raises the effective German tax rate quite significantly. Furthermore, the group's effective tax rate on German profits will in many cases reach astonishing levels if the lender's state of residence does not follow the reclassification ordered by Section 8a, but continues to treat the interest received as such. In this situation, economic double taxation of the interest that is a Section 8a dividend will almost inevitably occur with little chance to obtain relief, i.e. exemption for the interest income or credit for German taxes underlying the payment. Hence, effective measures avoiding reclassification shall ideally eliminate double taxation as well as result in an acceptable effective German tax rate.

To this end, it may be worthwhile to consider the following suggestions:

- gathering third party evidence;
- injection of new equity;
- redemption or part redemption of loan;
- conversion of profit-participating loan into ordinary loan;
- restructuring to obtain holding company safe harbour;
- conversion of company into a partnership;
- consider debt funding techniques not covered by Section 8a.

VI. FINAL REMARK

Since the first attempt to enact a thin capitalization rule, many have repeatedly raised various observations against it. The concerns relate to the arbitrariness of any debt: equity ratio and likely violation of Germany's obligations arising from tax treaties and the EEC treaty.[4] Whether the courts will join the critics remains to be seen.

Most taxpayers and their advisers consider Section 8a as a rather moderate and reasonable rule. It is probably fair to assume that most foreign investors can live with the current version. However, there is concern that the rules might be tightened in the future if they miss their objective, i.e. curtailing abusive shareholder debt-financing.

2. See for instance French-German tax treaty, Art. 9(9); Swiss-German tax treaty, Art. 10(2)(c).
3. See US – German tax treaty of 1989, Art. 10(2), (4) and (5).

D. Relief from financing costs

I. THE UNITED KINGDOM AS A HOLDING COMPANY CENTRE

Under existing laws, the use of the United Kingdom as a location for an international holding company is notable for some very significant advantages sharply contrasted by major disadvantages. The principle advantages and disadvantages are highlighted below.

A. *Advantages*

Interest and other financing costs relating to the acquisition or establishment of foreign shareholding participations are normally fully deductible to the UK holding company. Subject to appropriate structuring of the financing such costs can also be available for offset against other profits of the UK group.

Provided that profits from foreign participations have suffered corporate and withholding taxes at an effective rate at least equivalent to the UK corporation tax rate (currently maximum 33 percent), the United Kingdom will allow full credit for such taxes against UK taxes so that no corporate taxes are suffered on dividends received. Any participation of 10 percent or more qualifies for this relief and foreign tax credit may extend down an unlimited number of "tiers" of participations.

The United Kingdom does not impose any withholding tax on dividends and the foreign corporate shareholder will not be subject to any further UK taxation on a dividend received, wherever the shareholder is located.

Under certain double taxation treaties the United Kingdom gives a tax credit refund to a foreign shareholder on a dividend. This includes 11 countries where a partial tax refund is given to a corporate shareholder with a 10 percent or more interest in the UK company.

The importance of London as an international financial centre has resulted in many foreign-based groups preferring London as the prime location for a centre of European operations for non-tax reasons.

B. *Disadvantages*

Advance corporation tax ("ACT"), currently at a rate of approximately 29 percent of the net dividend, is payable on all dividends distributed to UK companies and this tax is never reduced by double taxation treaties or the parent/subsidiary directive.

As the United Kingdom operates a credit rather than an exemption system of foreign tax relief the United Kingdom is not suitable for holding shares in companies qualifying for a low tax regime, e.g. Irish companies enjoying the special 10 percent tax rate.

The consent of the UK Treasury is still required for certain transactions by foreign subsidiaries of UK companies.

II. THE PROPOSED INTERNATIONAL HEADQUARTER COMPANY REGIME

In the UK budget on 16 March 1993 the Government announced an intention to introduce new legislation to solve the ACT problem for UK companies acting as international holding companies. This will be through the introduction of a special ACT regime for companies which will be termed "international headquarter companies".

© 1993 International Bureau of Fiscal Documentation

The international headquarter company will not be a separate class of company but the regime will be available to any UK company which satisfies the following conditions:

- it is at least 80 percent owned ultimately by foreign shareholders;
- there are no more than five shareholders;
- the company receives foreign income to which a foreign tax credit is attached.

The international headquarter company will be able to elect to pay a "foreign income dividend" out of foreign source income to which a foreign tax credit is attached. Such a foreign income dividend will not be subject to ACT, but shareholders will not be entitled to a tax credit in respect of the dividend.

The international headquarter company regime effectively means that dividends from foreign participations could flow through an international headquarter company in the United Kingdom without any UK tax liability provided that the dividends are paid out of profits which have suffered foreign corporate and income taxes at a rate of at least 33 percent.

III. IMPACT OF THE EC PARENT-SUBSIDIARY DIRECTIVE

The parent-subsidiary directive, effective from 1 January 1992, has had a major impact on the choice of holding company location for groups involved in the EC. Because of the nil or low rate of withholding tax on dividends specified in the parent-subsidiary directive, where qualifying conditions are satisfied, holding companies outside of the EC will be at a major disadvantage with respect to receiving dividends from subsidiaries within the EC. This means that they are no longer viable in most cases. Only in the case of Portugal, with its special transitional provisions, do double tax treaties often give better withholding tax relief than the parent-subsidiary directive.

The parent-subsidiary directive has not, however, equalized the holding company regime within Europe so that it will still be important to seek to find the optimum regime for a particular group.

A major issue that has arisen in relation to the parent-subsidiary directive is the position of European groups owned ultimately by non-EC shareholders. Three countries, France, Italy and Spain, have included in their implementation legislation provisions allowing them to refuse to apply the dividend withholding tax exemption under the parent-subsidiary directive in situations where the group is ultimately controlled outside of the EC and it is considered that the structure has been established in order to take advantage of the parent-subsidiary directive.

IV. HOLDING COMPANIES IN OFFSHORE CENTRES AROUND THE EC

An interesting issue in relation to the parent-subsidiary directive is the extent to which it applies to companies enjoying certain favourable tax regimes within the EC. The position in a number of territories is as follows:

- Irish international financial centre companies fully qualify for the parent-subsidiary directive;
- Luxembourg holding companies, i.e. special holding companies enjoying the "1929 regime" do not qualify. However, ordinary Luxembourg companies now enjoy participation exemptions on dividends and capital gains broadly equivalent to those available in other holding company centres such as the Netherlands;
- Gibraltar: the United Kingdom and Gibraltar appear to be of the view that Gibraltar comes within the parent-subsidiary directive and mergers directive and a new type of company, known as the "Gibraltar 1992 company" has been introduced to take advantage of the regime. However, it is not entirely clear from the terms of the directive that such Gibraltar companies can enjoy the benefits.

Madeira is part of Portugal and therefore Madeira companies can potentially enjoy the benefits of the parent-subsidiary directive. It is not clear, however, as to whether those companies enjoying the especially favourable "offshore" regime are within the terms of the directive.

V. A COMPARISON OF THE UNITED KINGDOM WITH OTHER EUROPEAN HOLDING COMPANY CENTRES

The United Kingdom can be compared with other European holding company centres in relation to a number of different holding company "facilities".

A. *Dividend relief*

Of the significant European holding company centres only the United Kingdom operates a foreign tax credit relief system. Belgium, Denmark, France, Germany, Luxembourg and the Netherlands all generally operate an exemption system, at least under treaties. In some cases this exemption may be as to only 95 percent of the dividend (e.g. in Belgium).

B. *Capital gains relief*

The United Kingdom fully taxes capital gains; France taxes them at a reduced rate. Germany currently taxes capital gains at the full rate, but is contemplating the introduction of an exemption. Belgium, Denmark, Luxembourg and the Netherlands all have exemptions for capital gains.

C. *Withholding taxes on outgoing dividends*

Only the United Kingdom has no withholding tax on outgoing dividends without the need to use double tax treaties, the parent-subsidiary directive or other structuring.

D. *Relief from financing costs*

Belgium, Denmark, France and the United Kingdom potentially allow relief for financing costs on foreign participations against other income of the holding company.

BANGLADESH:

SALIENT FEATURES OF THE 1993-94 BUDGET

K.A. Gofran
Mr Gofran, BA, LL B, is editor of *Bangladesh Tax Decisions*.

INTRODUCTION

The Minister of Finance, Mr M. Saifur Rahman, presented the 1993-94 Budget on 10 June 1993, and it was enacted as the Finance Act 1993 on 30 June 1993. According to the Minister, this year's budget aims to stabilize the economy, increase the efficiency and size of public investment, restrain current expenditure, increase the revenue earning and private sector development. Emphasis has been placed on investment in human resources. Poverty alleviation is another objective of the Budget.

FISCAL MEASURES

Several important measures are aimed at collecting more revenue, streamlining tax administration and providing relief to both middle and upper-middle class taxpayers.

Highlights of the changes, which are effective from 1 July 1993, are as follows:

- The exemption limit for individual taxpayers has been increased from Tk. 40,000 to 50,000.
- The highest tax rate for individuals has been reduced to 25 percent.
- The corporate tax rate has been reduced from 55 to 50 percent for banks, financial institutions and non-industrial companies whose shares are not publicly traded. For publicly-traded companies the tax rate is 40 percent and for companies whose shares are not publicly traded the rate is 45 percent.
- The present system of imputing income from owner-occupied dwellings has been abolished. To encourage investment in housing the exemption limit for income from property has been increased from Tk. 20,000 to 30,000.
- Currently, the limit for advance income tax relief is set at Tk. 5,000, Tk. 20,000 and Tk. 60,000 for various categories of assessees. The limit has been increased to Tk. 100,000 for all categories of assessees.
- The deduction of income tax at source has been reduced to 2.5 percent (from 3 percent) for contractors in the construction sector, and increased to 10 percent (from 6.2 percent) on service charges earned by manpower export agents.
- The requirement that income tax at source be withheld on all bank mortgages exceeding Tk. 100,000 has been abolished.
- The method of computing capital gains has been changed. Under existing law, capital gains arising from inherited property are calculated on the actual cost of acquisition to the immediate previous owner. Now the capital gain will be calculated on the basis of the market value of the property on the day on which it was inherited.
- An amendment has been made to include in Part "C" of the First Schedule a provision for recognition of an approved gratuity fund.
- An amendment has been made which obliges the authorities, in cases of appeal, to communicate a final assessment notice to an assessee within 30 days of making a decision on an appeal.
- The rate schedule of the wealth tax has been amended; the rates now range from nil to 1 percent of net wealth. Income tax and wealth tax together cannot exceed 30 percent of the total income of an assessee.

BICOL – BUSINESS INTERNATIONAL – Cost of living.
London, E.I.U. The Economist Intelligence Unit, 40 Duke Street, London W1A 1DW, England. 1993
The cost of living survey contains a general description of the basic elements such as: base salary, incentives, benefit plans and cost of living and housing, allowances for expatriate compensation. How the index is calculated to compare the cost of living in London, Brussels and Amsterdam is described in detail. The disposable income table shows the percentages of gross salary remaining to an employee after personal income tax on social security contributions have been accounted for. By checking the calculates for the Netherlands they have taken into account the 35% deduction of salary before taxation granted to expatriates for a period of 5 years or less. Belgium has also some provisions for expatriates, but if they are taken into account is also not indicated at the tables. The price for a single city survey is 235 Pnd, additional cities 210 Pnd; 5 cities 920 Pnd, 10 cities 1640 Pnd, full survey 5775 Pnd.

THE EUROPA WORLD YEARBOOK 1993.
Volume I: International organizations. Countries: Afghanistan to Jordan. 34th Edition.
London, Europa Publications Limited. 1993, pp. 1635. 290.- £.
Volume I contains international organizations and the first part of the alphabetical survey of countries of the world, from Afghanistan to Jordan. A detailed entry on the Commonwealth of Independent States (CIS) is included in international organizations, for the first time, in this edition. In addition chapters on Armenia, Azerbaijan, Belarussia, Bosnia and Herzegovina, Croatia, the Czech Republic and Georgia appear for the first time.
(B. 112.789)

GUPTA, S.; MIRANDA, K.; PARRY, I.
Public expenditure policy and the environment. A review and synthesis.
Washington, IMF International Monetary Fund. 1993.
IMF Working Paper, No. WP/93/27. pp. 35.
This paper focuses on the implications of public expenditure policy for the environment and illustrates how countries can reform environmentally harmful subsidies, increase operations and maintenance expenditures for public investment projects and incorporate the environmental aspects of projects into their cost-benefit analyses.

INTERNATIONAL: INTERCOMPANY TRANSFER PRICING REGULATIONS UNDER US SECTION 482 TEMPORARY AND PROPOSED REGULATIONS — 619

Committee on Fiscal Affairs
The January 1993 issue contained the Task Force Report on the proposed Section 482 Regulations. The purpose of that Report was to provide the United States with the collective views of other OECD Member countries on the new Regulations. The Task Force has now issued another Report which considers the issues identified in the first Report that continue to be of concern, sets out new difficulties that Member countries have with the revised Regulations as presently drafted and puts forward a number of recommendations to deal with these difficulties.

UNITED STATES: THE 1993 US TAX ACT WILL AFFECT INTERNATIONAL TRANSACTIONS — 630

Philip H. Spector
On 10 August the final version of the Omnibus Budget Reconciliation Act of 1993 was signed by President Clinton (an overview of the provisions of the Act can be found in the October issue). This article summarizes the principal provisions of the Act affecting international business transactions, identifies taxpayer exposure and suggests possible responses.

UNITED STATES: ENTITY CLASSIFICATION GUIDELINES FOR GERMAN GmbHs — 638

J.G. Rienstra
The Internal Revenue Service has revised its entity classification guidelines for German limited liability companies (GmbHs) in situations of common control by a single corporate group. The IRS now holds that such entities may be classified as either partnerships or corporations. Formerly, GmbHs under common control were automatically required to be classified as corporations.

NEW ZEALAND: APPLYING A SLEDGEHAMMER TO FOREIGN INVESTMENT: FOREIGN INVESTMENT FUND MEASURES — 646

Michael Dirkis
The new FIF regime will affect not only the manner and form of current and future investment, but it will also profoundly affect some of the financial markets in which the funds are placed and the individual enterprises operating within those markets. This article critically analyses the new FIF legislation against its policy objectives. Next month Mr Dirkis will examine the Australian FIF measures.

AUSTRALIA: NEW FIF REGIME: AN INTERNATIONAL COMPARISON	652	*Peter A. Harris* The Australian government recently introduced measures aimed at preventing the deferral of Australian tax through investment in non-Australian controlled offshore funds which do not pursue a full distribution policy. These new measures are both similar and dissimilar to measures existing in the United States and Germany. This article evaluates the Australian measures by focusing on a number of the key elements to the applicability of those measures and compares them to the corresponding elements under the US and German measures.
RECENT LEGISLATIVE DEVELOPMENTS	664	*Friedhelm Jacob* As a follow-up to the article in the July/August issue, Mr Jacob provides an update on the key features of the tax reform package which was promulgated on 17 September 1993.

INTERCOMPANY TRANSFER PRICING REGULATIONS UNDER US SECTION 482 TEMPORARY AND PROPOSED REGULATIONS

Committee on Fiscal Affairs

I INTRODUCTION

1.1 The problems currently being encountered in the transfer pricing area by the United States are not new and are similar to those encountered by other Member countries of the OECD. The Task Force wishes to emphasise again that these difficulties, which are inherently global in nature, cannot be resolved unilaterally. A multilateral approach is required which builds upon widely accepted principles of international taxation. The recent discussions in the United States regarding the proposed Regulations provide a new approach to the determination of transfer prices that will be considered in the revision of the OECD's guidelines set out in the 1979 report entitled "Taxation and Multinational Enterprises" (hereinafter referred to as the OECD 1979 Report).

1.2 The purpose of the present report, which has been prepared by a special Task Force established by the Committee on Fiscal Affairs of the OECD, is to provide the United States Administration with the collective views of other OECD Member countries on the new Regulations under Section 482 of the United States Internal Revenue Code (hereinafter referred to as the revised Regulations). The report identifies issues set out in the OECD's report "Tax Aspects of Transfer Pricing Within Multinational Enterprises: The United States Proposed Regulations" (hereinafter referred to as the Task Force Report) that continue to be of concern in the revised Regulations issued in January 1993. It also identifies a number of new problems that arise with the Regulations in their present format. The United States was not a member of this Task Force but participated as an observer.

1.3 Once again, the Member countries of the OECD stress that they are prepared to work further with the United States, both bilaterally and in such international fora as the OECD, to address the problems to which the revised Regulations are directed.

1.4 The structure of this report is as follows. Chapter 1 (the present chapter) provides the background to the report. Chapter 2 considers the issues identified in the Task Force Report that continue to be of concern. Chapter 3 sets out new difficulties that Member countries have with the revised Regulations as presently drafted and puts forward a number of recommendations to deal with these difficulties. Chapter 4 provides a summary of the Recommendations and proposals for follow-up.

Legislative Background

1.5 The proposed Regulations issued in January 1992 were intended to provide guidance in implementing the amendment to Section 482 made by the Tax Reform Act of 1986, which requires that consideration for intangible property be commensurate with the income attributable to the intangible. The legislative history stated that this change was intended to assure that the division of income between related parties reasonably reflects the economic activities each undertakes. The legislative history also expressed concern that insufficiently stringent standards had previously been used in determining whether a controlled transfer was comparable to an uncontrolled transfer.

1.6 When the US issued the proposed Regulations, the Department of the Treasury requested comments from treaty partners and from other interested parties to be provided before 23 May 1992. Subsequently this period for comment was extended to July 1992.

1.7 The proposed Regulations aroused considerable interest both among Member countries of the OECD and among companies and practitioners in both the United States and elsewhere. The proposed Regulations were discussed by the Committee on Fiscal Affairs – the main tax policy body of the OECD – at its meeting in June 1992, at which time it was agreed to establish a special Task Force to undertake a detailed examination of the proposed Regulations. The Task Force Report was finalized by the end of December and passed to the US Administration. In January 1993, the report of the Task Force was published by the OECD.

1.8 Many of the Recommendations of the Task Force have been taken into account in the revised Regulations and the Task Force generally welcomes the direction taken. By adopting a more flexible approach to the methods that can be used for the determination of a transfer price and by placing greater emphasis on the facts and circumstances of individual cases, there is now less risk that these Regulations will produce results that are incompatible with the arm's length standard. Nevertheless, there remain features of the revised Regulations that continue to give rise to concerns. This report identifies these problems and attempts to put forward solutions to deal with them.

II ISSUES OF CONTINUING CONCERN

A. *General comments*

2.1 The Task Force welcomes the substantial changes made by the United States to the proposed Regulations and the fact that the United States adopted many of the recommendations of the Task Force. The Task Force is particularly pleased to see a reaffirmation of the arm's length standard. By putting greater emphasis on facts and circumstances of individual cases, there is less of a risk that the regulations will produce results that are incompatible with the arm's length standard. A number of changes reflect a move towards greater consistency with the arm's length standard such as the removal of the overly restrictive sound business judgment rule, the introduction of the best method rule, and the elimination of the comparable profits method (CPM) as a mandatory check on other methods.

2.2 Other positive changes include increased flexibility, the elimination of a strict priority of methods, the preference for transaction-based methods, the acknowledgement that profit splits can also be a valid method of arriving at an arm's length result, and the fact that more than one method may be used to confirm results obtained under another method.

2.3 The Task Force hopes that the new administration will act swiftly to assure its treaty partners and the international business community that it supports the internationally accepted arm's length standard and the efforts by the former administration reflected in the revised Regulations to establish rules consistent with that standard.

2.4 Some of the concerns identified in the Task Force Report continue to be of concern in the revised Regulations. These issues are discussed in this Chapter. For ease of reference, these issues are presented in the order in which they appear in the Task Force Report.

B. *Compatibility with the arm's length standard*

2.5 One of the main issues raised by the Task Force in connection with the proposed Regulations issued by the United States in 1992 was the consistency of the regulations with the arm's length standard. Of particular concern was the commensurate with income standard applicable to transfers or licenses of intangible property that was added to Section 482 by the 1986 Tax Reform Act. The Task Force Report indicates that to the extent that the implementation of the commensurate with income standard involves the use of hindsight, there is a risk that the arm's length standard will be violated because the application of the arm's length standard depends on the evaluation of the facts and circumstances surrounding transactions at the time they take place. The Task Force Report suggests that the inconsistency between profit approaches used to implement the commensurate with income standard and the arm's length principle could be resolved by limiting the application of such methods to profits that were predictable or reasonably foreseeable by the taxpayer at the time the transaction was entered into. The Task Force concluded that "as long as the objective is to exclude from consideration all events which were not known and could not reasonably have been predicted by the parties at the time the transfer was made, the Task Force would not regard the arm's length standard as necessarily having been breached, although this could raise serious practical problems". The revised Regulations do not take such a narrow approach. (A more detailed discussion of the periodic adjustments provisions is provided in Section H below).

2.6 The Task Force was also concerned about the compatibility of the comparable profits method with the arm's length standard. The Task Force recognized that the use of a comparable profits method may be appropriate as a method of last resort to determine an arm's length price or to check the results obtained under other methods, but strongly endorsed the 1979 OECD Report view that profit comparisons should be made with care and that "exceptional profits or losses" do not necessarily reflect an attempt to use transfer prices as a way to shift profits.

2.7 Although the revised Regulations have reduced the importance of the comparable profits method by eliminating the requirement that it be used to check the application of other methods and by suggesting a preference for transaction-based methods, Member countries are concerned, as discussed further below, that the comparable profits method may in practice become the predominant method used by the IRS. Recommendations with respect to periodic adjustments and the comparable profits method are provided below.

C. *Application of the revised Regulations in the context of a mutual agreement procedure or arbitration process*

2.8 The Task Force Report identifies the application of the proposed Regulations in the context of a tax convention's mutual agreement procedure or arbitration process as one of two fundamental issues affecting international tax arrangements raised by the proposed Regulations (the other being consistency with the arm's length standard). The concern was that the results of the methods prescribed by the proposed Regulations would not be accepted by other countries, which would lead to economic double taxation and a disruption of international trade (e.g. if the United States rejects the application of a method due for instance to the taxpayer's failure to satisfy reporting and documentation requirements, but the US treaty partner considers that method to be most appropriate in the circumstances). The Task Force Report suggests that these concerns could be eliminated to some extent if the United States were to confirm that the US competent authority would not be bound to use the approaches prescribed by the Regulations in attempting to reach agreement with a treaty partner under a mutual agreement procedure of a tax convention, and that the rules of the Regulations would not be required to be applied in the context of arbitration permitted under a tax convention. Such a confirmation was deemed to be consistent with the practice of other OECD Member countries in resolving cases through the use of the mutual agreement procedure. The revised Regulations do not include such a formal confirmation.

© 1993 International Bureau of Fiscal Documentation

2.9 Because the revised Regulations contain provisions that may conflict with the approaches of other Member countries to transfer pricing, such as the comparable profits method, periodic adjustments, and compensating adjustments, Member countries continue to believe that the United States should provide assurances that it does not consider itself bound to apply the rules set forth in the revised Regulations in the context of a mutual agreement procedure or arbitration process under a tax convention. The Task Force accepts that the Regulations may not be an appropriate place to comment on the application of the Regulations in the context of a mutual agreement procedure or arbitration process provided for in a double taxation agreement. However, it is felt that some form of official confirmation on this issue is needed.

2.10 *Recommendation on application of the revised regulations in the context of a mutual agreement procedure or arbitration process*:

> It is recommended that the United States issue a general policy statement confirming that it will not be bound by the revised Regulations when dealing with a case through the mutual agreement procedure or arbitration process of a tax contention.

D. *Concentration on abusive cases*

2.11 The Task Force acknowledges that positive steps were taken to reduce the importance of the comparable profits method. These steps include the intended expression in the best method rule of a general preference for methods based on stricter comparability (i.e. a preference for transaction-based methods over profit-based methods) and the elimination of the CPM as a mandatory check on the results obtained from application of other methods. However, because of the importance of the concerns expressed in the Task Force Report, the Task Force recommends that the United States clarify that by effectively limiting the scope of the CPM to cases where a transaction-based method cannot reasonably be applied, the best method rule effectively adopts the Task Force recommendation that CPM be used only as a method of last resort. The Task Force continues to be of the view that CPM should be used only in abusive cases and as a method of last resort (for example, CPM may be used in a case where no other method is more appropriate or can reasonably be applied with the result that both the taxpayer and administrations agree that its use on a consistent basis will produce an acceptable result for practical purposes).

2.12 *Recommendation on concentration on abusive cases*:

> For the reasons set forth in the Task Force Report, especially as the Task Force recognizes that the CPM remains at the experimental stage and requires further testing before its precise impact in the transfer pricing area can be determined, it is recommended that to the extent that the CPM is used to determine the amount of the adjustment to be made in a particular case, it should be clarified that it should only be used in abusive cases and as a method of last resort (for example, CPM may be used in a case where no other method is more appropriate or can reasonably be applied with the result that both the taxpayer and administrations agree that its use on a consistent basis will produce an acceptable result for practical purposes).

E. *Priority of methods*

2.13 The introduction of the best method rule to replace the strict ordering of methods and the provision of standards to determine comparability between controlled and uncontrolled transactions are positive developments that make the revised Regulations more flexible for both taxpayers and the IRS. However, the Task Force is concerned that because of the increased flexibility the IRS examiners now have in selecting a method, they may move too quickly to the conclusion that the CPM is the best method. IRS examiners may be inclined to resort to the CPM in most cases because it operates within a standard of comparability that is easier to satisfy than is the case for the other methods identified in the revised Regulations and because the IRS is not required to prove the inapplicability of other methods before using the CPM. Therefore, the Task Force is worried that the CPM will be used routinely and taxpayers will be forced to defend themselves by seeking data establishing the appropriateness of other methods, even though the availability of the necessary data is very limited to them. In particular, in the case of intangible transfers, the comparable uncontrolled transaction method would appear to require a standard of comparability in relation to profit potential that would be very difficult to demonstrate satisfactorily in practice. If this is the case, the result would be to lead examiners too quickly to the CPM in cases involving intangibles. This is an undesirable result in light of the preference expressed for transaction-based methods over profit-based methods (this preference being also relevant to the possible application of a profit-split method as now provided in the revised Regulations).

2.14 Another issue raised by the adoption of the best method rule is whether the revised Regulations would allow "the evidence of all methods to be used in conjunction" as the Task Force previously recommended. It seems that a method may be displaced by another method if that method provides a more accurate measure of the arm's length result. Furthermore, only one method may be used to produce a range of arm's length results.

2.15 The revised Regulations do acknowledge the use of multiple methods but only give guidance if two or more methods produce inconsistent results. This would appear to support a single best method approach rather than an multi-method approach as advocated by the Task Force. Where there is a conflict between the results derived from the application of two or more methods, the revised Regulations suggest taking another method into account. The Task Force approach seems more flexible. Where there are fundamental contradictions between the results of applying two or more methods, the Task Force took the view that an attempt should be made to reach a conclusion that was satisfactory from a practical viewpoint, taking into account the facts and circum-

© 1993 International Bureau of Fiscal Documentation

stances of the case and also the mix of evidence available provided the results were consistent with the arm's length principle. For example, this would not rule out the possibility of a range of arm's length results, the upper end of which being determined by one method and the lower end of it being determined by another method. An issue that is not clear with respect to the application of the best method rule is whether in providing an analysis of why the method used by the taxpayer is the most accurate measure of an arm's length result, the taxpayer will in practice be required to disprove other methods. This would impose a fairly significant burden on taxpayers. Further clarification on this point would appear to be necessary.

2.16 *Recommendation on the priority of methods*:

> Given the stated preference in the revised Regulations for transactional methods for determining intercompany transfer prices, it would be desirable if such a preference were clearly reflected in the process leading to the choice of a method by examiners.
>
> As recommended in the Task Force Report, the revised Regulations should allow the evidence of all methods to be used in conjunction to determine transfer pricing adjustments.

F. *Lack of available data to implement the CPM*

2.17 The Task Force continues to be concerned about the lack of availability to taxpayers and tax authorities of the information needed to apply the CPM. The Task Force Report recommended that the data used to apply the CPM be drawn from information that is available to the public or to which a taxpayer could reasonably be considered to have access or from other information that is available to the tax authorities and that could be shared with the taxpayer and, if necessary, with the competent authority of the appropriate tax administration in accordance with the provisions of tax treaties relating to mutual agreements and exchange of information. This issue is not addressed by the revised Regulations and therefore continues to raise the problems identified in the Task Force Report. However, the Task Force recognizes that, in practice, the sharing with taxpayers of data relied upon by the IRS does not appear to have presented problems in the past.

2.18 *Recommendation on the lack of available data to implement the CPM:*

> The Task Force reiterates its initial recommendation that the data used for the purposes of the CPM to determine the arm's length range be drawn from information that is available to the public or to which the taxpayer could reasonably be considered to have access or from other information that is available to tax authorities that could be shared with the taxpayer. All such data used by an examiner in constructing the arm's length range for the purposes of the CPM should be shared with the taxpayer and, if necessary, with the competent authority of the appropriate tax administration in accordance with the provisions of tax treaties relating to mutual agreements and exchange of information.

G. *Difficulties in the application and role of the CPM*

2.19 The comparability standard of the CPM is very loose and not defined with sufficient precision. The comparables "need only be broadly similar and significant product diversity and some functional diversity ... is acceptable". Because the comparability standard of the CPM is much looser than the standards under the comparable uncontrolled price, resale price, cost plus, and comparable uncontrolled transaction methods there is a concern that in practice the CPM will become the predominant method. For example, in the case of intangible transfers, the comparable uncontrolled transaction method would appear to require a standard of comparability in relation to profit potential that would be very difficult to demonstrate satisfactorily in practice. An undesirable priority of methods could prevail in practice if the methods other than the CPM are so circumscribed by the revised Regulations that their use became infrequent or exceptional. The United States has indicated that this should not be the case because the operation of the best method rule should favour the use of transaction-based methods requiring more rigid comparability and that the differing comparability standards should be viewed in conjunction with the best method rule.

2.20 In order to avoid an undesirable priority of methods in practice, the revised Regulations should make it clearer that methods that require more rigid comparability are more appropriate methods than are other methods that require less comparability even if the latter relatively satisfy other factors such as data completeness or accuracy of adjustments. This will give emphasis to transaction-based methods, which is what the United States indicated was its intention.

2.21 In addition to the loose standard of comparability, there is no requirement to adjust arm's length result to achieve greater consistency. Constructive operating profits derived from profit level indicators of uncontrolled parties who are only broadly similar would not necessarily achieve an arm's length result. If appropriate adjustments cannot be made to the profit level indicators of the comparable parties, these comparable parties should not be used to determine the arm's length range.

2.22 *Recommendation relating to the application and role of the CPM*:

> It is recommended that the CPM's standards of comparability be more precisely defined, in particular in relation to their interaction with the best method rule.
>
> To prevent IRS examiners from going too quickly to the CPM, it is recommended that the revised Regulations make it clearer that methods requiring stricter comparability are more appropriate than methods with looser comparability standards even if the other factors of the best method rule have been met. This concept may be inherent in the best method rule but should be explicitly stated.

© 1993 International Bureau of Fiscal Documentation

It is also recommended that adjustments of profit level indicators of comparable parties be required to achieve greater consistency. If appropriate adjustment cannot be made, the party should not be used as comparable.

H. *Application of periodic adjustments*

2.23 The Task Force acknowledges that the revised Regulations take into account part of the Task Force's recommendation with respect to periodic adjustments. As noted in paragraphs 3.64 and 3.65 of the Task Force Report, there may be cases where it is difficult to ascertain the profits that were reasonably foreseeable at the time a transaction was entered into. In such cases, there may be a need to consider whether a retrospective adjustment is required. However, as noted above, the Task Force continues to hold the position that periodic adjustments should be restricted as far as possible to truly abusive cases and to cases where the taxpayer fails to provide the tax authorities with the information reasonably required to support the transfer prices in order to avoid inconsistency with the arm's length standard.

2.24 Transfers of intangibles involving the payment of royalties over periods exceeding one year are different from the sales of goods in two respects: the property transferred is usually more difficult to define and to value than a tangible good for the purpose of using a method that relies on comparables; and, perhaps more importantly, payments for the intangible may span over several years, unlike payments for goods, which are usually lump sums.

2.25 However, the fact that the payment for an intangible takes the form of a multi-year royalty should not change the criteria one uses to determine whether a price is consistent with the arm's length standard. An arm's length price is generally determined at the time a transaction is entered into. If normally in a comparable uncontrolled relationship, parties do not include a price adjustment clause in their long term agreements, a subsequent adjustment to the price by the tax authorities is in conflict with the arm's length principle. If on the other hand parties in an uncontrolled relationship would insert such an adjustment clause, an adjustment should only be made from the year that clause would have come into effect.

2.26 This is not to say that a new arm's length price cannot be determined in years following the initial agreement. If, for example, the parties decide to modify the terms of the agreement and unrelated parties would do the same thing in the same circumstances, or the agreement ceases to reflect the functions actually carried out by the parties, ex post facto, then a new agreement is either formally or de facto in application, and such agreement would require the determination of a proper transfer price. However, determining a new transfer price in such cases is quite different from making adjustments in arm's length prices, in disregard of contractual arrangements between the parties, and exclusively on the basis of the actual income attributable to the intangible.

2.27 The two exceptions to periodic adjustments, although broader than the exceptions provided in the proposed Regulations, continue to be too narrow and of limited use. The set of conditions for avoiding periodic adjustments differs according to whether the comparable uncontrolled transaction method (CUT) or another method was initially used to determine the transfer price. Six conditions must be met when the CUT method is used: four conditions apply when other methods are used. For the most part, the conditions seek to ensure that the controlled agreement between the parties is formal, that the consideration for the first year in which consideration was payable is arm's length, and that the functions performed by the controlled parties have not changed over time. When the CUT method is used, additional conditions require that the controlled and uncontrolled agreements be comparable and that the terms of the uncontrolled agreements not be changed.

2.28 A further condition imposed regardless of the method used is the requirement that the total profits actually earned or the total cost savings realized by the controlled transferee from the use of the intangible in all open years be not less than 80% nor more than 120% of the prospective profits or cost savings that were foreseeable when the controlled transaction was entered into. No distinction is made among the different factors that may explain the difference between forecast and actual profits. It seems contrary to the arm's length standard to deny the exception to periodic adjustments merely on the grounds of the size of the unforeseeable profits or savings.

2.29 As a result, ex post adjustments could be made to a consideration – despite the fact that the controlled and uncontrolled agreements remained comparable over the period and the functions performed by the controlled parties did not change over time – only because actual profits proved to be somewhat different from those forecast when the agreement was entered into. An adjustment in such a circumstance seems difficult to reconcile with the arm's length standard.

2.30 No allowance is made for the fact that the difference between actual and forecast profits can be attributable to factors unforeseeable by the controlled taxpayer at the time the transaction was entered into (e.g. market factors like greater/lower demand for the product, greater/lower market price for the product, etc.). To the extent that the contract does not provide for the adjustment of consideration to reflect potential changes in profitability attributable to unforeseen circumstances, tax authorities should not be allowed to second-guess such an agreement. The unexpected profit or loss attributable, for example, to market risk should remain with the party that assumed that risk under the terms of the agreement, generally the manufacturer or distributor.

2.31 The exception applicable to taxpayers that have used the comparable uncontrolled transaction method requires that the taxpayer have access to written agreements relating to the uncontrolled transaction on which they relied to set their transfer prices. This condition is problematical because it will exclude those cases in which the taxpayer is not a party to the uncontrolled transaction.

© 1993 International Bureau of Fiscal Documentation

2.32 There is also a concern that there is a conflict between the arm's length standard and the provision that allows the district director to make an adjustment to the amount charged for an intangible even where there was a determination in an earlier year that the amount charged for the intangible was arm's length. It is recommended that there be an exception that would preclude the making of periodic adjustments where there were factors beyond the control of any member of the controlled group and these were neither anticipated nor reasonably foreseeable.

2.33 *Recommendation concerning application of periodic adjustments:*

> It is recommended that the Task Force's original recommendation that periodic adjustments be confined to truly abusive cases be adopted. Although it is recognized that the exceptions to periodic adjustments were broadened, the Task Force recommends deletion of the requirement limiting the total profits actually earned or the total cost savings actually realized by the controlled transferee from the exploitation of the intangible in all open years to between 80% and 120% of the foreseeable profits or cost savings, because an adjustment in such circumstances would seem difficult to reconcile with the arm's length standard.
>
> It is also recommended that once a transaction has been determined to have been made at arm's length, adjustments should not be made in later years where there were factors beyond the control of any member of the group and these factors were neither anticipated nor reasonably foreseeable.

I. *Treatment of tangibles with intangible elements*

2.34 The recommendations of the Task Force are largely reflected in the revised Regulations with respect to the treatment of tangibles. However, the methodology to be used to check the transfer price of property that involves both tangible and intangible elements is not clear. The revised Regulations provide that because the methods to be applied to transfers of tangible property do not adequately account for significant, non-routine intangibles that may be transferred or used with the sale of property, it may be necessary to adjust the results obtained using the tangible methods with the "principles" of the intangible methods. A similar statement is made with respect to the transfer of property that includes tangible and routine intangible elements.

2.35 Although the treatment of tangibles with intangible elements has been made much more flexible, it is still not clear whether a can of tuna fish sold under a brand name would fall under the tangible rules. If the brand name is regarded as a significant, non-routine intangible, the results of the application of the tangible method may need to be adjusted with the intangible methods. Further guidance in this area is needed because it is not clear how such an adjustment would be made, particularly given that neither the cost plus nor resale price method would ordinarily apply in the case of transfers of intangibles.

2.36 *Recommendation relating to the treatment of tangibles with intangible elements*:

> It is recommended that further guidance be provided as to how the intangible methods are to be applied in the transfer of property that involves both tangible and intangible elements.

III NEW ISSUES

A. *Comparability standard of the comparable uncontrolled price method (CUP)*

3.1 The revised Regulations seem to have a different, more stringent comparability standard for the CUP method than has been used in the past. The preamble of the revised Regulations explains that "although the text of this rule differs somewhat from its counterpart in the final regulations, the changes were intended to be clarifications of the current standard rather than substantive changes". However, the specific text of the revised Regulations suggests otherwise.

3.2 The revised Regulations provide that "for purposes of the comparable uncontrolled price method, transactions are considered comparable only if the tangible property and circumstances of the controlled transaction are substantially the same as those of the uncontrolled transaction. The tangible property and circumstances of an uncontrolled transaction will be considered substantially the same as those of a controlled transaction only if any minor differences between the transactions either have no effect on the amount charged, or can be accounted for by a reasonable number of adjustments. If there are material differences between the controlled and uncontrolled transactions, other methods must be applied such as the resale price method ..., the cost plus method ..., or the comparable profits method ...".

3.3 Since the CUP is generally preferable to other methods, the Task Force considers that the CUP can be applied even where differences are material, if their effect on the prices concerned is definite and reasonably ascertainable. In fact, the same kind of adjustments may be necessary to reach an accurate comparability of margins and mark-up when the resale price or the cost plus methods appear to be applicable. If such adjustments are not allowed, examiners could move too quickly to other less accurate methods, like the CPM.

3.4 *Recommendation on the comparability standard of the CUP*:

> It is recommended that the comparability standard of the CUP method be amended to allow for material differences if the effect on price is reasonably ascertainable.

B. *Comparability standards of the CUT*

3.5 The CUT method applies to cases where an uncontrolled transaction is comparable to a controlled transaction, in practice when there exists a market in which a comparable intangible is being traded. Three conditions must be met to establish that the controlled and uncontrolled intangibles are com-

© 1993 International Bureau of Fiscal Documentation

parable. Eight additional factors are examined to determine if the "circumstances" of the controlled and uncontrolled transactions are comparable.

3.6 Among the three conditions required to establish the comparability of intangibles, the third condition may be problematic. The condition requires that both intangibles have substantially the same profit potential, as measured by the net present value of the benefits to be realized (based on prospective profits to be realized or costs to be saved) through the use or subsequent transfer of the intangible, taking into consideration the capital investment and start-up expenses required, the risks to be assumed and other relevant considerations.

3.7 This requires the taxpayer to establish the profit potential of his own intangible, which may sometimes prove to be highly speculative. It also requires the taxpayer to gather data and knowledge about the uncontrolled intangible in order to establish its profit potential. This may be difficult, if not impossible, to obtain because while the uncontrolled transaction may be an arm's length transaction, it is not necessarily a "public" transaction the details of which are readily available and the uncontrolled transaction may be carried out by a competitor who, understandably, will not be anxious to share the financial aspects of its comparable intangible with its rival.

3.8 Compliance with this condition could prove to be impractical, thus making the CUT method virtually inaccessible to taxpayers, even in cases when uncontrolled intangibles exist and all other conditions are met. When the CUT method cannot be used, it is likely that the IRS would then turn to the CPM, which means, as noted above, that the CPM would become the norm rather than the exception.

3.9 The concern regarding the "profit potential" test could be reduced significantly – without compromising its basic policy purpose – by its being worded in the negative. In other words, a taxpayer could not use a comparable where it ought to have been clear at the outset to the taxpayer that the profit potential from the two properties was so different that the situations could not reasonably be considered comparable. Such a modification would ease the burden of proof of the taxpayer, and would prevent denying use of the comparable where the taxpayer has a reasonable expectation that the profit potential of the controlled and uncontrolled properties is similar, but is unable to actually prove that the profit potentials are nearly equal.

3.10 The eight conditions to determine whether the circumstances of the controlled and uncontrolled transactions are comparable appear to be reasonable if looked at individually but impose a very high standard of comparability when taken together. Information about some of these factors – e.g. uniqueness of property, expected economic life of the property, provisions of third party agreements, etc. – may be difficult, if not impossible to obtain for the controlled taxpayer. The inability to obtain such information, in turn, would preclude meeting the conditions and, thus, prevent the use of the method.

3.11 The concerns regarding the application of the CUT method would be significantly diminished with the retention of the comparable adjustable transaction method included in the 1992 proposed regulations – without the requirement that the results obtained be confirmed with the CPM. Retention of the method would permit adjustments to the sales prices for factors which are quantifiable. Provision for such adjustments is made with respect to transfers of tangible property.

3.12 The CUT method is the most appropriate method to use in the case of transfers of intangibles for which comparables exist. Taxpayers should be given every possible chance to use this method even if the uncontrolled property and transaction are not in every respect comparable. It would be unfortunate if the high standards required for the utilisation of the CUT method were to overly restrict the use of the method to near-perfect cases of comparability and of data availability, when adequate comparables exist.

3.13 *Recommendation on the comparability standards of the CUT method*:

> In order to reduce what might otherwise be an impossible compliance burden, it is recommended that the "profit potential" test of the CUT method be revised to prohibit the taxpayer from using a comparable where it should have been clear to the taxpayer at the time the transaction was entered into that the profit potential from the two properties was so different that the situations could not reasonably be considered to be comparable.
>
> It is also recommended that the comparable adjustable transaction method included in the 1992 proposed Regulations be reintroduced but without the requirement of a check of the results with the CPM. This would provide taxpayers greater access to a CUT method.

C. *Problems with comparability of controlled and uncontrolled transactions*

3.14 In general, the Task Force views the revised Regulations as providing considerable guidance on factors which determine comparability. However, the consideration of alternatives realistically available to a buyer or seller would appear to be making a significant change to the nature of the transaction under review. The revised Regulations provide that allocations will be based on the taxpayer's actual transactions except where a controlled transaction lacks economic substance. However, "the district director may consider the alternatives available to the taxpayer in determining whether the terms of the controlled transaction would be acceptable to an uncontrolled taxpayer faced with the same alternatives and operating under comparable circumstances. In such cases the district director may adjust the consideration charged in the controlled transaction based on the cost of the alternative, but will not restructure the transaction as if the alternative had been adopted by the taxpayer."

© 1993 International Bureau of Fiscal Documentation

3.15 As a rule, the determination of transfer prices should be made on the basis of actual transactions and actual business choices. Whilst the Task Force recognizes that the revised Regulations provide that this determination must be based on the taxpayers' actual transactions, there is concern that the examination of alternatives may nevertheless be used to second-guess the appropriateness of bona fide business decisions. The construction of alternative business arrangements for the purpose of determining transfer prices would be, at best, an uncertain enterprise and could prove to be arbitrary. In addition, if alternative transactions are to be considered, many factors other than costs, such as the opportunities and risks involved in production, would need to be taken into account.

3.16 Furthermore, no such statutory or regulatory flexibility may be afforded to the revenue authority in the jurisdiction in which the other controlled corporation resides. Thus, double taxation is likely where an adjustment is based on an alternative transaction that the taxpayer could have entered into.

3.17 Another factor that causes concern and may be inconsistent with the arm's length standard is the first step in the risk analysis. The risk analysis required by the revised Regulations "states that the district director must determine which controlled taxpayer bears the risk which includes a consideration of whether the income earned by [the] controlled taxpayer over a reasonable period of time is commensurate with the risk assumed." The use of hindsight in transfer pricing methodologies, as previously stated, is generally inconsistent with the arm's length standard.

3.18 *Recommendation on the problems with comparability of controlled and uncontrolled transactions*:

> It is recommended that the alternative business transactions realistically available to the taxpayer not be used to second-guess the appropriateness of bona fide business decisions except where the transaction lacks economic substance.
>
> It is also recommended that the use of hindsight be eliminated from the risk analysis required by the revised Regulations.

D. *Adjustments to the midpoint of the arm's length range*

3.19 Application of the arm's length range concept to all transfer pricing methodologies is a welcome development. However, there is some doubt as to whether the general rule requiring adjustment to the midpoint of the range is appropriate. Although the mid-point may be as valid as any other point, it may be unfair to place the taxpayer at the midpoint if there is an uneven concentration of arm's length prices. It may therefore be more accurate to put the taxpayer within the range and towards the end of the range that best reflected the facts and circumstances of the controlled taxpayer.

3.20 *Recommendation relating to adjustments to the midpoint of the arm's length range*:

> It is recommended that the revised Regulations be modified to require adjustments to be made to the point within the range that best reflects the facts and circumstances of the controlled taxpayer.

E. *Profit split approach*

3.21 The Task Force is concerned that the administrative requirements for using the profit split approach may be overly restrictive. For example, where the profit-split approach is the most appropriate of the available pricing methods, a taxpayer should be able to use the method without advance reporting and documentation obligations that are not required for other methods. The Task Force Report discussed the advantages of a profit split approach over the CPM and suggested that the CPM not be treated as a more favoured method. However, under the regulations, the CPM might mistakenly be considered a more favoured method because the profit-split is subject to a higher level of reporting and documentation requirements.

3.22 A profit split is only available if both controlled taxpayers own valuable, non-routine intangibles either developed by the taxpayer or acquired from uncontrolled taxpayers. Therefore, it would not appear to cover more conventional transfers of a single intangible from a parent company to a manufacturing subsidiary in a foreign jurisdiction, or the transfer of more conventional intangibles. Whether the method is appropriate should be a question of fact to be determined in accordance with the best method rule. This approach would require a significant liberalization of the conditions under which the method may be used. Such a liberalization would enable taxpayers that are otherwise prevented from using the CUT method to rely on a profit split, instead of the CPM or other methods, provided the use of a profit split is consistent with the best method rule.

3.23 The revised Regulations reintroduce the basic arm's length return method (BALRM), which raises concerns because it relies on hard-to-find comparable rates of return with respect to every function performed in connection with the intangible sold or licensed, instead of relying on generally known data involving more or less comparable situations. Further, there are doubts as to whether unrelated parties do apply functional analysis to determine a sales price or royalty. Substantial manpower would be needed to perform such an analysis, especially since it should be performed during the full life-time of the intangible and not limited to the time of sale or the outset of the licensing agreement. The revised Regulations' BALRM approach does not remove these difficulties.

3.24 The Task Force acknowledges that more work is necessary to determine the proper application of the profit-split method. This will be done in the context of the revision of the OECD 1979 Report.

3.25 *Recommendation relating to profit splits*:

> The Task Force recommends eliminating the advance reporting and documentation obligations required for the use of the profit split method and applying the best

© 1993 International Bureau of Fiscal Documentation

method rule to determine whether use of such a method is appropriate.

F. *Difficulties created by reporting prices other than actual prices*

3.26 The revised Regulations allow taxpayers, where necessary to reflect an arm's length result, an opportunity to report the results of their controlled transactions based on prices different from those recorded in their books and records. However, this may result in double taxation or non-taxation of income if the other country does not make corresponding adjustments to account for those made by the taxpayer. The laws of some countries may not permit the reporting of amounts other than the amount agreed to by the parties for purposes of the transaction. This issue requires further study in connection with the revision of the OECD 1979 Report.

G. *Compliance burden on taxpayers*

3.27 The revised Regulations increase the flexibility of the acceptable arm's length methodologies and results on the one hand, but impose onerous procedural requirements on taxpayers on the other.

Although requiring some contemporaneous documentation is acceptable, if seems unduly burdensome to require taxpayers to conduct extensive studies that depend on information that may not be available, before determining each transfer price. The documentation requirements should be realistic and not excessive, particularly in the case of the corresponding regulations governing transfer pricing penalties. Further, a taxpayer should not be deprived of the opportunity to use a method even if the method is not documented before the return is filed.

3.28 Under the revised Regulations, a taxpayer who engages in a variety of businesses will have to examine numerous tax requirements before filing a return that reports transactions with related parties. Requiring taxpayers to perform excessively intricate tax analyses before entering into transactions will distort the normal practice of business and deter international trade and foreign investment, although it is accepted that some appropriate analysis should be required before the taxpayer files its return.

3.29 *Recommendation on compliance burden on taxpayers:*

> It is recommended that a taxpayer's documentation requirements be limited to information to which the taxpayer could reasonably be expected to have access and that there be a limit on the intricate tax analyses required of taxpayers before entering into transactions in order not to disrupt international trade and foreign investment. Further, a taxpayer should not be deprived of the opportunity to use a method even if the method is not documented before the return is filed.

H. *Safe harbour*

3.30 The Task Force recommended that the United States provide a safe harbour for small businesses in order to avoid the compliance burden associated with the use of the comparable profits method. Acknowledging that the concept of safe harbours requires further work by the OECD, the Task Force was reluctant, in view of the limited time available to it, to make any specific recommendations on the safe harbour.

3.31 Under the safe harbour rules of the revised Regulations, no adjustment will be made when a qualifying taxpayer elects the safe harbour provisions. The electing taxpayer is required to determine its taxable income by applying profit level indicators to be published in a revenue procedure by the IRS. Since the profit level indicators have yet to be disclosed, it is not possible to assess them.

3.32 As the Task Force Report mentions, difficulties would arise if a safe harbour provision resulted in the attribution of more profit to the United States than the subsequent application of the arm's length standard would attribute. The preamble of the revised Regulations states that ... some taxpayers may find that the results they achieve under the safe harbour are somewhat less favourable than they could have achieved if they did not elect the safe harbour..." which suggests that the risk of a shift of profits to the United States may be unavoidable. In order to avoid such a result, the Task Force Report suggests adopting an approach "that is likely to give the taxpayer a more favourable result than the strict application of the arm's length standard". It is hoped that the profit level indicators adopted will attempt to achieve such a result.

3.33 There is also concern about the inability to revoke the election to use the safe harbour without the consent of the Commissioner. If such consent is difficult to get, taxpayers will be forced to shift income to the United States to meet the profit level indicator even where it is apparent that their actual taxable income is below the indicator.

3.34 Permanent establishments are excluded from the safe harbour benefits. To the extent that such exclusion may violate the non-discrimination provisions of tax treaties, it should be reconsidered.

3.35 *Recommendation with respect to the safe harbour:*

> It is recommended that the profit level indicators be chosen with a view to providing the taxpayer with a result that is likely to be more favourable than that which would be achieved under a strict application of the arm's length standard and that the safe harbour be applied in a non-discriminatory manner.

IV CONCLUSIONS

A. *Main Recommendations*

4.1 The Recommendations set out below would, if adopted, alleviate the problems with the revised Regulations, as identified in this Report. They would also ensure that the international consensus referred to above would be maintained.

© 1993 International Bureau of Fiscal Documentation

4.2 The main recommendations are:

Recommendation on application of the revised regulations in the context of a mutual agreement procedure or arbitration process:

It is recommended that the United States issue a general policy statement confirming that it will not be bound by the revised Regulations when dealing with a case through the mutual agreement procedure or arbitration process of a tax convention.

Recommendation on concentration on abusive cases:

For the reasons set forth in the Task Force Report, especially as the Task Force recognizes that the CPM remains at the experimental stage and requires further testing before its precise impact in the transfer pricing area can be determined, it is recommended that to the extent that the CPM is used to determine the amount of the adjustment to be made in a particular case, it should only be used in abusive cases and as a method of last resort (for example, CPM may be used in a case where no other method is more appropriate or can reasonably be applied, with the result that both the taxpayer and administration agree that its use on a consistent basis will produce an acceptable result for practical purposes).

Recommendation on the priority of methods:

Given the stated preference in the revised Regulations for transactional methods for determining intercompany transfer prices, it would be desirable if such a preference were clearly reflected in the process leading to the choice of a method by examiners.

As recommended in the Task Force Report, the revised Regulations should allow the evidence of all methods to be used in conjunction to determine transfer pricing adjustments.

Recommendation on the lack of available data to implement the CPM:

The Task Force reiterates its initial recommendation that the data used for the purposes of the comparable profit method to determine the arm's length range be drawn from information that is available to the public or to which the taxpayer could reasonably be considered to have access or from other information that is available to tax authorities that could be shared with the taxpayer. All such data used by an examiner in constructing the arm's length range for the purposes of the comparable profit method should be shared with the taxpayer and, if necessary, with the competent authority of the appropriate tax administration in accordance with the provisions of tax treaties relating to mutual agreements and exchange of information.

Recommendation relating to the application and role of the CPM:

It is recommended that the CPM's standards of comparability be more precisely defined, in particular in relation to their interaction with the best method rule.

To prevent IRS examiners from going too quickly to the CPM, it is recommended that the revised Regulations make it clearer that methods requiring stricter comparability are more appropriate than methods with looser comparability standards even if the other factors of the best method rule have been met. This concept may be inherent in the best method rule but should be explicitly stated.

It is also recommended that adjustments of profit level indicators of comparable parties be required to achieve greater consistency. If appropriate adjustments cannot be made, the party should not be used as a comparable.

Recommendation concerning application of periodic adjustments:

It is recommended that the Task Force's original recommendation that periodic adjustments be confined to truly abusive cases be adopted. Although it is recognized that the exceptions to periodic adjustments were broadened, the Task Force recommends deletion of the requirement limiting the total profits actually earned or the total cost savings actually realized by the controlled transferee from the exploitation of the intangible in all open years to between 80% and 120% of the foreseeable profits or cost savings, because an adjustment in such circumstances would seem difficult to reconcile with the arm's length standard.

It is also recommended that once a transaction has been determined to have been made at arm's length, adjustments should not be made in later years where there were factors beyond the control of any member of the group and these factors were neither anticipated nor reasonably foreseeable.

Recommendation relating to the treatment of tangibles with intangible elements:

It is recommended that further guidance be provided as to how the intangible methods are to be applied in the transfer of property that involves both tangible and intangible elements.

Recommendation on the comparability standard of the CUP:

It is recommended that the comparability standard of the CUP method be amended to allow for material differences if their effect on price is reasonably ascertainable.

Recommendation on the comparability standards of the CUT method:

In order to reduce what might otherwise be an impossible compliance burden, it is recommended that the "profit potential" test of the CUT method be revised to prohibit the taxpayer from using a comparable where it should have been clear to the taxpayer at the time the transaction was entered into that the profit potential from the two properties was so different that the situations could not reasonably be considered to be comparable.

© 1993 International Bureau of Fiscal Documentation

It is also recommended that the comparable adjustable transaction method included in the 1992 proposed Regulations be reintroduced but without the requirement of a check of the results with the CPM. This would provide taxpayers greater access to a CUT method.

Recommendation on the problems with comparability of controlled and uncontrolled transactions:

It is recommended that the alternative business transactions realistically available to the taxpayer not be used to second-guess the appropriateness of bona fide business decisions except where the transaction lacks economic substance.

It is also recommended that the use of hindsight be eliminated from the risk analysis required by the revised Regulations.

Recommendation relating to adjustments to the midpoint of the arm's length range:

It is recommended that the revised Regulations be modified to require adjustments to be made to the point within the range that best reflects the facts and circumstances of the controlled taxpayer.

Recommendation relating to profit splits:

The Task Force recommends eliminating the advance reporting and documentation obligations required for the use of the profit split method and applying the best method rule to determine whether use of such a method is appropriate.

Recommendation on compliance burden on taxpayers:

It is recommended that a taxpayer's documentation requirements be limited to information to which the taxpayer could reasonably be expected to have access and that there be a limit on the intricate tax analyses required of taxpayers before entering into transactions in order not to disrupt international trade and foreign investment. Further, a taxpayer should not be deprived of the opportunity to use a method even if the method is not documented before the return is filed.

Recommendation with respect to the safe harbour:

It is recommended that the profit level indicators be chosen with a view to providing the taxpayer with a result that is likely to be more favourable than that which would be achieved under a strict application of the arm's length standard and that the safe harbour be applied in a non-discriminatory manner.

B. *Follow-up*

4.3 The Task Force believes that with the completion of this Report, it has fulfilled the Mandate given to it by the Committee on Fiscal Affairs to review the US 482 Regulations. Nevertheless, the Task Force feels that it would be necessary to continue the dialogue with the United States on the implementation of the revised Regulations. As noted in the 1993 Task Force Report and by numerous commentaries in the public and private sectors, the impact of the revised Regulations on taxpayers will, to a large extent, depend upon how they are implemented. In particular, the attitude of the IRS auditors will be crucial.

In that context, the Task Force suggests that:
i) it would be useful if the US were to agree to present to the Task Force the guidelines for IRS auditors that are currently being prepared.
ii) at the December 1994 meeting, Working Party No. 6 could devote a half-day session to examining the operation of the Regulations. This review could examine any experience gained with transfer pricing audits (although it is recognized that this is unlikely to be extensive by end 1994) and the compliance experience of taxpayers. BIAC could be invited to participate in part of this session.

4.4 The Task Force also recommends that the Temporary Regulations not be finalized before it completes its review of the OECD 1979 Report.

UNITED STATES:

THE 1993 US TAX ACT WILL AFFECT INTERNATIONAL TRANSACTIONS

Philip H. Spector

On 10 August 1993, President Clinton signed into law the final compromise version of the Omnibus Budget Reconciliation Act of 1993 (the "Act"). The Act, the result of six months of political struggle, is intended to reduce the US federal budget deficit through a combination of tax increases and spending reductions. The most publicized tax increases target high-income individuals, who now face a 39.6 percent top marginal personal income tax rate.

One of President Clinton's campaign promises was to ensure that foreign companies doing business in the United States pay their "fair share" of US taxes. This politically popular sentiment is borne out in the Act's transfer pricing penalty provisions. However, US multinational companies will feel this bite of the Act's international provisions to a far greater degree than will foreign companies. Moreover, while President Clinton's original economic proposals emphasized the need for capital investment in the United States, some of the Act's provisions may have the effect of encouraging US multinationals to locate or expand operations overseas.

Unfortunately, the Act does not include any of the recently proposed broad simplification proposals, which would dramatically simplify the taxation of US multinationals' overseas income. Instead, the Act adds yet another layer of complexity to these already difficult rules.

This article summarizes the principal provisions of the Act affecting international business transactions, identifies taxpayer exposure and suggests possible responses.

Philip Spector is a US tax partner in the New York office of the international law firm Watson, Farley & Williams. Mr Spector specializes in cross-border transactions and international tax planning and has published numerous articles in tax and financing journals. He is a graduate of Columbia University (B A 1978), the University of Pennsylvania Law School (J D 1981) and New York University School of Law (LL M in Taxation 1986).

Contents

I. Provisions Affecting US Multinationals
- A. Partial repeal of deferral of US tax on active overseas earnings
- B. PFIC rules likely to reach more foreign companies
- C. Foreign tax credit

II. Provisions Affecting Inbound Investment and Financing US Operations
- A. Guaranteed debt now subject to "earnings stripping" rules
- B. Contingent interest not eligible for "portfolio interest" exemption
- C. Conduit financing arrangements

III. Transfer Pricing
- A. Transfer pricing penalty provisions expanded

IV. Possessions Corporations
- A. New limitations on Section 936 benefits

I. PROVISIONS AFFECTING US MULTINATIONALS

A. *Partial repeal of deferral of US tax on active overseas earnings*

US persons generally are taxed currently on their worldwide income. In contrast, US tax on earnings of a foreign corporation that is owned by US persons normally is deferred until the corporation pays a dividend. Several US tax regimes reverse this deferral and tax US shareholders directly and currently on the foreign corporation's earnings.

Under the "controlled foreign corporation" ("CFC") rules, US persons that own at least 10 percent of the voting stock of a foreign corporation are taxed directly on certain corporate earnings if such 10 percent-US shareholders own, in the aggregate, more than 50 percent of the corporation's stock (by vote or value). The income taxed to US shareholders includes passive investment income such as interest, dividends, capital gains, rents and royalties, and certain sales and services income from transactions undertaken for or involving related parties (so-called "Subpart F income"). In addition, US shareholders are taxed currently when the CFC increases its investments in certain US property (including loans to certain US affiliates). Before the Act, the CFC rules did not tax US shareholders on the foreign corporation's active business earnings, even if those earnings were accumulated in passive investments.[1]

1. New excess passive asset inclusion

Congress determined that neither the CFC nor the PFIC regimes sufficiently restricts the benefits of deferral in the case of CFCs that accumulate excessive amounts of earnings without reinvesting them in active business assets. The Act

1. However, another set of rules, the "passive foreign investment company" ("PFIC") rules do eliminate deferral in the case of foreign corporations that allow undistributed earnings to accumulate in passive assets to such an extent that the corporation's passive assets equals or exceeds its business assets. See discussion at I.B.

© 1993 International Bureau of Fiscal Documentation

addresses this perceived deficiency by requiring 10 percent-US shareholders of a CFC to include in income currently the CFC's post-1993 accumulated earnings to the extent invested in "excess passive assets".

Generally, the new amount included by 10 percent-US shareholders is the lesser of: (1) the shareholder's share of the CFC's "excess passive assets" and (2) the shareholder's share of the CFC's current and accumulated earnings. "Excess passive assets" is the amount by which the CFC's passive assets exceed 25 percent of the CFC's total assets. "Passive assets" are assets that produce, or are held for the production of, passive income, such as dividends, interest, royalties and rents. All assets are valued by reference to the average of their adjusted basis at the end of each quarter of the year. For purposes of these provisions, only earnings for taxable years beginning after 30 September 1993 are taken into account. Also, a complex series of rules avoids double inclusions of the same earnings under the three CFC inclusion schemes (See the following Example for an illustration of the operation of the new rules).

EXAMPLE

Operation of the New Excess Passive Assets Rule

Assume that a US corporation owns all of a CFC's stock, that this is the first year of the CFC to which the new rules apply, and that the CFC's assets, post-1993 earnings and profits, and Subpart F income are as follows:

Total assets	100
Passive assets	40
Excess passive assets (40 minus 25% of 100)	15
Year-end post-1993 accumulated E&P	25
Subpart F income	5
Amount includible under new excess passive rule	10

The US shareholder has two inclusions under the CFC rules: a Subpart F income inclusion of 5 and an excess passive asset inclusion of 10. The latter inclusion is the lesser of two amounts. The first amount is 10, the amount by which the excess passive assets (15) exceed amounts previously included (or treated as included) under the new rule (5). For this purpose, the current Subpart F inclusion of 5 is treated as an amount previously included under the new rule because these $ 5 of earnings would have been taxed under the excess passive asset rules if the Subpart F income rules did not apply first. The second amount is 20, the excess of the year-end post-1993 accumulated E&P (25) over amounts previously included (or treated as included) under the new rule (5). At the end of the year, 15 is the amount deemed previously included in the US shareholder's income under the new rule, and the accumulated E&P of 25 remains unaffected by the income inclusions.

2. Look-through and CFC chain rules

Under a look-through rule, a foreign parent CFC is treated as owning a pro rata portion of the assets of 25 percent-owned subsidiaries. In addition, excess passive assets are determined on an aggregate basis for each CFC in one or more chains of related CFCs linked by more than 50 percent stock ownership with a top-tier CFC. Thus, a US multinational using a central holding company to own several chains of CFCs must treat the holding company and its CFC subsidiaries as one company for purposes of applying the excess asset test. If the CFC group taken as a whole has excess passive assets, this excess is allocated among the CFCs based on each CFC's proportionate share of the group's earnings. This allocation is significant because it can result in a deemed dividend from a CFC that holds no passive assets. The purpose of the CFC group rule is to prevent avoidance of the new inclusion by having one CFC transfer passive assets to another related CFC that owns little passive assets.

3. Working capital is a passive asset

Working capital is treated as a passive asset. A CFC that requires substantial working capital invested in liquid assets, even temporarily, could trigger inclusions under the new rule. Many companies require working capital in excess of 25 percent of total assets for legitimate non-tax business reasons (e.g. to acquire new inventory, or in the case of a service business that owns few fixed assets). The new rules will affect such companies, and others, even if they hold excess passive assets only temporarily. For example, the rules can apply to a company engaged in an active business that disposes of its assets and holds the proceeds for a short period before investing them in another active business. Similarly, the rules may apply to a company in its first taxable year if it is not able to invest its initial capital quickly enough in active assets.

4. Assets valued at adjusted basis

In determining "excess passive assets", passive assets and total assets are valued by reference to their adjusted basis rather than fair market value. Active business assets (e.g. machinery and equipment) often have a depreciated basis. Passive assets, on the other hand, are generally not depreciable, and will have an adjusted basis close to fair market value. A CFC with substantial depreciated assets can have "excess passive assets" even though the value of its passive assets does not exceed 25 percent of the value of its total assets. Foreign manufacturing subsidiaries with large amounts of substantially depreciated active assets could be affected by the rule.

5. Certain expenditures added to total assets

Since CFCs frequently invest in activities that generate intangible assets that have no tax basis, the Act has special rules to increase the amount of the CFC's total assets for certain research expenditures. These rules can mitigate a CFC's excess passive assets by increasing the CFC's total assets. The amount of a CFC's total assets is increased by (i) qualified research expenditures including cost-sharing payments (but net of reimbursements) that the CFC made during the current year and its two prior tax years, (ii) three times the royalties the CFC paid (other than to related foreign persons) for the licensing of intangibles that are used in the CFC's business operations, and (iii) the unamortized portion of the present value of lease payments made by the CFC under a lease of 12 years or more of tangible personal property used in its business.

© 1993 International Bureau of Fiscal Documentation

6. CFC investments in US property

As under present law, the amount by which a CFC's investment in certain US property has increased from the preceding year is a deemed dividend to its 10 percent-US shareholders (Section 956). The Act revises the formula for calculating the increased amount invested in US property. Most importantly, the increase will now be based on the average amount of US property held at the end of each quarter, rather than the amount held at the end of the year. As a result, it will be more difficult for a CFC to fund US affiliates with short-term loans (which are considered investments in US property) without triggering a deemed dividend. Also, because of the quarterly average, CFCs that affirmatively use Section 956 at the end of the year (e.g. to draw out foreign tax credits carried in deemed dividends) must substantially increase the amount invested in US property to obtain the desired Section 956 inclusion.

The Section 956 rules have been modified so that a US shareholder will no longer have an income inclusion greater than its actual investment in US property, as was possible under prior law when the CFC's earnings fluctuated but the amount invested in US property remained the same.

7. Other changes to the CFC rules

• The "same country" exception, which excludes from Subpart F income dividends and interest received by a CFC from a corporation organized in the same country as the CFC, no longer applies to dividends attributable to profits accumulated while the recipient did not hold (directly or indirectly) the stock of the payor corporation, including any period when the recipient was not in existence.

• As under present law, US taxpayers are allowed to increase their foreign tax credit limitation when a CFC distributes income that was previously taxed directly to the US shareholder. Under the Act, the amount of the increase will be calculated by reference to a single "excess limitation account", rather than by reference to the complicated separate calculations required under present law.

8. Effective date

The new excess passive asset inclusion and the other changes to the CFC rules are effective for taxable years of CFCs beginning after 30 September 1993 and for taxable years of US shareholders in which or with which the CFC's taxable year ends. There is no transitional rule that would allow CFCs a reasonable amount of time to adjust their asset holdings before the passive asset rules take effect.

9. Planning for the excess passive assets regime

The creation of the third level of income inclusions under Subpart F will require additional tax planning by US shareholders and their CFCs. US shareholders of CFCs will probably not be affected by these new rules if they reinvest those earnings in non-passive income-generating activities, even if the earnings are loaned to related foreign entities investing those funds in similar activities. Nonetheless, given the complexity of these rules, US shareholders will have to constantly monitor the composition of their CFCs' assets and income streams. US shareholders may want to consider increasing the rents and royalties that their CFCs now pay (subject to arm's length standards) as a way of increasing total assets and mitigating the amount of the CFC's excess passive assets (see I.A.5 above).

B. *PFIC rules likely to reach more foreign companies*

A US person that owns stock in a foreign corporation that is a "passive foreign investment company" ("PFIC") must either (1) include currently in income its share of the PFIC's total earnings, or (2) defer such inclusion and pay an interest charge on the amount deferred when the income is realized (e.g. through actual or deemed distributions by the PFIC or through gains from selling PFIC stock). A PFIC is any foreign corporation if (1) 75 percent or more of its gross income for the taxable year is passive income, or (2) 50 percent or more of its total assets consist of assets that produce, or are held for the production of, passive income.

1. Adjusted basis must be used by CFCs

Under prior law, assets were generally measured by their fair market value, but corporations could elect to use adjusted basis. Valuation at adjusted basis ordinarily would increase the likelihood of PFIC status because the value of active assets often exceeds their depreciated basis.

The Act requires assets to be measured only by reference to their adjusted basis for purposes of determining the PFIC status of a CFC and the impact on its 10 percent-US shareholders. Foreign corporations that are not CFCs may still elect to measure assets by either fair market value or adjusted basis, as may CFCs with respect to less than 10 percent-US shareholders. The use of adjusted basis to measure assets will likely cause many more CFCs to become subject to the PFIC rules.

On the positive side, for purposes of the asset test, a foreign corporation's total assets are increased for certain research expenditures and rent and royalty expenses, in the same manner that total assets are increased for purposes of the "excess passive assets" inclusion rule described at I.A.5.

2. PFIC relief for securities dealers

The Act provides relief from the PFIC rules for some foreign securities dealers by excluding from the definition of passive income interest, dividends and other income derived in the active conduct of a securities business by certain registered securities brokers or dealers.

C. *Foreign tax credit*

1. Research expense allocation

The Act extends for one additional year the following scheme for allocating research and experimental expenses between US and foreign sources:

– First, research expenses are allocated entirely to income from one country or geographical area if they were

© 1993 International Bureau of Fiscal Documentation

incurred to meet local legal requirements and cannot reasonably be expected to generate income outside that location;

- Second, 50 percent of any remaining research expenses, to the extent attributable to research performed within the United States, is allocated against US source income, and 50 percent of any remaining expenses attributable to research performed outside the United States is allocated to foreign source income; and
- Last, any remaining research expenses are allocated between US and foreign source income on the basis of either the ratio of US and foreign gross receipts from sales of products to which the research relates, or the ratio of the taxpayer's US source gross income and foreign source gross income, except that the amount allocated to foreign sources under the gross income method must be at least 30 percent of the amount that would have been allocated to foreign sources under the gross sales method.

2. Shipping and oil and gas investment income

The Act prevents cross-crediting of foreign taxes on foreign oil and gas and foreign shipping income by placing certain income from investment of working capital in the "passive income" separate limitation category. In addition, any income that qualifies as both passive income and as oil or shipping income will from now on be treated as passive income. The changes will be felt primarily by oil companies and shipping companies with significant passive income.

II. PROVISIONS AFFECTING INBOUND INVESTMENT AND FINANCING US OPERATIONS

A. *Guaranteed debt now subject to "earnings stripping" rules*

"Earnings stripping" refers to the practice of transferring the earnings of a US subsidiary to its foreign parent in the form of tax-deductible interest payments. Many US tax treaties exempt interest payments from US withholding tax. Repatriation of earnings in the form of dividends is not as tax efficient because dividend payments are not deductible by the US subsidiary and tax treaties do not eliminate the US withholding tax on dividends.

Convinced that foreign companies were abusing the tax advantages of capitalizing their US corporate affiliates with debt rather than equity, Congress in 1989 limited the ability to "strip" earnings out of a US corporation through interest payments. The means was a limitation on the deductibility of interest paid to related lenders that are exempt, in whole or in part, from US tax on the interest received. The current "earnings stripping" rule disallows a current deduction for interest paid or accrued to related persons not subject to US tax on the interest received, but only to the extent that the payor's net interest expense exceeds, generally, 50 percent of the payor's operating cash flow, and only if the payor corporation's "debt-equity ratio" is greater than 1.5 to 1 on the last day of its taxable year.

1. New guarantee rules

Before the Act, only loans made by foreign related parties were subject to the earnings stripping rules because Congress concluded that only related parties were able to contract with themselves to arrange an artificially high debt capitalization. The rules have been avoided by some foreign-controlled US corporations by substituting unrelated party debt guaranteed by the foreign parent for a borrowing by the US corporation from its foreign parent. The Act focuses on this financing technique and subjects the guaranteed debt to the earnings stripping rules.

Specifically, any interest paid or accrued in tax years beginning after 31 December 1993 to an unrelated lender on debt for which there is a "disqualified guarantee" will be subject to the earnings stripping rules, unless the lender is subject to US withholding tax on the interest. Four observations:

- Very rarely will the lender be subject to US withholding tax on the interest. The lender will likely be a US bank that is subject to net basis taxation (rather than withholding tax) or a foreign lender entitled to a treaty exemption from withholding tax.
- The rules apply whether or not the unrelated lender is subject to full US net basis tax on the interest received.
- These rules apply whether or not the foreign related party guarantor would be eligible for a treaty exemption from US withholding tax if the interest had been paid directly to it.
- As discussed below, the scope of what constitutes a "guarantee" is extremely broad.

There are two exceptions to the guaranteed debt rules, both of limited practical application. First, debt guaranteed by a foreign related party controlled by the borrower (upstream guarantees) is not subject to the earnings stripping rules. Thus, borrowings from a foreign subsidiary would be subject to the earnings stripping rules, but third party borrowings guaranteed by a foreign subsidiary would not. Second, the rules do not apply if the foreign related party guarantor would be subject to US net basis taxation if it had received the interest directly. This exception appears limited to situations in which the guarantor is a foreign person engaged in a US trade or business to which the interest, had it been received by the guarantor, would have been attributable.

2. Definition of "guarantee"

A "disqualified guarantee" is defined to include any arrangement under which a related party directly or indirectly assures, on a conditional or unconditional basis, the payment of the borrower's obligation. Congress intends that the term be interpreted broadly enough to encompass any form of credit support. This includes a commitment to make a capital contribution to the debtor or otherwise maintain its financial viability. It includes an arrangement reflected in a "comfort letter", regardless of whether the arrangement gives rise to a legally enforceable obligation. If a guarantee is contingent

© 1993 International Bureau of Fiscal Documentation

upon the occurrence of an event, the rules apply as if the event had occurred.

The definition of guarantee is broad enough to include arrangements that, while not legally enforceable as guarantees, may have the economic effect of supporting the borrower's credit. If, for example, a foreign parent deposits with a foreign bank an amount equal to the amount borrowed from that bank by its US subsidiary, the deposit would likely be viewed as a disqualified guarantee. As another example, suppose a US subsidiary borrows from its foreign parent, which in turn borrows from the public. Although the parent-subsidiary borrowing may technically be subject to the current earnings stripping rules, some commentators had hoped that the IRS would treat this arrangement as a public borrowing by the US subsidiary and not subject to the rules. Now, the arrangement might be viewed as a public borrowing by the US subsidiary that is guaranteed by its foreign parent. It should also be noted that the rules will apply to publicly-held notes directly issued by th US subsidiary and guaranteed by the foreign parent.

3. Effective dates

The effective date provisions of the provision are unusual. When Congress enacts legislation affecting the taxation of debt instruments, there is typically an exception (a so-called "grandfather") for debt issued before announcement of the proposal and frequently for debt issued after the announcement but under a commitment entered into before the announcement. Under the Act, however, interest on all debt guaranteed by a foreign related party, whenever issued, will be subject to the provisions in tax years beginning after 1993.

In addition, the Act retroactively makes the original 1989 earnings stripping rules applicable to all related party debt obligations issued before 11 July 1989. Most debt issued before that date had been "grandfathered" under the original 1989 legislation.

4. Reaction and retaliation

By extending the earnings stripping rules to unrelated party debt, the rules have been removed from the original policy notion that related parties could contract with each other to pay interest that is deductible by the borrower and not taxable to the lender. Now, the rules apply even if interest is paid to a fully taxable US bank or to taxable US holders of securities issued by a US corporation and guaranteed by its foreign parent.

The new rules are bound to invite retaliation from foreign governments. The rules appear to violate the non-discrimination clause in most US income tax treaties to the effect that a US enterprise owned by treaty partner shareholders cannot be "subjected in [the United States] to any taxation or any requirement connected therewith that is other or more burdensome than" the taxation and related requirements to which a US-owned US enterprise would be subject. A borrowing by a US subsidiary of a US-owned corporation and guaranteed by the parent would not be subject to these rules. Moreover, although many US trading partners have thin capitalization rules that arguably provided some legitimacy for the original earnings stripping legislation, we are not aware of any analogous foreign rules treating unrelated party debt guaranteed by a related person as the equivalent of related party debt. Notwithstanding these arguments, Treasury officials have taken the position that the guarantee rules do not violate non-discrimination clauses.[2]

5. Planning to mitigate earnings stripping

To avoid the impact of the earnings stripping rules, many US borrowers will need to refinance guaranteed debt. More generally, strategies to avoid these rules include replacing debt with preferred stock and effecting sale- and leasebacks for assets that are now debt-financed. Both of these strategies could improve the borrower's debt-equity ratio and reduce interest expense.

B. *Contingent interest not eligible for "portfolio interest" exemption*

US source interest income earned by a foreign corporation or non-resident alien individual is subject to a 30 percent gross basis withholding tax, unless the income is attributable to a US business conducted by the recipient, or an exemption under US law or a tax treaty applies. An important US law exemption from the withholding tax on interest applies to "portfolio interest" received by foreign persons. Generally, portfolio interest is any US source interest (including original issue discount) that is not attributable to a US business conducted by the recipient and (1) is paid on an obligation that is either in registered form, or is in bearer form but satisfies certain requirements, and (2) is not received by a 10 percent-owner of the issuer of the obligation, taking into account shares owned by attribution. In addition, the exemption is not available for certain bank loans and in certain other circumstances.

Under prior law, foreign investors had a strong incentive to structure US investments that have equity participation rights so that the returns were characterized as interest income that is eligible for the portfolio interest exemption, rather than other forms of income. For example, a foreign owner of a note that pays interest contingent on appreciation in US real property was subject to US income tax if he sold the note, but if he held the note and received payments under its terms, the interest could be exempt portfolio interest. Congress determined that the portfolio interest exemption should not be available in such cases.

1. Contingent interest defined

The Act makes the portfolio interest exemption inapplicable to certain "contingent interest" received by foreign persons.

2. See letter from Roger C. Altman, Deputy Secretary of the Treasury, to James A: Harmon, 8 September 1993, reprinted in *Highlights & Documents* (17 September 1993). Mr Altman states that the provision does not subject similarly situated corporations to dissimilar treatment because a loan guaranteed by a foreign parent can erode the US tax base, while a loan guaranteed by US parent cannot; hence, a US-owned corporation is not "similar" to a foreign-owned corporation. Query whether non-discrimination clauses have any value at all if a US-owned subsidiary is *per se* dissimilar to a foreign-owned subsidiary, thereby justifying dissimilar treatment. Mr. Altman also defends the provision on thin capitalization grounds, the same defense to treaty violation claims asserted when the original legislation was enacted in 1989.

© 1993 International Bureau of Fiscal Documentation

Such interest will be subject to US withholding tax unless a treaty exemption is available. Contingent interest is defined broadly, but numerous exceptions are specified.

Contingent interest includes interest determined by reference to any of the following attributes of the debtor or any person related to the debtor: receipts, sales or other cash flow; income or profits; or changes in the value of property. Thus, for example interest that is computed as a percentage of the borrower's profits would not be entitled to the tax exemption for portfolio interest.

In addition, contingent interest includes interest determined by reference to any dividend, partnership distribution or similar payment made by the debtor or a related person. For example, interest is contingent where its receipt by the foreign investor is contingent upon the payment of a dividend to the shareholders of the corporate borrower.

Only the contingent portion of interest is disqualified from portfolio treatment. If the interest rate on a note is stated in terms of the greater of either of two amounts (e.g. 6 percent of the principal amount or 10 percent of gross rents), only one of which is a contingent amount, it appears that only the excess of the contingent amount, if any, over the minimum fixed amount would be disqualified.

Although the statute is not specific, it seems clear that interest based on formula tied to an index of interest rates (e.g. LIBOR plus one) is not contingent interest for purposes of this provision.

2. Exceptions: interest not considered contingent

An obligation that otherwise qualifies for the portfolio interest exemption will not be disqualified merely because it possesses one or more of the following features:

• *Borrower default*. Interest is not contingent merely because its payment can be impaired by a default on the debt obligation by the borrower.

• *Timing contingencies*. Interest is not considered contingent merely because the timing of the interest or any related principal payment is subject to a contingency. For example, assume that the terms of a debt obligation provide that if the borrower has insufficient cash to make an interest payment, the borrower may defer the payment, but this does not eliminate the borrower's liability for the deferred amount. In this case, the interest is not considered contingent.

Interest on securitization investments, such as certain mortgaged-backed obligations, can also come within this exception. For example, if the maturity of an interest in a REMIC or other collateralized instrument is dependent upon prepayments on the underlying mortgage obligations (or other collateral), the interest received on the investment would not be treated as contingent because of this feature.

• *Non-recourse debt*. Portfolio interest treatment is not denied under the Act solely because the interest is paid on non-recourse or limited recourse indebtedness. For example, this exception would apply where a corporation issues a limited recourse debt instrument that pays fixed interest and is secured by the corporation's trade receivables or operating assets.

• *Interest determined by non-contingent interest*. Interest also is not denied portfolio treatment under the Act if all or substantially all of it is determined by reference to certain other amounts of interest that is not described as contingent above (or by reference to the principal amount of indebtedness on which such other interest is paid). This exception is targeted to securitization structures where debt obligations (e.g. mortgages) serve as the collateral for the instrument owned by the investor, or where the interest received by the investor is otherwise dependent upon cash flow from the underlying obligations. If the interest on the underlying obligations is not considered contingent under the rules of this provision, then the interest received by the investor is not contingent.

• *Interest linked to actively traded property*. Interest is not contingent, and is eligible for portfolio interest treatment, if it is determined by reference to changes in the value of (or any index of the value of) any "actively traded property". Based upon proposed regulations, actively traded property generally would include any personal property, including stock (other than stock in a US real property holding corporation) for which there is an established financial market (e.g. a national or foreign securities exchange, a domestic commodities board of trade).

Portfolio treatment also is not denied if the interest is determined by reference to the yield (or any index of the yield) on such actively traded property. However, this exception does not apply if the property is a debt instrument that itself pays contingent interest, or the actively traded property is stock or other property that represents a beneficial interest in the borrower or a related person.

• *Hedging transactions*. Interest is not denied portfolio treatment solely because the borrower or a related person enters into a hedging transaction to reduce the risk of interest rate or currency fluctuations with respect to the debt. For example, portfolio treatment is not denied in the case of a debt instrument that pays interest in an amount determined by reference to the value of a commodities index merely because the debtor hedges its interest rate risk on the debt by acquiring an offsetting position in commodities which produces a cash flow that correlates with the interest payments. As another example, portfolio treatment is not denied in the case of a debt instrument that pays interest in an amount determined by reference to the value of a stock market index merely because an affiliate of the debtor holds stock which is publicly traded on that market.

The IRS is given authority to describe additional categories of contingent interest and to exempt additional types of interest from denial of portfolio treatment. In addition, Congress expects the IRS to challenge inappropriate taxpayer use of the exceptions specified above.

3. Relationship to tax treaties

Interest that is classified as contingent interest and ineligible for the "portfolio interest" exemption may still qualify for an

© 1993 International Bureau of Fiscal Documentation

exemption from US withholding tax under a tax treaty. The new rule does not override existing treaties that reduce or eliminate US withholding tax on interest.

4. Effective date

The provision applies to interest received after 31 December 1993. It does not apply, however, to any interest paid or accrued on indebtedness with a fixed term that was issued on or before 7 April 1993, or was issued after such date pursuant to a written binding contract in effect on such date and at all times thereafter before the indebtedness was issued.

C. *Conduit financing arrangements*

The Act authorizes the IRS to issue regulations recharacterizing any multiple-party financing as a transaction directly between two (or more) of the parties where necessary to prevent tax avoidance.

This provision is designed to give the IRS broader powers to attack transactions using "conduit" entities. Where three parties have engaged in a chain of transactions, the IRS and the courts have at times ignored the "middle" party as a mere "conduit" and imposed tax as if a single transaction had been carried out between the parties at the ends of the chain.

A classic example of a conduit arrangement is a back-to-back loan. For example, foreign party A wishes to make a loan to US borrower C, but the interest payments made by C to A would be subject to US withholding tax. Instead of a direct loan to C, A makes a loan to foreign party B, which is eligible for a treaty exemption from US withholding tax. B, in turn, makes a closely matching loan to C. This type of transaction has been recharacterized as a direct loan by A to C. The IRS reached a similar result in cases where the back-to-back related party debt obligations are not closely matched so long as the intermediary entity does not obtain "complete dominion and control" over the interest payments. The IRS has taken a similar position where an unrelated financial intermediary is interposed between the two related parties as lender to one and borrower from the other, and the intermediary would not have made or maintained the loan on the same terms without the corresponding borrowing. In a recent ruling, the IRS held that interest payments by a US company to a related, treaty-protected financial intermediary may be treated as payments by the US company directly to the foreign parent of the financial intermediary even though the matching payments from the intermediary to the parent are not interest payments, but rather are dividends.

The IRS' own positions on conduit arrangement are ambiguous and inconsistent. A coherent set of principles is difficult to discern. A single uniform set of rules addressing these issues would assist taxpayers and the IRS. However, the regulatory authority granted to the IRS in the Act specifies that the IRS will not be bound, in developing regulations, by the standards on which the IRS' prior guidance has been based. This broad power may make this area of the law even less predictable than it already is. Hopefully, whatever rules the IRS develops will apply prospectively only.

III. TRANSFER PRICING

A. *Transfer pricing penalty provisions expanded*

The Act's transfer pricing provisions focus on penalties for violating arm's length pricing rules and on documentation requirements, rather than on substantive arm's length pricing formulas.[3]

To encourage taxpayers to adhere to arm's length transfer pricing, present law imposes penalties for tax deficiencies attributable to transfer pricing adjustments. A 20 percent penalty applies to underpaid tax attributable to transfer pricing adjustments that increase tax liability by more than $ 10 million. A 40 percent penalty applies where the Section 482 adjustment increases tax by more than $ 20 million. The penalty may also apply if other tests are met, but in no case is the penalty imposed if the taxpayer establishes reasonable cause for the underpayment.[4] Under proposed regulations, reasonable cause could be established if the taxpayer makes a reasonable effort to accurately determine a transfer price, and the taxpayer reasonably believes that its transfer pricing methodology produces an arm's length result. The Act lowers the penalty thresholds and makes it more difficult to establish reasonable cause.

1. Lower threshold for imposing penalty

Under the Act, the 20 percent penalty will apply where increased tax liability attributable to Section 482 adjustments exceeds the lesser of $ 5 million or 10 percent of the taxpayer's total gross receipts for the year. The 40 percent penalty will apply where the increased tax liability exceeds the lesser of $ 20 million or 20 percent of gross receipts. The new threshold based on gross receipts has no minimum dollar floor. As a result, small taxpayers who formerly were protected by the $ 10 million threshold (now $ 5 million) may become subject to the penalties under the new gross receipts test.

2. Contemporaneous documentation required to establish reasonable cause

Under the Act, the reasonable cause exception to the penalties is broken down into two rules: one applies when a specific transfer pricing method set forth in IRS regulations is used; the other applies when an "other" method is used.

The reasonable cause exception to the penalty will apply if: (1) it is established that the taxpayer determined its price in accordance with a specific pricing method in IRS regulations and the taxpayer's use of that method was reasonable; (2) the taxpayer has documentation (in existence at the time the return was filed) that sets forth the determination of the price in accordance with that method and establishes that the use of

3. Transfer pricing methodologies are addressed in temporary regulations issued in January 1993. See Ruchelman, "Transfer Pricing Regulations Issued in the United States," 47 *Bulletin for International Fiscal Documentation* (April 1993), at 187. The Act does not contain the formulary transfer pricing proposal which would have required foreign corporations to report as taxable income an amount equal to at least 75% of gross receipts. See Foreign Income Tax Rationalization and Simplification Bill of 1992, introduced on 27 May 1992.

4. The penalties do not apply to adjustments in transactions between foreign corporations (including CFCs) unless one of the corporation's own US source income or effectively connected income is adjusted.

© 1993 International Bureau of Fiscal Documentation

that method was reasonable; and (3) the taxpayer provides such documentation to the IRS within 30 days of a request.

The exception also would apply when the price was *not* determined in accordance with a specific pricing method if:

(1) the taxpayer establishes that none of the specified methods was likely to result in a price that would clearly reflect income, that the taxpayer used another pricing method to determine such price and that other pricing method was likely to result in a price that would clearly reflect income;
(2) the taxpayer has documentation (in existence at the time the return was filed) that sets forth the determination of the price in accordance with the other pricing method and that establishes that the requirements of (1) above were satisfied; and
(3) the taxpayer provides such documentation to the IRS within 30 days of a request.

In the case of a transaction to which none of the regulations' pricing methods would ordinarily apply, then the reasonable cause exception is available if the taxpayer merely establishes that the transaction is of a type for which no methods are specified in the regulations. If, however, the transaction is one to which a specified method could apply and the taxpayer uses an "other" method, then, as described above, the taxpayer will need contemporaneous documentation to prove that every method specified in the regulations produces a less satisfactory transfer price: an extremely burdensome requirement.

A taxpayer will not be treated as having reasonable cause for any portion of an underpayment attributable to a Section 482 transfer price adjustment unless the taxpayer satisfies these requirements. Thus, the penalty is automatic and there is no defense unless the taxpayer has contemporaneous documentation as described above. This is quite a change from prior law, where reasonable cause was a fairly low good faith/reasonable belief standard, which could be met by reliance on counsel or a return preparer to whom there had been full disclosure of the relevant facts. However, Treasury Department officials have stated that the IRS must use discretion in applying the penalties, and noted that the IRS "has not historically been aggressive in imposing penalties".[5] Although it appears that no taxpayer has yet paid the existing 20 percent and 40 percent penalties, very few tax years subject to the penalties have been audited.

IV. POSSESSIONS CORPORATIONS

A. *New limitations on Section 936 benefits*

Section 936 was enacted to foster economic development in US possessions, and Puerto Rico in particular. Section 936 essentially eliminates all US tax on a US corporation's income from operations in a possession. Two categories of income are exempt from US tax: active business income derived from the conduct of business in a US possession, and income from investment of active business income, which must be derived from certain investments in a US possession or in designated Caribbean Basin countries.

To qualify for Section 936 benefits, a corporation must (1) derive at least 75 percent of its gross income from active business operations in a US possession over a three-year period and (2) derive at least 80 percent of its gross income from sources within a possession during that same three-year period.

Puerto Rico tax laws encourage capital investment by providing corporate tax exemptions and relief from Puerto Rico withholding tax on dividends paid by US subsidiaries operating in Puerto Rico to their US parents. The combination of US and Puerto Rico tax exemptions has encouraged many major US multinationals to establish manufacturing and other operations in Puerto Rico through US subsidiaries ("possessions corporations").

Certain industries, the pharmaceutical industry in particular, have taken advantage of Section 936 by shifting income attributable to intangible assets (e.g. patents and secret formulas) to possessions corporations operating in Puerto Rico. Congress is concerned that in many instances, these operations generate substantial tax-free income but create few jobs in Puerto Rico and do not involve large amounts of local capital investment.

1. Two alternative limitations

Under the Act, Section 936 benefits for a possession corporation's active business income are determined as under prior law, but are subject to either of two alternative limitations. Section 936 benefits for investment income are not changed by the Act.

One alternative limitation for active business income, the "economic activity limitation" (described below), is based on factors that reflect economic activity in US possessions. The other alternative is a prescribed percentage of the benefits that would be allowed if calculated under present law. The percentage is 60 percent for 1994 and is phased down to 40 percent for 1998 and later years. The taxpayer has the option of choosing either limitation, but once the percentage limitation is chosen, it generally must be used for all later years.

2. Economic activity limitation

Under the economic activity limitation, the tax exemption for business income cannot exceed the sum of:

(1) 60 percent of certain wages paid to employees for services performed in a possession and certain allocable fringe benefit expenses,
(2) a designated percentage of depreciation deductions claimed for regular tax purposes with respect to qualified tangible property located in a possession and used by the possessions corporation in its active business (15 percent of depreciation deductions for short-life, 40 percent of deductions for medium-life and 65 percent of deductions for long-life qualified tangible property), and
(3) a portion of the income taxes the possessions corporation pays to the possession not in excess of an effective 9 percent rate, but only if the corporation does not use the "profit split" method for allocating income from intangible property between possession source and non-possession source income.

UNITED STATES:

ENTITY CLASSIFICATION GUIDELINES FOR GERMAN GMBHS

J.G. Rienstra
Research Staff IBFD

I. INTRODUCTION

The Internal Revenue Service ("IRS") has issued revised entity classification guidelines for German GmbHs in cases where the GmbH is wholly owned by members of a controlled group of corporations. The IRS had formerly ruled that such entities would in all events be classified as corporations.[1] The position of the IRS had been increasingly criticized, and in Revenue Ruling 93-4,[2] the IRS has modified it in key respects. Under the ruling, a commonly controlled GmbH may be classified as either a partnership or a corporation depending on the applicable provisions of its memorandum of association. The new ruling will apply to GmbHs organized on or after 18 February 1993.[3]

Unincorporated business entities are classified for US federal income tax purposes using the *Kintner* regulations issued in 1960.[4] These regulations classify an unincorporated entity as either a corporation or a partnership on the basis of six characteristics. The distinction between partnerships and corporations is vital in planning for joint ventures and foreign branches since partnerships permit *de facto* tax consolidation, i.e. flow-through of operating results and tax attributes, in situations where corporate consolidation would not be possible. In addition, the use of an entity with corporate-type limited liability is often a *sine qua non* for non-tax business reasons. Foreign entities, such as German GmbHs, that can combine these features from a US point of view are thus a matter of great interest.

A. Continuity of life factor
B. Free transferability factor
C. Centralized management factor

II. THE *KINTNER* REGULATIONS

The six characteristics used in the *Kintner* regulations to distinguish partnerships and corporations are: (1) the presence of associates, (2) an objective to carry on business and divide the gains therefrom, (3) continuity of life, (4) centralization of management, (5) limited liability, and (6) free transferability of interests.[5] The *Kintner* regulations classify an entity as an "association" (and hence as a corporation)[6] for US tax purposes if it has a preponderance of these characteristics. Because associates and the objective to carry on business are common to both corporations and partnerships, the regulations provide that they are to be treated neutrally. Classification is thus determined on the basis of the four remaining characteristics, and an entity is classified as a corporation if it has a preponderance of these, i.e. more than two. An entity is classified as a partnership if it has two or fewer.[7]

III. CLASSIFICATION OF FOREIGN ENTITIES

In the case of unincorporated entities created under foreign law, the IRS determines tax classification in the same manner as in the case of US domestic entities. However, in determining whether the *Kintner* characteristics are present or absent, the local law of the jurisdiction where the entity is organized is applied and, to the extent necessary, the organizational agreement of the foreign entity is construed in accordance with that law.[8] If local law and the organizational agreement indicate that a preponderance of the non-neutral *Kintner* characteristics are present, the entity and its members will be subject to US tax rules as if the entity were a foreign corporation.

Due to the wide variety of foreign entities and the variations in the laws under which they are organized, the IRS takes the position that all foreign entities, even

1. Revenue Ruling 77-214, 1977-1 C.B. 408.
2. 1993-3 I.R.B. 5 (19 January 1993).
3. GmbHs organized prior to 18 February can continue to use their current classification if they had reasonably relied on the IRS's former position and they or their members file their first tax returns after 18 February consistent with that classification.
4. Treas. Reg. § 301.7701-2 and -3. The regulations take their name from the taxpayer in *United States v. Kintner*, 216 F.2d 418 (9th Cir. 1954).
5. These six factors were identified as indicative of corporate status by the US Supreme Court in *Morrissey v. Commissioner*, 296 U.S. 344 (1935).
6. The technical classification as an association does not make a practical difference under the Internal Revenue Code since associations are within the category of entities that are treated and taxed as corporations. See IRC Sec. 7701(a)(3).
7. Each of the remaining four characteristics is accorded equal weight. *Larson v. Commissioner*, 66 T.C. 159 (1976), *acq.* 1979-1 C.B. 1.
8. Rev. Rul. 73-254, 1973-1 C.B. 613. In addition, Treas. Reg. § 301.7701-1(c) provides in part as follows:

> "Although it is the Internal Revenue Code rather than local law which establishes the tests or standards which will be applied in determining the classification in which the organization belongs, local law governs in determining whether the legal relationships which have been established in the formation of an organization are such that the standards are met. Thus, it is local law which must be applied in determining such matters as the legal relationships of the members of the organization among themselves and with the public at large, and the interests of the members of the organization in its assets."

Rev. Rul. 73-254 applied the same analysis to foreign entities.

© 1993 International Bureau of Fiscal Documentation

those nominally incorporated, must be tested under the *Kintner* regulations. This is the case regardless of the label attached to the entity by the foreign jurisdiction involved.[9] The use of the *Kintner* regulations to evaluate an entity on the basis of identifiable and substantive aspects, rather than formalistic ones, is intended to ensure consistency and predictability in the US classification of foreign entities. A difficulty exists, however, for foreign limited liability companies, and that is that the IRS will not generally issue private letter rulings on their classification if they are commonly controlled by a single corporate group.[10]

IV. REVENUE RULING 77-214

The IRS first addressed the tax classification of a German GmbH in Rev. Rul. 77-214.[11] The IRS held in that ruling that a GmbH can assume characteristics of both corporations and partnerships. With respect to the two neutral *Kintner* factors of associates and an objective to carry on business, the IRS held that these were automatically present by virtue of the governing German law (the "GmbH-Gesetz"), and that two of the non-neutral *Kintner* factors, namely centralization of management and limited liability, were also automatically present. Limited liability is present in the case of a GmbH because the GmbH-Gesetz limits the rights of third-party creditors to the assets of the GmbH.[12] For the remaining non-neutral factors, i.e. continuity of life and free transferability of interests, the IRS held that flexibility allowed by the GmbH-Gesetz in drafting the memorandum of association permitted these factors to be either present or absent. Under this analysis, the IRS concluded that a GmbH could in theory be classified either as a partnership (if both remaining factors are absent) or as a corporation (if either remaining factor is present). The IRS has subsequently issued private letter rulings classifying GmbHs both as partnerships and as corporations, depending on the circumstances, and one US court has classified a GmbH as a corporation.[13]

The controversial aspect of Rev. Rul. 77-214 was its analysis of the continuity of life and free transferability factors in the context that the members of the GmbH – two US subsidiaries – were commonly controlled by a single US parent. In the IRS's view, the common control element changed the analysis that would apply if the members had each been able to act in accordance with its own economic interest. This became known as the lack of separate interests analysis. There were, however, doubts about the legal underpinning of the analysis, and special difficulties arose because the same situation had been present in a ruling issued two years earlier, and implicitly present in a ruling issued later, both involving US domestic partnerships, and the IRS did not express any reservations on the common control element.

The earlier ruling, Rev. Rul. 75-19,[14] dealt with a domestic partnership that was organized by four subsidiary corporations using a state statute that corresponded to the Uniform Partnership Act ("UPA").[15] Without significant discussion, other than noting that the subsidiary corporations had been created for independent business reasons and that the transaction was not entered into for tax avoidance purposes, the IRS concluded that the status of the entity as a partnership would be respected for US federal income tax purposes. The reason for this result was that the provisions of the UPA preclude a partnership from having a preponderance of the *Kintner* characteristics. Specifically, the UPA precludes the characteristics of continuity of life, centralized management and limited liability. Lacking three of the corporate factors, a partnership subject to a UPA-type statute in the United States cannot have a preponderance of corporate characteristics regardless of how the remaining factors are analysed. The second and later ruling, Rev. Rul. 83-156,[16] involved a US partnership formed by first- and second-tier subsidiaries of the same parent. The IRS did not directly address the classification issue, but implicitly recognized the status of the partnership in analysing the underlying transaction.

The situation in Rev. Rul. 77-214 involving the German GmbH was virtually identical to Rev. Rul. 75-19 except that the law governing the entity was the GmbH-Gesetz rather than a state UPA statute. As discussed above, the IRS determined that both neutral *Kintner* factors and two of the non-neutral factors were automatically present under the GmbH-Gesetz. For the remaining two factors, the IRS applied the lack of separate interests analysis and found them present as well. This holding was made notwithstanding that the memorandum of association for the GmbH contained provisions which, in a UPA context, would have been sufficient to avoid these characteristics. For the continuity of life factor, the IRS held that the provisions in the memorandum would not be given substantive effect because there were no "separate interests" that could enforce the provisions in the memorandum. For the free transferability of interests factor, the IRS held that limitation on transfers contained in the memorandum, which applied to the subsidiaries, could be overcome by the parent as it saw fit.

V. LACK OF SEPARATE INTERESTS ANALYSIS

The rationale underlying the IRS's lack of separate interests analysis was that the parent and subsidiary companies

9. Rev. Rul. 88-8, 1988-1 C.B. 403 (entity organized under UK Companies Act of 1985 classified as a partnership for US federal income tax purposes where the Act and Memorandum of Association prevented a preponderance of the *Kintner* factors).
10. Rev. Proc. 93-3, 1993-1 I.R.B. 71, 77 (Sec. 3.01(47)) (4 January 1993) (20% independent ownership required).
11. Literally translated, Gesellschaft mit beschränkter Haftung is "company with limited liability".
12. GmbH-Gesetz Sec. 13(2). Limited liability under the *Kintner* regulations is the concept that the members or shareholders of the entity are not personally liable for third-party claims against the entity beyond the amount of their required contributions. In other words, if the creditors do not have a right to seek personal satisfaction against the members if the assets of the entity are insufficient to meet the creditors' claims, then the entity has limited liability. Treas. Reg. § 301.7701-2(d). The GmbH-Gesetz clearly causes this requirement to be met.
13. See, e.g. PLR 9001018 (6 October 1989) (GmbH classified as a partnership); PLR 8012063 (27 December 1979) (GmbH classified as a corporation); *Barnette v. Commissioner*, 63 TCM 3201 (1992) (GmbH classified as a corporation).
14. 1975-1 C.B. 382.
15. Partnerships are formed in the United States under the laws of the individual states. The state laws generally conform to the Uniform Partnership Act, with minor variations.
16. 1983-2 C.B. 66.

© 1993 International Bureau of Fiscal Documentation

formed a single economic grouping with respect to matters involving the GmbH. The IRS did not ignore the separate corporate existence of the subsidiaries as such, but its holding had the same practical effect as far as the *Kintner* factors were concerned since the IRS maintained that the subsidiaries would not be able to act independently from the parent. In the case of the free transferability factor, the analysis also appeared to take on aspects of agency, the IRS stating that the parent company could make the transfer decisions on behalf of the subsidiaries. Where this authority derived from, apart from the stock ownership, was not made clear.

There are a number of difficulties with the separate interests analysis in the context of Rev. Rul. 77-214. First, separate corporate entities, and more to the point in the context – the assets they hold, cannot generally be disregarded by the IRS absent a showing of tax avoidance, lack of business purpose, sham transaction or a like tax device. The cases in this area are legion, with perhaps as many findings one way as the other. Nevertheless, as a general matter, the IRS is required to have justification beyond the mere fact of stock ownership in order to recharacterize a transaction or rearrange the way that corporate groups choose to hold their assets.[17] The IRS implicitly recognized this in Rev. Rul. 75-19 when it gave credence to the four subsidiaries in that ruling. In addition, the IRS acknowledged that the subsidiaries controlling the GmbH in Rev. Rul. 77-214 had in fact been organized for valid business reasons, and these reasons were broader than merely holding the interests in the GmbH. This should have made the case for disregarding the subsidiaries' ownership a difficult one under the established precedents.[18] The IRS has been careful to argue, however, that it is not disregarding the existence of the subsidiaries as such, but only their ability to make independent decisions about the interests in question.[19]

Secondly, it is arguable that there are in fact separate interests present in the case of commonly controlled partnerships. The officers and directors of the subsidiaries have responsibilities to the partnership, and responsibilities to their own creditors and business relations as well, that are separate from those of the parent company. It is possible, for example, that one of the subsidiaries in Rev. Rul. 77-214 may have found itself in conflict with its co-partner or its parent company with respect to outside creditors, and would have been required to act independently.[20]

Thirdly, the IRS has thus far applied the lack of separate interests analysis in the international context but not in the domestic context. This raises questions under the non-discrimination clauses of US tax treaties. Under the US–German treaty, for example, discrimination would occur if the application of a different standard resulted in additional taxes or compliance burdens being placed on the GmbH.[21] As an illustration, if the GmbH in Rev. Rul. 77-214 had a US branch operation, it would be subject to the US branch profits tax if it were classified as a foreign corporation, but not if it were classified as a foreign partnership.[22] The government asserted in a litigated case involving the separate interests analysis that the *Kintner* regulations had been drafted in reference to domestic entities and should be applied differently to foreign entities. The court rejected this argument, but noted that the IRS could draft regulations specifically targeted at foreign entities if it chose to do so.[23]

VI. REVENUE RULING 93-4

The IRS re-examined the application of the separate interests analysis in Rev. Rul. 93-4. It holds in this ruling that the analysis will no longer be applied to the continuity of life factor, but it reaffirmed the earlier conclusion on the application of the analysis to the free transferability factor. The IRS recognized, however, that free transferability can be avoided if appropriate provisions are included in the memorandum of association, and so its holding has made it possible for free transferability to be avoided notwithstanding the common control element. The IRS also states in Rev. Rul. 93-4 that it will apply the same standards to the classification of foreign entities as for unincorporated domestic entities, thus clearing up the double standard argument discussed above.

A. *Continuity of life factor*

Continuity of life is the concept that an entity is not dissolved by reason of a disability or incapacity that arises in its individual members or shareholders, for example, death, resignation, bankruptcy or retirement.[24] Dissolution in this sense refers to an alteration in the relationship between the members of the organization as determined by local law. In a general partnership formed under a UPA-type statute, there is a

17. See e.g. *Moline Properties v. Commissioner*, 319 U.S. 436 (1943) (corporation organized for valid business purpose cannot be disregarded).
18. The courts have generally refused to disregard a subsidiary formed to hold a partnership interest where the subsidiary was not merely a shell company. See *Evans v. Commissioner*, 447 F.2d 547 (7th Cir. 1971); *Divine v. United States*, 62-2 USTC ¶ 9632 (W.D. Tenn. 1962). Cf. *Noonan v. Commissioner*, 52 T.C. 907 (1969), *aff'd* 451 F.2d 992 (9th Cir. 1971) (subsidiaries holding interests in partnership disregarded where formed for no purpose other than tax avoidance).
19. The distinction would seem to be a fine one. Presumably the IRS would still tax the subsidiaries on any gain from a sale of the interests.
20. The *McKee* treatise on partnership taxation notes that upon bankruptcy of one of the members of the controlled group, outside creditors could force a termination or liquidation of the entity regardless of the wishes of the parent company. *See* McKee, Nelson & Whitmire, *Federal Taxation of Partnerships and Partners*, at ¶ 3.06[5][b] (2nd ed. 1990). Other commentators have offered additional reasons why commonly controlled entities may indeed have separate interests. See Spudis and Wilczynski, "Entity Classification When a Purported Partnership is Ultimately Owned by One Corporation", 69 *Taxes* (1991), at 659, 661-662.
21. US–Germany tax treaty, Art. 24. The GmbH would be a protected entity by the treaty since the term "nationals" is defined to include all legal persons, partnerships and associations that derive their status from the laws of the contracting states. See Art. 3(1)(h)(bb).
22. IRC Sec. 884.
23. *MCA Inc. and Universal City Studios Inc. v. United States*, 685 F.2d 1099 (9th Cir. 1982), *rev'g* 502 F. Supp. 838 (C.D. Cal. 1980). The *MCA* case involved entities that were jointly owned 95% by a Netherlands corporation (CIC) and 5% by an employee trust formed under Netherlands law (a Stichting). Since there was not a complete identity of ownership between CIC and the Stichting, the IRS's separate interests analysis was not tested by the court. At issue in the *MCA* case was whether the foreign entities would flow through certain rents and royalties to CIC as subpart F income. Under the law in effect at the time of the case, this would only occur if the foreign entities were classified as corporations for US tax purposes.
24. Treas. Reg. § 301.7701-2(b). Only one of the listed events is required to cause dissolution in order to prevent continuity of life. See McKee, *supra* note 20, at ¶ 3.06[4][a].

© 1993 International Bureau of Fiscal Documentation

mutual agency relationship between each partner and each of his or her co-partners.[25] The removal or disability of any one of the partners alters the mutual agency that exists among all of them, and this occurs automatically by virtue of the UPA itself. If the remaining partners agree to continue together after such an event, they do so in a "new" partnership that is a distinct entity from the old partnership. Dissolution is distinguishable from liquidation and winding-up of the organization's affairs, which is not required.[26] The *Kintner* regulations provide that there may be a dissolution and thus an absence of continuity of life even though the business is continued by the remaining members.[27]

The relationship among the partners of a partnership formed under a UPA-type statute is of course fundamentally different from the relationship among shareholders in a GmbH. There are, for example, no provisions in the GmbH-Gesetz that create or define a mutual agency relationship between GmbH shareholders. Nevertheless, the GmbH-Gesetz does provide for the dissolution of a GmbH under given circumstances. These are set out in Section 60(1), and include completion of a defined term, shareholder resolution, court decree and bankruptcy of the GmbH.[28] None of these events, however, refers to or includes disabilities that arise among the shareholders in their individual capacities, and none apart from completion of a defined term is automatic or self-executing.[29] There is thus no meaningful similarity between Section 60(1) and the provisions in the UPA which provide that the death, expulsion or bankruptcy of any partner automatically causes dissolution of a partnership,[30] and it is therefore clear that Section 60(1) is not sufficient to give a GmbH limited life under the *Kintner* regulations. However, Section 60(2) of the GmbH-Gesetz provides that the memorandum of association may set forth dissolution events in addition to those listed in Section 60(1), and the language in this respect is unrestricted.

The IRS recognized in Rev. Rul. 77-214 that the GmbH-Gesetz, presumably Section 60(2), allows flexibility in drafting the memorandum of association, and that if the dissolution events listed in the *Kintner* regulations were included in the memorandum, a GmbH would lack the characteristic of continuity of life. However, in the commonly controlled context, the IRS held that the provision would have no substantive effect because there was no separate interest that could compel a dissolution if one of the listed events occurred. The IRS was of the view that the controlling entity could continue the GmbH indefinitely by ignoring the dissolution events. It is this position that the IRS retreated from in Rev. Rul. 93-4, holding that the presence or absence of separate interests will no longer be considered relevant to determining whether an entity has continuity of life. Thus, if the memorandum of association for the GmbH provides that the bankruptcy, resignation or expulsion of any shareholder will automatically cause dissolution of the GmbH, without further action being required, then the GmbH will be considered to lack continuity of life notwithstanding that the shareholders of the GmbH are under common control.[31]

B. *Free transferability factor*

Free transferability of interests is the concept that shareholders in a corporate entity may normally transfer their shares on an unrestricted basis. Specifically, the *Kintner* regulations provide that free transferability of interests exists in the corporate sense if all the members of the entity, or those owing substantially all the interests, can assign their rights and substitute new members for themselves without the consent of the other members. The regulations also provide, however, that free transferability does not exist if, under local law, the transfer of an interest causes a dissolution of the entity.[32] The key to the presence of free transferability is thus the right of substitution of membership in the organization, and the key to the absence of free transferability is the technical dissolution of the entity if a transfer occurs. A dissolution clearly takes place in the case of transfers subject to the UPA since, as discussed above, the transfer of an interest in the partnership will cause an alteration in the mutual agency among the existing partners.[33]

---

25. For example, each partner is the agent of the partnership (UPA Sec. 9), each partner binds the partnership by his admissions and representations (UPA Sec. 11), each partner binds the partnership by any notice he receives (UPA Sec. 12), each partner binds the partnership by any wrongful acts (UPA Sec. 13), and each partner is jointly and severally liable for the debts of the partnership (UPA Sec. 15).
26. Sec. 29 of the UPA defines dissolution as follows:
The dissolution of a partnership is the change in the relation of the partners caused by any partner ceasing to be associated in the carrying on as distinguished from the winding up of the business.
27. Treas. Reg. § 301.7701-2(b)(2).
28. Sec. 60 of the GmbH-Gesetz provides as follows:
Reasons for Dissolution
(1) The Company with limited liability is dissolved:
1. With the expiration of the period of time determined in the articles of association;
2. by a resolution of the shareholders; unless otherwise determined in the articles of association, this requires a majority of three fourths of the votes cast;
3. by a court decision or by a decree of the administrative court or of the administrative agency in the case of §§ 61 [Dissolution by Court Decision] and 62 [Dissolution by Administrative Action];
4. by the institutions of bankruptcy proceedings; if the proceedings are terminated after conclusion of a compulsory settlement or are terminated upon motion of the debtor in bankruptcy, then the shareholders may decide to continue the company;
5. with the final order of the court of register by which a defect of the articles of association has been determined pursuant to § 144 a of the Law regarding Matters of non-contentious Jurisdiction.
(2) The articles of association may determine other reasons for dissolution.
This translation and the others herein are from Mueller, *GmbH – German Law Concerning the Companies With Limited Liability*, Fritz Knapp Verlag, Frankfurt am Main (3rd ed. 1977) (hereinafter "Mueller"). An additional text that includes an English translation of the GmbH-Gesetz and a discussion of its provisions is Oliver, *The Private Company in Germany* (MacDonald & Evans Ltd: Plymouth, England, 1976) (hereinafter "Oliver").
29. The *Kintner* regulations provide that the fact that dissolution occurs at the completion of a defined term does not mean that the entity lacks continuity of life. Treas. Reg. § 301.7701-2(b)(3).
30. UPA Sec. 31.
31. The IRS has ruled privately that a commonly controlled société en nom collectif ("SNC") lacked continuity of life where the applicable law provided that the bankruptcy of any member would automatically cause dissolution of the SNC. PLR 9122074 (6 March 1991). The IRS did not apply the lack of separate interest analysis in this ruling.
32. Treas. Reg. § 301.7701-2(e).
33. As noted in the text, the transfer of an interest within the meaning of the *Kintner* regulations involves the substitution of the new member in the entity in the place of the old member. This is distinguishable from a mere assignment of a member's interest in the profits and assets of the entity. The UPA provides that a partner may assign his or her interest in the partnership, but that the assignee does not thereby become entitled to participate in the management or affairs of the partnership. An assignment without substitution does not cause a dissolution of the partnership. UPA Sec. 27.

© 1993 International Bureau of Fiscal Documentation

With respect to the transfer of shares in a GmbH, the GmbH-Gesetz generally provides for free transferability, subject to the observance of certain formalities, but also allows for transfers to be restricted by the memorandum of association.[34] This was the case in Rev. Rul. 77-214, where the memorandum provided that a shareholder could not transfer its interest in the GmbH without the written approval of the other shareholders. This is the same approach taken in partnerships in the United States to prevent free transferability factor from being present and, on the surface, would satisfy the *Kintner* regulations. However, because of the common control element, the IRS held in Rev. Rul. 77-214 that free transferability existed because the parent could make all transfer decisions on behalf of the subsidiaries. For this reason, the IRS concluded that there was no meaningful restraint on the transfer of the interests even though the memorandum of association contained a consent requirement. The IRS reaffirmed this conclusion in Rev. Rul. 93-4, stating that there must be the possibility of an impediment to a transfer in order for free transferability to be absent.

The IRS went on to acknowledge, however, that the flexibility permitted by the GmbH-Gesetz allows provisions to be placed in the memorandum of association that either prohibit transfers of interests altogether or provide that the GmbH will be dissolved if a transfer takes place. If transfers are prohibited altogether, free transferability cannot exist in a corporate sense under the *Kintner* regulations. Alternatively, if transfers are permitted, but cause an automatic dissolution of the GmbH, then there is no right of substitution for the transferee shareholder since the continuing GmbH is a "new" entity, and this again prevents free transferability under the *Kintner* regulations.[35] The IRS thus concluded in Rev. Rul. 93-4 that if the memorandum of association contains either of these provisions, the GmbH will be considered to lack free transferability of interests notwithstanding the common control element.

C. *Centralized management factor*

The IRS took the position both in Rev. Rul. 77-214 and Rev. Rul. 93-4 that centralized management is automatically present in the case of a GmbH. The IRS did not offer an analysis on this factor beyond stating its conclusion. While partnership status can be assured under Rev. Rul. 93-4 by including the appropriate provisions in the memorandum of association, tax planners who desire greater flexibility on the continuity of life factor or, more likely, on the free transferability factor, will have to turn their attention to centralized management.

The concept of centralized management is that authority for managing the affairs of an entity is vested in persons who can make decisions without obtaining the prior approval of the members or shareholders. The analogy is to the board of directors in a corporate setting. The test for centralized management under the *Kintner* regulations is whether "any person (or any group of persons which does not include all the members) has continuing *exclusive* authority to make the management decisions necessary to conduct the business for which the organization was formed" (emphasis added).[36] "Exclusive authority" is defined by the regulations to mean "sole authority".[37] The regulations further provide that centralized management does not exist if the managers merely perform ministerial acts as agents for the members.[38]

In the case of a limited partnership formed in the United States, centralized management is not deemed to exist if the general partner (who is himself a member of the partnership) owns a substantial interest in the entity. The theory in this case is that the general partner is viewed as acting on his own behalf and not simply in a representative capacity for the other members.[39]

The GmbH-Gesetz contains a number of provisions that have a bearing on the centralized management factor. Foremost is Section 52, which provides for a supervisory board to be appointed to oversee the managing directors. This board functions in a manner similar to a corporate board of directors. The creation of a supervisory board is optional, however, except for special situations mandated elsewhere in German law.[40] Whether or not a supervisory board is appointed, Section 6(1) of the GmbH-Gesetz requires the appointment of one or more managing directors to manage the affairs of the GmbH,[41] Section 35 provides that the GmbH is represented by these managing directors "in and out of court", and Section 36 provides that the GmbH is bound by the actions taken by the managing directors on its behalf.[42] All the fore-

34. Sec. 15 of the GmbH-Gesetz provides as follows:
Transfer of Shares
(1) The shares are transferable and inheritable.
(2) Shares which a shareholder acquires in addition to his original share remain separate shares.
(3) The assignment of a share by shareholders requires a contract in notarial form.
(4) Notarial form is also required for an agreement creating the obligation of a shareholder to assign his share. However, an agreement concluded without observation of this form becomes valid by a contract of assignment concluded pursuant to the foregoing paragraph.
(5) The articles of association may make the assignment of shares dependent upon additional conditions, in particular upon the consent of the company.

35. Treas. Reg. § 301.7701-2(e)(1)(last sentence).
36. Treas. Reg. § 301.7701-2(c)(1).
37. Treas. Reg. § 301.7701-2(c)(4).
38. Treas. Reg. § 301.7701-2(c)(3).
39. See e.g., *Glendser Textile Co. v. Commissioner*, 46 B.T.A. 176 (1942)(centralized management lacking where general partners owned 41% of total interests in a limited partnership). The IRS will issue an advance ruling that centralized management is lacking in a limited partnership if the general partners own 20% or more of the total interests in the partnership. See Rev. Proc. 89-12, 1989-1 C.B. 798, 801 (Sec. 4.06) and Rev. Proc. 91-13, 1991-1 C.B. 477, 480 (Question 16).
40. Supervisory boards are mandatory for capital investment companies, for GmbHs that are engaged in certain types of German industries, notably coal and steel, and for GmbHs that have a substantial work force and are required to comply with the labour co-determination laws, i.e. to appoint employees to management positions and board participation. See Mueller, *supra* note 28, at 8-10.
41. Sec. 6 of the GmbH-Gesetz provides as follows:
Managing Directors
(1) The company shall have one or more managing directors.
(2) Shareholders or other persons may be appointed as managing directors. The appointment shall either be made in the articles of association or pursuant to the provisions of the Third Title.
(3) If the articles of association provide that all shareholders shall be entitled to the management, then only the shareholders belonging to the company at the date at which this provision is adopted are considered as appointed managing directors.
42. Sec. 36 of the GmbH-Gesetz provides as follows:
Nature of the Representation
The company is entitled and obligated by the legal transactions performed in its name by the managing directors; it is irrelevant whether or not the transaction is expressly performed in the name of the company or whether it follows from the circumstances that it was to be performed on behalf of the company according to the intention of the parties.

© 1993 International Bureau of Fiscal Documentation

going would tend to indicate that a GmbH may have a management structure similar to that of a US corporate entity.

On the other hand, the GmbH-Gesetz contains a number of provisions that permit substantial flexibility in the way a GmbH can be managed. As noted above, the appointment of a supervisory board is generally optional. Furthermore, with respect to the managing directors, Section 6(2) provides that the shareholders can appoint either themselves or any other persons they designate. If the shareholders appoint themselves, or at least those among themselves that own a substantial interest in the GmbH, then centralized management would be lacking since such persons would not be acting in a representative capacity as required by the *Kintner* regulations.[43]

Even in cases where separate managers are appointed, and thus serve at least nominally in the representative capacity that is indicative of centralized management, the GmbH-Gesetz includes an variety of additional provisions that can be used to limit their powers. Section 45, for example, provides that the shareholders can be granted rights over control of the company and the conduct of its affairs to the extent provided by the memorandum of association.[44] Also, Section 46(6) specifically permits the shareholders to decide on appropriate measures for the "control and supervision" of the managing directors.[45] Whatever is decided, Section 37 requires the managing directors to act only within their designated scope of authority.[46] There is no limitation elsewhere in the GmbH-Gesetz on what rights the shareholders can exercise over management other than that they may not conflict with law.

One commentator takes a broad view of the restrictions that can be placed on the managing directors by the foregoing provisions, stating that the managing directors can be required to obtain the consent of the shareholders for individual or general items of business, that the shareholders may refuse to consent to actions proposed by the managers and that the shareholders may take the initiative in directing the managers to take specific action in the business of the GmbH.[47] This would indicate that even in cases where separate managers are appointed, their powers can be so restricted as to limit them to acting directly in accordance with the wishes of the shareholders in all but ministerial matters.

The foregoing provisions would indicate that *Kintner* requirements for centralized management can be negated under the GmbH-Gesetz either by granting direct management of the GmbH to the shareholders or their agents or by stating in the memorandum of association that the shareholders are to have control over all material decisions made by managing directors. The IRS has accepted these factors as negating centralized management in prior cases. The *Kintner* regulations, for example, contain an illustration of an organization with 25 members who meet monthly to make business decisions for the organization on a majority vote basis, and the regulations conclude that centralized management is lacking in this situation.[48] Furthermore, in a revenue ruling involving a trust, the IRS found the absence of centralized management where the trustee could not make managerial decisions (other than ministerial ones) without first obtaining the unanimous approval of the trust beneficiaries.[49]

Notwithstanding the foregoing, the IRS has found centralized management to be present in the case of limited liability companies ("LLCs") formed under certain state statutes in the United States.[50] Based on the IRS rulings, these statutes come in two varieties as far as the centralized management factor is concerned: first, those that provide that management of the LLC must be vested in one or more designated managers (Colorado), and second, those that provide that management of the LLC is vested in the members in proportion to their ownership interests unless the LLC agreement expressly provides for a separate manager (Delaware, Florida, Illinois, Nevada, Virginia, West Virginia, Wyoming). In the ruling for the first type, the IRS held that centralized management was present even though the members had elected themselves to be the managers, which was permissible under the LLC statute, since the authority to make management decisions rested in them in their capacity as managers and not in their capacity as members. This conclusion appears to be based on the structure of the LLC statute, the IRS stating that the members did not, solely by virtue of being members, possess management authority. In the rulings for the second type, the IRS has held that centralized management was present in the cases where management of the LLC was vested in des-

43. Sec. 6(3) of the GmbH-Gesetz recognizes that all the shareholders can be designated as managers.

44. Sec. 45 of the GmbH-Gesetz provides as follows:
Rights of the Shareholders in General
(1) The rights of the shareholders in matters of the company, as well as their exercise, in particular with respect to the conduct of the business follow from the articles of association except for statutory provisions to the contrary.
(2) In the absence of special provisions of the articles of association the provision of §§ 46 to 51 shall apply.
The provision of Secs. 46 to 51 deal with specific shareholder rights, shareholder meetings, voting rights and minority rights.

45. The German text of Sec. 46(6) provides that shareholders may decide on "die Maßregeln zur Prüfung and Uberwachung der Geschäftsführung". The *Mueller* text translates this as "the measures applicable to the examination and supervision of the management". See *Mueller*, *supra* note 28, at 57. The *Oliver* text translation is "control and supervision" of the management. See *Oliver*, *supra* note 28, at 75.

46. Such limitation is not effective, however, against third persons. GmbH-Gesetz Sec. 37(2).

47. See *Mueller*, *supra* note 28, at 8.

48. Treas. Reg. § 301.7701-2(g) Example (7). The example involves an investment organization, and describes the management structure as follows:
> The business of the organization is carried on by the members at regular monthly meetings and buy or sell action may be taken only when voted by a majority of the organization's membership present. Elected officers perform only ministerial functions such as presiding at meetings and carrying out the directions of the members.

As discussed in the text, the provisions of the GmbH-Gesetz are broad enough to permit a similar management structure.

49. Rev. Rul. 57-607, 1957-2 C.B. 887. Trusts are subject to the classification under the *Kintner* regulations in a manner similar to partnerships, although there are of course differences in the way the factors are analysed. See Treas. Reg. § 301.7701-2(a). The *Morrissey* case cited in note 5, *supra*, wherein the Supreme Court first identified the six corporate characteristics, involved the classification of a trust rather than a partnership.

50. The revenue rulings issued to date on LLC statutes include Rev. Rul. 88-76, 1988-2 C.B. 360 (Wyoming); Rev. Rul. 93-5, 1993-3 I.R.B. 6 (Virginia); Rev. Rul. 93-6, 1993-3 I.R.B. 8 (Colorado), Rev. Rul. 93-30, 1993-16 I.R.B. 4 (Nevada); Rev. Rul. 93-38, 1993-21 I.R.B. 4 (Delaware); Rev. Rul. 93-49, 1993-25 I.R.B. 11 (Illinois); Rev. Rul. 93-50, 1993-25 U.R.B. 13 (West Virginia); Rev. Rul. 93-53, 1993-26 I.R.B. 7 (Florida).

© 1993 International Bureau of Fiscal Documentation

ignated managers but not in the case where it was vested in the members. [51]

There is also an earlier private letter ruling that precedes the above rulings, where the IRS reviewed a LLC statute that provided that management was vested in the members of the company in proportion to their capital contributions unless the articles of association provided otherwise. The LLC statute also provided that the company was obligated for liabilities incurred on its behalf by the members if they retained the management function. The IRS held that this combination made the LLC sufficiently similar to a general partnership formed under the UPA to be lacking in centralized management.[52]

The issue raised by these rulings, and more particulary by Rev. Rul. 93-4 in the case of GmbHs, is whether the *Kintner* test for centralized management was intended to be a pragmatic one that asks whether an entity is managed by its members (or is instead managed by designated managers), or whether it was intended to be a formalistic test that focuses on the presence or absence of statutory management *per se*. There are indications in the regulations themselves that the test was intended to be a pragmatic one, but there is enough ambiguity to leave the matter in doubt. To the extent that a formalistic requirement exists, the analogy drawn is to a corporate-style board of directors that excludes the members from acting on behalf of the organization.

Where the GmbH-Gesetz fits into all of this is not clear, and in fact it is probably somewhere in between the two alternatives presented by the LLC statutes discussed above. While Section 6(1) clearly mandates the appointment of a managing director, Section 6(2) permits the shareholders to appoint themselves to this capacity within the ambit of the memorandum of association, so their management status flows from the organizational document for the entity rather than from an annual election procedure as is the case in the Colorado statute. Presumably, the memorandum can provide that shareholders, and only shareholders, may be appointed as managing directors, and indeed that all shareholders *must* be appointed managing directors.[53] In the latter situation, the management function would flow automatically from membership in the GmbH. In addition, as discussed above, there are other provisions of the GmbH-Gesetz that allow considerable flexibility in the way that the management authority is defined and carried out. There is Section 45, for example, which provides that the shareholders *qua* shareholders can have whatever rights over the affairs of the GmbH that the memorandum of association provides them with, and Section 36, which binds the GmbH for action taken by the managing directors who, again by virtue of the memorandum, would be deriving their capacity as managers directly from their capacity as shareholders. Seen in this light, the provisions of the GmbH-Gesetz allow the management structure to be brought close to the UPA model for a general partnership.

Whatever the merits of the foregoing, the IRS has determined for the present that a GmbH does in fact have centralized management. A representative from the IRS recently stated in correspondence that the IRS is studying whether an LLC organized in the United States that has a separate manager position designated by statute can *ever* lack centralized management.[54] A final IRS's conclusion that this is the case for domestic LLC's will probably seal the fate for GmbHs as far as the IRS is concerned. Upon judicial review, however, the IRS position would have to be tested against the specific language of the *Kintner* regulations, which require a representative management of less than all the members in order for centralized management to exist. It would appear to be at odds with this, and also with the analysis that the IRS applies to limited partnerships formed in the United States. A limited partnership is required to have at least one general partner to manage its affairs, and it is clear under the *Kintner* regulations that centralized management does not automatically result from this. The general partner is also, by necessity, a member of the partnership, but the authority it has to manage the partnership's affairs derives from its capacity as a general partner and not automatically from its membership interest.[55]

An IRS position that limited liability companies, including GmbHs, automatically have centralized management if the manager position is designated in the underlying statute also seems to have little to do with the basic test for centralized management, which, if the pragmatic view is adopted, is simply whether or not the managers are acting in a representative capacity. This cannot be the case if all the members are themselves managers, regardless of how this came to be – whether by appointment, election or designation in the statute or the memorandum of association.[56] In one of the seminal classification cases, the Court of Claims noted that centralization of management *per se* is common to both corporations and limited partnerships, and that therefore the focus of the inquiry should be on the "representative" aspect of the test rather than on the "centralized" aspect. In other words, since both entities have management that is undoubtedly centralized, that is, held either by less than all the members or by designated managers, then centralization itself is immaterial in making a distinction between the two, and the focus should instead shift to whether there is any representative aspect.[57] The same reasoning would hold true in trying to distinguish between corporations and GmbHs.

51. Where managers comprising less than all the members have been designated, centralized management should not be present in the representative sense if the designated managers own a significant membership interest in their own right. This question was not addressed by the IRS in the LLC rulings, although it has been recognized in the limited partnership context. See *supra* note 39, and accompanying text.
52. PLR 9010027 (7 December 1989). Private letter rulings by the IRS do not have precedential value.
53. Under Sec. 6(3), if the memorandum provides that all shareholders are to be designated managers, this would only apply to shareholders of the GmbH on the date the memorandum is adopted. Subsequent amendments to the memorandum would be necessary to achieve the result suggested in the text.
54. Letter from Susan Pace Hamill, Attorney Advisor, Office of IRS Assistant Chief Counsel (Passthrough and Special Industries), published in *Tax Notes*, 8 March 1993.
55. That is to say, not automatically from its economic interest in the profits and capital, which, disregarding the risk element, could be represented by either a limited or general partnership interest.
56. While the IRS may argue that the members may, at their option, remove themselves at a later time and appoint someone who will act in a representative capacity, the presence of the *Kintner* factors is generally made based on the facts as they exist at the time of the determination. Other *Kintner* factors, such as free transferability, can also be affected by subsequent changes in the memorandum of association, but this is not taken into account unless and until such changes are made.
57. *Zuckman v. United States*, 524 F.2d 729 (Ct. Cl. 1975).

© 1993 International Bureau of Fiscal Documentation

Even if the IRS withdraws from the position that centralized management is automatically present under the GmbH-Gesetz, it may continue to argue that the situation in a commonly controlled GmbH, as was present in Rev. Rul. 77-214 and Rev. Rul. 93-4, is different, and requires the application of a lack of separate interest analysis. What will follow from this is less clear. If the conclusion is that the management authority of the members is to be ignored, and instead placed in the commonly controlling parent, then centralized management should be viewed as absent since the ultimate economic owner is also the managing owner. On the other hand, the IRS may argue that the controlling parent has the management function, but that the members are deemed to be the economic owners of their interests for all other purposes, in other words that the parent is managing the GmbH in a representative capacity for the members. This latter approach is fraught with the same difficulties that are inherent in the separate interests analysis to begin with.[58] In addition, the application of the theory goes further in the centralized management context since it requires the IRS to deny that subsidiaries within a controlled group can have any independent management function at all. The better result would be for the IRS to abandon the separate interests analysis altogether.[59]

58. See Section V above.

59. Other commentators have reached a similar conclusion regarding efforts to apply an economic analysis to US entity classification. See Davis and Lainoff, "US Taxation of Foreign Joint Ventures", 46 *Tax Law Review* (1991), at 185:

> The difficulty faced by the Service is that at its most fundamental level, Revenue Ruling 77-214 threatens to expose the shaky foundation upon which the U.S. entity classification scheme is built. In applying a separate interests analysis, the ruling attempts to look behind the legal relationships of the venturers and instead to examine their true economic relationship. The emphasis on economic substance is misplaced in the context of entity classification, however, because the rules for taxation of partnerships as compared to corporations are themselves arbitrary and have little dependence on the economics of the relationship. In such an environment, a determination of "substance" when classifying an entity is illusory.

THE TAXATION OF COMPANIES IN EUROPE

Country-by-country survey, systematically examining the taxes applicable at each stage of the life of a company in the 12 EC countries, Austria, Cyprus, Finland, Norway, Sweden, Switzerland and Turkey. Each country chapter follows the same outline to allow country comparisons:

- Basic company and accounting law
- Taxes on the establishment and expansion of a business
- Corporate income taxation: types of taxes, types of company taxpayers and taxable income, including computation of taxable income, anti-avoidance measures, exclusions, deductions, depreciation, incentives and disincentives, valuation, reserves and provisions, capital gains, losses and rates
- Miscellaneous taxes based on income, capital, payroll etc.
- Taxes on transactions and services
- International aspects
- Group taxation
- Mergers, spin-offs and divisions
- Full English texts of EC Directives (including drafts) on corporate and tax law, plus extensive bibliography.

Five binders, updated six times a year • 2,500 Dutch Florins including binders,1993 updates, packing and postage by air

Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

NEW ZEALAND:

APPLYING A SLEDGEHAMMER TO FOREIGN INVESTMENT: NEW FOREIGN INVESTMENT FUND MEASURES

Michael Dirkis

Michael Dirkis *LL M (Comm)(Adel), GDLP (SAIT), BEc (ANU) is a Lecturer in Law at the University of Canberra, Canberra, Australia. He is admitted as a Barrister and Solicitor, is a Fellow of the Tax Institute of Australia and is actively associated with the Australian Corporate Law Research Centre. He has also written a number of articles in leading journals. His major interests include revenue law, corporation law and corporate crime.*

The author wishes to thank Mr Peter Wilson for his assistance during the preparation of this article.

I. INTRODUCTION

1992 and 1993 saw New Zealand implementing its final approach to the taxation of foreign investment funds. It replaced New Zealand's original Foreign Investment Fund (FIF) legislation. Although the legislation had been introduced in April 1988, it had never operated. The Government had twice deferred its start date, pending inquiries into its operation. In the 1992 budget[1] the New Zealand Government announced the withdrawal of this existing legislation and the introduction of a new FIF regime. These new measures, introduced on 17 December 1992, became law (received the Royal Assent) on 1 April 1993.[2]

In this article I propose to critically analyse the new FIF legislation against its policy objectives. Given large amounts are invested offshore by New Zealand investors, these measures will have a marked effect on the manner and form of current and future investment. The measures will also have a profound effect on some of the financial markets in which the funds are placed and upon individual enterprises operating within those markets. My approach will be to identify the scope of each regime, its operational date, the existence of exemptions and the FIF income calculation methods. However, I will discuss first the reasons why the former measures were withdrawn. This will provide a base from which the new measures can be evaluated.

II. PROBLEMS WITH THE FORMER MEASURES

The initial 1988 scheme for taxing FIFs was derived from the application of the same principles adopted in respect of the controlled foreign company (CFC) regime (i.e. an attributed foreign income regime). Under this regime Section 245R of Income Tax Act (NZ) 1976 (NZ Act)[3] (which defined a FIF interest) required portfolio investors to possess financial information of the entity's effective foreign tax rate, the percentage of distributed profits and the composition of its assets. However, these information requirements created substantial compliance difficulties for small investors who frequently lack the detailed financial information necessary to comply with these requirements.

Even when the necessary financial information was available for use, its inaccuracy resulted in the calculation of the income base of a FIF being substantially underestimated. This arose as accounting standards vary between countries. Also, accounting standards usually incorporate 'conservative' asset valuation and profit calculation principles. The net result was that holders of FIF interests were taxed on an attributed income amount less than the actual income, which resulted in reduced tax collections.

From the technical side the regime was also ineffective when FIF income was sheltered in lower tier entities. Thus, given all these difficulties, the 1988 FIF measures were the subject of widespread criticism and their repeal was inevitable.

III. WHAT IS TARGETED BY THE NEW MEASURES?

The target of the new measures differs substantially from that originally stated. The New Zealand Government, through earlier statements, indicated that the FIF regime would be targeted at tax deferral through interests held in foreign entities resident in low tax jurisdictions, and conversion of accumulated income into capital receipts (which are tax free in the investors' hands).[4]

However, in the 1991 budget the Government announced that it would review its policy in light of the following principles:

- that foreign source income earned by residents should generally be taxed;
- that compliance costs should be minimized;
- that the tax base should be protected; and
- that the tax system should not be biased in favour of investment overseas.

After an independent study of the compliance costs and a Governmental review of public submissions on the underlying policy framework of the regime, the Government restated the object of its measures as being to balance the

> "...interests of maintaining the revenue base, providing New Zealand residents the opportunity to develop international markets and business opportunities, and reducing tax distortions which otherwise encourage the export of capital and jobs from New Zealand".[5]

It was further stated that

> "The proposals should bring more closely into line the tax costs of overseas and domestic investments. This should encourage New Zealand investors to invest where capital is employed most efficiently; that is, where the before-tax return is highest."[6]

Thus, these policies are substantially different from those previously stated of targeting tax deferral through interests held in foreign entities, resident in low tax jurisdictions. They represent a major policy switch from mere anti-avoidance measures to measures which have the dual purpose of anti-avoidance and offshore investment control.

IV. WHEN DO THE MEASURES HAVE EFFECT?

The new FIF regime will apply to income derived in the 1992-93 income year in respect of FIF interests acquired on or after 2 July 1992. However, it will only apply from 1 April 1993 in respect of interests owned before 2 July 1992.[7]

Although the legislation has now been formalized, there were major delays between the announcement of the policy in the 1992 budget, and its implementation as legislation. The result of this ad hoc policy development is that taxpayers have been unaware for six months of the precise details of the legislation as it applies to FIF interests acquired after 2 July 1992. However, the introduction in December 1992 of the legislation has meant that taxpayers did know the details well in advance of their current holdings being affected.

V. WHAT INVESTMENTS ARE NOW CAUGHT?

Under the revised measures a new wider definition of an interest in a FIF was introduced. An interest in a FIF is defined[8] to be any interests held by a resident in a foreign company and includes interests or entitlements to:

- any benefits from foreign life insurance policies;
- any benefits from a foreign superannuation scheme; and
- entities specified in Part B of the 16th Schedule of the NZ Act.[9]

As the definition does not require taxpayers to possess large amounts of financial information to determine whether an interest in a FIF exists, it is an easier definition to comply with than the original 1988 definition.

VI. HOW IS THE LEGISLATION STRUCTURED?

The new measures are 32 pages long consisting of 14 new sections and a number of consequential and transitional sections. The brevity of the legislation lies in the formulation of the structure of the FIF measures. New Zealand's approach to FIFs has been to continue with the jurisdictional approach[10] adopted under its CFC regime.[11]

Although this approach in the New Zealand context reduces the volume of legislation required to implement the new measures, it is contrary to the worldwide approach,[12] preferred by most countries with FIF regimes. The traditional advantages inherent in a "worldwide approach" are simplicity (resulting from avoiding the complexities of a jurisdictional approach with designated concessions) and reduction in compliance costs (resulting from the elimination of the administrative costs of maintaining the list to prevent the avoidance opportunities that a jurisdictional approach can afford). However, these traditional advantages are negated under New Zealand's jurisdictional approach as the New Zealand scheme contains a very short list of excluded countries.

VII. EXEMPTIONS FROM THE MEASURES

Given the inevitable nature of the Government's broad policy direction, much of the policy discussion and development was centred on the exemptions to the measures. From the industry's view, if you are able to get your investment exempted, then the measures have no impact, save record keeping. Thus, as the wide scope of these measures is narrowed by the exemptions, a detailed understanding of them

4. *International Tax Guide* (1989) Internal Revenue NZ, 46.
5. See *supra* note 1, at 85.
6. See *supra* note 1, at 84.
7. Sec. 245RL.
8. Sec. 245RM and 245RA.
9. The 16th Schedule currently does not list any foreign entities or classes of foreign entities rights which are deemed to be interests in FIFs. The Government intends to list concessions and special tax treatments available in grey list countries which permit significant tax deferral (*supra* note 1 at 80).
10. A "jurisdictional approach" is based on the application of measures on whether the investments are in comparable tax or low tax countries (including tax havens).
11. Part IVA.
12. Sometimes subject to certain exclusions (for example, for comparably taxed investments).

© 1993 International Bureau of Fiscal Documentation

and the underlying policy becomes crucial in defining the scope of the measures.

A. *Residency*

The measures are limited to residents holding interests in FIFs.[13] Thus, the effect is to exclude most non-residents from the measures. The non-residents which are caught are those persons who possess dual residency of New Zealand and another country. This arises even when a dual resident is deemed to be a resident of another country under a comprehensive double tax agreement. Such dual residents will be subject to the measures as at domestic level as they are still residents of New Zealand. This is contrary to the purpose of such bilateral agreements under which the parties agree to give up certain rights to tax in order to prevent double taxation. Any attempt to then claw back those rights could amount to treaty override. A minor amendment could resolve this problem.

B. *Jurisdiction exemption*

Interests in entities resident in a 15th Schedule jurisdiction (the "grey list") which are liable to income tax in that jurisdiction (country) by reason of domicile, residence or place of incorporation or management, are exempt from FIF taxation, unless the 16th Schedule applies to those interests.[14] The "grey list" is a list of countries which generally have a tax base similar to that of New Zealand. This means that their income and expense recognition rules are no more favourable than that of New Zealand, they have few or no tax incentives, they subject companies resident there to an effective tax rate that is not less than 85 percent of that imposed under New Zealand tax law, they have strong anti-avoidance rules such as their own CFC regime, and they have a tax treaty with New Zealand.[15]

Countries currently listed under the 15th Schedule are Australia (excluding Norfolk Island), Canada, Federal Republic of Germany, Japan, the United Kingdom and the United States (excluding its possessions and territories).[16]

Interests in superannuation funds (other than employment-related superannuation funds) and life insurance policies in grey list countries are not exempt from these measures.

C. *Small investor exclusion (de minimis rule)*

Small investors, being natural persons, with total FIF interests costing less than $ 20,000, are excluded from the measures.[17] This exclusion is extremely narrow when compared with the level of exclusion offered under the Australian FIF regime ($ 50,000) and given the fact that the exclusion level does not take into account indirect investments. The narrowness of the exemptions further confirms the investment control nature of such measures.

D. *Foreign employer-sponsored superannuation exemption*

An exemption is also provided for employment-related superannuation funds. It was recognized that some immigrants to New Zealand may have worked in countries which provided compulsory or voluntary superannuation funds. Even though some of the funds are not tied, or are subject to a low rate of tax, many are non-alienable (i.e. employees cannot dispose of an interest in the fund even if they so desire). Therefore, it would be inequitable to tax those individuals on their interests in such funds, as the funds cannot be used for general investment (i.e. cannot be abused). Further, it would subject individuals to the FIF regime, even though such persons would not have the option of disposing of the interest, due to the alienation restrictions.[18]

To ensure investment funds are not indirectly excluded, only employment-related superannuation funds qualify for the exemption. A superannuation fund is defined[19] to be an employment-related superannuation fund if:

- the taxpayer (an individual) had acquired the interest in the fund as a result of employment in the country of residence of the fund, and any benefits that accrued, accrued before the taxpayer first became a New Zealand resident. Also, the taxpayer must be subjected to either substantial legal penalties under the deed or substantial tax penalties for pre-retirement withdrawals from the fund; and
- the fund is required to be funded by the individual and/or the individual's employer, contributions being based upon a percentage of the individual's employment income. The fund should also prohibit assignment of the benefits.

E. *Attributable taxpayer exemption*

Also excluded from the measures are income interests in CFCs of 10 percent or greater.[20] This ensures integrity of the two systems and reduces the scope for double taxation.

F. *Life assurance policies*

Another exemption is to "grandfather" pre-announcement life policies. This is done by providing a limited exemption for persons who receive a death benefit under a policy of life assurance. The binding contract must have been entered into before 2 July 1992 or before the taxpayer became a resident, and the benefit must not increase by any voluntary action taken after this date.[21]

G. *Trading stock*

To limit manipulative use of trading stock, the new measures prohibit FIF interests being treated as trading stock if, either the comparative value method or the deemed rate of return methods of calculation are used.[22]

H. *Conclusion*

The effect of the exemptions is to exclude small investors and to provide relief where the full application of the measures would be inequitable. The absence of active business exemptions or some form of distribution exemption means that there is no scope for rearranging offshore investment portfolios to lessen or even avoid the impact of the measures. The measures remain extremely wide and punish investments even where no avoidance lies. Thus, the measures have retained a strong investment/exchange control profile.

The effect of the measures can only be to act as a practical impediment to offshore investment by New Zealand residents. This practical prohibition can only have negative consequences for New Zealand, particularly in terms of the general development of an internationally competitive economy that is integrated with global markets. The absence of exemptions for investments in emerging nations, for example, may hinder New Zealand's access to these markets and the future financial rewards that will flow from these fast growing economies.

If the levels of capital flowing out for investment in other countries was a major concern to the New Zealand Government then direct controls, rather than the bastardization of tax anti- avoidance measures, may have been a better way to overcome this. If return of profits stored offshore was a concern, then to encourage the return of capital, an amnesty period should have been used to allow for certain capital and profits to be repatriated tax free, or at very low rates of tax. It would be a more positive approach than the current Foreign Dividend Withholding Payment (FDWP) scheme.

VIII. HOW IS ATTRIBUTED INCOME OF THE FIF CALCULATED?

As the interests in FIF are non-controlling, the availability of financial information to investors will usually be limited. In other circumstances, however, the interest, although small in terms of control, maybe financially significant. In these circumstances financial information will be readily available. To balance this diversity between available information and the associated needs for simplicity, the regime provides four alternative methods whereby the FIF interest is taxed according to information available to the investors.

As the schemes enable movement between the various measures and have extensive anti-avoidance provisions to deal with such changes, the calculation methods are highly technical. Therefore, I propose to give an overview of each method rather than examine each of them in detail. This will be done in descending information requirement order.

A. *Branch-equivalent method*

The branch-equivalent method is only available to holders of FIF interests in foreign companies. The branch-equivalent method is the same method used to attribute income to a taxpayer under the CFC regime[23] (i.e. the income or loss is calculated as if the FIF is a resident of New Zealand, subject to a number of modifications). The actual calculation is as follows. The FIF income or loss is calculated by multiplying the holder's interest in the FIF (as calculated under the CFC rules) by the branch equivalent income or loss. The branch equivalent income or loss is calculated according to the CFC rules; however, some modifications apply. It is calculated in the currency in which the FIF prepares its financial accounts, unless the New Zealand resident elects to prepare them in New Zealand currency. This amount is then to be converted into New Zealand currency at the average of the close of trading spot exchange rates for the 15th day of each complete month falling within the accounting period of the FIF.[24]

The modifications to the CFC rules include modified rules for calculating the opening book value of any premises, plant, machinery, equipment and trading stock,[25] the acquisition price of any financial arrangement in relation to any accounting period[26] and special provisions to allow a deduction for foreign Goods and Services Taxes.[27]

Other sections of the Act are deemed to apply,[28] whilst some sections are excluded from the calculation of the branch equivalent income or loss. Among the excluded sections are: [29]

- which exempt from income tax interest payments made by the Government or by a local or public authority to non-residents,[30] or that exempt from income tax income derived by any organization established for the purpose of tourism or general public amenity development in any city, borough or other district;[31]
- that exclude from the accruals regime non-residents and non- resident withholding income,[32] or those which include attributed foreign income (in respect of an interest in a CFC) and all FIF income as assessable income directly;[33]
- that allow a deduction for first year depreciation on certain plant and machinery and on certain buildings,[34] or for certain development expenditure by a taxpayer engaged in any farming or agricultural business, a forestry business or aquaculture;[35] or
- that allow for income equalization.[36]

To accommodate FIFs under the method specific sections have been added that determine a taxpayer's share of the income calculated[37] and prescribe jurisdictional quarantining, similar to that prescribed under the CFC regime.[38]

23. Part XIIC is extended to apply by Sec. 245RH.
24. Sec. 245J(3).
25. Sec. 245J(4).
26. Sec. 245J(5).
27. Sec. 245J(16).
28. Sec. 245J(7) deems a business to be carried on in New Zealand if Sec. 74 (income derived from use or occupation of land), or Sec. 113A (supplementary depreciation allowance for plant and machinery used in two and three shift industries) or Sec. 128A to 128C (expenditure on land improvements used for farming, agriculture, forestry and in relation to aquaculture) apply to the business conducted by the CFC.
29. Sec. 245J(6).
30. Sec. 61(18).
31. Sec. 61(33).
32. Sec. 64M(e).
33. Sec. 65(2)(ea) and (eb).
34. Sec. 112.
35. Secs. 127A, 127 and 128, respectively.
36. Secs. 175 to 186.
37. Sec. 245RG.
38. Sec. 245RJ(3).

This method is the fairest and most accurate as it only taxes the income as calculated in accordance with New Zealand tax law. However, on the down side, in order for interest holders to elect to use the method, they must have access to a large amount of financial information in respect of the FIF. Therefore, as the information requirements are onerous, it is likely that only a minority of taxpayers would use this method.

B. *Accounting profits method*

Under the accounting profits method[39] the net after-tax accounting profits or losses of a FIF for the relevant accounting period are multiplied by the income interest of the holder calculated in accordance with the CFC provisions of the Act.[40]

Although the amount of information required to use the method and the actual income calculation are greatly reduced when compared with the branch-equivalent method, its use is the subject of strict qualifying requirements. These include restricting its operation to interests in foreign companies[41] listed on a recognized exchange or which have their shares widely available. Also, in order to qualify, the accepted accounting principles must be used in the calculation of the foreign company's income and the audited net after-tax profits must be detailed in financial accounts sent to shareholders or made available to the public. Finally, the net after-tax profits must not be declared by the Commissioner as not representing the net profits of the company.[42]

Although this method does not reflect the income calculated in accordance with New Zealand law, it still provides a reasonable estimate of a taxpayer's income. Also, taxpayers will not be required to have access to large quantities of financial records in order to use the method. However, the number of persons able to use this method is again limited by the harsh qualification standards.

C. *Comparative value method*

The comparative value (CV) method[43] assesses the taxpayer on the change in the market value of an interest in a FIF over a financial period. It is the same method as prescribed in the former Section 245R(3). Although there are no requirements under the New Zealand proposals to use any particular calculation method, the CV method is deemed to apply when the accounting profits method is impractical to use. The precise formula for calculating the income attributable is as follows,

(a + b) - (c + d)

where:

a is the market value of the interest in the FIF held on the last day of the person's income year;

b is the aggregate of all distributions received or receivable in relation to the interest in the FIF during the income year (including any tax paid or payable by or on behalf of the person which is allowable as a credit to that person.[44] Item b also includes the proceeds received or receivable from the sale of all or part of the FIF interest during the year;

c is the beginning-of-year market value, i.e. the market value of the interest in the FIF held on the last day of the person's preceding income year;

d is the total market value of all amounts paid or payable in relation to the interest in the FIF during the income year. Item d will include all amounts paid or payable to purchase all or part of the interest.

If the result is positive, the amount represents the gross FIF income. If the result is negative a FIF loss has occurred. This FIF loss may be offset against other income according to a prescribed order.[45]

The taxpayer must first offset the FIF loss against FIF income derived by that taxpayer in the same income year from any FIF (regardless of the country or territory in which the FIF was resident). Any balance remaining then can be offset against other assessable income, derived in that income year. However, the amount offset is limited to the amount of FIF income that the person has derived in previous years, which has not been offset against other FIF losses.

Finally, where the total FIF loss cannot be offset using the above rules, the balance of the loss is carried forward[46] to the next income year. As FIF losses are to be offset in the same order as that in which they were incurred it is worth noting that losses carried forward are deemed to have been incurred on the last day of the income year in which they were incurred.

There are also group loss provisions which allow (subject to certain conditions) a FIF loss which is unable to be offset by a company, to be offset within the specified group to which the company belongs.[47]

This method has been the subject of many criticisms. The first criticism relates to accuracy. The taxpayer's income, which is estimated as being equal to the increase in market value of the FIF, will often bear no relationship to the taxpayer's actual share of income earned by the FIF.

Other criticisms are based upon equity concerns. Realized gains will also be assessed even though such gains would not be assessed if earned domestically. Should this criticism be dismissed by the fact that the realized gains, which are otherwise exempt in New Zealand, were in fact a stated target of the regime, the fact that unrealized gains can be taxed cannot be. This will occur where a fully distributing fund may experience an increase in market value due to increase in the value of its assets. The application of the market value in these circumstances will result in the taxation of these unrealized capital gains.

These outcomes are easily illustrated in the following example:

> Assume that an interest in a fund was acquired for $ 245,000 on 30 June 1994. For the year ended 30 June 1995 there are no distributions, but the market value has increased to $ 275,000 due to the

47. Sec. 245RK.

© 1993 International Bureau of Fiscal Documentation

increase in the value of land the fund owned. The interest is sold on 1 July 1996 for $ 275,000.

Thus, in 1995, applying the above formulas, the market value increase is $ 30,000. The taxpayer would be assessed $ 30,000 in respect of an unrealized capital gain for the year ended 30 June 1995. However, had the asset been a domestic one the $ 30,000 gain would not have been assessable (unless sold in the ordinary course of carrying on a business or deemed to be income under Section 65).

D. *Deemed rate-of-return method*

Under the deemed rate-of-return method the interest holder's income is calculated by multiplying "the adjusted cost" (book value) of the interest by a specified rate of return.[48] The rate was recently announced to be 11.6%. This method must be used where the comparative value or accounting profits methods are not available, or the taxpayer is a natural person with FIF funds not greater than $ 100,000 during the year.[49] Thus, it will be used mainly in respect of interests in private companies and interests in superannuation funds and life insurance policies.

The formula is adjusted to deal with variations[50] in the amount of the interest and in part year holdings.[51] Where the proceeds on disposal are greater than the book value, the method provides that the difference be assessed as it represents accrued income. Similarly, where the proceeds on disposal are less than the book value an equivalent deduction is available.

The major criticism of the method is that as the income calculation is based on an arbitrary figure it bears no relationship to the actual income earned. Further, if a penal rate is set by the Government, the effect of the method will be to deem the taxpayer's interest in the FIF to have an earnings rate far in excess of market returns. When faced with the stark reality of being taxed upon returns in excess of the market rates, taxpayers have no other option other than to dispose of such interests, regardless, in some cases, of the potential high realization costs.

IX. TAXATION OF FOREIGN LIFE ASSURANCE POLICIES

Although interests in life policies are deemed to be interests in FIFs, the regime does not prescribe any special calculation rules. Given the valuation problems, it is likely that the life policies will be assessed under the deemed rate-of-return method. The problem with this from an equity viewpoint is that the interest holder will be assessed not only on the investment component of the policy but also on the risk component of the premium. This problem will be compounded if the Government specifies a penal rate for the deemed rate-of-return method.

Further, as there are no exemptions, the effect of these measures is to remove any incentive for offshore life assurance policies and to destroy the market for single premium bonds ("wrap-around bonds"). This in turn will have a major impact upon expatriate investment decisions. Further, the high monetary cost of surrendering the policies may effect some migration decisions.

X. AVOIDANCE OF DOUBLE TAXATION

Income taxed under the branch-equivalent method may be taxed again upon distribution under the dividend withholding payment regime. To avoid this double taxation a branch-equivalent tax account may be maintained to relieve the tax imposed under dividend withholding to the extent that a credit for tax paid upon attribution on foreign income is recorded on that account.

XI. PENALTIES

The penalty and offence provisions were originally amended in 1988 to introduce new provisions to deal with CFC regime offences.[52] These provisions continue to apply to these new measures, prescribing offences for:

- knowingly failing to disclose any information required in relation to a FIF;
- knowingly making a false declaration or giving false information to the Commissioner; and
- aiding, abetting or inciting one of the above.

A taxpayer if convicted on any one of these offences a term of imprisonment of up to two years and/or a fine of up to $ 50,000 may be imposed. Officers and employees of a company may also be charged with an offence, where they are responsible for making disclosures for that entity.

XII. CONCLUSION

In summary, the scope of these anti-avoidance measures is such that it renders them akin to "applying a sledgehammer to crack a nut".[53] This is more so given their investment control objective. The result of combining the two policies has been to severely limit the range of offshore investments available to investors in New Zealand. Investor involvement has not only been removed in the passive income investments (pooled investment funds, short-term life policies and like investments), but also in active businesses, particularly in the emerging Asian markets. In their current form they can only have negative consequences for New Zealand, particularly in terms of the general development of an internationally competitive economy that is integrated with global markets.

Further, as a result of the introduction of these measures, every resident taxpayer with foreign investments would be wise to dispose of any investments not held in the 15th Schedule countries. To retain such investments would be foolhardy and costly leaving the investor after the fall of the hammer without the kernel, merely the dust.

I. INTRODUCTION

The Australian government recently introduced new measures[1] aimed at preventing the deferral of Australian tax through investment in non-Australian controlled offshore funds which do not pursue a full distribution policy. These funds formerly enabled the deferral of Australian tax through the accumulation of low-taxed income offshore, which on disposal of the interest in the fund was usually converted into concessionally-taxed capital gains. The new Australian measures are both similar and dissimilar to measures existing in the United States and in Germany. In broad terms, the new Australian measures provide that where an Australian taxpayer has an interest in an offshore fund which holds mainly passive income-earning assets, the income earned by that fund is to be attributed to the Australian taxpayer in proportion to that taxpayer's holding in the fund. The amount of income attributed is to be included in the taxpayer's assessable income for the year of income in which the accounting period of that fund ends.[2]

This article evaluates Australia's new measures by focusing on a number of the key elements to the applicability of those measures and compares the breadth of those elements with the corresponding elements under the US and German measures. Part II examines which persons are affected by the measures. Part III considers the payment of tax under the measures, including when tax on the attributed amount is to be paid and how it is calculated. Finally, Part IV provides a short factual example of the application of the measures in order to illustrate the differences between the measures imposed by each of the three countries under consideration.

Each of the headings addressed will first discuss the relevant provisions under the Australian measures. The relevant provisions under US measures are then compared, pointing out similarities and differences where relevant. Finally, the relevant German provisions are compared to the corresponding provisions under both the Australian and US measures.

II. TO WHOM DO THE MEASURES APPLY?

This section compares the persons caught by the measures.

The discussion will first focus on which foreign entities are caught, i.e. which are the foreign entities whose income may be attributed to resident taxpayers? Secondly, the types of income which may be attributed under the measures will be considered, and finally the discussion will shift to whom attribution of the foreign entities' income can be made, i.e. at whom the measures are aimed.

A. *Which entities are caught*

1. Australia

The Australian measures potentially apply to any non-resident corporation or trust[3] as well as certain foreign life assurance policies[4] that have an investment component. However, the measures go on to provide an exemption for a direct investment in a foreign corporation which is carrying on an active business by principally engaging in "eligible activities".[5] All activities other than those listed are considered to be eligible activities, i.e. a blacklist approach of activities is used. Business activities which are not "eligible activities" are banking and the provision of finance, financial intermediation services, life insurance business, general insur-

1. Which applies from 1 January 1993 and is known as the Foreign Investment Fund regime.
2. Sec. 529 Income Tax Assessment Act (ITAA). Unless otherwise indicated, all references are to the ITAA.
3. Sec. 481.
4. Sec. 498.
5. Sec. 497. Because both the US and German measures only apply to foreign corporations, the discussion of the Australian measures will be limited to their application to foreign corporations unless otherwise relevant. However, it is worth noting that the active business exemption is not available to a taxpayer with an interest in a non-resident trust even though the trust's underlying investments are principally active.

© 1993 International Bureau of Fiscal Documentation

ance business, management of funds, certain activities connected with real property and investment in certain tainted assets.[6]

There are two methods by which a corporation may show that it is not principally engaged in one of the blacklisted activities. The first method uses stock exchange categorization or international sectoral classifications[7] to establish a corporation's principal activity at the end of the accounting period of the foreign corporation.[8] This method can only be used if the interest held by the taxpayer in the foreign corporation is listed either on one of the stock exchanges approved by the Australian legislation or an approved international sectoral classification system.[9]

The second method of showing a foreign corporation is engaged principally in active business is the balance sheet method. Where at least 50 percent of the gross value of a foreign corporation's assets are held for use in active business, the corporation will pass the active business test. This test is satisfied by reference to the foreign corporation's balance sheet which must be prepared in accordance with commercially accepted accounting principles. For the purposes of this 50 percent test, where an asset is not used solely in active business its value must be apportioned, the asset's active business value being reduced to the extent that the asset is used for non-active purposes.[10]

For the purposes of this second method, there is also a look-through rule which applies to direct or indirect holdings of 50 percent or more in other corporations.[11] Where this rule applies, the foreign corporation is treated as owning its proportionate share of the subsidiary's assets. Further, the foreign corporation's holding in the subsidiary is ignored as an asset for the purpose of establishing whether the foreign corporation is engaged principally whether active business under the balance sheet method. The effect of the look-through rule is that a foreign holding corporation with active subsidiaries will not fail the balance sheet method of determining if its principal activity is active and therefore will not be subject to the Australian measures.[12]

Where a foreign corporation is engaged in two or more active business activities but the corporation is not principally engaged in one of those activities, the corporation will be subject to the Australian measures. However, an exemption is provided[13] where two or more activities of the foreign corporation, which are eligible activities for the purposes of the active business exemption or for one of the industry specific exemptions (see below), when taken together are the activities in which the corporation is principally engaged. For this exemption to apply, the corporation's shares must be listed on an approved stock exchange and widely held.

While banking, insurance and activities of certain real property corporations are expressly excluded from eligible activities and these activities are therefore prima facie subject to the Australian measures, specific exemptions are provided for these activities. To fall within these exemptions,[14] shares in the foreign corporation must be widely held and listed on an approved stock exchange. The exemptions are only available to shareholders who hold such shares.

The conduct of life assurance business is also provided with a specific exemption[15] where the foreign corporation's assets are principally used in carrying on that business.[16]

2. United States

The US measures only apply to "Passive Foreign Investment Companies" (PFICs), as defined.[17] The definition has two prongs: a PFIC is a foreign corporation which in any given year has at least 75 percent of its gross income represented by passive income;[18] and a foreign corporation is a PFIC if in any given year at least 50 percent of its assets were used in earning passive income.

When comparing the definition of a PFIC under the US measures with a foreign corporation which meets the active business test under the Australian measures, two points are worthy of note. Firstly, both measures have a 50 percent passive assets test; however, the second test under the Australian measures looks to stock exchange categorization while the US second measure tests the age of passive income earned. The Australian test is to be preferred, as it promotes certainty and is simple to apply. Secondly, the US measures concentrate on the type of income earned, i.e. passive income, while the Australian measures focus on the type of business conducted, i.e. active business. This second difference does not appear to be significant unless it can be argued that under the Australian measures there may be circumstances where an asset may be classified as an active business asset despite the fact that it produces passive income, i.e. an argument similar to the German functional approach (see below).[19]

Under the US measures, "passive income" is defined to include dividends, interest and its equivalents, passive rents and royalties, annuities, gains from the sale of shares, bonds and certain other assets, gains from commodity trading and certain foreign exchange gains. There are two exclusions from this definition. Firstly, certain income derived in the active conduct of a banking or insurance business. The second exclusion from the definition of passive income is inter-

6. These activities are listed in Schedule 4.
7. Such as Bloomberg's Information Systems or Morgan Stanley Capital International Index.
8. Sec. 499.
9. Sec. 500.
10. Sec. 500(11).
11. Sec. 501.
12. There is no limit to the number of tiers of subsidiaries that can be looked through, provided the first tier foreign holding corporation has an effective interest of at least 50% in the lower tier corporation (see Sec. 501).
13. Sec. 523.
14. See Secs. 503, 508 and 511.
15. Secs. 506-507.
16. It should be noted that despite this exemption, the holder of a life assurance policy with an investment component will still be subject to attribution.
17. The US measures were introduced in 1986 by Internal Revenue Code (IRC) Sec. 1296(a).
18. A tax bill has been introduced into the US Congress which, if passed, will lower this level to a 60% passive income test.
19. It is submitted that the requirement under the Australian active business test that an asset be used `solely' in active business (and an apportionment of its value where the asset is not) would negate any argument that the functional approach could apply.

© 1993 International Bureau of Fiscal Documentation

est, dividends, rents or royalties received from a related person[20] which is paid from income which is not itself passive.

In determining whether a foreign corporation is a PFIC, look-through rules apply. If the foreign corporation has an interest of 25 percent or more in another corporation (a 25 percent subsidiary), that corporation is treated as earning a portion of the subsidiary's income based on its level of shareholding. These rules attribute a proportionate share of both the passive and the active income of the 25 percent subsidiary for the purpose of the 75 percent passive income test in determining whether a foreign corporation is a PFIC. Similarly, these look-through rules treat the foreign corporation as the owner of its proportionate share of the assets of the subsidiary in determining the 50 percent assets producing passive income test. When these look-through rules apply, any dividends or interest received from the subsidiary are ignored for the purpose of the 75 percent test and the foreign corporation's holding in the subsidiary is ignored for the purpose of the 50 percent test. These look-through rules also extend to lower tier subsidiaries owned indirectly by the foreign corporation. The effect of these look-through rules is that a foreign holding corporation with active subsidiaries will not be caught by the US measures. This US rule, which only requires a 25 percent subsidiary, can be contrasted with the corresponding Australian provision where a 50 percent subsidiary is required.

Finally, under the US measures there are exceptions to the definition of a PFIC for the first year of operation of the foreign corporation if it thereafter engages in active business, and a grace year for a foreign corporation that disposes of an active business and is in the process of acquiring another active business. The Australian measures have no equivalent; this may be due to the fact that the Australian measures also have no equivalent to the US 75 percent passive income test, but only an active assets test. It is probable that when an active business starts up or is in the process of acquiring a new active business the assets it holds will be classified as active assets even though they may not earn active income at the relevant time. As previously mentioned, the Australian measures are not concerned with active income but rather active business.

3. Germany

The German measures[21] include two limits on the applicability of the attribution regime to foreign corporations. Firstly, the German measures were enacted as an extension of their controlled foreign corporation (CFC) measures.[22] One effect of this extension is that the German measures only apply to a foreign corporation which is subject to low-level taxation in the country where that foreign corporation resides. Thus the foreign corporation has to be subject to effective foreign tax of less than 30 percent before the German measures can apply to such a corporation. Contrast this position with both the Australian and US measures which may apply to foreign corporations resident in countries which have an effective tax rate which is higher than the respective tax rates in those countries.

The second limit on the applicability of the German measures to foreign corporations is that only foreign corporations which generate predominantly "income with investment character" as defined (i.e. passive type income) may be subjected to the measures. "Predominantly" is accepted to mean that the foreign corporation's income must consist of more than 50 percent passive income before the measures can apply. This German test is much the same as the 75 percent passive income test for the definition of a PFIC under the US measures but with the threshold reduced to 50 percent. However, unlike either the Australian or the US measures, there is no alternative test for determining "passive corporation" status under the German measures. Further, the German measures are similar to the US measures in that they appear to concentrate on the type of income earned and not, as the Australian measures do, the type of business carried on by the foreign corporation. But this apparent similarity with the US measures and difference with the Australian measures may be deceptive because of the application of the German functional approach which results in a consideration of the underlying business in determining whether or not income is to be classified as passive. The German approach requires that items of income which would qualify as passive income if viewed separately be regarded as part of the income generated from an active business if it is viewed from a functional point of view as associated with an active business. For example, interest received on the interim deposit of funds set aside for the purchase or manufacture of machinery to be used in a manufacturing industry is, under the functional approach, not passive income.

"Income with investment character" (i.e. passive type income) is defined[23] as including the following types of income: income derived from holding, administering, value-maintenance or value-appreciation of monetary funds, claims, securities, participations or similar assets. While the Australian blacklist defines what is not active business (i.e. non-eligible activities), the German blacklist defines what is passive income although this difference appears to be of little significance.

The German measures provide four exceptions to this definition of passive income. Income to which these exceptions apply is not "income with investment character" and will not be counted towards meeting the 50 percent passive income test, but rather will reduce the proportion of passive income and therefore reduce the possibility that the German measures apply. The exceptions from the definition of "income with investment character" are as follows.

(a) *Active business exception*

Income generated by an active business conducted by a foreign corporation is not considered passive income. The German measures use the definition of "active" activities contained in the German CFC measures. These activities include agriculture and forestry, manufacturing and extractive industries, trading activities, international financing transactions,

certain banking and insurance activities and the receipt of certain dividends.

Banking and insurance activities may be considered to be active in similar circumstances as the Australian measures, i.e. they must be widely held and listed on an approved stock exchange. Life assurance is treated differently under the Australian measures.

Dividends received by a foreign corporation are principally treated as passive income. But where those dividends are received from a corporation of which the foreign corporation holds at least 25 percent, those dividends may be treated as active if two conditions are met. Firstly, the foreign corporation and the subsidiary must reside in the same jurisdiction, and secondly, the gross income of the subsidiary must be almost exclusively derived from active business. This provision is somewhat similar to the second exception to the US definition of passive income which treats dividends received from an active related corporation as active income. The Australian measures require no equivalent provision because those measures are not concerned with income.

(b) *Intercompany participations*

The second exception to the definition of "income with investment character" is similar in effect to the Australian and US look-through rules. This exception provides for attribution to the foreign corporation of a portion of the income of another corporation in which the foreign corporation holds at least a 10 percent interest. This threshold of 10 percent is much lower than the Australian 50 percent or the US 25 percent threshold. This exception attributes a portion of both the active income and the passive income of the 10 percent subsidiary. This exception can be contrasted with the classification of dividends received from a 25 percent subsidiary as active income discussed above. The look-through rules apportion undistributed income whereas the 25 percent rule deals with distributed dividends.

(c) *Intercompany financing*

The third exception to the definition of passive income applies to income derived from the financing of a foreign permanent establishment or a related corporation within the same group. This means a foreign company may be funded by equity and earn interest income from financing active group members or branches without being caught by the German measures. This may also be the case under the US measures due to the second exception to its definition of passive income.[24] By contrast, the Australian measures are not concerned with income types but rather with the type of business being conducted by the foreign corporation. In such a financing situation, under the Australian measures the assets of the subsidiaries concerned would be attributed to the foreign financing corporation and that corporation's holdings in the subsidiaries ignored under the look-through rules. The result may ultimately be the same, but not necessarily. Where assets bear different rates of return on their value a foreign corporation may be caught by the measures under a passive income test but not under a passive assets test or vice versa.[25]

(d) *Arm's length services*

The fourth exception to the definition of passive income under the German measures is for income derived from arm's length fees for services rendered by the foreign corporation. These services must be rendered to third parties, but the third party may be related to the servicing foreign corporation.

B. *Which income is caught*

This section considers what type of income earned by a foreign corporation may be attributed to a resident shareholder.

1. Australia and the United States

Under both the Australian and US measures, *all* income of a corporation subject to the measures may be apportioned and attributed to resident shareholders and not just the passive income which subjected the corporation to those measures. Attribution under both the Australian and US measures is not limited to passive income; once a foreign corporation has failed the active business test under the Australian measures or is deemed a PFIC under the US measures, even a proportionate share of the active income of such a foreign corporation is attributed to a resident shareholder.

2. Germany

In stark contrast to the Australian and US measures, the application of the German measures may only attribute the passive income of a foreign corporation to resident shareholders. Only "income with investment character" may be attributed to German shareholders.[26] Therefore the German measures are narrower in application than the Australian or US measures. The Australian and US measures are restricted in their application to certain types of foreign corporations but will attribute all income of such a corporation to resident shareholders. The German measures also restrict their application to certain types of foreign corporations but in addition restrict the type of income which may be attributed to German shareholders, i.e. only passive income.

C. *To whom can attribution be made*

This section looks at which residents may have their taxable income increased by the attribution of income earned by a foreign corporation which is subject to the measures.

1. Australia

The Australian measures apply to Australian taxpayers who have an interest in a FIF to which the measures apply. "Interest" is defined[27] to mean a share in a corporation[28] or an

24. This US exclusion appears to cover similar ground to the combined effect of the German measures which treat dividends received from active subsidiaries as active income and the intercompany financing exception from passive income being discussed. This is because the US measure covers the payment of not just dividends but also interest, rents and royalties.
25. Of course the threshold required is also important, the Australian threshold at 50% is much higher than the other two countries.
26. Sec. 7(6) International Tax Act.
27. Sec. 483.
28. Or an interest in the corpus or income of a trust.

© 1993 International Bureau of Fiscal Documentation

instrument to acquire such a share, e.g. an option or a convertible note. The Australian measures apply regardless of the level of the taxpayer's interest in the FIF. However, these measures do not apply to an interest in a FIF where that interest is sold before the end of the year of income in which it was purchased. Such a disposal is subject to ordinary taxation measures, i.e. the gain is taxed but there is no attribution of income. Some Australian taxpayers are exempt from the new measures despite their holding an interest in a FIF. Those exemptions are as follows.

(a) *Temporary residents*

An exemption from the Australian measures is available for taxpayers who are resident in Australia on a temporary entry permit.[29] This exemption is available for a maximum of four years.

(b) *Attributable taxpayers*

Where the new measures overlap with the existing Australian CFC or transferor trust measures, the CFC or transferor trust measures only apply, relieving any double taxation.[30]

(c) *Small investor*

The third, and most important exemption, for Australian interest holders in a FIF is the exemption available for small investors.[31] Where an Australian taxpayer's interests in FIFs[32] do not exceed A$ 50,000 aggregate in value at the end of the year of income, that taxpayer will not be subjected to attribution under the Australian measures. In determining the A$ 50,000 level, the taxpayer must aggregate his interests with those of his associates. "Associates" is defined to include relatives, controlled corporations and trusts, and partnerships in which the taxpayer is a partner.[33]

The small investor exemption is only available to a taxpayer who is a natural person. In valuing the taxpayer's interests, the higher of cost or market value at the end of the year of income is used. Where the aggregate of these values does not exceed A$ 50,000, the Australian measures will not apply to the directly held interests of the taxpayer.

However, an Australian taxpayer meeting this test who also holds an interest in a resident public unit trust may still be indirectly subjected to attribution in respect of his share of the trust's income where that trust holds interests in FIFs. This is because the trust is subject to attribution. In this case there is a second test which, if satisfied, excludes the effect of the Australian measures when calculating the taxpayer's share of income from the trust.[34] To obtain this extended exemption the taxpayer must show that the aggregate value of his interests in FIFs *and* resident public unit trusts does not exceed the A$ 50,000 limit.

(d) *Foreign employer-sponsored superannuation*

Natural persons who hold an interest in a foreign employer-sponsored superannuation fund which is a FIF are not subject to attribution with respect to that interest.[35] This exemption is only available if the taxpayer is or was an employee of the sponsoring employer.

(e) *5 percent of interests in FIFs only are caught*

Where 5 percent or less of the aggregate of a taxpayer's interests in FIFs are subject to attribution under the Australian measures, this 5 percent will be exempt from the measures together with the other 95 percent that is exempt under other exemption provisions.[36]

(f) *Trading stock*

An exemption is also available for an interest in a FIF that is trading stock, provided the taxpayer values that stock at the end of each year at market value.[37]

2. United States

Similar to the Australian measures, the US measures apply to all US taxpayers regardless of their level of participation in a PFIC.

The US measures apply to US taxpayers which own shares in a PFIC. Ownership of shares will include the holding of options to the extent provided by regulations. Contrast the Australian measures which expressly apply to the holders of options or convertible notes. The US measures also contain broad attribution rules which determine whether a US taxpayer is to be treated as the shareholder of a PFIC. US taxpayers may be taxable under the US measures if they hold shares in a PFIC indirectly through a foreign corporation (which may itself be a PFIC), partnership, trust or estate. These attribution rules are only applied to the extent that their ultimate effect is to treat shares of a PFIC as held by a US taxpayer. While the Australian measures have no equivalent, they may classify the offshore entity through which the Australian taxpayer indirectly holds interests in FIFs as being subject to the Australian measures. This is because all non-resident trusts are considered FIFs and partnerships are not taxable entities in Australia so they will be looked through in determining FIF status.

3. Germany

Once again, the German measures are the narrowest of the three countries under consideration. The German measures only apply to German taxpayers who have a shareholding of at least 10 percent in the foreign corporation. It appears that this 10 percent level was chosen because an investment of less than 10 percent does not benefit from the intercompany dividends-received exemption found in most German tax treaties. Therefore distributions received by a corporation from a foreign holding of less than 10 percent or by an individual from a foreign holding of any level, are subject to Ger-

man tax.[38] This limitation on the applicability of the German measures shows that the policy behind the German measures was not just aimed at the deferral of German tax through investment in foreign corporations, but was also aimed at the perceived abuse of the intercompany dividends-received exemption in tax treaties. Neither the Australian nor the US measures have a shareholding limit before which attribution can be made, although the Australian small investor exemption may provide much the same relief for individuals.

It appears that unlike the Australian measures, the German measures do not apply to the holding of options or convertible notes. Further, the German measures do not apply to the use of a non-resident related person to hold shares in a PFIC for a German resident; they have no equivalent to the US attribution rules discussed above.

III. PAYMENT OF TAX

This section examines the payment of tax. Firstly, the calculation of the taxable amount and the time for payment of tax imposed will be discussed. Secondly, the effect of a distribution of profits by the foreign corporation from income which has been previously attributed to shareholders will be explored, and finally the relief available for foreign taxes imposed on income which has been subject to attribution and that available when a subsequent distribution is made will be considered.

A. *Calculation and payment of tax*

1. Australia

Where the Australian measures apply, an amount of the FIF's income will be attributed to and included in the Australian taxpayer's assessable income for the income year in which the statutory accounting period of the FIF ends. The amount to be included in the taxpayer's assessable income will be determined under one of three taxing methods. Under each of these methods the income to be attributed is measured in relation to a notional accounting period. This period is generally the taxpayer's income year but the taxpayer may elect to use the period for which the annual accounts of the FIF are made.[39] The legislation intends that the calculation of the attributable amount under each of these three methods approximates the portion of the FIF's net income for the notional accounting period that the taxpayer's shareholding in the FIF bears to the FIF's entire share capital. This amount, as calculated by any of the three methods is then reduced by any distributions made to the taxpayer by the FIF in the notional accounting period and the resultant amount is the sum that is included in the taxpayer's assessable income for the relevant year of income. The three methods of calculating the taxable amount are as follows.

(a) *Market value method*

The amount attributable to the taxpayer under the market value method is the increase in the market value of the taxpayer's interest in the FIF over the notional accounting period.[40] This method applies if it is practicable to do so and the taxpayer has not chosen to apply the calculation method. It is only practicable to use this method where it is possible at the end of the year of income to ascertain the market value for the class of interest in a FIF held by the taxpayer. Market value is determined by reference to quotations on approved stock exchanges or the officially quoted buy-back or redemption price is used.

In calculating the attributable amount, distributions made to the taxpayer during the year are added to the end of year market value of the stock. From this amount is deducted the opening market value for the year; the result is known as the attributable amount which will be included in the taxpayer's assessable income subject to the deduction for current year distributions mentioned earlier. Where this calculation results in a loss, the loss can be set off against other assessable income up to a limit of the amount previously subjected to the Australian measures for which loss relief has not been claimed. Any excess loss which cannot be set off against other assessable income may be carried forward to set off against any future assessable income, subject to the same limitation.

(b) *Deemed rate-of-return method*

The deemed rate-of-return method[41] applies where it is impracticable to apply the market value method and the taxpayer has not chosen to use the calculation method.[42] This method is applied separately to each group of interests held by the taxpayer. A group of interests is constituted by interests of the same class in the same FIF. The amount to be included in assessable income is the increase in value of the group of interests over the year subject to reduction for distributions made in the current year. This increase is determined by taking a pre-determined percentage of the opening value for the year in question. This percentage is currently set at 4 percent above the long-term bond rate. The opening value for the year is the closing value for the previous year plus the calculated increase for that year, i.e. the cost of the investment is compounded. The initial opening value is the consideration paid for the interest. Where the interest exists at the commencement of the FIF measures, a quotation value on an approved stock exchange, an independent valuation or the initial consideration indexed to the date of the commencement of the FIF regime will be used as the initial opening amount.

(c) *Calculation method*

The calculation method will only be used if the taxpayer elects to apply it.[43] Under this method, a notional income for the FIF is calculated and apportioned between holders of interests in that FIF. The first step is to calculate the FIF's notional income[44] which will include any gross income and

© 1993 International Bureau of Fiscal Documentation

profits and gains of a capital or revenue nature derived during the notional accounting period. Secondly, deductions from this amount are generally allowed as they are incurred.[45]

Where the FIF itself has an interest[46] in another FIF, generally an amount of the income of the second tier FIF will be included in the notional income of the first tier FIF. This amount is calculated as though the first tier FIF was an Australian taxpayer. Notional income will not include any dividend or distribution paid to a first tier FIF by another FIF. Further, any amount to be included in the notional income of a FIF is a pre-tax amount.

A notional deduction is also allowed from the notional income of a FIF for Australian tax and foreign taxes paid by that FIF or any other FIF provided the tax relates to income included in the calculation of the notional income of that FIF.

Loss relief is granted in similar circumstances to that granted under the market value method.

While the market value method is likely to tax the unrealized capital gains of a FIF,[47] by contrast, the calculation method would not tax the unrealized capital gains of the FIF because capital gains will not be included in a FIF's notional income until realized. It can therefore be assumed that the attributable amount calculated under the calculation method will generally be less than that calculated under the market value method in years where capital gains are not realized.[48]

2. United States

The US measures, unlike the Australian measures, allow taxpayers to defer paying US taxes on otherwise attributable income until such time as they have actually received funds from the PFIC. A deferral charge is imposed for any such deferral in addition to regular tax. The US government felt that a taxpayer should not be forced to pay taxes on income that the taxpayer had not received provided the taxpayer and not the US government pays the cost of deferral. Contrast the Australian measures where no such option is available and the taxpayer must pay the tax imposed on the attributable amount despite the taxpayer not having received the income which has been subjected to taxation.

Under the US measures, the benefits received by the deferral of US tax through the use of a PFIC are removed in two ways. The first method imposes no current taxation but does impose a deferral charge on the shareholders that receive actual distributions from a PFIC or dispose of their shares in the PFIC. The second method imposes current taxation on the portion of income of a PFIC attributable to a US taxpayer's shareholding in that PFIC. This method is broadly similar to the calculation method under the Australian measures. However, even under this second method the taxpayer may choose to defer any tax currently payable, subject again to a deferral charge.

The first method is used when the taxpayer does not make an election to use the second method. Under this first method a taxpayer who disposes of his shares in or receives an "excess distribution" from a PFIC will be subjected to tax on any gain as well as a deferral charge to compensate the government for the delay in receiving payment of the deferred taxes. An excess distribution is a distribution received by a taxpayer from a PFIC that exceeds 125 percent of the average amount of annual distributions received by that shareholder during the preceding three years. Previous excess distributions subject to a deferral charge are not taken into account when computing this average. The excess distribution as calculated is allocated rateably to each day in the period that the shareholder has held the shares in the PFIC. The amounts attributed to each day are subjected to tax at the highest marginal rate for the year in question. A deferral charge is then imposed by way of accrued interest. There is no deferral charge for amounts allocated to the current year. Taxpayers that dispose of their shares in a PFIC are taxable on any gain recognized on the disposal as if that gain were an excess distribution, regardless of whether there has been a high level of distribution during the period of the shareholder's ownership.

The taxation of a gain on disposal of shares in a PFIC as an excess distribution may include the taxation of unrealized gains at the foreign corporation level, something which would not occur even if the PFIC was subjected to full current taxation. Upon such a sale, increases in value of the assets of a PFIC are allocated rateably to the entire holding period of the shares even if realization of the gains by the PFIC itself came later or not at all. Earlier, under the Australian measures it was suggested that the market value method may also tax these types of unrealized gains.

The second method is to currently tax the income of a PFIC attributable to a PFIC's shareholders as a deemed dividend. This method allows capital gains of the PFIC to flow through to the shareholder on disposal and be taxed at slightly concessional rates. The PFIC is required to be treated as a "qualified elective fund" (QEF). This status is granted to the PFIC for each shareholder individually, depending on whether that shareholder so elects and the PFIC complies with certain reporting requirements. Every taxpayer that makes such an election must include its pro rata share of the profits of the PFIC in its gross income. This amount is subject to current taxation.

As mentioned earlier, this method broadly corresponds with the calculation method under the Australian measures. One major difference between the application of these methods is the treatment of income from second tier FIFs or PFICs. Under the US measures there are broad attribution rules (see above) which will attribute shares held by a first tier PFIC in a second tier PFIC to US taxpayers for the purposes of current taxation. In this case, the US taxpayers will be subjected to two separate levels of attribution, one for the first tier PFIC and another for the second tier PFIC. Contrast the position under the Australian measures (discussed above) where a portion of the second tier FIF's income is attributed to the first tier FIF, so the taxpayer suffers indirect attribution from

45. However, a deduction is generally not allowed for expenditure on capital assets, but depreciation may be allowed.
46. There is no limitation on the level of this interest.
47. Assuming that these gains are reflected progressively in the value of quoted interests in the FIF from year to year.
48. Unless the FIF has incurred unrealized capital losses which current depreciation has not compensated for.

© 1993 International Bureau of Fiscal Documentation

the second tier FIF. Under the US measures, the US taxpayer is subjected to direct attribution from the second tier PFIC.

Under the US measures payment of tax on the attributable amount may also be deferred by a further election of the taxpayer, this time on a yearly basis. This deferred tax is subjected to an interest charge generally applicable to late payment of taxes. This deferral expires upon a subsequent distribution or transfer of the shareholding giving rise to the taxation.

Another point of contrast between the Australian and the US measures is that while the Australian measures have no election to defer the amount of current taxation, the US measures have no equivalent to the deemed rate-of-return method or the market value method of calculating the taxable amount. In particular, the latter method seems appropriate when a shareholder may have difficulty in obtaining the information necessary to use a calculation type method from an uncontrolled foreign corporation. It is therefore not surprising that the market value method would be introduced into the US measures if the bill to amend the US measures mentioned earlier is passed.[49] Under that bill, each US taxpayer owning less than 25 percent of a PFIC will be taxed under one of three methods: a calculation type method; current taxation on an annual increase in the value of the PFIC's shares, determined by a "mark to market" valuation, i.e. a market value method; or an interest charge on the disposal of PFIC shares similar to the present measures. Where a US shareholder owns 25 percent or more the calculation method must be used.

3. Germany

At the end of the German taxing year, undistributed passive income of a foreign corporation is attributed to and taxed in the hands of shareholders caught by the German measures as if it had been distributed in the form of a dividend. The quantum of passive income is computed in accordance with the valuation and accounting rules of German law. The attributable amount taxable in the hands of the German taxpayer is a portion of the total attributable income of the foreign corporation depending on the taxpayer's shareholding. This method of calculating the attributable amount is broadly similar to Australia's calculation method or the computation of the current taxable amount under the US measures. However, the German measures are only concerned with calculating the amount of passive income. This is also the only method of calculating the taxable amount under the German measures, unlike the Australian and US measures which provide options.

B. *Distribution of profits*

This section discusses the distribution of profits by the foreign corporation from income which has been previously attributed to a shareholder and the effect that such a distribution has on the shareholder's taxable income.

1. Australia

A distribution from income which has been attributed to a taxpayer under the FIF measures is exempt from tax when paid to that taxpayer.[50] This is done in order to prevent the double taxation of those attributable profits. The exemption is only available where the distribution comes to the particular taxpayer who was subject to attribution. Additionally, when an interest in a FIF is disposed of the money received from the sale is reduced by previously attributed income that has not been distributed to the taxpayer, thereby reducing any capital gain.[51]

To claim the exemption on distribution or the reduction on disposal, the taxpayer must keep records of the income attributed under the FIF measures and any distribution from the FIF for which an exemption or part thereof has been granted. These records are known as attribution accounts.[52] These attribution accounts are credited by amounts attributed to the taxpayer from the FIF. The accounts are debited by the amount distributed to the taxpayer by the FIF. Any distribution from the FIF to the taxpayer will be exempt unless the payment exceeds the surplus of the account. In such a case only an amount equal to that surplus will be exempt. These attribution accounts are specific to a particular taxpayer, so that when income is attributed to an Australian partnership or trust, the credit does not attach to the partnership or the trust but the person paying the tax, i.e. the partner or beneficiary.

2. United States

Where a shareholder has not elected for current taxation and receives a distribution which is an excess distribution (see discussion above), the distribution gives rise to the imposition of tax at the highest marginal rates and a deferral charge. Undistributed income included in the gross income of a shareholder under the current taxation election is not taxable again when an actual distribution is made. However, any taxes deferred under the current taxation election and accrued interest thereon must be paid at the time of distribution. Such a distribution from previously attributed earnings of the PFIC is treated as a distribution which is not a dividend and therefore not taxable as such.

Under the current taxation election, the cost base of the holding in the foreign corporation is altered from year to year. That cost base is increased for undistributed attributable amounts and decreased for distributions from profits which have already been attributed. Under the Australian measures, it is not the cost base that is altered but the consideration received from the sale of the shares.

3. Germany

The amount of income which will be attributable to a German taxpayer in any given year is reduced by dividends received in that year. Similar to the Australian and US measures, dividends actually distributed by the foreign corporation from previously attributed income are exempt up to the amount of previously attributed income. The German measures also reduce the tax payable on gains received on the sale of shares in a PFIC by the tax paid on attributed amounts that have not been distributed.

49. See *supra* note 18.
50. Sec. 23AK.
51. Sec. 613.
52. The rules in relation to these accounts appear in Secs. 601-607.

© 1993 International Bureau of Fiscal Documentation

C. *Relief from foreign taxes*

This section considers what relief is available for foreign taxes imposed on both income that has been subject to attribution and distributions which have been made from such income.

1. Australia

Under the foreign tax credit system, foreign-source income derived by Australian residents is generally subjected to Australian income tax. A credit for foreign tax paid, up to a limit of the Australian income tax payable on the relevant amount, is allowed against the Australian tax payable. Further, an Australian resident corporation that receives a dividend from a related foreign corporation is allowed not only the direct credit for foreign taxes imposed on the dividend but also an indirect credit for any foreign taxes imposed on the portion of profits from which the dividend is paid, i.e. the underlying foreign tax. A foreign corporation is a related corporation if the Australian corporation has a direct voting interest of at least 10 percent in the foreign corporation. This relationship can extend through any number of tiers of foreign corporations provided each member in the chain has a 10 percent interest in the corporation in the tier below and the Australian corporation has a direct or indirect voting interest of at least 5 percent in the foreign corporation. The credit allowable for foreign tax paid on foreign income is also subject to quarantining provisions whereby the allowable credit is calculated separately for various types of income. Further, excess foreign tax credits can be carried forward for five years and applied against foreign income of the same class. Non-portfolio dividends paid to a resident corporation by a related corporation which is resident in one of certain listed countries[53] are exempt from Australian tax.

The availability of relief for foreign taxes when income of a FIF is attributed to an Australian taxpayer will now be considered. Firstly, where the market value method is used to determine attributable income, no credit is allowed for foreign tax paid by the FIF. This is because the closing market value of the interest in the FIF implicitly takes into account any liability for taxes. No credit for this underlying tax is available where the deemed rate-of-return method is used to calculate FIF income.

Where the calculation method is used, a foreign tax credit may be allowed for the foreign tax paid by the FIF on the income which has been attributed. However, this will only be allowed where the Australian taxpayer and the FIF are related.[54] The credit allowed is equal to the resident corporation's share of the taxes paid by the FIF that were allowed as a notional deduction in the calculation of the FIF's notional income. However, where the credit is claimed, the foreign attributable income in the hands of the Australian related corporation must be grossed up to include the foreign tax, i.e. the deemed underlying tax credit.[55]

Relief from foreign taxes when a distribution is made in whole or in part from income which has been previously attributed will now be considered. Firstly, the part of the dividend which is taxable[56] may qualify for a foreign tax credit under the general provisions mentioned earlier. In addition, the taxpayer is allowed a credit for the foreign tax paid on that portion of the dividend that is exempt because of previous attribution.[57] The difficulty with these credits is that when attribution is made, Australian tax is paid on the foreign income. When a distribution from that income occurs some time later, foreign withholding tax will be paid on the distribution and a foreign tax credit will arise in Australia despite the dividend being exempt. However, this credit can only be set off against foreign income of the same class, but the foreign income it relates to may have been attributed and taxed some years before and the taxpayer is only allowed to carry excess credits forward for five years. Shareholders who have amounts attributed to them and taxed, and receive a final large distribution from a FIF[58] may find that they have large foreign tax credits and after the disposal of their interest in a FIF, no foreign income to set them against.

As mentioned earlier, where the Australian shareholder and the FIF are related corporations, the shareholder is entitled to claim a foreign tax credit at the attribution stage for the underlying foreign tax on the income attributed, but only if the calculation method is used. A shareholder who claims such a credit must keep "attributed tax accounts" in addition to the attribution accounts mentioned above.[59] The foreign tax credit which is normally allowed on the distribution of profits from previously attributed income, including the credit for underlying foreign tax, will be reduced by the tax credit which the shareholder has already claimed at the attribution stage.

2. United States

The US measures with respect to relief for foreign taxes are broadly the same as the Australian measures, i.e. there is both a direct foreign tax credit for foreign taxes paid on distributions to US shareholders and an indirect credit for the foreign tax paid on the income from which the distribution is made where the US shareholder is a corporation with at least a 10 percent interest in the foreign corporation paying the distribution.

Where such a 10 percent corporate shareholder has elected for current taxation it can claim an immediate tax credit for the underlying foreign tax paid by the PFIC on the income which has been attributed to it. This also requires the grossing up of the attributable amount to include the indirect foreign taxes. When a distribution is made, any creditable direct or indirect foreign taxes will be reduced by the credit previously granted. These provisions are much the same as the Australian measures.

Where the US shareholder does not elect for current taxation, when a distribution is made the shareholder may still claim

58. E.g. upon its liquidation.
59. Secs. 602-612.

© 1993 International Bureau of Fiscal Documentation

both a direct and indirect (where the shareholder is a corporation) credit for the foreign tax paid. These taxes are first allocated between that part of the distribution which is an excess distribution and that part which is not. The taxes attributable to the excess distribution are further allocated rateably to each day the taxpayer has held the shares in the PFIC. The portion of taxes so allocated reduces the tax payable with respect to each year that the excess distribution is allocated, thereby reducing the overall deferral charge. While this is not technically a foreign tax credit, it operates in much the same way.

US shareholders who elect current taxation may also claim a direct credit for foreign taxes imposed on distributions from a PFIC, but these taxes are not allocated to each year of their holding. A corporate shareholder may also claim an indirect credit where one was not claimed at the attribution stage. Income derived from a PFIC will be included in the passive income basket for the purposes of computing the limitation on the foreign tax credit under the US quarantining measures.

3. Germany

Germany also has implemented a foreign tax credit system. Both a direct foreign tax credit and an indirect credit (where the German corporation directly holds at least 10 percent of the foreign corporation for a full 12 months) may be available to the extent of the German tax imposed.

Under most German tax treaties, dividends received by a German corporation from a corporation resident in the other country are tax exempt.[60] This treaty exemption has been removed for income which is attributable as a deemed dividend under the new German measures. A direct credit is available for taxes imposed on distributions from previously attributed amounts when that income is distributed. An indirect tax credit may be available for German corporate shareholders[61] for the underlying tax on income which has been previously attributed to the shareholder; this credit reduces the German tax payable on the attributed dividend. The German measures apply in much the same way as the Australian and US measures.

IV. EXAMPLE

Offshore Co. is a foreign corporation which earns predominantly passive income and is therefore subject to the Australian, US and German measures. Offshore has issued 100 shares of which A owns 5, B owns 15 and C Ltd owns 25. The shares in Offshore have been held for three years during which Offshore has paid no dividends. Offshore has assets of $ 400,000. In years 4 and 5, Offshore's books reveal:

	Year 4	*Year 5*
Gross Active Income	10 000	10 000
Gross Passive Income	30 000	30 000
Total	40 000	40 000
Tax	10 000	10 000
Net available for distribution	30 000	30 000
Distributions from Net Income	Nil	50 000

For the purpose of this example, it is assumed that the foreign corporate tax rate is 25 percent and the foreign withholding tax rate is 15 percent. Further, it is assumed the domestic corporate tax rate is 30 percent and the individual tax rate is 35 percent. The taxation of the shareholders in years 4 and 5 is as follows:

Year 4

Shareholder A

Australia
A is a small investor as his interest is worth approximately 5 percent of $ 400,000 or $ 20,000. A is exempt from attribution under the Australian measures.

United States
A is subject to the US measures but for the purpose of the example it is assumed he does not elect current taxation and therefore has no liability in year 4.

Germany
A is exempt from the German measures because he holds less than a 10 percent interest.

Shareholder B

Australia
B uses the calculation method to determine the attributable amount. Offshore's notional income is $ 40,000 less foreign corporate tax of $ 10,000, i.e. $ 30,000. B's share of this income is 15 percent or $ 4,500. This amount is included in B's taxable income for year 4 giving rise to tax of $ 1,575.

United States
B elects current taxation, the tax payable in year 4 is $ 1,575, calculated in a similar manner as under the Australian measures. B elects to defer payment of this tax and so has no liability in year 4.

Germany
B is attributed only a portion of Offshore's passive income. This amount is $ 30,000 less foreign corporate tax of $ 7,500, leaving $ 22,500 of which B's share is 15 percent or $ 3,375. This amount is included in B's taxable income giving rise to tax of $ 1,181.

Shareholder C Ltd

Australia
C Ltd also uses the calculation method. Notional income is again $ 30,000 (net of foreign corporate tax) of which C Ltd's share is 25 percent or $ 7,500. C Ltd must gross this amount up with foreign corporate tax in order to claim an indirect foreign tax credit. $ 10,000 is included in C Ltd's taxable income giving rise to $ 3,000 tax. This tax is reduced by the indirect foreign tax credit of $ 2,500, leaving $ 500 of tax payable in year 4.

United States
C Ltd elects current taxation. This tax is calculated in a similar manner as under the Australian measures giving rise to a current liability of $ 500.

60. Conditions are generally placed on this exemption, e.g. a 10% holding in the other corporation.
61. Subject to certain conditions.

© 1993 International Bureau of Fiscal Documentation

Germany

C Ltd is attributed its portion of Offshore's passive income gross of foreign corporate tax assuming it can claim an indirect foreign tax credit. C Ltd's share of the passive income is 25 percent of $ 30,000 or $ 7,500. This amount gives rise to tax of $ 2,250 which is offset by a foreign tax credit equal to C Ltd's share of the foreign corporate tax paid, being 25 percent of $ 30,000 is $ 7,500 foreign corporate tax of which C Ltd's share is 25 percent or $ 1,875. C Ltd must pay $ 375 in year 4.

Year 5

Shareholder A

Australia

A receives 5 percent of the distribution, i.e. $ 2,500. This amount is included in A's taxable income, giving rise to tax of $ 875. A is granted a tax credit for foreign withholding tax of 15 percent of the dividend or $ 375. A must pay $ 500 in tax in year 5.

United States

A receives a dividend of $ 2,500, all of which constitutes an excess distribution because no distributions have been received in the last three years. This amount is allocated rateably to each day in A's five years of holding shares in Offshore and tax is imposed on the yearly totals at the highest marginal rates, i.e. $ 500 is allocated to each year, the tax on this amount is $ 175 per year. A may still claim the direct foreign tax credit of $ 375. This amount is also allocated rateably to each day in A's holding and reduces the tax payable in each year, i.e. $ 75 credit is allocated to each year reducing the tax payable in each year to $ 100. The deferral charge is then imposed and compounded on the tax outstanding for years other than the current year. Suppose the deferral rate is 10 percent simple interest per year, the deferral charge for year 1 in year 5 is $ 46, for year 2 is $ 33, for year 3 is $ 21 and for year 4 is $ 10. A is liable to pay the total of the outstanding taxes and the compounded deferral charges i.e. 500 + 46 + 33 + 21 + 10 = $ 610.

Germany

A's tax is calculated in a similar method as the Australian measures giving rise to tax of $ 500.

Shareholder B

Australia

The notional income of Offshore is the same as for year 4, i.e. $ 30,000, of which $ 4,500 is B's share. B also receives 15 percent of the dividend or $ 7,500. $ 4,500 of this amount eliminates the notional income attributable to B, but this amount of the dividend is not paid from previously attributable income so it must be included in B's taxable income. The remaining $ 3,000 is paid out of previously attributed income and is therefore exempt. The tax imposed on $ 4,500 is $ 1,575. B may offset against this tax a credit for the foreign withholding tax payable on the entire dividend, i.e. 15 percent or $ 1,125. B must pay $ 450 tax in year 5.

United States

Of the $ 7,500 dividend received by B, $ 4,500 is attributable to income earned by Offshore in the current year. This amount is subject to tax of $ 1,575. The other $ 3,000 is paid out of previously attributed income which is exempt. However, the payment of this amount makes a portion of the tax deferred from year 4 payable. $ 3,000 is two-thirds of the income attributed in year 4 and so two-thirds of the tax deferred is payable, i.e. $ 1,050 is now payable. B can claim a credit for the foreign withholding tax of $ 1,125. $ 675 of this credit relates to current tax on the sum of $ 4,500, reducing tax thereon to $ 900. The remaining $ 450 reduces the deferred tax that is payable to $ 600. The deferral charge on this amount is $ 60. In year 5 B must pay $ 1,560 (900 + 600 + 60).

Germany

As all Offshore's passive income for year 5 has been distributed, B is not subject to attribution. Of the $ 7,500 dividend, $ 4,500 relates to income from year 5 and $ 3,000 to income from year 4. In year 4, three-quarters of Offshore's income was passive, therefore three-quarters of the $ 3,000 is attributable to passive income of year 4 or $ 2,250. This amount is exempt from tax because it is paid from previously attributable income. The remaining $ 5,250 is subject to tax of $ 1,837.50. This tax is reduced by a credit for the foreign withholding tax of $ 1,125. B must pay tax of $ 712.50 in year 5.

Shareholder C Ltd

Australia

C Ltd's share of Offshore's income ($ 7,500 the same as year 4) is paid as part of the $ 12,500 dividend received, attribution taxation will not apply to this sum of $ 7,500. This $ 7,500 has not been paid out of previously attributed income; it is grossed up with foreign tax because C Ltd wishes to claim an indirect credit for the underlying foreign corporate tax. The grossed up amount is $ 10,000 which is included in C Ltd's taxable income, giving rise to tax of $ 3,000.

C Ltd can claim a credit for the foreign withholding tax on the $ 12,500 dividend, being $ 1,875. There is also an indirect credit for the part of the dividend not paid out of previously attributed income, i.e. $ 10,000 giving rise to a tax credit of $ 2,500. The indirect foreign tax credit for the rest of the dividend was claimed in year 4. The total of these credits ($ 4,375) is limited to the amount of Australian tax payable on similar income. The Australian tax payable on the $ 7,500 part of the dividend is $ 3,000 (as calculated in the last paragraph). The $ 5,000 part of the dividend is first grossed up by foreign corporate tax to $ 6,666.66, the Australian tax on this sum is $ 2,000. Therefore, the foreign tax credit limit is $ 5,000, of which, indirect credit for the $ 5,000 part of the dividend was granted in year 4 in an amount of $ 1,666.66 (i.e. $ 5,000 is two-thirds of the amount attributed in year 4, so two-thirds of the $ 2,500 tax credit is $ 1,666.66). Thus the foreign tax credit available in year 5 is $ 3,333.34 ($ 5,000 – $ 1,666.66). This amount offsets the Australian tax payable giving rise to an excess foreign tax credit of $ 333.34.

© 1993 International Bureau of Fiscal Documentation

United States
C Ltd's tax is calculated in a similar way to that under the Australian measures. C Ltd has an excess foreign tax credit of $ 333.34.

Germany
All passive income for year 5 has been distributed. The $ 12,500 dividend relates $ 7,500 to income of year 5 and $ 5,000 to income of year 4. Three-quarters of this $ 5,000 amount is attributable to passive income of year 4, i.e. $ 3,750. This amount is exempt because it is paid from previously attributed income. The remaining amount of the dividend, i.e. $ 8,750, is grossed up with foreign corporate tax assuming C Ltd can claim an indirect tax credit, i.e. $ 11,666.66. The tax on this sum is $ 3,500.

C Ltd claims a credit for the foreign withholding tax on the distribution in the sum of $ 1,875. There is also an indirect foreign tax credit for foreign corporate tax paid on that part of the dividend which was paid out of income which was not previously attributed, i.e. $ 8,750 grossed up to $ 11,666.66, giving rise to a credit of $ 2,916.66. The potential foreign tax credit is $ 4,791.66 but this sum is limited to the amount of German tax payable on a similar sum, i.e. $ 11,666.66 + $ 5,000 ($ 3,750 grossed up with foreign tax) = $ 16,666.66. The German tax would be $ 5,000 and this is the foreign tax credit limit. This limit is reduced by the portion of the credit granted in year 4 which relates to the exempt part of the dividend, i.e. grossed up dividend of $ 5,000 is two-thirds of the amount attributed in year 4 ($ 7,500); two-thirds of the foreign tax credit granted in year 4 ($ 1,875) is $ 1,250. Therefore the limit is reduced to $ 3,750 ($ 5,000 – $ 1,250). This credit eliminates the tax due in year 5 and C Ltd has an excess foreign tax credit of $ 250.

V. CONCLUSION

The most significant difference between the measures is that the German measures only attribute income of corporations resident in low-taxed countries and only seek to attribute passive income. In contrast, the Australian and US measures apply regardless of the foreign tax rate and seek to attribute all the income of the foreign corporation. Therefore the German measures are the narrowest in scope. Another major difference is the option under the US measures to defer payment of the tax imposed on the attributable amount; this option is not available under the Australian or German measures. This option is desirable as it temporarily relieves a tax burden imposed on a taxpayer who has not received the income subject to taxation.

The example illustrates how the most simple factual situation can give rise to complex issues in determining the tax payable, particularly the foreign tax credits available. While the Australian model appears fair in light of the US and German models, it suffers the same flaw in that it creates a high level of compliance costs. While this factor is unlikely to upset lawyers and accountants, the taxpayers who have to meet not only the compliance costs but the tax liability may decide to keep their passive investments onshore. No doubt, this is one of the motives behind the implementation of such measures.

GERMANY:
RECENT LEGISLATIVE DEVELOPMENTS

Friedhelm Jacob

Mr Jacob is an associate tax partner at Hengeler Mueller Weitzel Wirtz, Frankfurt. He was the Associate International Tax Counsel for the German Federal Finance Ministry from 1980–1986, and from 1986–1991 he was the Fiscal Counsellor of the German Embassy in Washington, D.C. He has authored numerous publications on international tax law, and is a co-author of the Debatin-Walter Handbook on the US–German Tax Treaty. He contributes regularly to Internationale Wirtschaftsbriefe.

In the July/August 1993 issue of the *Bulletin* a tax package was presented that was still in draft form at that time. We can now provide an update on the key features of this package which was promulgated on 17 September 1993.[1]

I. REVENUE LOSERS

Corporate income tax rates are lowered
- on retained profits from currently 50 percent to 45 percent;
- on distributed profits from currently 36 percent to 30 percent;
- on the profits of a German branch of a foreign corporation from currently 46 percent to 42 percent.

The current "recapture" of corporate income tax on the distribution of foreign treaty-exempt income is eliminated if such income is distributed to a corporate shareholder. The dividend received by the German shareholder corporation remains tax-exempt to the extent the dividend is distributed out of foreign treaty-exempt income. However, the further distribution of such income to the ultimate individual shareholder, while not subject to a recapture tax on the level of the distributing corporation, will remain taxable to the recipient. The individual shareholder is not entitled to the corporate imputation credit (because no German corporate income tax was collected with respect to the treaty-exempt income). There is also no relief for any foreign tax paid on the relevant income underlying the distribution. The new rules will enhance the tax situation of German holding companies and their German corporate shareholders.

The dividend participation exemption under tax treaties is extended to capital gains from the disposition of shares in a foreign subsidiary or affiliate. A capital loss remains deductible from taxable income.

The German permanent establishment of a non-resident corporation enjoys the same exemptions with respect to treaty-exempt income as a German resident corporation entitled to the benefits of the relevant tax treaty.

The top personal income tax rate on income from industrial or commercial activities is lowered from currently 53 percent to 47 percent in order to compensate for trade tax on income without eliminating this tax altogether (requiring an entirely new system of revenue sharing) and without an across-the-board lowering of the top personal income tax rate on all categories of income.

II. REVENUE RAISERS

These tax benefits are partly offset by base-broadening measures. In the international context these base-broadening measures involve the introduction of thin capitalization and anti-dividend stripping rules.

A. *New thin capitalization rules (Section 8a Corporate Income Tax Act)*

The new provisions would recharacterize as constructive dividend distributions any consideration payable by a German resident corporation to a shareholder not entitled to the corporate imputation credit holding more than a 25 percent interest in the stated capital of the corporation,[2] where such consideration pertains to
- any debt instrument providing for consideration in terms other than a fixed percentage of the loan principal (such as profit participating rights or loans or other

1. See Bundesgesetzblatt 1993 part I, at 1569.
2. Specific anti-avoidance rules provide that the thin capitalization legislation also applies to shares held through a partnership and to 25% or lower shareholdings where the shareholder, either alone or in cooperation with other shareholders, exercises "controlling influence" over the corporation.

© 1993 International Bureau of Fiscal Documentation

"hybrid instruments") where the loan capital extended by the shareholder exceeds 50 percent of that portion of the corporation's equity that corresponds to the shareholder's interest in the corporation's stated capital (1:2 debt/equity ratio);
- any other indebtedness, where the loan exceeds a debt/equity ratio of 3:1, unless an unrelated party would have extended such loan capital at the same terms and conditions or the loan serves to finance transactions usual in the banking sector.

The same rules apply if a person related to the shareholder extends the loan and such person is not entitled to the corporate imputation credit or if a third party provides the loan financing, where such third party has recourse to the shareholder or to a person related to the shareholder.

A special safe haven debt/equity ratio of 9:1 applies to German holding companies with respect to non-hybrid debt instruments. However, the German entities controlled by the holding company are not covered by a special safe haven. As a consequence a holding company structure cannot be used to increase the volume of acceptable shareholder loan financing of share acquisitions beyond the 9:1 ratio.

B. *New anti-dividend stripping rules (Section 36(2) No. 3(g); Section 50c(7) and (10) EStG)*

Due to the German corporate tax regime (imputation credit) and the unwillingness of the German legislature to permit a corporate tax refund to non-resident shareholders by treaty, stock of a German corporation is worth more in the hands of a resident taxable entity on dividend day than in the hands of a non-resident or a domestic tax-exempt entity. The imputation credit mechanism has led to a substantial volume of trade into Germany with respect to stock in German corporations around ex-dividend day designed to make the imputation credit available, at least economically, to non-resident shareholders. Surprisingly little administrative guidance exists on the acceptability of such "dividend strategies". A 1978 ruling denies the tax credit to the interim holder of stock that purchased stock from a non-resident shortly before ex-dividend day, collected the dividend, claimed the withholding and imputation credits, and agreed to sell the stock back at the quoted price soon thereafter. The ruling relies on abuse of legal form considerations.

A tax court decision of 1982 indicates that even a repurchase arrangement is acceptable and results in the attribution of the income derived from a security to its interim holder as the beneficial owner of the income. The decision dealt with debt instrument generating tax-exempt interest, not dividends.

The use by non-residents of the imputation credit runs counter to a core element of the German corporate tax imputation system. This is why the legislators saw a need for new rules designed to make certain dividend arrangements between persons not entitled to the German corporate tax imputation credit (i.e. persons not resident in Germany and German-resident tax-exempts) and persons entitled to such credit less attractive.[3]

The new legislation seeks to tackle the issue on two separate fronts, i.e. by
- denying the corporate imputation credit in full or in part to the resident dividend recipient;
- limiting the ability of the resident to claim a tax deduction for the trading loss that arises when he sells the share after the ex-dividend day.

1. Limitations on the resident's ability to claim the imputation credit

Under the new legislation (see Section 36(2) No. 3(g) Income Tax Act) the dividend recipient is not entitled to the corporate imputation credit to the extent that

> "the corporate income tax is attributable to investment income derived by the payee where such investment income does not result in an assessment of the payee to tax due to the fact that the payee, in connection with such investment income, has itself made deductible payments (other than for financing costs usual in the market) which are outside German taxability in the hands of their recipient."

This language is obviously designed to apply to any arrangement pursuant to which the resident and the non-resident somehow share the imputation credit benefit. If a non-resident makes available over ex-dividend day shares issued by a German resident corporation to a German resident entity, the German resident is entitled to the dividend income and would normally also be entitled to the corporate imputation credit. If the German resident transports the dividend plus all or part of the corporate imputation credit to the non-resident, for instance by way of a stock lending fee or an "in lieu" payment, such payment constitutes a deductible business expense to the German resident and offsets the taxable income from the dividend receipt, grossed-up by the amount of the corporate imputation credit. The non-resident is not subject to German tax with respect to the "in lieu" payment received. Section 50c Income Tax Act (see below at 2) is generally inapplicable to this type of arrangement as the shares are either not transferred back to the non-resident or are transferred back at a predetermined price that does not result in a loss to the German resident.

2. Limitations on the recognition of loss after ex-dividend day

Pursuant to Section 50c Income Tax Act a German resident acquiring from a non-resident stock issued by a German resident corporation cannot recognize a tax loss where the loss reflects a reduction in the stock's value due to the distribution of the dividend. A tax deduction for such loss is barred for ten years beginning in the year of the acquisition and extends to losses from the disposition of the stock and to extraordinary write-offs under a mark-to-market approach. By way of an exception to this general rule, Section 50c is currently inapplicable to stock acquired on the exchange through a financial institution.

3. For ease of presentation a person not entitled to the corporate imputation credit is referred to here as the "non-resident" and a person entitled to such credit as the "resident".

© 1993 International Bureau of Fiscal Documentation

The new legislation modifies and limits the exchange-trading exception. The exception now applies to any acquisition of shares on the exchange regardless of whether the trade was executed through a financial institution. Where shares are acquired on the exchange the exchange-trading exception will be unavailable in any one of the following three situations:

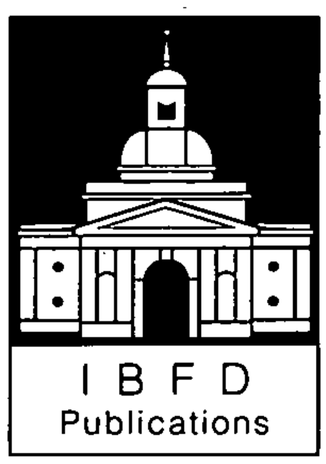
- the time period between the acquisition of the shares and the disposition of the same shares or shares of the same kind does not comprise at least 30 days, and the dividend was declared during such time period;
- the shares or shares of the same kind are sold back to the seller, directly or indirectly, pursuant to terms and conditions that result in a "limitation of the price risk", whether these terms and conditions are taken alone or in conjunction with other arrangements;
- all or part of the consideration for the acquisition of the shares is represented by an obligation to transfer shares that do not or do not fully entitle their owner to receive dividends.

If the German resident purchaser of the shares can demonstrate that the shares were acquired from a resident then the foregoing limitations to the exchange-trading exception do not apply.

Under the new rules the limitations to the exchange-trading exception do not apply to the extent the imputation credit is denied under Section 36(2) No. 3(g) Income Tax Act.

EUROPEAN TAXATION

The official journal of the Confédération Fiscale Européenne, European Taxation offers in-depth coverage of taxation in European countries.



- Current issues discussed in detailed articles
- An outline of the latest changes and developments in systems and treaties
- 'EC Update' section details developments from the European Community

The journal also includes case notes, rulings and decisions and is indexed.

IFA NEWS

SOME HIGHLIGHTS FROM THE SECRETARY GENERAL'S 1992/93 GENERAL REPORT

J. Frans Spierdijk

INTRODUCTION

In this year between Cancún and Florence the General Secretariat has been involved particularly in the deliberations and preparations concerning the new discussion procedures for the main Subjects which we are going to try out in the forthcoming Congress. There have been frequent contacts and meetings with Prof. Fantozzi, with the Discussion Leaders, the General Reporters and others and we all look forward with great interest now to what the discussions are going to bring us in actual practice. It is a gratifying experience to assist in the work that a number of highly qualified people are willing to do for IFA on a voluntary basis. This is true not just for this specific project. Generally speaking, there is no doubt that our sizeable worldwide Association could not be seconded by a small General Secretariat like we have without the invaluable contributions of time, effort and resources made by many of our members and by the National Branch organizations. There is every reason for me and the staff at the General Secretariat to express our appreciation to all of you who make our work feasible and light.

CANCÚN CONGRESS

The second IFA Congress held in Mexico – the first one convened in Mexico City in 1974 – definitely was a great success. First of all, the topics of both the main Subjects and Seminars were of great interest. Secondly, the tropical time schedule met with the approval of many attendants to the sessions. The working sessions were remarkably well attended. Upon recommendation of the Permanent Scientific Committee (PSC), in consultation with our Italian IFA friends, it was decided to follow the same time schedule during the 1993 Florence Congress. Let us see whether it works as well in a non-tropical climate.

We owe great thanks to the Mexican IFA Branch for having done such a good job. In particular, Mr Carlos Sellerier, President of the Congress, and Mr Enrique Ramírez Villegas, were the ones who made it all work and who invested much time, enthusiasm and effort during the long period of preparation. Mrs Mercedes Sellerier and Mrs Yolanda Ramírez, I know, were more than supportive to their husbands and I gladly include them in our feelings of appreciation and gratitude.

For main Subject I, "Transfer pricing in the absence of comparable market prices", the General Reporter was Avv. G. Maisto (Italy). Twenty-six National Reports were included in the 1992 Cahiers. Discussion Leader was Mr N. Boidman (Canada). Panellists were Messrs J.P. Le Gall (France), Y. Gomi (Japan), H.M.A.L. Hamaekers (Netherlands), D. Lüthi (Switzerland) and R. Watson (USA), whereas Mr A. Navarro (Mexico) was Chairman of the Working Session and Mr R. Caraza Escobedo (Mexico) and Mr A. Manganelli (Italy) acted as Secretaries. The Résumé Committee was chaired by Mr M. Ellis (Netherlands), with Messrs P. Anderson (Australia), J.A.K. Clark (United Kingdom), R. Moreyra (Mexico), H. Torrione (Switzerland) and A. Weber (Germany) as members.

Mr W.B. Taylor (USA) covered main Subject II, "Tax consequences of international acquisitions and business combinations", in his General Report. This Cahier contains 27 National Reports. Mr R. Koch-Nielsen (Denmark) acted as Discussion Leader, and Dr J. Sáinz Alarcón (Mexico) and Mr G. Preciado (Mexico) as Chairman and Secretary of the Working Session. Members of the Panel were Messrs M. Gammie (United kingdom), H. de Groot (Netherlands), J.S. Hausman (Canada), Y. Kergall (France) and Dr J. Killius (Germany). Chairman and members of the Résumé Committee were Dr A. Burckhardt (Switzerland), and Messrs A.C. de Abreu e Silva (Brazil), C. D'Andria (Italy), Dr H. Becker (Germany), M. Castro (France) and H. Ortiz (Mexico).

The Report of Proceedings on Subjects I and II were written by Dr J.B. Bracewell-Milnes (United Kingdom) and published in the IFA Yearbook 1992. There one also finds the Resolutions on the two Subjects and their reviews by the Chairmen and of the Résumé Committees. The IFA membership is again indebted to all those people who have helped to develop two most interesting Subjects of international taxation. The General Reporters, the National Reporters, the Discussion Leaders, the Panellists and Secretaries, the Chairmen and Members of the Résumé Committees and also the other participants in the discussions deserve our sincere thanks.

The Seminars were the following: Seminar A treated the topic of "Advance ruling: practice and legality". Prof. J.M. Rivier (Switzerland) acted as Chairman, Mr P.A. Harris (Australia) as Secretary, and Messrs R. Baconnier (France, W. Dann (Germany), S. Lainoff (USA), A. Timmermans (Netherlands) and N. Virin (Sweden) as members of the Panel. "Branch Tax" was the topic of Seminar B. The Panel, consisting of Messrs E. Bunders (Netherlands), J.C. Contrim (Brazil), F.L. Jacob (Germany) and Guillouet (France) was chaired by Mr C.L. Estes (USA). Dr R. Asorey (Argentina) chaired Seminar C, "Tax treatment of international loans". The Panel consisted of Messrs A. Elvinger (Luxemburg), E. Henbrey (United Kingdom), A. Joseph (USA), M Otsuka (Japan) and A. de Souza Correa Meyer (Brazil). "Consequences under tax treaties of operating through a dependent or independent agent", Seminar D, was chaired by Prof. K. van Raad (Netherlands). Panellists were Messrs R. Doernberg (USA), W.T. Kim (Korea, Republic of), Prof. J.M. Mössner (Germany) and A. Skaar (Norway), while Mr R. Sommerhalder (Netherlands) acted as Secretary. Chairman of Seminar E, "Mexican tax treaties", was Dr R. Aguirre (Mexico), with Messrs J.M. Déry (Canada), F. Ruiz (Mexico), M.

© 1993 International Bureau of Fiscal Documentation

Stucker (USA), and M. Tron (Mexico) as members of the Panel.

Expectedly, Seminars A and D will result in a publication in the "IFA Congress Seminar Series".

Finally, I take pleasure to report that Mr Jacques Sasseville from the OECD made an interesting and lively presentation of the new loose-leaf OECD Model Tax Convention at a special session of the Cancún IFA Congress. We took good note of his speech and in particular of the fact that the OECD would welcome suggestions from IFA on various matters. The PSC and Executive Committee (EC) are considering how to best structure IFA's involvement in this process.

PERMANENT SCIENTIFIC COMMITTEE

In February the PSC enjoyed the superb hospitality of the Italian Branch at their meeting in Rome. Part of the deliberations dealt with the new discussion procedure at the working sessions of the Main Subjects, which is going to be introduced in Florence on a trial basis. Application of this so-called "Fantozzi Model" is going to be an interesting experiment for all of us. The new procedure is explained in a letter by the PSC Chairman, Prof. Avv. Augusto Fantozzi, sent with the Florence invitation programme. Like last year, this programme was printed in and mailed from the Netherlands, in April. Since the new procedure needs careful evaluation afterwards, I urge all participants to the Florence Congress to please fill out the questionnaire to be distributed.

Another new feature to be introduced at the Florence Congress on a trial basis is what was called "Poster Sessions". It means that in the Exhibition Area some students are given the opportunity to present to the Congress participants the doctoral thesis they are working on in the field of international or comparative taxation. They are invited to do so by way of showing a sort of Poster outlining the structure of their thesis. It is expected that the students and, hopefully, a great number of Congress participants will find it interesting and beneficial to meet and exchange views.

The preparations for Florence are proceeding satisfactorily. Twenty-six National Reports were submitted for both Subject I, Interpretation of double taxation conventions, and Subject II, "Non-discrimination rules in international taxation". General Reporters are Prof. Dr K. Vogel and Dr R. Prokisch (Germany) for Subject I; and Prof. Avv. P. Adonnino (Italy) for Subject II.

The following Seminars will be held:

A: Harmonization of corporate taxes in the EC.
Chairman: Prof. H.M.A.L. Hamaekers (Netherlands)

B: Taxation of employee fringe benefits
Chairman: Prof. R. Krever (Australia)

C: Environmental taxes and charges
Chairman: Prof. S.O. Lodin (Sweden)

D: Corporate tax on distributions (equalization tax)
Chairman: Dr M. Pagani (Italy)

E: Resolution of tax treaty conflicts by arbitration
Chairman: Prof. G. Lindencrona (Sweden)

F: Italian tax treatment of new financial instruments
Chairman: Prof. Avv. G. Tremonti (Italy).

For the 1994 Toronto Congress the two main Subjects will be "Deductibility of interest and other financing charges in computing income", General Reporter: Prof. B.J. Arnold (Canada); and Subject II, "National and international tax consequences of demergers", General Reporter: Prof. A.J. Rädler (Germany). The Seminars will deal with Harmonization of tax under the North American Free Trade Agreement; How domestic anti-avoidance legislation affects double taxation conventions; OECD Model Treaty; Recent transactions; and possibly "Secondary aspects of transfer pricing adjustments".

The main Subjects for Cannes 1995 were definitely fixed. They are: Subject I, "International tax problems of partnerships", with Mr J.P. le Gall (France) as General Reporter; and Subject II, on "Tax aspects of recently developed financial instruments", with Messrs H.D. Rosenbloom and C.T. Plambeck (USA) as General Reporters, and Ms D.M. Ring (USA) as Assistant General Reporter.

Promising topics came up for the 1996 Congress in Geneva. With the help of the IFA researchers some of them will be developed further.

Implementing IFA's policy of a more frequent rotation and rejuvenation of Committee membership it was decided to recommend a number of changes to the Executive Committee for subsequent proposal to the General Council during the Florence Congress. The proposed changes are as follows:

- Prof. I. Claeys Bouuaert to be replaced by Mr J. Malherbe (Belgium)
- Prof. Dr E.J. Reig by Dr A. Atchabahian (Argentina)
- Dr J.B. Bracewell-Milnes by Mr I. Spence (United Kingdom)
- Mr J. Basxanta de la Peña by Mr M. Marin Arias (Spain).

The selection of topics by the PSC is made considerably easier by the thorough preparatory work done by the Research Subcommittee. Under the Chairmanship of Prof. Hugh Ault the Subcommittee develops balanced recommendations for the scientific programmes of our Congresses. In making its recommendations, the Subcommittee liaises with the hosting IFA Branches of future Congresses and also has an open eye for what is going on in OECD circles. In close cooperation with the IBFD, the IFA researcher is instructed to work on certain subjects and to prepare outlines and bibliographies. Mr Peter Harris (Australia) did an excellent job in this respect. He has now been replaced by Ms Lynette Eastmond (Barbados), from whom we also have great expectations.

EXECUTIVE COMMITTEE

On 2 May 1993, the Executive Committee convened at the Como Lake, Italy, in the beautiful Villa Serbelloni in Bellagio, where our Italian IFA friends spoiled us with their generous hospitality. Mr R.J. Dart (Canada) was welcomed as a new member and we were glad to see Mr A. Piera (Spain) in our midst as member-elect. It was decided to try and involve

© 1993 International Bureau of Fiscal Documentation

the IFA branches in Japan and Australia more actively in the Central IFA organization and to that end a membership of the EC would be appropriate. Our new Articles of Association allow for a maximum of 14 members. In the meantime discussions with these Branches are underway.

As regards the further composition of the EC, the following will be submitted to the General Council for approval. To re-elect Messrs G. Dominjon (France), S.H. Goldberg (USA), I.W. Harris (United Kingdom, previously Hong Kong) and L. Hinnekens (Belgium) for another term of two years; and to nominate Prof. F. Zimmer (Norway) and a candidate from Germany in the vacancies created by the resignations of Mr P. Sundgren (Sweden) and Mr K. Beusch (Germany), respectively.

To issue a press release after each IFA Congress aimed at the major financial newspapers is an idea to be further developed. The distribution of IFA Resolutions/Précis by the National Branches to their governments and other institutions is, generally speaking, taking place on a large scale, so the EC noted with satisfaction.

THINK TANK COMMITTEE

As a result of the discussions held during the Cancún Congress, the TT Committee drafted a questionnaire, which was sent to the National Branches. It is hoped to receive representative answers by 1 September 1993. The purpose of this questionnaire is to ask whether the National Branches of IFA can assist the TT Committee in achieving one of its tasks: to try and establish the desires and objectives of National Branches regarding IFA activities and come up with recommendations or suggested discussion points for EC and PSC.

The outcome of this questionnaire will be carefully reviewed by the TT Committee during their Florence, October 1993, meeting.

MEMBERSHIP FEES

The General Treasurer will propose to maintain the membership fees for 1994 at the level of the previous year:

NLG 105 for individual members of National Branches
NLG 115 for direct individual members
NLG 250 for corporate members, both direct and of National Branches.

NATIONAL BRANCHES AND MEMBERSHIP

During the Cancún Congress we recognized our 41st Branch, in the Republic of China (Taiwan). I am glad to report that the Branch is active and alive as I was able to observe when visiting Taiwan last March, where I was invited to attend a meeting of CESTO, the Council of Executive Secretaries of Tax Organizations.

The Congress in Cancún gave me an opportunity to pay a visit to Panama where I assisted at the inauguration of the association which will expectedly be recognized as IFA Branch at the Florence Congress. With the help of Ms Grace Hernandez and some other IFA members a visit to Costa Rica resulted in a number of interesting contacts which might lead to further developments at a later stage. In Chile, where I attended the Annual Meeting of CIAT last April, I found a number of people interested in establishing an IFA Branch and I look forward to further discussions with participants from Chile at the Florence Congress.

Preparations for the formation of a Branch in Poland are in an advanced stage. In Russia the process is likely to take some more time.

Mr Charlie Dowling has been instrumental in the creation of a Branch in Ireland which will expectedly be recognized as such during the Florence Congress. It is a pleasure working with him.

During a visit to Greece I met with Messrs D. Tsingris, G. Stathopoulos and G. Samothrakis to discuss future activities. Our congratulations to Mr Tsingris, an old-time and devoted IFA member, whom many of us have often met at Congresses, who recently informed us of his Honourary Chairmanship of the Branch.

The annual meeting of the US Branch in Boston on 4-5 March 1993, made it again clear that this is one of the most interesting and comprehensive conferences on international taxation taking place in the US. Contacts between Central IFA and the very active US Branch are excellent from my perception and it is a pleasure to be in touch from time to time with President Mr Richard Goldman and many others.

The Netherlands/UK bilateral IFA meeting in Amsterdam last June provided a good occasion to take part in high-level, off the record discussions in an amicable atmosphere. A most enjoyable experience.

In conclusion, let me refer to the Newsletter which we send quarterly to all National Branches. More and more Branches are informing us of their activities to the benefit of other Branches. Bravo and thanks.

REGIONAL CONFERENCES

It was unfortunate that the 3rd Regional Conference which was scheduled to be held in Singapore in May 1993 had to be cancelled due to a regrettably low number of registrants. All the time and effort spent by the members of the Singapore and US Branches were lost in this way and we can only express our gratitude to them for their thorough preparatory work.

The EC evaluated the situation in their meeting in May of this year and concluded that IFA should for the time being consider the organization of Regional Conferences with some degree of reservation. It was decided that the expansion and strengthening of IFA in certain countries in Asia and Eastern Europe, which continues to be one of our priorities, should be pursued primarily on a country by country basis. To that end a plan of specific action is being developed. The (greater) involvement of government authorities in a number of countries forms part of that plan.

© 1993 International Bureau of Fiscal Documentation

MITCHELL B. CARROL PRIZE 1992

Out of four candidates, Ms Irene Burgers (Netherlands) received the 1992 MBC award for her thesis entitled "Taxation and supervision of branches of international banks". The Prize was awarded during the Cancún Opening Ceremony by Prof. Avv. P. Adonnino, acting Chairman of the Jury. The work of Dr M. Lang (Austria) "Doppelbesteuerungsabkommen und innerstaatliches Recht" received an "honourable mention". We have great admiration for Dr Lang who also in 1991 received a similar award for his work on hybrid financing.

INTERNATIONAL BUREAU OF FISCAL DOCUMENTATION

As can be concluded from what is mentioned under the heading PSC, the cooperation with the IBFD continues to be very useful for our organizations. At this place I would like to express my appreciation for the good and pleasant working and personal relationships we are experiencing at the General Secretariat in our frequent contacts with IBFD representatives.

CONTACT WITH INTERNATIONAL ORGANIZATIONS

Our contacts with CIAT and with the ICC Tax Committee are being carefully maintained. This year IFA was made a corporate member of the International Institute of Public Finance (IIFP), a prestigious organization with which we have a strong historical relationship (*vide* the IFA Jubilee Book). I attended their 49th Congress in Berlin this year, where Tax Evasion was one of the topics.

The ties with the UN Economic and Social Council have been strengthened. In December of this year IFA will participate as an observer to the 7th meeting of the Ad Hoc Group of Experts on International Cooperation in Tax Matters in Geneva.

THE 47TH CONGRESS IN FLORENCE

The number of registrants to date confirms our expectations of a great attendance. We are looking forward to the Congress with anticipation and confidence. A number of novelties will be introduced, not only on a trial basis in the scientific programme, as described under the heading of the PSC, but also in the social events. A gala dinner split up into four locations with a choice of ambience going from gala to jeans. Our very best wishes for a successful Congress to all the people actively involved in its preparation, in particular to the enthusiastic Organizing Committee chaired by Prof. Avv. Piera Filippi, and to our busy President-elect, Prof. Avv. P. Adonnino, who is also President of the Congress and General Reporter for Subject II.

CONFERENCE DIARY

For further details of the events listed below please write to the organizers at the addresses indicated.

NOVEMBER 1993

The Asian Corporate Finance Conference 1993, Singapore, 22-23 November 1993 (English):

IIR PTE Ltd., Suite 08-03 Golden Wall Centre, 89 Short Street, Singapore 0718, Tel.: 65-338 3521, Fax: 65-336 4017.

Internationale Holdinggesellschaften im deutschen Steuerrecht, Bonn, 23 November 1993 (German):

Gesellschaft für Unternehmerinformation, Postfach 26 01 46, 43153 Bonn, Germany, Tel.: 49-228-379 355, Fax: 49-228-373 162.

The Legitimate Use of European Tax Havens, Malta, 29-30 November 1993 (English):

IBFD International Tax Academy, PO Box 20237, 1000 HE Amsterdam, the Netherlands, Tel.: 31-20-626 7726, Fax: 31-20-620 9397.

DECEMBER 1993

Internationale Steuersparmodelle auf dem Prüfstand, Bonn, 7 December 1993 (German):

Gesellschaft für Unternehmerinformation, Postfach 26 01 46, 43153 Bonn, Germany, Tel.: 49-228-379 355, Fax: 49-228-373 162.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

AFRICA

South Africa

DIVARIS, Costa; SILKE, Jonathan.
Tax Yearbook 1992-93.
Kenwyn, Juta & Co Ltd., P.O. Box 14373, Kenwyn 7790, South Africa. 1993, pp. 900.
This edition is the successor to the annual "Silke on South African Income Tax Yearbook". The book contains detailed and technical commentary on the 1992 tax changes. It also includes consolidated and annotated texts of the Income Tax Act 1962 and the Estate Duty Act 1955.
(B. 13.475)

DIVARIS, D.; STEIN, M.L.
1992/93 Old Mutual Income Tax Guide.
22nd Edition.
Kenwyn, Juta & Company Ltd., P.O. Box 14373,Kenwyn 7790, South Africa. 1992, pp. 271. 39.80 R.
Quick reference guide illustrating the workings of income tax, undistributed profits tax, donations tax and estate duty in South Africa. The book is based on the law as at 1 October 1992 and on the 1992 income tax returns and information brochures. In relation to individuals, it covers the years of assessment ending 28 February and 30 June 1993, and in relation to companies, years of assessment ending during the twelve-month period ending on 31 March 1993.
(B. 13.471)

ASIA & THE PACIFIC

Hong Kong

DOING BUSINESS IN HONG KONG.
New York, Price Waterhouse. 1992, pp. 224.
Updated edition of information guide on doing business in Hong Kong. The material includes information on investment climate, audit and accounting, taxation of individuals and corporations, banking and finance, indirect taxes and tax treaties.
(B. 57.884)

India

DOING BUSINESS IN INDIA.
Investment and tax profile.
New Delhi, Vaish Associates, 10 Hailey Road, Flat No. 7, New Delhi 110001, India. 1993, pp. 51.
The booklet presents in a clear and easy to understand way the current economic policies of the Government, import-export and exchange control laws, the status of the intellectual property laws in India, taxation and finance and various incentives offered to foreign and local enterprises and an outline of accounting and auditing practices.
(B. 57.877)

INCOME TAX REPORTS ANNUAL
Digest 1992.
Madras, Company Law Institute of India Private Lts., 88, Thyagaraya Road, Thyagarayanagat, Madras-600 017, India. 1993, pp. 1500.

Annual updated extensive and detailed overview of Belgian individual income tax for residents in 1993 assessment year (income year 1992).
(B. 112.979)

VANDEBERGH, Henri.
Het BTW Handboek.

© 1993 International Bureau of Fiscal Documentation

Gent, Mys & Breesch Uitgevers, Coupure 120, 9000 Gent. 1993, pp. 661. 7950.- Bfrs.
This comprehensive book details the adaptation of the Belgian VAT law to the Sixth VAT Directive and is supplemented with a table of cases (both European Court of Justice and Belgian jurisprudence), a comprehensive bibliography and an index. It is intended for use in practice and is not a theoretical or historical discussion. The text of the book itself is divided into ten sections and includes coverage of the following topics: adoption of a VAT in Belgium, taxable persons, taxable transactions, taxable event and liability for VAT, imports and exports, VAT deductions and refunds, obligations of the taxable person, and European issues.
(B. 112.996)

WETBOEK BTW. INCLUSIEF DE ZESDE BTW-richtlijn.
Gecoördineerd tot en met het K.B. van 29 December 1992 en de Richtlijn van 14 December 1992.
Kalmthout, Biblo. 1993, pp. 202. 785.- Bfrs.
Updated 1993 text of the VAT Legislation and the Sixth EC Directive.
(B. 112.637)

FISCOLEX BTW. WETBOEK VAN DE belasting over de toegevoegde waarde met uitvoeringsbesluiten. Wetboek van zegelrechten en Wetboek van met het zegel gelijkgestelde taksen. Richtlijnen van de Raad van de Europese Gemeenschap. 4th Edition, 1993-1994.
Deurne, Kluwer Rechtswetenschappen. 1993, pp. 567.

A GUIDE TO VAT IN THE EC.
The 1993 changes.
Edited by Coopers & Lybrand.
Deventer, Kluwer Law and Taxation Publishers. 1993, pp. 330. 85.- Dfl.
This pocket sized book explains how each EC country has implemented Council Directives 91/680/EEC and 92/111/EEC. It is divided into three parts: an overview of the new VAT system; the key points and rules of each country including whether or not a party is liable to VAT and if so the obligations of a taxable person; and an appendix which includes the integrated text of the Sixth VAT Directive. An index is also included. The book contains information which is based on the laws and regulations in force on 1 March 1993.

Fiscale Encyclopedie "De Vakstudie", Deel 15.
Monograph in looseleaf publication explaining the taxation of motor vehicles. Text of the statutes and parliamentary documents of bills and explanatory notes and comments are appended.
(B. 112.766)

VERVLOED, J.L.M.J.; BOD, W.B.
Wegwijs in de BTW. Theorie en praktijk. 3rd Edition.
Lelystad, Koninklijke Vermande BV., Platinastraat 33, 8211 AR Lelystad. 1991. pp. 306. 52.50 Dfl.
Roadmap to VAT. This book is intended for use in teaching and it is oriented towards a university level student in tax law. It includes VAT jurisprudence and resolutions of the Secretary of Finance. The information, in many instances, is explained with examples. Therefore it is also appropriate for use by tax advisers who practice in the area of VAT. However, this book does not include the changes in intra-Community transactions which resulted from the implementation of the Single European market effective 1 January 1993 and changes in the VAT rate.
(B. 112.804)

Poland

TERESA DEBOWSKA-ROMANOWSKA.
Zagadnienia prawne wydatkow publicznych na rzecz osob trzecich.
Lodz, Wydawnictwo Uniwersytetu Lodzkiego. 1993, pp. 105.
Legal problems of public expenditure for third persons. The book deals with legal and constitutional questions which are almost absent in the Polish financial law doctrine.
(B. 112.763)

DOMANSKI, Grzegorz.
Law on foreign investment in Poland. Volume 1.
Warsaw, Foreign Investment Agency, 1 Szopena Street, 00-559 Warsaw. 1991, pp. 180.
Commentary to the law on companies with foreign participation. English translation of the law of 14 June 1991 is included.
(B. 112.819)

GAJL, Natalia.
Teorie podatkowe y swiecie.
Warsaw, Wydawnictwo Naukowe PWN. 1992, pp. 216.
Taxation theories in the world. The book comprises analyses of various taxation theories, covers characteristics of modern theories, characteristics of new functions to be realized by a modern tax system, and discusses the problems of the role of taxes in the policy of modern states, and the position of the tax law in the doctrine of finance and financial law.
(B. 112.818)

Portugal

WOLF, Ronald Charles.
Corporate acquisitions and mergers in Portugal. A practical guide to the legal, financial and administrative implications.
London, Graham & Trotman. 1993.
European Business Law & Practice Series, pp. 125. £ 50.-.
Despite its title, the subject of the book is "doing business in Portugal". The author provides a broad overview of legal and other practical issues a foreign investor will have to deal with when investing in Portugal. The book is well written and very informative.
(B. 113.035)

DOING BUSINESS IN PORTUGAL.
New York, Price Waterhouse. 1993, pp. 219.

(B. 112.232)

KUNTZ, Joel D.; PERONI, Robert J.
US International Taxation. Volumes 1 and 2.
Boston, Warren, Gorham & Lamont. 1992.
A comprehensive treatise on the international tax rules of the United States. The book contains a complete, detailed and expert explanation of the full range of laws, regulations, and court decisions that make up the international tax system of the United States. The text runs to more than 2000 pages in length and is fully footnoted to primary sources. The major topics covered include general principles of US international taxation, the taxation of US persons with foreign activities, the taxation of foreign persons with US activities, and taxation relating to US possessions. Text is kept up to date by supplements.
(B. 112.940)

VANDEVELDE, Kenneth J.
United States Investment Treaties. Policy and practice.
Deventer, Kluwer Law and Taxation Publishers. 1992, pp. 480. 250.- Dfl.
A study of the bilateral investment treaties entered into by the United States and developing countries, and more recently, the emerging nations of Eastern Europe. As of the date of writing, there were 13 such treaties that had been signed by the United States: Bangladesh, Cameroon, Congo, Egypt, Grenada, Haiti, Morocco, Panama, Poland, Senegal, Tunisia, Turkey and Zaire. The author reviews and discusses the principal provisions of each of these treaties. Copies of the texts are included in an appendix to the book.
(B. 112.297)

THE US SAVINGS CHALLENGE.
Policy options for productivity and growth.
Edited by Charles E. Walker, Mark A. Bloomfield and Margo Thorning.
Colorado, Westview Press Inc., 5500 Central Avenue, Boulder, Colorado 80301, USA. 1990, pp. 408.
A collection of essays, studies and discussions on the low rate of savings in the United States as compared to other industrial countries. The authors are prominent policymakers, academians and business leaders. Topics covered include the US savings and investment rate, the impact of tax policies on savings, and strategies for increasing personal and business savings.
(B. 112.873)

INTERNAL REVENUE CUMULATIVE bulletin 1992-2, July-December.
Washington, Government Printer. 1993, pp. 902.
Compilation of all official rulings, decisions, executive orders, tax treaties and other items of a permanent nature published in the monthly bulletins during July-December 1992.

The Taxation of

PERMANENT ESTABLISHMENTS

The most in-depth and comprehensive treatment of the practical and theoretical aspects of permanent establishments available.

A commentary section, written by leading international tax experts, offers explanation and analysis of international tax law provisions.

Country chapters by local specialists give full information on the establishment and operation of permanent establishments in developed countries:

- Description of resident and non-resident tax liability
- Definition of 'permanent establishment' in national law and tax treaties.
- Practical aspects of setting up a permanent establishment
- Details of the tax treatment of permanent establishments: taxation of income, avoidance of double taxation and setting-off of losses
- Items of special interest from a practical and/or theoretical viewpoint
- Principle differences between inward and outward investment via a permanent establishment and operation via a subsidiary
- Taxation of personnel.

Chapters on EC Member States also include the effect of EC tax measures.

One volume, to be updated twice a year. 1993 subscriptions are inclusive of 1993 updates and supplements (which will include additional country chapters as the book expands – in due course virtually all OECD countries will be included).

1,200 Dutch Florins
Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

IBFD INTERNATIONAL TAX ACADEMY is pleased to announce...

the second

CARIBBEAN TAX CONFERENCE

17-18 February 1994
Fiesta Americana Condesa, Cancun

Topics to be covered will include:

- Captive insurance companies in the Caribbean
- Free trade agreements in the Caribbean basin area
- Anti-tax haven laws in OECD countries
- Offshore banking in Caribbean jurisdictions
- Holding and investment companies in the Caribbean
- Caribbean based trusts and the Hague Convention.

For further information, please contact:

AUSTRALIA:
THE LAST CHAPTER? A REVIEW OF AUSTRALIA'S NEW FOREIGN INVESTMENT FUND MEASURES — 687 — *Michael Dirkis*
The Australian Government has been engaged for several years in a drive to comprehensively reform the system for taxing foreign source income. While a number of measures were enacted avenues for tax avoidance remained via the holding of substantial passive investments (foreign investment funds) in non-resident entities, that are not Australian controlled and therefore fall outside the scope of the foreign source income rules. To overcome the revenue deferral and avoidance advantages of investments in these FIFs the Government FIF measures in 1992. This article illustrates the effect of the new legislation on offshore investment by Australians, first by examining the scope of the measures in light of the various exemptions, and then examining the income calculation methods.

UNITED STATES:
"TRIANGULAR PROBLEM" SETTLED IN US/NETHERLANDS TREATY PROTOCOL — 698 — *Philip H. Spector*
The United States and the Netherlands recently signed a protocol to their proposed new income tax treaty, which settles the so-called "triangular problem" involving interest and royalty payments from the United States to branches of Netherlands companies located in tax havens.

SOUTH AFRICA:
NEW DUAL TAX SYSTEM — 701 — *Marius Cloete van Blerck*
With a view to encouraging reinvestment, South Africa recently introduced a dual tax system, comprised of a single uniform lower income tax rate on corporate income and a 15 percent secondary tax on companies levied on the declaration of dividends. Mr van Blerck takes a look at how the new STC will operate in practice.

I. INTRODUCTION

The Australian Government's programme of comprehensively reforming the system for taxing foreign source income started with the introduction, for the 1987-88 income year, of a foreign tax credit system. The programme continued with the introduction, for the 1990-91 income year, of the foreign source income ("FSI") measures (which taxed Australian residents on an accrual basis on income earned by controlled foreign companies ("CFCs") and transferor trusts).

Although these measures were comprehensive, avenues remained for offshore tax avoidance via the holding of substantial passive investments in non-resident entities, that are not Australian controlled and thereby fall outside the scope of the FSI measures.[1] These passive holdings are commonly known as foreign investment funds ("FIFs") or foreign income funds. They remained the last, untackled chapter in the Government's reform project.

Specifically, the Government sought to overcome the tax deferral advantage enjoyed by investments in these funds. The deferral arises from the fund income escaping Australian tax on a current basis, and in some cases, the non-remittance of the income to Australia. They also sought to negate the advantages arising from the conversion of lowly taxed (or untaxed) income of the funds into tax-exempt forms (e.g. loans) or more favourably taxed receipts like capital gains.[2]

With large amounts invested offshore (estimated to be A$ 25 billion) by fund managers on behalf of superannuation funds, life companies, banks and private investors, the FIF measures will have a marked effect on the manner and form of current and future offshore investment. Early estimates of the cost of the measures was A$ 2 billion annually, rising to A$ 10 billion annually.[3] Although these early estimates were on the high side, industry sources have recently estimated that up to 30 June 1993 the measures have induced precautionary sales of offshore investments by fund managers in excess of A$ 500 million.[4] It is also claimed that the

Michael Dirkis LL M (Comm)(Adel.), GDLP (SAIT), B Ec (ANU) is a Lecturer in Law at the University of Canberra, Canberra, Australia. He is admitted as a Barrister and Solicitor, is a Fellow of the Tax Institute of Australia and is actively associated with the Australian Corporate Law Research Centre. He has also written a number of articles in leading journals. His major interests include revenue law, corporation law and corporate crime.

The author wishes to thank Mr Carmine Di Cesare for his thoughtful comments and editorial suggestions during the preparation of this article.

measures are already having a profound effect on some markets in which the funds are placed, and on individual enterprises within those markets.[5]

Therefore, in order to illustrate the effect of these reforms on offshore investment by Australians I propose initially to identify the scope of the measures in light of the various exemptions, before looking at income calculation methods. Unfortunately, the complexity of the measures necessitates the adoption of technical based descriptions in some areas. These technical descriptions combined with policy comment are required to accurately convey the impact of the measures and the subtleties of the policy decisions underlying certain aspects of the measures.

II. IMPLEMENTATION HISTORY

To overcome the revenue deferral and avoidance advantages of investments in these FIFs, the Government announced its FIF measures in April 1992.[6] Legislation encoding the measures was introduced in Parliament on 25 June 1992. However, in an unprecedented move the Government announced, after the introduction of the legislation, that it would consult further with industry before passing the measures.[7]

The Government appointed Canadian Professor Brian Arnold to oversee the consultation process. In response to Professor Arnold's report (the "Arnold Report")[8] released on 9 October 1992, the Government announced a number of changes.[9] The initial Bill was withdrawn and a consolidated bill was introduced on 3 November 1992, becoming law on 18 December 1992 (the Income Tax Assessment Amendment (Foreign Investment) Act 1992). Subsequently, minor procedural amendments were made in the Taxation Laws Amendment Act (No. 2) 1993, which became law on 9 June 1993. As both these Acts amend the Income Tax Assessment Act 1936 (ITAA), in this paper all section references will be in terms of the ITAA.

III. SCOPE OF THE MEASURES

The measures have been designed to have a broad scope. They apply to any proprietary interest or right to acquire such an interest in

- a foreign trust or company (FIF),[10] or
- a life assurance policy issued by a foreign entity (FLP).[11]

Despite general criticisms from fund managers that the scope of the definition is too wide, the Government has resisted the temptation to narrow the scope of the legislation to deal only with known offshore avoidance schemes. As the "...methods of tax avoidance are many, varied and subject to continuous change..." the Government believed that focused legislation would only lead to a "...wasteful and extensive game of seeking new tax avoidance methods".[12] The failure of the measures to address prescibed avoidance schemes does not mean that the legislation is unfocused. As will be discussed later, the extensive list of exemptions adopted means that in fact the measures are focused on areas of tax avoidance.

IV. WERE THE MEASURES NECESSARY?

Fund managers have argued that "...the legislation is aimed at stopping tax avoidance that does not virtually exist."[13] This is clearly not the case given Hong Kong newspaper reports in May 1992 that stated that "...the tax avoidance industry here in Hong Kong that specializes in Australian tax is burning the midnight oil to find a way around the new measures".[14] The need for such measures in the Australian context was in fact acknowledged in the Arnold Report.[15] The report did not even question the fundamental underlying policy and structure of the measures; rather, it concentrated on changes to the minor policy issues associated with the structure of the measures.

V. COMPLEXITY OF THE LEGISLATION

The Australian legislation "is excessively long and complicated",[16] consisting of 113 pages, made up of 168 new sections and three new schedules. That it adopted a worldwide, activity-based approach in structuring the FIF measures is in part the reason for its length.

Had Australia continued with the jurisdictional approach adopted under its FSI measures,[17] the scheme enacted would have been shorter in length. However, the long list of excluded countries under Australia's FSI measures would have resulted in greater complexity. The complexity arises from the provision of designated concessions. Also a jurisdictional-based scheme would have imposed greater compliance costs on the Australian Taxation Office due to the greater administrative costs of maintaining the lists to prevent avoidance opportunities that a jurisdictional approach embodies.

VI. COMMENCEMENT DATE

The FIF measures took effect on 1 January 1993. Many of the changes contained in the Taxation Laws Amendment Act

(No. 2) 1993 were also backdated to have effect from 1 January 1993, despite only becoming law (receiving the Royal Assent) on 9 June 1993.

The measures apply differently for interests in FIFs compared with those in FLPs. A FIF interest will only be subject to the measures if the resident's interest in a FIF is held at the end of the year of income[18] and the notional accounting period of the FIF also ends during that year.[19] Thus, where the taxpayer disposes of the interest in a FIF before the end of that year of income, there will be no FIF taxation for that income year, as the interest is not held.

In contrast, where the resident's interest in an FLP is held at any time during the notional accounting period of the FLP that ends during the taxpayer's year of income, the measures will apply.[20] An exception was provided for interests in an FLP where it was disposed of before 30 June 1993.[21]

VII. EXEMPTIONS

As it seems that the investors and Professor Arnold had accepted the inevitable nature of the Government's broad policy direction, much of the policy discussion and development in the later days of the consultative process was centred on the exemptions to the measures. From the industry's view, if you are able to get your investment exempted, then the measures have no impact, save record keeping. Thus, a detailed understanding of the exemptions and the underlying policy is crucial in grasping the actual scope of the measures.

A. *Short-term holding exemptions*

Taxpayers under the measures may elect for the notional accounting period of the FIF to coincide with the period for which the accounts of the FIF are prepared,[22] where a divergence between the accounting period of the FIF (the notional accounting period) and the taxpayer's year of income occurs. As a FIF interest will only be subject to the measures if the resident's interest in a FIF is held at the end of the year of income and the notional accounting period of the FIF also ends during that year, this divergence gives rise to a "short-term holding" exemption of up to 18 months.[23] This is best illustrated by the following example:

> In year 1 the interest is purchased 1 January 1998 in a FIF with a notional accounting period ending on 31 December 1998. At 30 June 1998, as the notional accounting period of the FIF did not end during that year, no income is brought into account. It is not brought into account under the operative provision until 31 December 1998.
>
> In year 2, if a taxpayer sells the interest on 29 June 1998 again no income will arise for the income year ended 30 June 1998 as it was not owned at the end of the taxpayers year of income. Thus, again the interest escapes the FIF measures in both years. The divergence has resulted in an exemption from the measures for interests held up to 18 months.

B. *Residency*

The legislation only taxes resident taxpayers with the requisite interest in offshore entities held at the end of the 1992-93 income year.[24] However, as the measures provide for apportionment of income based on the period of residency of the taxpayer,[25] a non-resident taxpayer could be assessed on a FIF interest under the measures. This could occur where a resident taxpayer becomes a non-resident and retains a FIF interest at the end of the period.[26]

Dual residents who hold FIF interests are expressly excluded from the measures, provided they are deemed to be residents of another country under a comprehensive double tax agreement.[27] This exemption is consistent with the purpose of entering such bilateral tax agreements, i.e. the avoidance of double tax by the parties agreeing to share the rights to tax. The taxpayer is only taxed in the country of most attachment.

C. *Active business exemption*

The Australian measures provide an exemption to exclude "active" businesses from its scope. A similar exemption is provided for in the United States under its passive foreign investment company rules. However, the Australian measures are radically different to the US exemption which determines an active business by the percentage of passive income in gross income of the fund.[28] The Australian "active business exemption" exempts all direct investment (or in respect of offshore holding companies, indirect investments) in foreign companies whose business does not principally derive passive income.

The exemption is provided by restricting the measures only to interests in companies which are engaged in business activities that are principally passive. The business activities that are considered to be principally passive (i.e. investment, financial services, and certain real estate, banking and insurance businesses) are prescribed on a "black list". The Government felt that by prescribing a short "black list", the exemption would be administratively easier to manage. Also, by reducing the number of categories, uncertainty in categorization of activities is reduced.[29]

Whether a foreign company is principally engaged in a "black list" business activity is determined by two methods.

18. Sec. 485(3).
19. Sec. 529.
20. Sec. 485(4).
21. Sec. 485(5).
22. Sec. 485(4).
23. Sec. 529, the operative provision, provides for the FIF income to be included in the taxpayer's assessable income for the taxpayer's year of income in which the notional accounting period of the FIF ends.
24. Sec. 485(3).
25. Sec. 529.
26. See further Pizzacalla, "Foreign Investment Fund Income: A Practical Perspective", *Australian Accountant* (May 1993), at 27.
27. Sec. 485(3)(4).
28. For details see Klein and Sofe, "Passive Foreign Corporation Proposal: Simplification or Complication", 20 *Tax Management International Journal* (1991), at 423.
29. See *supra* note 8.

© 1993 International Bureau of Fiscal Documentation

The first method uses stock exchange listings to determine what industry a company is principally engaged in. If the activities of the company are classified by the "approved stock exchanges" or the "approved international sectoral classification systems"[30] as belonging to a class of companies in the "black list" at the test time, the company is deemed not to be principally engaged in an "active business".

This exemption is widened to exclude interests in listed foreign companies whose principal activities are an aggregate of two or more of active businesses or business activities expressly exempted.[31] However, this is conditional on the company's shares being listed on an approved exchange, being widely held and actively traded on a regular basis.

The second method is the balance sheet method. The principal activity of a company is determined by reference to the company's balance sheet at test time.[32] Where at test time at least 50 percent of assets are for use or held for use[33] in a "black list" business activity the company will fail the active business test. If both of these methods are capable of being applied to a particular company, the company must choose the method to be used. If it is not possible to use either one of the methods the exemption will not be available.

Only companies can take advantage of the active business exemption. It will not apply to any interest in a non-resident trust, even though the trust's underlying investments may be principally active. A recommendation in the Arnold Report to extend the exemption to trusts was rejected by the Government[34] on the grounds that the inherent flexibility of trusts would result in tax planning advantages.[35] However, the exemption will apply when calculating the FIF income of interests held by foreign trusts, assessed under the trust provisions in Division 6.

D. *Balanced investment exemption*

A balanced investment exemption is provided to ensure that the measures do not lead to lack of diversity in foreign investment portfolios, thus exposing investors to greater risk.[36] Under this exemption a taxpayer with "black listed" FIF interests will be exempt if the "black listed" interests do not constitute 5 percent or more of the taxpayer's portfolio at the test time. It has been reported that many fund managers have taken advantage of this exemption.[37]

E. *Exclusions for certain "black listed" businesses*

Not all "black listed" investments are caught under the measures. The measures do prescribe restrictive exemptions in respect of certain "black listed" activities, in particular certain banking, real estate, life and general insurance businesses that are considered to be active businesses. For interests in a foreign bank (including a foreign holding company of a foreign bank),[38] general insurance[39] or real estate[40] company to be exempt, the shares must be listed on one of the approved stock exchanges, must be widely held and actively traded on a regular basis. Also, the companies must actually carry on their respective businesses of banking, general insurance and real estate development. In addition, banks and general insurance companies must meet a further requirement. They must be authorized to carry on their respective businesses of banking or general insurance in their country of residence.

An investment in a life insurance company will be exempt if the company's balance sheet at test time shows that at least 50 percent of the gross value of the company's assets was used in the carrying on of a life assurance business, as defined by Section 4 of the Life Insurance Act 1945.[41] It must also be authorized by law to carry on life insurance business in its country of residence. Unlike the other categories of black list exceptions, it does not matter whether the company's shares are publicly listed. This modification for life companies reflects the fact that many life companies are owned by policy holders, rather than share holders or via a combination of both.

F. *Small investor exclusion (de minimis rule)*

The measures also provide for two small investor exemptions for natural persons with A$ 50,000 or less invested offshore. Under the first exemption the FIF measures will not apply to individuals (other than trustees) where the total of the individual's interests together with the interests of associates, in foreign companies, trusts and life policies is not more than A$ 50,000.[42] The term "associates" is widely defined to include the immediate relatives, a company in which the taxpayer holds a majority of the voting shares, a trust controlled by the taxpayer and a partnership in which the taxpayer is a partner.[43]

The second exemption takes account of indirect offshore investments held through interests in resident public unit trusts. If the total of the taxpayer's interests (together with those of associates) in foreign companies, trusts, foreign life policies and interests in resident public unit trusts at the end of the year of income does not exceed A$ 50,000, the FIF

30. The following are approved international sectorial classification systems:
- Bloomberg's Information Systems;
- Financial times - Actuaries World Index;
- Morgan Stanley Capital International Index;
- Solomon Brothers Frank Russell Index; and
- Standard and Poor's Composite Index (S&P 500).

In July 1993 the Treasurer announced that two further approved international sectorial classification systems were to be included:
- Extel Financial Workstation Index; and
- International Finance Corporation Composite Index.

measures will not apply to the taxpayer's direct interests, nor to the taxpayer's share of net income from the resident public unit trusts.[44]

G. *Foreign employer-sponsored superannuation exemption*

Where a natural person holds an interest in a foreign employer-sponsored superannuation fund, the interest is excluded from the operative provision[45] provided that the person is an employee (including a company director) or past employee of the employer and that the fund is managed by the employer or associate company on behalf of current or past employees. The exemption is very narrow and the Arnold Report[46] recommended that the exemption be widened. The Government's view on the matter is still under consideration.[47]

H. *Attributable taxpayer exemption*

The FIF measures will apply in calculating the income of a CFC or trust which holds interests in FIFs. However, in overlap situations (i.e. where they overlap with the FIF measures), the CFC measures or the transferor trust measures[48] will continue to have precedence.

I. *Exclusions of certain country funds*

A further exemption is provided in respect of interests in foreign trusts listed in Schedule 6.[49] These trusts are established in countries which prohibit or restrict direct investment on their stock exchanges (e.g. Chile, India, the Republic of Korea and Taiwan). The list has been extended recently to bring the total number of trusts listed in Schedule 6 to 28.[50]

However, the exemption has been criticized as outdated, as some of these countries have recently freed up their markets[51] and other developing markets with restrictions, such as Indonesia and Vietnam, should have been listed. There is, however, hope for change as the Government has indicated that this exemption will be modified and updated where necessary.[52] To date no major review has been undertaken.

Also, where the measures do not apply to the beneficiary's interest in that estate because of the country fund exemption, the legislation ensures that the measures will also not operate in the calculation of a beneficiary's income of a trust estate.[53] This avoids possible double taxation.

J. *Exclusion of certain visitors to Australia*

Natural persons who are visitors to Australia may also be exempt from the FIF measures.[54] This exemption is an extension of the exemption granted to such visitors in respect of the capital gains tax provisions. An exempt visitor is prescribed to be any person who resides in Australia under a temporary entry permit (with a maximum duration, including rights to extension, of four years).[55] However, they will not qualify for the exemption if they have applied for, or been given, permanent residency in Australia.

K. *Life assurance policies*

The measures also exclude three categories of life policies.[56] The exempt policies are those policies:

- which provide life cover, or life and permanent disability cover only; or
- were issued before 1 July 1992 and cannot, after this date, be cancelled, surrendered or redeemed and for which the terms have not, after this date, been altered in a material respect; or
- which are a contract of reinsurance of pure life cover between a resident insurer and a non-resident reinsurer.

L. *Trading stock, bare trusts and Lloyds*

Other minor exemptions provided are for interests that are trading stock,[57] interests that are held via bare trusts[58] and interests held by underwriting members of Lloyds.[59]

M. *Effectiveness of the exemptions*

The effect of the exemptions is to focus the measures "...more directly at tax avoidance..."[60] They achieve this by excluding small investors and directing offshore investment to specific areas. Investments in entities holding passive investments are on the whole excluded, as such entities can more easily shift profits to entities resident in low-tax countries.

However, the lack of a distribution exemption has been much criticized.[61] Under a distribution exemption a FIF interest would be excluded if the FIF distributed all or a prescribed percentage of its income. It is claimed that the effect of such

© 1993 International Bureau of Fiscal Documentation

an exemption would force distributions, thus ensuring that the fund's income is subjected to Australian tax annually. Such exemptions exist in the UK FIF measures and formed part of the definition of a FIF under New Zealand's former measures.[62]

However, the Treasurer claimed that such exemptions do not work,[63] and the exemption would merely provide another avenue for continued avoidance. The Treasurer pointed to tests in other countries and how these tests are overcome by storing realized gains in lower tier entities. The higher tier entity merely has unrealized gains and therefore nothing to distribute.

Even from a practical viewpoint there are limitations in such exemptions. Given legitimate reinvestment requirements of businesses, the distribution requirement must be less than 100 percent. Otherwise, the operation of active businesses and investment therein would be disadvantaged. Thus, the setting of a distribution percentage to take account of entities' reinvestment requirements can only be arbitrary. Further, such a reduction in the distribution required provides a tax discount for the passive funds. It does this by prescribing that they only need to distribute a portion of their income, rather than all of it.

Thus, the exemptions do provide a means by which offshore investment portfolios can be rearranged to lessen or even avoid the impact of the measures. This can be achieved by investing directly or through a holding company in companies that are classified as primarily engaged in active businesses. Investments can also be channelled to approved banking, life assurance, general assurance and real property stocks, as well as approved country funds. Even interests in passive investments can be maintained, provided they form less than 5 percent of a portfolio.

However, care must be taken in choosing the investment vehicle. A direct interest in a company engaged in an active business should always be sought ahead of an indirect investment through a company which holds the interest. The direct interest will be exempt, while the indirect interest is not.

VIII. CALCULATION OF THE FIF INCOME (EXCLUDING LIFE POLICIES)

The availability of financial information to investors will usually be limited in respect of FIF interests as they are non-controlling interests. However, in a limited number of cases the interest, although small in terms of control, may be financially significant. In these circumstances financial information will be readily available. To balance this diversity in available information and the associated needs for simplicity, the measures provide three alternative methods for calculating the income attributable to the interest in the FIF. The method used by an investor will depend upon the information available.

The calculation methods are highly technical as the measures allow movement between the various calculation methods and have extensive anti-avoidance provisions to deal with these potential movements. Therefore, I propose to give an overview of each method rather than examine each of them in detail.

A. *Market value method*[64]

The principal method of determining the attributable income in respect of an interest in a FIF is the market value method. Under this method, the attributed income is the amount represented by the annual change in the value of an investor's interest in a FIF. As it is based on the value of interests, it is most likely to be used where financial information is scarce and/or where the scale of interests held is large (e.g. where fund is being managed).

A market value of an interest in a FIF is determined by reference to the quoted market values of interests from an approved stock exchange.[65] The officially quoted buy-back or redemption price of units will be used for unlisted funds.[66] Where there is more than one quoted price, or where the stock exchange used can no longer be used, or where a price is not quoted at the time the measures begin, special rules apply.[67] Generally, if the market value for an interest or class of interests in a FIF cannot be ascertained at the relevant measurement point, the method cannot be used. Also, a taxpayer can only use the method provided he has not elected to use the calculation method at the first or second tier.

The income accrued to the holder of a FIF interest is calculated in two steps. The first step is to calculate the movement in the market value between two annual reporting dates (i.e. the Foreign Income Fund Amount (FIFA)). The FIFA is calculated by:

deducting

- the sum of (a) the opening value of the interests (i.e. closing value of interests held at the end of the prior accounting period), determined either under the deemed rate-of-return method[68] (if applied), or if the method did not apply, determined under the market value method and (b) the cost of any interests in the FIF which the taxpayer acquired during the notional accounting period;

from

- the sum of the market value of the taxpayer's interests in the FIF on the last day of the notional accounting period, *and* the value of distributions by the FIF to the taxpayer during the notional accounting period in respect of the interests held on that day;

and adding

- the value of distributions by the FIF to the taxpayer during the notional accounting period in respect of interests which have been disposed of prior to that day.

Generally the entire calculation is done in the currency in which the market value is recorded. However, rather than doing all the calculations in a foreign currency and only converting where a gain arises, a taxpayer can irrevocably elect for all FIF interests to do all the calculations in Australian currency.[69] This has the effect of dealing with all currency gains and losses annually.

If the FIFA is positive, the amount represents the gross FIF amount.[70] If the FIFA is negative a FIF loss has occurred.[71] This FIF loss may be used to offset assessable income of the taxpayer. However, the amount of offset is limited to the amount of foreign income taxation previously raised in respect of that FIF.[72] The undeducted balance of the loss (the 'undeducted amount of FIF losses')[73] is carried forward, in its foreign currency form, to be offset against future years' gross FIF income.

The second step[74] is to provide for recoupment of any 'unapplied previous FIF losses' (past year losses) against the gross FIFA in the current year. If the net FIFA after applying the losses is positive, then that amount is included in the assessable income of the taxpayer. Only where the calculation is done in a foreign currency is there a need to convert the net FIFA figure into Australian dollars.[75] If the calculation results in a loss, no conversion is required.

If the result is negative, the balance of the 'undeducted amount of FIF loss' will be carried forward to subsequent years. To stop manipulation of losses there are special rules to deal with determining the actual 'unapplied previous FIF loss', where one or more of the exclusion or exemption provisions apply.[76] If a notional FIFA would have been assessed except for an exemption, that amount is used to reduce the 'unapplied previous FIF loss'.

The market value method was the subject of the greatest criticism when enacted. First, the measures successfully remove indexation for capital gains purposes by taxing the whole of the market value increase. As well as taxing the realized gains as intended, the methods also tax unrealized gains. A fully distributing fund may experience an increase in market value due to an increase in the value of its assets. The application of the market value in these circumstances will result in the taxation of these unrealized capital gains. These outcomes are easily illustrated in the following example:

> Assume that an interest in a fund was acquired for $ 100,000 on 30 June 1993. For the year ended 30 June 1994 there are no distributions, but the market value has increased to $ 110,000 due to the increase in the value of land the owned by the fund. The interest is sold on 1 July 1995 for $ 110,000. Also assume that CPI increase is 10%.
>
> Thus, in 1994, applying the above formulas, the market value increase is $ 10,000. The taxpayer would be assessed $ 10,000 in respect of an unrealized capital gain for the year ended 30 June 1994. However, had the asset been a domestic one, the $ 10,000 gain would not have been assessable in either year because of indexation.

Despite the Arnold Report recommending the restoration of the indexation advantage,[77] the Government rejected the recommendation on the basis that the accruals taxing methods make no distinction between income and capital. To allow indexation it was argued, would in effect permit the indexation of income.[78]

B. *Calculation method*

Where a taxpayer has the financial information to calculate the income of the FIF, a taxpayer can elect to use this method in preference to the market value method.[79] Under this method the income related to the FIF interest is calculated in accordance with a series of modified rules based on the general scheme of Australia's legislation.

It would be safe to assume that this method will only be available to a few interest holders as the information requirements are so high. Further, the use of the method is restricted to calculating the income of the first and second tier FIFs. One of the other two methods must be used for calculating the income of the third tier FIF.[80] However, where the first tier is a CFC, the calculation method can be used for calculating the income of the second and third tier FIFs.

There are two steps in the calculation under this method. The first step requires a taxpayer to calculate the profit or loss for the FIF for a notional accounting period, by deducting the FIF's notional expenses from the FIF's notional income. This method uses a general income section and a general deductions section, similar to that used in the general scheme of Australia's legislation. However, it is different in a number of key aspects. For example, deductions that are of a capital or private nature (subject to specific non-allowable categories) will be deductible. This modification recognizes the fact that due to the scarcity of information most taxpayers could not distinguish private and capital expenditure. Thus, it allows more taxpayers to use this method.

The calculation is to be done in the currency in which the FIF keeps its accounts.[81] Amounts derived or incurred by a FIF that are expressed in another currency may be converted to the FIF's currency on a reasonable and appropriate basis. If there is a loss, it is carried forward in the foreign currency and taken into account for subsequent notional accounting periods. If there is a profit, the second step arises.

Under the second step the taxpayer's share of the profit must be determined (i.e. the attributable income). The attributable income is determined by multiplying the profit of the FIF (as determined above) by the taxpayer's percentage interest in the FIF at the end of that period (the "attribution percentage"). The resulting amount is included in the taxpayer's

assessable income for the year of income in which the notional accounting period of the FIF ends.

There are two methods of calculating the attribution percentage; one where the interest is in a FIF company, the other where it is in a FIF trust. For an interest in a company, a taxpayer's FIF attribution percentage will be equal to the percentage that the taxpayer holds or is 'entitled to acquire' in

- the total paid-up share capital of the company;
- the total rights to vote, or to participate in decision making, in relation to distributions of profit or capital of the company, the constituent document of the company, or a variation to the share capital of the company; or
- the total rights to distributions of profits or capital on winding-up, or at any other time.

Where different rights exist, the attribution percentage for a FIF interest in a company is the greatest of the taxpayer's rights.[82]

The calculation of attribution percentage for an interest in a foreign trust is a two tier, alternative test. In order to use the first test, the trust must be fully distributing (i.e. the trustee distributes or allocates to the beneficiaries, all of the trust's accounting income, profits and gains, which are income, profits and gains to which the beneficiaries are presently entitled, or which are distributed to the beneficiaries within two months of the end of the income year).[83] The "income, profits or gains" referred to is not the "net income" calculated under Division 6 for income tax purposes. Instead, the terms refer to the accounting income, profits or gains of the trust.

If the above requirement is satisfied, the taxpayer's attribution percentage is calculated by reference to the present entitlement and/or the amount distributed to the taxpayer out of the income, profits or gains that arises during the trust's notional accounting period. If the income, profits or gains of the foreign trust are not fully distributed or allocated to beneficiaries, as described above, then the taxpayer's attribution percentage is determined under the second test.

Under the second test the taxpayer's attribution percentage is equal to the greater of the percentages of the taxpayer's interest in, and entitlement to acquire the income of the trust or the corpus of the trust.[84]

In general, it is assumed that the taxpayer's rights in relation to the foreign trust at the test time applied at all times throughout the applicable period. However, where a taxpayer holds an interest in the FIF during a notional accounting period and adds to or reduces that interest during the period, the amount included in assessable income will be altered to reflect the changing size of the attribution interest. If the taxpayer had an interest in a FIF for only a particular part of the notional accounting period, the above formula is modified by multiplying it by the proportion of the number of days throughout the period in which the taxpayer held the interest.

The resulting amounts calculated above under both tiers are included in the taxpayer's assessable income for the year of income in which the notional accounting period of the FIF ends.[85]

C. *Deemed rate-of-return method*

The calculation method of last resort is the deemed rate-of-return method. Under this method, the attributed income is calculated by multiplying the taxpayer's interests in the FIF by the "deemed rate-of-return" for the period the investment was held. It applies only if it is not practicable to apply the market value method and the taxpayer has not choosen to use the calculation method.[86]

The deemed rate-of-return method is applied separately to each group of interests held by the taxpayer.[87] If a taxpayer had only one interest in a FIF during the notional accounting period that interest is a group. If a taxpayer had two or more interests in a FIF that are not in the same group of interests, the deemed rate-of-return method is applied separately to each group.

The opening value of the interest is the actual cost increased by previous inclusions of income attributable to the interest and decreased by distributions received. Once the opening deemed value has been ascertained, the FIFA for the notional accounting period, is calculated by applying the specified formula:[88]

$$\text{FIFA} = \text{Opening value} \times \text{Deemed rate} \times \frac{\text{Number of days held}}{\text{Total number of days}}$$

Where:

The deemed rate-of-return is the rate of interest prescribed (currently 10 percent per annum) increased by 4 percent.[89]
Number of days held is the number of days in the notional accounting period in which the taxpayer had the interests in the group.
Total number of days is the total number of days in the notional accounting period (usually 365 days).

The final step in applying the deemed rate-of-return method is to determine the amount attributed to the taxpayer (the FIF income). To do this the FIF amount is first converted to the corresponding amount in Australian currency.[90] Losses cannot occur. Where the investment has been either under-taxed (its value increased at a rate greater than the deemed rate) or over-taxed (its value increased at a rate less than the deemed rate) the capital gains provisions are used as the adjustment mechanism.

IX. TAXATION OF FOREIGN LIFE ASSURANCE POLICIES

A foreign life assurance policy (FLP) is a life assurance[91] policy which has been issued by an entity that was a non-resi-

82. Sec. 555(1).
83. Sec. 582(1).
84. Sec. 582(6).
85. Secs. 580 and 582.
86. Sec. 535.
87. Under Sec. 518, interests in a FIF are considered as a group of interests if they are of the same class (for example, two parcels of A class shares held during the same period).
88. In Sec. 544.
89. By Sec. 10 of the Taxation (Interest on Overpayments) Act 1983.
90. Secs. 556 and 557.
91. A life assurance policy is defined by Sec. 482(2)(a)-(2)(d) to be a policy which provides for a payment of money upon death, other than death by accident or specified sickness, or the happening of a specified event which relates to the ending or continuing of a human life. A life assurance policy also includes an instrument which grants an annuity for a term dependent upon a human life.

© 1993 International Bureau of Fiscal Documentation

dent at any time in that year of income. Foreign companies authorized to carry on life assurance business in Australia are excluded from the definition.[92] This prevents policies, issued in Australia by foreign life companies operating through a branch, from being caught by the measures.[93] An interest is defined to be legal title to the FLP.[94] Assessing the legal owner of the interest ensures that employers who pay the premiums on behalf of an employee will not be assessed.

The measures impose on the holder of an interest in an FLP[95] a tax calculated either under the deemed rate-of-return method[96] or via election,[97] under the cash surrender value method. Under the deemed rate-of-return method (already described) an interest holder will be assessed on a deemed earnings rate (currently 14 percent per annum) on the value of the FLP. The cash surrender value method,[98] on the other hand, assesses the interest holder on the increase in the cash surrender value of the life policy by the use of a formula similar to that used in the market value method. The cash surrender value method overcomes the problem under the deemed rate-of-return method of assessing a taxpayer on the risk component of the policy.

However, despite the cash surrender value method alternative only assessing the holder on the investment component of a life policy, it would be safe to say that these measures have effectively ended the market in Australia for foreign life assurance policies. They have removed any incentive for offshore life assurance policies and destroyed the market for single premium bonds ("wrap-around bonds"). They may also have a major impact on expatriate Australian[99] investment decisions as the monetary cost of surrendering the policies will be high. This high cost of surrendering policies may also effect some migration decisions.[100]

X. THE ASSESSMENT CALCULATION

Once the income attributable to the FIF or FLP interest is calculated, taxpayers are required to include in their assessable income of a year of income that attributable income.[101] A combination of exemption provisions and attribution accounts has been provided in the measures to minimize the risk of double taxation.

The amount of attributable income to be included in a taxpayer's income is reduced by the amount of any income already included in assessable income or exempt under Section 23AJ.[102] Also excluded from the taxpayer's assessable income are amounts which are notionally exempt income of a CFC in which the taxpayer has an interest. These measures ensure that double taxation does not occur where a distribution is made during an accounting period from profits which are included in the taxpayer's attributable income of the FIF at the end of that period.

Also, to prevent double taxation attribution accounts are provided for under the measures. The accounts are designed to operate in a manner similar to the CFC attribution account system.[103] Attribution accounts work simply. If tax is raised on the assessment, that tax will give rise to an attribution credit.[104] Any subsequent distribution from the FIF will be exempt under Section 23AK to the extent there is an attribution surplus. Thus, the credit in the account is offset by these subsequent FIF distributions[105] (i.e. they give rise to an attribution debit). An attribution surplus can be used to reduce the consideration paid on disposal of the FIF interest, thus reducing the amount assessable under either Section 25(1) or under Part IIIA.[106]

The foreign tax credit regime also has limited application. Only taxpayers using the calculation method can take advantage of it, but only in respect of distributions that are not exempt under Section 23AK.

XI. NEW MEASURES FOR TAXING OFFSHORE TRUSTS

For the 1992-93 year of income the method of taxing non-resident trusts which escape the FIF net is dramatically changed. Interests in the non-resident trust will escape the FIF regime if they are either excluded from the FIF measures (i.e. where the interest is held by an attributable taxpayer in respect of a transferor trust[107] or an attributable taxpayer in respect of a controlled foreign trust[108]) or are exempt interests under the FIF regime.[109] The new scheme affects the quantum of income attributed to Australian beneficiaries of non-resident trust estates, as well as the method for calculating the income of non-resident trust estates.[110]

Again there are two steps in calculating the income of a beneficiary. The first step is to calculate the net income of the trust. The net income of a non-resident trust is calculated as it always has been under Division 6.[111] The assessable income of the trust is calculated as if the trustee were a resident taxpayer. It includes the assessable FIF income from interests which the trustee holds in a lower tier FIF.

The second step is to calculate the beneficiary's share of the net income of the trust. A two tier test, similar to that used in

111. Sec. 95(1).

© 1993 International Bureau of Fiscal Documentation

the calculation method,[112] is used.[113] In order to use the first test, the trust must be fully distributing (i.e. the trustee distributes or allocates to the beneficiaries, all of the trust's accounting income, profits and gains, which are income, profits and gains to which the beneficiaries are presently entitled, or which are distributed to the beneficiaries within two months of the end of the income year).[114]

If the above requirement is satisfied, the taxpayer's attribution percentage is calculated by reference to the present entitlement and/or the amount distributed to the taxpayer out of the income, profits or gains that arises during the trust's notional accounting period. If the income, profits or gains of the foreign trust are not fully distributed or allocated to beneficiaries, as described above, then the taxpayer's attribution percentage is determined under the second test.

Under the second test the beneficiary's share of the net income of the trust estate is determined by calculating the beneficiary's share of the net income referable to interests held in a trust estate for the whole year and adding it to the beneficiary's share of the net income referable to interests held in a trust estate for only part of the year.[115]

The method for calculating the beneficiary's share of the net income referable to interests held in a trust estate for the whole year is to multiply the net income by the attribution percentage. Where a part or parts of the beneficiary's share of the net income referable to interests held in a trust estate for only part of the year, the method of calculation is the same as above, but is apportioned by the number of days held over the number of days in income year. The attribution percentage is defined to be the greater of:[116]

- the percentage of the income of the trust estate represented by the share of income to which the taxpayer was entitled, or entitled to acquire, because of the beneficiary's interest in the trust estate and any interest in the trust estate that the beneficiary was entitled to acquire; or
- the percentage of the corpus of the trust estate to which the beneficiary was entitled, or was entitled to acquire, because of the taxpayer's interest in the trust estate and any interest in the trust estate that the taxpayer was entitled to acquire.

Untaxed income of non-resident trusts that is distributed or applied for the benefit of a resident taxpayer and is included in the assessable income of a taxpayer under Section 99B is subjected to an interest charge.[117] Section 99B does not apply to amounts which have previously been subject to tax in Australia either in the hands of the trustee or the beneficiary. The measures also exempt a taxpayer from an interest charge on distributions from deceased estates,[118] public unit trusts[119] and amounts which have been taxed at comparable rates.[120]

The purpose of the interest charge is to compensate the Government for the deferred taxation where a taxpayer receives distributions on an infrequent basis. The method is an estimate, as to attempt to calculate the tax that is actually deferred would add complexity to the measures. The major advantages of the interest charge approach is that it only taxes at points where there is an actual distribution of income and profit, thereby avoiding the taxation of unrealized gains. However, interest charges do not necessarily prevent deferral. Some taxpayers can be expected to hold out indefinitely from receiving a distribution, even though an interest charge will apply to accumulations. The charge can in some situations cause a lock-in effect. In addition, because deferral is still possible under the interest charge, the revenue collections on a year by year basis are likely to be erratic. The interest charge approach also fails to adequately deal with income accumulated in lower tier entities.

However, despite these disadvantages and given the discretionary nature of trusts, the interest charge is the only practical mechanism available to get some compensation for lost revenue.

XII. EVALUATION OF TRUST CHANGES

These changes to the taxation of interests in foreign trusts, in particularly the changes to "present entitlement", are radical and require close study. Their impact will be profound in respect of the structure and practices of all offshore trusts. What is of major concern, however, is that the exemptions have the effect of treating the holders of small exempt FIF trust interests more harshly than larger FIF trust interests caught under the measures. This arises as holders of exempt interests are required to compute their share of the net income of the foreign trust in accordance with normal Australian tax laws. The lack of information means that they can never comply.

Professor Arnold's call for the whole system of dealing with foreign trusts to be thoroughly re-examined with a view to rationalizing and simplifying those provisions should be heeded.[121] Although the Government has agreed to undertake a review at some time in the future,[122] there is an urgent need to provide in the short term a mechanism with which holders of small exempt FIF interests can comply. A suggestion is to allow small holders to elect to be caught by the FIF measures, which at least they can comply with.

XIII. THE EFFECT ON DOUBLE TAX AGREEMENTS

The effect of accrual taxation methods worldwide on bilateral tax agreements is an issue which has only received scant examination. This is odd, given the fact that in many situations the accruals methods appear to claw back the rights to tax given away under the tax agreement. Whether in fact they

are a form of treaty override is unclear. Further research is required. Unfortunately, the issue is beyond the scope of this paper.

It is claimed that the FIF measures remove from investors any incentive granted by the foreign country and approved in bilateral tax agreements under tax sparing clauses.[123] This occurs where the FIF derives income subject to tax sparing (i.e. the income is subject to a tax holiday or to incentives via the reduction or waiver of tax). Under the bilateral tax agreements, these incentives are preserved by treating the income as being fully taxed in the country of derivation. Thus, when the income is remitted to Australia as dividends, these dividends are exempt.

However, under the FIF measures the income which would have been exempt is attributed in full to the Australian resident. Thus, the benefit of tax sparing is wasted and the subsequent dividend is granted exemption twice.[124]

However, in reality this is a theoretical rather than a practical problem as most tax sparing arrangements are restricted to active businesses. As active businesses are exempt under the measures, the tax sparing relief is still available.

XIV. ANTI-AVOIDANCE PROVISIONS

There are no specific anti-avoidance rules to prevent avoidance under the FIF measures. Instead, the general anti-avoidance rules of Part IVA apply.

XV. RECORD KEEPING REQUIREMENTS

A taxpayer who has an interest or interests in a FIF or an FLP must make and keep records in Australia. The extent of the records required for a particular taxpayer in relation to amounts of FIF income included in assessable income will depend on the method of assessment used,[125] the need to keep attribution accounts and whether the interest is exempt from FIF taxation.

To reflect the fact that access to information about offshore investments will be usually limited for resident investors with non-controlling interests, the record keeping requirements[126] are less onerous than the requirements for CFCs and controlled foreign trusts in Division 11 of Part X. Despite this, even taxpayers with exempt FIF interests are required to keep additional records or modify their existing accounting procedures.

The reasoning behind the imposition of these additional compliance requirements and their costs, even on taxpayers holding exempt interests, has been questioned, particularly given the Government's revenue estimates in respect of the measures. In fact, the Government's estimate of A$ 150 million in additional tax per annum has been criticized as being overstated. Some economists estimate the true revenue figure being closer to A$ 40 million.[127] If this is correct, then the measures may not be justified on economic grounds, particularly if the collection costs outweigh receipts.

XVI. PROSECUTION PROVISIONS

A prosecution can occur where there is a failure by a taxpayer to comply with the record keeping requirements prescribed.[128] The maximum penalty for a taxpayer who fails to keep records is a fine of A$ 3000.[129] Also, specific rules are enacted to ensure that partners cannot escape liability for the failure of another partner to keep partnership records.

XVII. VALUATION OF TRADING STOCK

As mentioned previously, where an interest in a FIF forms part of trading stock, an exemption is available provided the taxpayer elects to value all interests in FIFs, that are trading stock, at market value.[130] Another change was to prescribe for the 1991-92 income year and all subsequent years that where an interest in a FIF forms part of trading stock it is to be brought into closing value at cost.[131]

The purpose of this change is not concessionary. Its purpose is to stop taxpayers from electing to value the FIF interest at market value when the value of the FIF interest falls during the year (thus effectively allowing a deduction for the market value loss), but electing to value the trading stock at cost rather than market value where the value of the FIF interest is more than market value (thus deferring income).

Thus, in light of the general downward trend in stock market prices in recent times, this change will have a dramatic effect on current practices and tax planning in this area.

XVIII. CONCLUSION

Despite protests from the accounting and legal professions, investors and a review, the policy underlying the FIF measures remains. The measures have already had a dramatic effect on every Australian resident taxpayer with foreign investments. It is only with careful planning that portfolios can be arranged to best minimize the effect of the legislation. However, despite the best efforts there will still be increased record keeping requirements, resulting in higher compliance costs.

Despite the view that these measures represent the last chapter in the Government's reform process, like retiring football heroes, one gets the feeling that a comeback is around the corner, ready to provide a new chapter to the saga which is the taxation of income from foreign sources.

UNITED STATES:

"TRIANGULAR PROBLEM" SETTLED IN US–NETHERLANDS TREATY PROTOCOL

Philip H. Spector

The United States and the Netherlands recently signed a protocol to their proposed new income tax treaty (the "Treaty").[1] The protocol settles the so-called "triangular problem" involving interest and royalty payments from the United States to branches of Netherlands companies located in tax havens. The protocol paves the way for ratification of the Treaty, which is expected before year-end.

Philip Spector is a US tax partner in the New York office of the international law firm Watson, Farley & Williams. Mr Spector specializes in cross-border transactions and international tax planning and has published numerous articles in tax and financing journals. He is a graduate of Columbia University (B A 1978), the University of Pennsylvania Law School (J D 1981) and New York University School of Law (LL M in Taxation 1986).

I. THE "TRIANGULAR" PROBLEM

The "triangular problem" refers to a financing technique commonly used by foreign multinationals to finance US activities through a Netherlands corporation and its branch located in a tax haven. A combination of Netherlands tax rules and the availability of treaty benefits allows Netherlands companies to extract interest and royalties from the United States at a low overall tax rate. To illustrate, a Netherlands company could establish a branch in the Netherlands Antilles. The Netherlands company could transfer capital to the branch, or could transfer rights to use intangible property such as patents, copyrights or trademarks. The branch would then lend the capital, or license the intangible asset, to the Netherlands company's US subsidiary or affiliate. Interest and royalty income derived by the Netherlands company and attributable to the branch would be exempt from Netherlands tax under Netherlands law or the Netherlands–Netherlands Antilles tax treaty, the interest and royalty income would bear little Netherlands Antilles tax, and, absent a contrary provision, the interest and royalties would be subject to a zero rate of US withholding tax under the US–Netherlands tax treaty.

During the Treaty negotiations, the United States argued for a provision that would have denied treaty benefits in these branch financing scenarios. The issue was not resolved in the Treaty, but the Treaty required the issue to be addressed either in Netherlands domestic law or in a future protocol to the Treaty.[2] Although anti-tax haven legislation is now circulating in the Netherlands, the protocol route was chosen to resolve the issue in sufficient time to allow for ratification of the Treaty this year, and to ensure that all US concerns were addressed.

Subject to certain exceptions, the protocol permits the United States to impose withholding tax at the rate of 15 percent on US- source interest and royalties derived by a Netherlands enterprise and attributable to a permanent establishment in a third country if the overall profits of the permanent establishment are subject to a low rate of tax. For interest and royalties derived before 1 January 1998, the 15 percent withholding tax applies if the aggregate rate of tax on the profits imposed by the Netherlands and the third country is less than 50 percent of the general Netherlands corporate tax rate. For interest and royalties derived after 1 January 1998, the withholding tax applies if the aggregate tax rate is less than 60 percent of the general Netherlands corporate tax rate.[3]

The current Dutch corporate tax rate is 40 percent on the first NLG 250,000 of income and 35 percent on the remainder. It is understood that 35 percent is presently the regular corporate tax rate referred to in the protocol. Accordingly, for interest and royalty payments attributable to a third country permanent establishment that do not qualify for an exception for "active" income described below, the regular zero withholding tax rate will apply if the permanent establishment's overall profits

are subject to combined Netherlands and third country tax of at least 17.5 percent. The 17.5 percent threshold will rise to 21 percent (60% of 35%) for payments made after 1 January 1998, assuming that the Dutch corporate tax rate remains the same.

An exception to the protocol's provisions applies to branches with active businesses. The Treaty's regular zero withholding tax rate continues to apply to interest derived in connection with or incidental to the active conduct of a trade or business in the third country, regardless of the aggregate rate of tax on the permanent establishment's profits. For this purpose, managing or holding investments (including group financing and portfolio investment) is not considered "active" unless carried on by a bank or insurance company. In addition, the zero withholding rate continues to apply to royalties received as compensation for the use of, or the right to use, intangible property produced or developed by the permanent establishment itself, in the third country.

II. LIMITATIONS ON BENEFITS

The protocol makes a couple of important changes to the Treaty's limitation on benefits provisions (Article 26), and ties up some loose ends.

A. *Indirect stock ownership*

The protocol modifies the test by which a subsidiary of one or more publicly-traded companies is made eligible for benefits. One of the categories[4] of Netherlands companies eligible for Treaty benefits is a company where (1) more than 50 percent of the aggregate vote and value of all of its shares is owned, directly *or indirectly*, by five or fewer companies ("parents") which are residents of either the United States or the Netherlands, (2) each parent satisfies the "publicly-traded" test,[5] and (3) the company is not a "conduit company".

Another category of Netherlands company eligible for all Treaty benefits is a company that satisfies the following requirements: (1) the company is resident in the Netherlands, (2) the company is not a conduit company, (3) at least 30 percent of the aggregate vote and value of all of its shares is owned, directly *or indirectly*, by five or fewer corporations that are residents of the Netherlands, each of which meets the publicly-traded test, and (4) at least 70 percent of the aggregate vote and value of all of its shares is owned, directly *or indirectly*, by five or fewer companies that are residents of the United States or residents of an EC member state, each of which companies satisfies the publicly-traded test (other than the listing requirement of that test).[6]

The protocol clarifies that for each of these tests, "indirect" ownership through a chain of companies can be taken into account in applying the 30% and 70% tests so long as each company in the chain is either a US or Netherlands resident or a resident of an EC member state.[7] Absent the protocol, the Treaty appeared to require each intermediary company to satisfy the requirements necessary to qualify for Treaty benefits under the relevant category, without regard to the intermediary's own country of residence.

B. *Active trade or business test*

Treaty benefits are available, in certain circumstances, for US source income that is derived "in connection with" or is "incidental to" an active trade or business carried on by a Dutch company in the Netherlands and/or in EC countries.[8] The provision generally contemplates that the Dutch company has an ownership interest in the US income-producing activity (e.g. stock of a US subsidiary or affiliate).[9]

The protocol makes treaty benefits available under the active business test in situations where the Dutch company is not engaged in a trade or business in the United States and does not own a significant ownership interest in the US income-producing activity. In such a case, the active business test is met so long as the US-source income is derived in connection with, or is incidental to the Netherlands/EC business. There is no requirement that the Netherlands/EC business be "substantial" in relation to the US income-producing activity. The protocol's provision might apply, for example, to interest received from a US customer that purchased goods from the Netherlands/EC business on credit.[10]

The protocol also clarifies that group financing and managing portfolio investments are not considered "active businesses" (unless conducted by a bank or insurance company). Thus, the active business test cannot be used to establish qualification for Treaty benefits for US-source interest income from those activities.[11]

C. *Headquarters companies*

A company resident in the Netherlands or the United States that functions as a headquarters company for a multinational corporate group can qualify for Treaty benefits if, among other requirements, the company provides a substantial portion of the overall supervision and administration of the corporate group and exercises independent discretionary authority to carry out those functions. The protocol clarifies that these functions must be performed in the company's country of residence.[12]

4. See Treaty Art. 26(1)(c)(ii). See also Spector at II.A.5.
5. For a description of the publicly-traded test, see Treaty Art. 26(1)(c)(i) and see also Spector at II.A.1.
6. See Treaty Art. 26(1)(c)(iii). See also Spector at II.A.6.
7. See Treaty Art. 26(8)(k) and Protocol Art. 5. See Spector at II.A.6: under the protocol, stock owned by NA in Example 3A would not be taken into account in applying the 30/70% test because NA, a Netherlands Antilles company, is not a resident of the Netherlands, the United States, or an EC member state.
8. See Treaty Art. 26(2)(a); see also Spector at II.B.
9. To be derived "in connection with" an active Netherlands trade or business, the business must be "substantial" in relation to the US income-producing activity. Substantiality is determined by reference to, among other things, the Netherlands resident's ownership interest in the US income-producing activity. Treaty Art. 26(2)(c).
10. Protocol, Agreed Minutes, Sec. II.
11. Protocol, Agreed Minutes, Sec. III.
12. Protocol, Agreed Minutes, Sec. V.

© 1993 International Bureau of Fiscal Documentation

D. *Publicly-traded companies*

The principal stock exchanges of Frankfurt, London, Paris, Brussels, Hamburg, Madrid, Milan, Tokyo, Sydney and Toronto now comprise the list of recognized stock exchanges on which a company's principal class of shares must be regularly and substantially traded to qualify for Treaty benefits as a publicly-traded company.[13]

E. *Resident of an EC member state*

Netherlands companies that are owned by a combination of residents of the Netherlands, the United States and EC members can qualify for treaty benefits in certain circumstances.[14] In addition, active business operations undertaken by affiliates that are members of EC member states can be taken into account in applying the active business test.[15] A person will qualify as a "resident of an EC member state" if it is entitled to treaty benefits under the income tax treaty between the company's home country and the United States, and would be entitled to benefits as a "qualified person" under a hypothetical tax treaty between its home country and the United States that contains a limitation on benefits provision identical to the Treaty Article 26. The protocol resolves issues that could arise from differences between the limitations on benefits provision the actual home country–US tax treaty and the Treaty Article 26. The protocol provides that the company must qualify as a qualified person under a hypothetical treaty between its home country and the United States that includes Article 26, and must also satisfy any additional provision of any limitation on benefits provision in the actual home country–US treaty if Article 26 does not contain the same or a similar provision.[16] If Article 26 does contain such a provision, the company must satisfy that provision of Article 26 (treating the company as though it were a resident of the Netherlands).

•

III. NETHERLANDS PENSION TRUSTS

Under the Treaty, pension trusts that are exempt from tax in their country of residence generally are exempt from source country withholding taxes on dividends and interest. The exemption does not apply to interest and dividends from a "related person".[17] The protocol provides that a person is related to a pension trust if the trust owns more than 80 percent (by vote or value) of the payor.[18]

The protocol also subjects Netherlands pension trusts to 30 percent US withholding tax on dividends from a US real estate investment trust ("REIT"), to the extent that the dividends are attributable to US real property gains of the REIT.[19] Such pension trusts are otherwise exempt from US withholding tax on dividends and interest. As a result, it appears that Netherlands investment institutions (*beleggingsinstellingen*) may receive all REIT dividends subject to a reduced 15 percent US withholding tax.[20] For pension trusts, however, the capital gains portion of REIT dividends will be taxed at 30 percent, and the remaining portion will be exempt from US tax.

SOUTH AFRICA:
NEW DUAL TAX SYSTEM

Marius Cloete van Blerck

Marius Cloete van Blerck Group Tax Consultant, Anglo American Corporation; Chairman of the Scientific Committee of the South African branch of the IFA; and founding editor of the SA Tax Review.

I. INTRODUCTION

South Africa recently introduced a dual tax system, comprised of a single uniform lower income tax rate of 40 percent on corporate taxable income[1] and a 15 percent secondary tax on companies (STC) levied on the declaration of dividends. The new provisions are found primarily in Section 64B and C of the Income Tax Act (ITA).

The new corporate tax rate applies to all companies which were previously taxed at the rate of 48 percent, and it is not necessary that a company distribute dividends to be subject to the 40 percent rate. Thus, a company may elect to reduce or entirely pass its dividend in order to reduce or eliminate STC liability, but still be taxed at the new lower corporate tax rate.

In order for a company to be subject to STC it is not necessary that it be currently liable for income tax. Thus, where a company has current operating income but is not paying income tax because of current tax allowances or tax losses brought forward from prior years, it will nevertheless be subject to STC if it declares a dividend. In a sense STC is a conditional minimum tax on companies, triggered by a dividend declaration.

The 40 percent rate is effective for companies with years of assessment ending on or after 1 April 1993 while STC is effective (generally speaking) from 17 March 1993.[2]

The new dual tax system is designed to encourage corporate investment, or, more accurately, reinvestment. On the one hand, distributed earnings are taxed at effective rates of up to 49 percent, depending on the proportion of earnings distributed; on the other, retained earnings are taxed at an internationally acceptable rate. There is thus an incentive for a company's shareholders to approve the productive reinvestment of a greater proportion of earnings. Given the relatively low level of fixed investment in South Africa in the last decade, this is a positive step.

In a narrower context, the philosophy of STC is that it should not have a cascade effect, i.e. once distributed earnings have been subject to STC, they should be able to flow through the economy without further tax consequences. Thus, where an operating company declares a dividend to its holding company, that dividend should be subject to STC, and when the holding company passes that dividend on to its own shareholders by way of dividend, the latter dividend will effectively not be subjected to further STC.

II. EFFECTIVE COMBINED TAX RATE

A lower corporate tax rate of 40 percent together with a 15 percent STC on dividends distributed means that the effective total corporate tax rate on companies earning taxable income will range from 40 percent for companies paying no dividends to 47.83 percent (i.e. 40 percent plus 15/115 of the remaining 60 percent) for a company distributing all of its taxable income in a combination of dividends and STC. Furthermore, should a company distribute all of its taxable income as dividends, and fund the STC from other sources (e.g. retained earnings or non-taxable income) the combined tax rate on taxable income becomes 49 percent (i.e. 40 percent plus 15 percent of the remaining 60 percent).

© 1993 International Bureau of Fiscal Documentation

Similarly, the effective rate on taxable income for a company distributing all of its current taxable income in a combination of dividends and STC in a period it is not currently taxable (e.g. because of current tax allowances or tax losses brought forward from prior years) is 13.04 percent (i.e. 15/115). Furthermore, should the company distribute all of its taxable income as dividends, and fund the STC from other sources (e.g. retained earnings or non-taxable income) the combined tax rate on taxable income becomes the full 15 percent.

It should be noted that South Africa does not subject resident recipients (corporate or individual) to any further tax on the receipt of dividend income. The above rates are the full effective rates on corporate earnings. However, in the case of non-resident shareholders, further tax is due as discussed under "International Aspects" below.

III. STC TAX BASE AND THE DIVIDEND CYCLE

The STC tax base is the difference between the dividends declared (as defined below) in a dividend cycle, and the dividend income (likewise, as defined below) in that cycle. To the extent that the dividends declared exceed dividend income, a tax base, known as the "net amount", is subject to STC. However, if the dividend income exceeds the dividends declared, there is an excess tax credit which can be carried forward to succeeding dividend cycles. There is no limit to the number of cycles such a credit may be carried forward to, but there is no provision for a carry back to previous cycles.

The first dividend cycle of a company commences on 1 September 1992 with one qualification: if there had been a declaration of an interim or final dividend by that company in respect of its ordinary shares (other than a dividend in specie) between that date and 17 March 1993, then the cycle commences on the date of such declaration. The first dividend cycle ends on the date on which the first dividend declared by a company in respect of any category of its shares (i.e. the initial limit to ordinary shares falls away) on or after 17 March 1993 accrues to the shareholders, with one controversial exception relating to certain dividends declared prior to 17 March 1993 but only paid thereafter.[3]

The second dividend cycle commences immediately after the end of the first, and ends on the date of accrual to shareholders of the next dividend declared by the company in respect of any category of shares; subsequent dividend cycles will be determined accordingly.

IV. STC TRIGGER – DIVIDENDS DECLARED AND ACCRUED

A. *Declaration*

As stated above, the potential STC liability of a company is triggered by the declaration of a dividend, at the time the dividend accrues to the shareholders. In this context, a "declaration" includes:

- in the case of an interim dividend of a company, the approval of the payment by the directors of the company or by another person under authority conferred by the company's memorandum and articles of association;
- in the case of a dividend distributed by a close corporation, the approval of the payment thereof by the "directors";[4] and
- in the case of a dividend in specie, the approval of the distribution thereof by the directors.

Where an unlisted company had declared a dividend prior to 17 March 1993 which had not been paid at that date, the dividend is deemed for STC purposes to have been declared on that date, and thus becomes subject to STC. There is only one exception to this, i.e. where prior to 17 March 1993 the company had taken reasonable steps to pay the dividend. Thus, for example, where exchange control procedures had delayed the remission of a dividend to a foreign shareholder, this exception will apply.

B. *Accrual*

Notwithstanding the declaration of a dividend, a dividend cycle only ends (and STC liability only becomes due) when the dividend accrues to the shareholders. In this context, where a dividend declaration specifies a last date of registration, accrual takes place only on that date. If the dividend declaration contains no such date, accrual takes place on the date of declaration.

C. *Exemptions*

For a dividend to be subject to STC, it must be a dividend for income tax purposes (see "What is a Dividend?" below). Nevertheless, a dividend will be exempt from STC if it falls within any of the following six exemptions:

- any dividend declared by a fixed property company, as defined in ITA Section 11(s), which qualifies for an income tax deduction under that provision;

3. Although the 40% corporate tax rate only applies to companies with tax years of assessment ending on or after 1 April 1993, STC commences with the close of the first dividend cycle on the earlier of the following two dates:
   - the date of accrual to the shareholders in respect of the first dividend declaration in respect of any category of shares, where such declaration is made on or after 17 March 1993; or
   - the date of accrual to the shareholders of any dividend declared by a company on or before 17 March 1993 which had not been paid on that date (with the exception of a dividend declaration which had publicly been announced by a listed company or its subsidiary), subject to the provisions below.

   Once the end of the first dividend cycle has been determined in this manner, the STC liability is determined on the basis of a calculation of a "net amount", taking into account the particular dividend which triggered the close of the cycle. In the case of the second category, somewhat controversially, the dividend is deemed to have been declared on 17 March 1993, with one exception, i.e. where the company had prior to this date taken reasonable steps to pay the dividend. As a concession of sorts the tax authorities have confirmed that where a company had credited shareholders' loan accounts prior to 17 March 1993, this will constitute payment.

4. Although close corporations do not have directors per se, for tax purposes this term includes anyone fulfilling a similar role for a close corporation.

© 1993 International Bureau of Fiscal Documentation

- the interest component of a dividend declared by a unit portfolio which is exempt from income tax under ITA Section 10(1)(iA);
- any dividend declared by a company which is exempt from income tax under ITA Section 10;
- any dividend declared in the course of the liquidation or winding up of a company, to the extent that it is shown by the company to be a distribution of profit (other than stock revaluation profits) derived in a year of assessment which ended on or prior to 31 March 1993;
- dividends in specie which are delivered to shareholders in the course of an approved unbundling exercise; and
- dividends declared by gold mining companies which have opted to retain the fiscal status quo (see "Special Taxpayers" below).

V. STC CREDIT – DIVIDEND INCOME

In order to ensure that the STC has no cascade effect, there is a deduction for dividend income in the calculation of the "net amount" subject to STC for any dividend cycle. For the dividend income to qualify for the deduction, it must have been declared in favour of, and have accrued to, the company in question.

All dividend income which accrues during the dividend cycle may be deducted, with only two exceptions, i.e. income relating to fixed property companies and income relating to unit portfolios (exempt dividends). Thus, both foreign-source dividends and dividends from gold mines which have opted to retain the fiscal status quo will be fully deductible.

For dividend income to be claimable as an STC deduction, it must specifically be classified as dividends for income tax purposes – it is not sufficient that the income be so classified for company law or accounting purposes.

VI. WHAT IS A DIVIDEND?

To be taken into account as a dividend declared or as dividend income for STC purposes, the amount in question must be a dividend as defined in ITA Section 1, or must be deemed to be a dividend under any other provision of the ITA.

A. *Dividend definition*

The ITA Section 1 dividend definition is regarded by many as the most complex in South Africa's fiscal legislation. Notwithstanding, the summary below should contain its essence.

A dividend means any amount distributed by a company to its shareholders, and includes:

- in relation to a company being wound up or liquidated, any profits distributed, whether in cash or otherwise, other than profits of a capital nature, earned before or during the winding up or liquidation;[5]
- in relation to a company not being wound up or liquidated, any profits distributed, whether in cash or otherwise, and whether or not of a capital nature;[6]
- in the event of a partial reduction or redemption of the capital of a company, so much of the sum of any cash and the value of any asset given to a shareholder as exceeds the cash equivalent of the sum of the reduction in the nominal value of the shares in question and the reduction of the company's share premium, subject to the capitalization issue qualifications;[7] and
- in the event of the reconstruction of a company, so much of the sum of any cash and the value of any asset given to a shareholder as exceeds the sum of the nominal value of the shares held and the company's share premium, prior to the reconstruction, subject to the capitalization issue qualifications.[8]

However, the definition expressly excludes:

- the nominal value of capitalization shares awarded on or after 1 July 1975 to shareholders as part of the equity share capital of a company; and
- a reduction in the share premium account of a company, represented by cash or assets given to shareholders, provided the share premium itself is what I will for convenience term a "primary" share premium, i.e. it was not created by means of a capitalization issue involving a transfer of reserves or undistributed profit to the share premium account. The latter form of premium could for convenience be termed a "secondary" share premium.

B. *Deemed dividends*

Limited measures have been introduced to deem certain loans and similar distributions to shareholders to be dividends purely for STC purposes (see below).

5. The use of the word "earned" has the effect that where a non-cash asset is distributed in specie to the shareholders, and its market value exceeds the cost to the company, the excess in question is not a dividend – in short, unrealized profits on liquidation dividends are not dividends.

6. The absence of the word "earned" means that both earned and unearned profits are dividends in the case of distributions by a going concern.

7. The capitalization issue qualifications are essentially simple:
- to the extent that an exempt capitalization issue which involved a transfer from reserves, a secondary share premium or unappropriated profits is followed by a partial reduction or redemption of capital;
- a reconstruction; or
- a reduction of share premium under which cash or any asset is given to shareholders, representing a return of share capital or share premium,

the amount so returned is automatically deemed to be a profit distributed (and thus, a dividend) to the extent of such previously capitalized reserves.
If any such reserves remain in existence when a company is ultimately wound up or liquidated, and the reserves originally capitalized were both of a capital and a revenue nature, apportionment rules apply to determine whether such reserves remaining on liquidation can still be so split. This is of significance because capital reserves distributed on liquidation are not dividends, even if capital reserves had previously been capitalized. By the same token, the distribution of capitalized revenue reserves on liquidation will be a dividend.

8. *Id.*

VII. EXEMPTIONS

Only four categories of dividends are exempt from STC, while a fifth category is effectively exempt. These categories are listed below, and the STC consequence to the recipient is discussed in each case.

A. *Tax-exempt companies*

Where companies are completely or partially exempt from tax under ITA Section 10, the dividends declared by such companies are exempt from STC in their hands. However, companies receiving dividends from such exempt companies are able to claim STC credits for these dividends, ensuring that this income flows through the corporate system without attracting STC at any level.

B. *Liquidation*

Profits derived during any year of assessment which ended on or before 31 March 1993, other than stock revaluation profits, and which are subsequently distributed in the course of the liquidation or winding up of a company are exempt from STC. This special exemption effectively applies only to realized revenue profits, as capital profits (realized or unrealized) and unrealized revenue profits distributed on liquidation are in any event excluded from the dividend definition and are thus automatically outside the scope of STC.

C. *Fixed property companies*

Dividends declared by fixed property companies (as defined in Section 1 of the Unit Trusts Control Act) out of revenue profits, on shares included in a unit portfolio (comprised in any unit trust scheme in property shares authorized under the Act) are effectively treated as interest for income tax purposes. An income tax deduction is allowed to the fixed property company, and recipients are fully taxed on the income. As a result, such distributions are exempt from STC, and for the same reason, the STC credit is denied to corporate recipients.

D. *Unit portfolios*

Linked to fixed property companies, unit portfolios which constitute companies under ITA Section 1(e) are in a unique position for income tax purposes. Such unit portfolios are conduits for the special category of dividends dealt with under the previous heading, as well as for certain tax-exempt interest which is then distributed as a dividend. In both cases, the dividend distributed by the unit portfolio is fully taxable in the hands of recipients, and as a result, such distributions are exempt from STC and an STC credit is denied to corporate recipients.

E. *Unbundling*

Simultaneously to the introduction of the STC, a new provision was inserted in ITA Section 60, enabling "unbundling" to take place without tax hinderance. The concept of unbundling is beyond the scope of this article but suffice it to say that STC itself would, in the absence of special provisions, constitute the single most formidable obstacle to unbundling, because an essential component in any such arrangement is a dividend in specie. For this reason, it has been provided in these unbundling provisions that such a dividend in the context of an approved unbundling arrangement will be deemed not to constitute a dividend for the purposes of STC (as well as for the purposes of the Non-Resident Shareholders Tax (NRST)).

VIII. INTERNATIONAL ASPECTS

A. *South African branch operations*

Foreign companies earning profits (other than dividends) from a South African source through a branch in South Africa may potentially be subject to STC. In fact, provided that some of the company's profits are so sourced, there may be potential STC liability even if there is no formal branch operation. The potential liability arises when the company declares a dividend, and would be calculated by applying a ratio to the net amount. This ratio is the net annual profits from a South African source divided by net annual profits from all sources. Such net annual profits must exclude dividend income, and are to be determined in respect of the latest year of assessment prior to the dividend declaration in question. Where the Commissioner is satisfied that this ratio cannot reasonably be determined in relation to this latest year of assessment, he is empowered to authorize another method of determining the ratio. This provision has something of a parallel in the provisions which create a NRST liability in similar circumstances.

Where the foreign company is a resident of a country with a double tax agreement with South Africa which contains the classic Article 10(5) restriction found in the OECD model treaty, then South Africa will only be able to levy STC to the extent that the dividend is paid to a South African resident, or where the holding in respect of which the foreign company's dividend is paid is effectively connected with a permanent establishment or fixed base in South Africa; it is thus not sufficient that the foreign company earns profits from a South African source. No South African treaty exactly mirrors this provision, but some agreements contain elements of it.

In practice the NRST provision has not been rigorously enforced by the South African tax authorities and it is likely that the same position will prevail with regard to STC.

B. *Foreign branch operations*

South African companies earning profits (other than dividends) from foreign sources through foreign branches (or

© 1993 International Bureau of Fiscal Documentation

similar operations) will be exempt from STC if these are their only profits. However, they will be subject to the STC regime to the extent that they earn local profits. Potential STC liability thus arises when the company declares a dividend, and would be calculated by applying a ratio to the net amount. This ratio is the net annual profits from a South African source divided by net annual profits from all sources. Such net annual profits must exclude dividend income, and are to be determined in respect of the latest year of assessment prior to the dividend declaration in question, as described under the previous heading.

C. *Foreign holders of South African shares*

From a purely South African domestic point of view, foreign investors in South African equities should for the most part be positively affected by the new dual tax system, in much the same way as local investors have been affected. In the most extreme case, where the South African company is in a full taxpaying position, and distributes 100 percent of its after-tax earnings to a non-resident subject to the maximum NRST rate of 15 percent, the combined tax rate on the underlying earnings will drop marginally from 56 to 55.65 percent as illustrated below:

	Old	New
Corporate taxable earnings	100,000	100,000
Income tax (old 48%/new 40%)	48,000	40,000
Corporate earnings after tax	52,000	60,000
Distribution thereof		
Dividend	52,000	52,174
STC @ 15%	0	7,826
NRST on dividend @ 15%	7,800	7,826
Net receipt by foreign shareholder	44,000	44,348
Effective combined tax rate (%)	56.00	55.65

In the case of an investment in a mining company (other than a gold mining company) the reduction is a little more significant, from 57.02 to 55.65 percent, because of the previous higher income tax rate of 49.44 percent applicable to such companies. In the case of a gold mining investment, there should be no change at all, for reasons set out below.

To the extent that the company had a low effective tax rate, or was not paying income tax at all because of special allowances or tax losses, there will be a substantial increase in the overall tax levied on distributions to foreign shareholders, similarly to the case of distributions to local shareholders.

From a global tax perspective, the position of the foreign investor depends on the home country's classification of STC and method of taxation of foreign holdings, as well as the possible impact of DTAs.

D. *South African holders of foreign shares*

The STC system has no specific effect on such shareholders. In the case of individual shareholders, there is simply no STC liability, while, in the case of corporate shareholders, they will be allowed to claim a full deduction for all foreign dividend income in the dividend cycle, in determining the net amount subject to STC. This will ensure that such dividends can flow through the economy to ultimate shareholders without attracting an STC liability.

IX. SPECIAL TAXPAYERS

A. *Tax-exempt entities*

Dividends which are subject to STC under general principles remain so subject even if declared in favour of tax-exempt entities. On the other hand, as noted above, tax-exempt entities which pay dividends will not have to deduct STC on such dividends; such declarations are exempt from STC. However, non-exempt entities which receive such exempt dividends and which pass them on to their shareholders by way of dividend will have to deduct STC on their own dividend declarations but this will not involve any net cost as they will be able to obtain a deduction for such dividend income in determining their net amounts subject to STC.

B. *Long-term insurance business*

Dividends which are subject to STC under general principles remain so subject even if declared in favour of assurers, regardless of whether such dividends relate to the assurer's taxed business (i.e. long-term insurance) or exempt business (i.e. pension, provident and retirement annuity operations).

At present, pending the introduction of the "four fund" approach[9] where an incorporated assurer declares a dividend, such a dividend will fall fully within the STC net. In the determination of the "net amount" subject to STC, a deduction will be allowed for a portion of dividend income in the dividend cycle, determined according to the ratio of the assurer's free reserves (loosely, those reserves not dedicated to policyholder's funds) to total assets. Where an assurer is

9. The 1993 tax legislation introduced the "four fund" approach to the taxation of life assurers to replace the current system, to which all assurers must convert by 1996. This approach compartmentalizes the assets of assurers into four funds, as follows:
- the untaxed policyholder fund, comprising assets of pension, provident and retirement annuity funds, as well as of policyholders who are exempted from tax under ITA Sec. 10, the income of which will remain tax-exempt;
- the individual policyholder fund, the taxable income of which will be determined using general principles (i.e. excluding dividends) and subjected to a 30% tax rate, being an estimate of the average individual tax rate;
- the company policyholder fund, the taxable income of which will be determined using general principles (i.e. excluding dividends) and subjected to the applicable company tax rate, currently 40%; and
- the corporate fund, comprising all remaining assets, the taxable income of which will be determined using general corporate tax principles (i.e. excluding dividends) and subjected to the applicable company tax rate, currently 40%.

Once this new regime is in place, the calculation of STC on dividends paid by corporate assurers will continue in much the same manner as before, except that the calculation of the deduction of dividend income in the dividend cycle will be far easier, with the deduction being simply the dividend income attributable to the corporate fund.

© 1993 International Bureau of Fiscal Documentation

not incorporated (i.e. a mutual assurer) it cannot pay dividends, and the question of STC simply does not arise.

C. *Gold mining companies*

Gold mines are taxed on a formula basis rather than on a flat rate basis, the current formula being $y = 58 - (290/x)$, where y is the tax rate, and x is the ratio of mining taxable profit to mining total revenue (the profit to revenue ratio). The formula effectively provides for a sliding scale tax rate which increases as profitability increases. As a quid pro quo, the tax rate drops substantially as profitability declines, falling away altogether when a profit to revenue ratio of 5 percent or lower is reached. Under the dual tax system, the formula will fall to $y = 49 - (245/x)$, the tax rate on non-mining income will fall to 40 percent, and STC will apply to dividends declared, in the manner outlined above.

However, because of the complexities of the gold mining formula, gold mines have been given the option of remaining with the current tax formula, in which case their non-mining income will continue to be taxed at the old 48 percent rate.[10] Dividends declared by such "status quo" gold mines will not be subject to STC even where the company also earns non-mining income.[11] Furthermore, these dividends will be able to flow through the corporate system without attracting STC at corporate shareholder level, as the corporate recipients will be entitled to deduct such dividends in computing their own "net amounts" subject to STC.

Gold mines must exercise their options by 31 August 1993, and this option will be binding on all future years. New gold mining companies which may be formed in the future will be given the option of being taxed on the status quo basis, which option must be exercised within six months of commencing gold mining operations. In all cases the company will automatically revert to the dual tax system in the year following that in which it ceases to mine for gold.

D. *Fixed property companies*

Certain dividends distributed by fixed property companies on shares included in unit trust portfolios have long been deemed to be akin to interest, and have thus remained subject to income tax in the hands of the unit holders, and tax deductible in the hands of the property companies. As discussed above, the STC system will continue to recognize this deemed "non-dividend" status by exempting such declarations from STC, while denying the recipients a deduction for such income in their dividend cycle.

X. COMPLIANCE PROVISIONS

STC is payable at a rate of 15 percent on the "net amount" determined in accordance with the above rules, by the end of the month following the month of the declaration of each dividend which triggers the close of a dividend cycle. In this context, where a declaration refers to a LDR the date of declaration is the LDR specified.

As a transitional measure, in the case of the first dividend cycle or cycles in respect of dividends declared on or before 30 June 1993 (note that there may be more than one such declaration) the STC payment date is 31 July 1993. Similarly, in the case of dividend declarations before 17 March 1993 and which have been specifically drawn into the STC net under the provisions discussed above, the STC payment date is also 31 July 1993, even if the dividend is only paid subsequent to this date, as declaration is deemed to have taken place on 17 March 1993, thus triggering STC liability.

There is one exception to these transitional measures: if a company's year of assessment ended during the period from 1 December 1992 to 31 March 1993 (both dates inclusive) then the STC in respect of any dividend declared on or before 30 June 1993 only needs to be paid by 31 December 1993.

If the correct amount of STC is not paid (accompanied by a prescribed form) by the due date for each dividend cycle, interest at the prescribed rate (currently 18 percent) will become due. The deduction of such interest for income tax purposes is specifically disallowed.

XI. ANTI-AVOIDANCE PROVISIONS

For obvious reasons, it has been necessary to provide detailed anti-avoidance provisions governing loans to shareholders. These provisions, which deem certain loans (and related distributions) to be dividends for STC purposes, are necessitated by the fact that many unlisted companies would otherwise legitimately avoid STC by lending reserves to shareholders rather than declaring dividends.

Under these provisions any amount which is deemed to have been distributed (including a loan or credit) to a "recipient" is deemed to be a dividend. In this context, a "recipient" is any shareholder of a company or close corporation, any relative of such shareholder, or any trust of which such shareholder or relative is a beneficiary. Furthermore, these provisions apply where cash or any asset has been distributed by a company to or for the benefit of such recipient; or where such recipient is released from any obligation measurable in terms of money which he owes to the company; or where any debt owed by the recipient to any third party is paid or settled by the company; and finally, where any amount is used or applied by the company in any other manner for the benefit of the recipient.

However, there are a number of circumstances where these provisions will *not* apply. These are:

- loans at market-related interest rates;
- loans by a wholly-owned subsidiary to its holding company;

10. See *supra* note 1.
11. Calculations by the author indicate that a gold mine distributing its earnings in full would need to maintain a future profit to revenue ratio of at least 32.8% for the new dual system to be more favourable than the status quo. Since such profitability levels are currently rare in the industry, it is unlikely that many (or any) gold mines will opt for the new system.

© 1993 International Bureau of Fiscal Documentation

- loans between fellow wholly-owned subsidiaries;
- distributions which already constitute dividends under the dividend definition in ITA Section 1;
- distributions which expressly do *not* constitute dividends (under paragraphs (e) to (h) of the aforementioned definition), i.e. essentially capitalization shares and the reduction of "primary" share premium;
- remuneration of employees;
- settlement of the company's debts;
- loans to employees under a loan scheme generally available to employees who are not shareholders;
- distributions in excess of profits and reserves available for distribution;
- capital profits distributed pending or during a company's liquidation or winding-up; and
- loans to shareholders which are repaid by the end of the following year of assessment, provided the loans are not subsequently re-advanced, and provided this exemption only applies once to any particular company and cannot be repeated in any subsequent year.

A further qualification is that these deeming provisions only came into operation on 17 March 1993 and, as a consequence, they do not apply to distributions and loans made before this date, even if they remain outstanding afterwards.[12]

Where a loan by a company is deemed to be a dividend for STC purposes, and it is subsequently repaid, the repayment will be deemed to be dividend income in the company's hands for STC purposes. As a consequence, the company may then declare an equivalent amount as a dividend without attracting further STC, due to the credit it is entitled to for the deemed dividend income.

XII. CONCLUSION

The dual tax system adds a new dimension to the fiscal planning requirements of new investments as well as existing structures in South Africa. There is no doubt that, compared with the previous tax regime, the new system provides an incentive which should encourage the productive reinvestment of corporate earnings. It also provides an incentive for locally-sourced investment for new projects which once established are likely to grow through internal reinvestment. However, before the system could be said to be optimal, the STC rate and/or the basic corporate tax rate need to be lowered further to ensure that in combination they are closer to the international norm of 40 to 45 percent.

12. However, any increase in such a loan after this date will potentially fall within these provisions.

CONFERENCE DIARY

INTERNATIONAL:

ENVIRONMENT AND TAXATION: MUTUALLY REINFORCING POLICIES

Jeffrey Owens

How do tax measures affect the environment? And what tax regime can best promote environmental protection without damaging production? The OECD has just published a report on taxation and the environment, prepared by a special task force which united both tax and environment experts.[1]

The potential for using taxes as part of an integrated environmental policy is now the subject of considerable interest in OECD countries. Environmental charges and taxes have multiplied over the last decade and, in energy policies and measures to combat greenhouse gases, several countries have introduced energy and/or carbon taxes.

The increased use of such "eco-taxes" raises two main issues. First, how should the (non-environmental) taxes that may have adverse effects on environmentally sensitive sectors – as in agriculture, transport and energy – be adapted? Second, how can such taxes be best properly integrated into existing tax structures and policies?

On the first count, a number of "government failures" have been identified. In transport, for instance, fiscal concessions have encouraged an excessive reliance on "company cars", and income tax deductions for commuting to work by car increase both accidents and air pollution. Energy taxes set at too low a rate will lead to pollution, such as emissions of carbon dioxide. Correcting this kind of fiscal failure reduces economic distortions and increases efficiency, and it also improves environmental protection – a "double dividend", which can even be increased if the introduction of new eco-taxes is compensated by the removal of existing tax distortions. Generally speaking, it may be preferable to replace taxes on labour and capital by taxes on pollutants – this is an issue which deserves much more attention. In Sweden, for example, a major fiscal reform was undertaken in 1990-91 in which income and corporate taxes were reduced (respectively, from 22.5 to 19.5 percent and from 2.8 to 1.9 percent of GDP) and new eco-taxes introduced on emissions of carbon dioxide, sulphur dioxide and nitrogen.

Jeffrey Owens is Head of the Fiscal Affairs Division of the OECD Directorate for Financial, Fiscal and Enterprise Affairs. The views expressed herein do not necessarily reflect those of the OECD and its Member countries.

I. FOUR FUNDAMENTALS

The changes required by this policy integration must be implemented in a way that respects the basic principles underlying modern tax systems (fairness, fiscal neutrality, administrative simplicity). Particular attention has to be paid to four issues: the earmarking of tax revenues, fiscal neutrality, revenue neutrality and fairness.

A. *Earmarking*

A number of environmental charges and taxes are already being used to finance specific programmes, such as pollution control equipment (by river-basin authorities in France; and pollution charges are used in this way in the Netherlands) or to finance special trust funds, sometimes to clean up hazardous waste sites (as in the "Super Fund" in the United States). Earmarking environmental taxes and charges has the advantage that it can build up popular support for a new environmental tax, since it makes the link between the tax and its objective explicit. More generally, earmarking may increase the reliability of funds for environment programmes, which is important when the public sector is operating under tight fiscal constraints.

But the trend in recent reforms has been to move away from earmarking tax revenues for specific purposes, in part because returning the revenue from earmarked taxes to the taxpaying polluters (in the form of subsidies, for example) weakens the incentive

1. *Taxation and Environment: Complementary Policies* (Paris: OECD Publications, forthcoming).

© 1993 International Bureau of Fiscal Documentation

for them to change their behaviour. And where environmental taxes are set high enough to provide the incentive necessary to change the polluting behaviour of firms and households, earmarking is not required.

Another disadvantage of earmarking is that, in the long run, it is likely to introduce undesirable rigidities into budgetary decisions: the desire for revenue rather than environmental effectiveness may dictate the choice of tax rates, and environmental spending may be determined simply by the availability of earmarked revenue. Experience suggests that earmarking should generally be viewed only as a second-best, transitory solution during the period when environmental taxes have not yet reached their most effective rates.

B. *Fiscal neutrality*

From a purely fiscal perspective, taxes should normally be designed exclusively to yield revenue in the most efficient and least distortive manner. That is, the design of the tax system should be influenced by fiscal considerations alone, not to induce any specific behaviour or reaction from producers and consumers. Clearly, few taxes meet these criteria, and environmental taxes, after all, are generally designed to induce polluting agents to abate their emissions and to behave in an environment-friendly manner. But the reason for not wanting the tax system to influence behaviour is that the market is generally better at ensuring economic efficiency than government is. This is clearly not the case when there is pollution as, without taxes and/or in the absence of well-defined property rights, prices do not reflect the broader costs of pollution. Nonetheless, a careful balance should be kept between the advantages of tax reforms designed to achieve fiscal neutrality and the achievement of environmental objectives.

C. *Revenue neutrality*

The revenue potential of environmental taxes is large and thus requires government to address the question of how the income should be used. To offset other taxes? To pay for additional government expenditure, either on the environment or for other purposes? To finance government deficits? Most governments favour the first option. The political acceptability of new environmental taxes will be enhanced if they are introduced as part of a revenue-neutral package with offsetting reductions in the yields from other taxes (as in the fiscal reform in Sweden). Such revenue neutrality may also be attractive from an economic standpoint if the taxes that are reduced are producing distortions in patterns of consumption or production. How far countries can achieve revenue-neutrality will in part depend upon the size of public-sector deficits and the resulting pressure on revenue to cover them. It will also depend upon whether the environmental taxes are earmarked for specific funds, thereby inhibiting any offsetting reductions in distortionary taxes.

D. *Fairness*

Environmental taxes high enough to have any real impact on the environment will also have distributive consequences for households by pushing up the cost of fuel, agricultural products and thus food, and other goods and services. Since these items consume a larger proportion of the income of poorer households, it has been claimed that these taxes are regressive and therefore unfair. Governments try to deal with these effects in a number of ways. First, they have developed compensation schemes. Second, equity issues can be dealt with by decisions on which of the existing taxes should be reduced. But it is unlikely that this would produce a distributionally neutral outcome. It is important that redistributive measures be undertaken separately (through benefit systems), not in the form of tax exemptions or reductions which would offset the environmental effect of eco-taxes in encouraging environment-friendly behaviour by reducing incentives not to pollute.

II. OPTIONS FOR GOVERNMENT

There are a number of options open to governments to improve the environment by using tax-based instruments.

A. *Emission taxes and charges*

Emission taxes and charges can make an important contribution to the reduction of a range of industrial effluents, especially where discharges can be readily observed and measured – which is not always easy. But improvements in measurement technology are increasing the number of taxable effluents where precise and continuous measurement is feasible, and where taxes can be levied in direct proportion to the amount of environmental damage from each source. Discharges of organic substances into water, for instance, or of sulphur oxides into the atmosphere from thermal power stations can be easily monitored. Although the potential revenue from emission taxes is high, present experience suggests that the actual yield has been limited because, for economic and political reasons, the rates of eco-taxes are kept relatively low, usually too low to achieve environmental objectives (hence the importance of combining taxes with regulations).

B. *Indirect taxes*

Before introducing new environmental taxes, existing fiscal measures that might have a detrimental effect on the environment should be modified or removed if they, say, encourage urban sprawl (through, for instance, the deductibility of travel as a commuting expense), or afforestation which damages wetlands or for land clearance and drainage, and so on.

Changes to the structure of the taxes on goods and services provide an alternative way of introducing incentives for pollution control into the existing system. Taxes on products which cause damage (say, pesticides) can also be effective, particularly if they are used in large quantities and are readily identifiable (if the product is highly toxic, a partial or total ban may be preferable). The higher the demand for elasticity and substitution possibilities of products, the higher the environmental effectiveness of product taxes, as consumers use less of them or turn to alternative, more readily acceptable alternatives.

© 1993 International Bureau of Fiscal Documentation

Input taxes offer another approach. They are applied to material and energy inputs that result in polluting productive processes and/or products. Reducing the energy and material intensity of production and consumption will affect all subsequent stages of production and result in reduced pollution. The approach can apply to specific raw materials (a tax on virgin – non recycled – paper, for instance) or polluting inputs (phosphates, chlorine, sulphur, and so on).

But there are limitations to the introduction of environmentally motivated changes in the existing consumption tax system: first, since not all polluting inputs can be taxed and, second, because the use of VAT systems may be inappropriate. VAT is paid on the value of products, whilst the environmental damage is usually related to quantities produced. The link may therefore be weak.

C. *Carbon taxes*

In order to combat global warming some countries are turning to a carbon tax (a tax on the carbon content of fuels, which is tantamount to an additional energy tax). These are imposed on energy sources (gas, coal, oil) in proportion to the amount of carbon dioxide given off when they are consumed. They encourage consumers to use less energy, and to switch to less carbon-intensive energy sources. Several OECD countries – Denmark, Finland, the Netherlands, Norway and Sweden – have already implemented such taxes.

The main problem with carbon taxes is that they would have to be very heavy to reduce emissions on any real scale. Stabilization of emissions at 1990 volumes in the OECD area over the period 2000-2050 would require a tax of about $ 81-88 per ton of carbon ($ 236 in Japan) by the year 2050 (at 1985 prices). That would probably result in substantial burdens on poorer households, where fuel usually accounts for a large proportion of their expenditure. To offset these undesirable effects, carbon taxes could be implemented as part of a package (for example, through reductions in other taxes to equalize the net incidence of the new tax across households and/or economic sectors).

The introduction of such heavy taxes would also produce structural changes in the economy which would influence the geographical distribution of income and employment in different sectors and international trade patterns in the energy sector. These changes would be heavily influenced by the precise way in which the revenues are used – some consumers and industries could be net gainers from a package that introduced a carbon tax and reduced other taxes.

III. QUESTIONS FOR IMPLEMENTATION

The introduction of environmental taxes and thorough integration of environmental and tax policies will require a set of simple rules and criteria to ease their implementation and strengthen their effectiveness.

Close coordination will be required between different arms of government, in particular between ministries of finance and of the environment. If revenue considerations dictate the choice of tax rates, it will make it more difficult to achieve the optimal environmental impact. And, if environmental taxes are introduced without considering their implications for the overall balance of the fiscal system, they are likely to run into administrative and political opposition that could have been avoided with better coordination.

There are important international dimensions to environmental taxes, two in particular. First, eco-taxes are bound to have an effect on the international competitiveness of domestic firms. Industry often claims, sometimes justifiably, that environmental taxes and charges introduce an additional financial burden which adversely affects its competitive position. But, relative to regulations, taxes encourage economic efficiency over the longer term and should minimize the overall cost of controlling pollution in a given country, thus improving its industrial competitive position overall in comparison to industries in a country which uses a regulatory approach.

Moreover, the additional tax burden has to be seen in the context of the implicit (sometimes explicit) subsidies that have been provided to polluting industries when environmental policies have been weak, for instance, through low emission standards or weak enforcement of regulations. Furthermore, if eco-taxes are implemented in the context of a more comprehensive reform, which decreases other taxes, the short-term additional burden may be reduced. Of course, tax reductions may affect different economic agents in different ways and thereby make it difficult to compensate completely those most adversely affected by the change. On balance, this fear of worsening the short-run competitive position of firms operating in a country which introduces a significant environmental tax is real, though perhaps occasionally exaggerated. Nevertheless, these reservations should not be used as a reason to postpone the introduction of eco-taxes if the approach is internationally coordinated and implemented in a progressive fashion, in order to alleviate potential trade distortions.

Because certain forms of environmental problems are of a regional or global scale, measures to address them will be most effective if they involve international cooperation. It can take a variety of forms. With global warming, for example, international cooperation may have to extend to a coordinated introduction of carbon taxes by all OECD countries (and preferably countries beyond the OECD area). That could require formal international agreements as well as policy dialogues in international fora, including the OECD.

The Commission of the European Community has made a formal proposal for an EC-wide carbon-energy tax, an issue actively debated at present, although unresolved. Such a tax would require the active coordination of policies and a proper integration into existing fiscal systems to achieve a revenue-neutral package and alleviate possible anti-competitive effects.

Environmental taxes will not provide the unique solution to environmental problems and will usually have to be used in combination with direct regulation of environmentally damaging activities. But they may contribute to a more efficient solution to national and international environmental problems.

DENMARK:
TAX REFORM

Bente Møll Pedersen

Bente Møll Pedersen is Attorney-at-law, Kromann & Münter, and lecturer on Tax Law at the University of Copenhagen.

I. INTRODUCTION

Comprehensive Bills[1] providing for a tax reform were enacted by the Danish Parliament on 24 June 1993. The reform covers the taxation of individual income, business profits and companies, and as a general rule will be effective as of 1 January 1994. However, a number of the amendments apply from 19 May 1993, the date the proposals were introduced.

VIII. Conclusion

II. BACKGROUND AND OBJECTIVE

Danish taxation of individual income has traditionally been characterized by extremely high and progressive tax rates. Some of the problems associated with the progressive tax principle in Denmark were resolved or at least mitigated by the 1987 tax reform. However, taxation remains progressive with a tax rate of up to 68 percent on earned income.

The overall objective of the reform is to reduce the tax burden by decreasing the taxation of earned income of individuals and gradually reducing the top marginal rate from 68 to 58 percent over the five-year period from 1994 to 1998. However, the introduction of a social security contribution implies that the marginal tax rates are actually only reduced to 62 percent.

The revenue to finance the reduction of the marginal tax rates will be provided by broadening the tax base, primarily by introducing taxation of all capital gains and abolishing the inconsistent treatment of different types of income and capital gains. The new social security contribution and the new environmental taxes (i.e. duties on petrol, gas, electricity, waste disposal and water, etc.) should provide additional sources of revenue.

The 1993 tax reform is not as fundamental as the 1987 reform, but substantial changes have been made in certain areas. This article describes the key features of the tax reform.

III. TAXATION OF INDIVIDUALS

A. *Tax rates*

Effective from 1994, the computation of tax payable is amended and the following new rates apply.

1. National tax

(a) *Bottom level tax*

The current 22 percent tax, which is levied on all taxable income, is replaced by a bottom level tax of 14.5 percent in 1994, gradually reduced to 8 percent in 1998.[2]

(b) *Mid-level tax*

A new national income tax is introduced as a mid-level tax of 4.5 percent in 1994, gradually increased to 6 percent in 1998. Tax is levied on personal income, plus or

1. Bills Nos. L 283 – L 297 of 19 May 1993.
2. The bottom-level tax is levied on all taxable income regardless of the amount.

© 1993 International Bureau of Fiscal Documentation

minus capital income. The mid-level tax is only levied on income exceeding DKK 130,000 (1994).

(c) *Top-level tax*

The current 12 percent national income tax is replaced by a new top-level tax of 12.5 percent in 1994, gradually increased to 15 percent in 1998. This tax is levied on personal income plus capital income over DKK 20,000 (1994) for a single taxpayer, and DKK 40,000 for a married couple. A deduction of DKK 234,900 (1994) is allowed when determining income subject to the top level tax.

2. Municipal taxes

Ordinary taxable income is subject to municipal taxes at the rate of approximately 29.5 percent and, if applicable, church tax of approximately 0.7 percent. These rules remain unchanged.

B. *Social security contribution*

A social security contribution has been introduced. The tax is imposed on employment income, fees and business profits. The employee contribution for 1994 is set at a flat rate of 5 percent on gross employment income or personal income, increasing to 8 percent by 1997.[3] The employer contribution will not take effect until 1997, at the rate of 0.3 percent of wages, increasing to 0.6 percent by 1998.

C. *Fringe benefits*

Fringe benefits received from an employer are regarded as taxable income for an employee. Until now an employee has been taxed on the estimated value of the private use of any such benefit. However, from 1994 the employee will be taxed at an amount equalling the cost to the employer.

For certain fringe benefits, i.e. free automobile, telephone, summer cottages and pleasure boats, standard amounts apply, and new rules are fixed according to which the employer must report such benefits to the tax authorities and withhold income tax from the salary.

D. *Income from immovable property*

Owner-occupied houses are deemed to produce taxable income for the owner in an amount equal to the rental value of the property. The rental value is set by the tax authorities; currently it is 2.5 percent of the public assessment value of the property up to DKK 1,483,200 (1993) and 7.5 percent of any excess. These rates are reduced to 2 percent and 6 percent with effect from 1994.

IV. TAXATION OF DIVIDENDS

One of the primary objectives of the reform is to ensure that dividends and capital gains are taxed in the same manner. From 1991 until 19 May 1993, dividends from Danish companies were classified as a special type of income, "dividend income", which was not included in the calculation of taxable income. Dividends were taxed separately at the rate of 30 percent if the dividend did not exceed DKK 31,700, and a further tax of 15 percent was levied if the dividend exceeded DKK 31,700 per year. Under the reform dividends are taxed as "share income" (see Section V) and the tax treatment of dividends from Danish companies is more favourable than previously.

Share income below DKK 31,700 (1993) is taxed at 30 percent, and from 1996 at 25 percent. Share income exceeding DKK 31,700 (1993) is taxed at 40 percent. However, the rules do not apply to dividends of non-resident companies which are taxed as capital income (i.e. up to 58 percent in 1998).[4]

Under the reform dividends are still subject to double taxation in Denmark as follows:

	below DKK 31,700	*above DKK 31,700*
Company profits	100.0	100.0
Corporation tax	34.0	34.0
Shareholders tax (on 66)	19.8	26.4
Total tax	53.8	60.4

V. TAXATION OF CAPITAL GAINS[5]

As a general rule all capital gains are taxable under the reform. A new classification, "share income", has been introduced which is comprised of either dividends or income related to capital gains on shares held for more than three years. As stated above "dividend income" has been abolished.

The gains are taxable as general taxable income or share income. For individuals, general taxable income is taxed as personal income or capital income. For companies, general taxable income is taxed at the corporation tax rate of 34 percent.

A. *Shares*

Capital gains derived from the sale of shares are taxed as capital income if the shares are held for less than three years. Any loss may be deducted from the gain on other shares held for less than three years. These rules remain unchanged.

3. The contribution is deducted from personal income before calculating ordinary taxable income, and thus reducing the base for calculating national and municipal income taxes.
Foreign key expatriate employees and research workers who are allowed to opt for a 30% income tax rate on their gross income are also subject to the social security tax. For further details, see Bente Møll Pedersen, "Tax Status of Expatriates", 47 *Bulletin for International Fiscal Documentation* (April 1993), at 211-213. Thus the actual taxation of such expatriates will be 38% in 1997 as the tax will not be deductible from the income which is subject to 30% taxation.
4. The different treatment of dividends of non-resident companies is most likely incompatible with the EC treaty and therefore the taxation of dividends of non-resident companies may be changed.
5. Unless otherwise indicated all changes apply to both individuals and companies.

© 1993 International Bureau of Fiscal Documentation

Before the reform measures took effect on 19 May 1993, if the shares were held for more than three years, the gain was generally exempt from taxation. However, if the shareholder in question together with close relatives held more than 25 percent of the share capital or 50 percent of the voting power of the company, special rules applied, i.e. the capital gain was subject to a special income tax at a flat rate of 50 percent. However, if the shareholder held the shares for more than seven years tax was reduced to 25 percent. The taxation of capital gains on shares held by individuals for more than three years has been substantially amended by the reform. For companies, however, the rules are unchanged, and any gain is still tax-exempt if the shares are held for more than three years.

Capital gains on shares held by individuals for more than three years are taxed in the same manner as dividends from Danish companies (see above). A loss can be deducted at a maximum tax value of 40 percent. The rules apply to capital gains realized on the sale of shares in both resident and non-resident companies.

By way of exception to the general taxation of shares held by individuals for more than three years, capital gains on shares quoted on a stock exchange and of a total value not exceeding DKK 100,000 (1993) are tax exempt. If the holding exceeds DKK 100,000 the gain is taxed as share income. If the gain is taxable, a loss can be deducted from gains on other quoted shares held for more than three years.

Special rules apply to major shareholders, i.e. shareholders with more than 25 percent of the shares or 50 percent of the voting rights of a company before 19 May 1993. The taxable gain is reduced by 1 percentage point for each year the shares are held prior to 1998, but the gain may not be reduced more than 25 percent. No reduction is granted if the shares are acquired after 19 May 1993.

Capital gains on shares of certain non-resident tax-exempt investment companies are taxed as capital income. These rules also apply if a Danish holding company owns the shares of a non-resident investment company.

As a result of the uniform taxation of dividends and capital gains on shares, the special Danish holding rules for companies have been abolished.

B. *Immovable property*

Prior to the reform capital gains from the sale of property other than residential property were taxed at various rates depending on the period of ownership. If the property was held for less than three years the gains were fully taxable. Thereafter the taxable gain was reduced by 20 percent annually, and after seven years the disposal was tax-free. Under the reform, the capital gain is reduced by 5 percentage points per year for each year of ownership, subject to a maximum of 30 percent. Thus if the property is held for more than eight years 70 percent of the capital gains are taxable.

For individuals the gain will be taxed as capital income at the highest marginal tax rate of 58 percent in 1998. The effective tax rate is thus 58 percent of 70 percent, or 40 percent, if the property has been held for more than eight years.

Rollover relief is granted which permits deferral of taxation if the property is used for the owner's business and if replacement property is acquired. In such a case the gain is deducted from the purchase price.

C. *Goodwill*

Until 1982 capital gains on goodwill were taxable. Between 1982 and 19 May 1993, capital gains on goodwill were tax-exempt. However, taxation on goodwill is reintroduced by the reform – capital gains on goodwill are taxable as ordinary income and personal income for individuals. Acquired goodwill may be depreciated over ten years by 10 percent annually. The amount on which depreciation is effected and the seller's gain are calculated on a cash basis.

A special rule has been introduced to prevent related persons or companies from transferring goodwill in a year with low income (and therefore minimum taxation of a gain) to a related buyer who can depreciate on the full purchase price. If goodwill or other intangible rights are transferred between related parties goodwill can only be depreciated at an amount equal to the seller's taxable gain.

In connection with the reintroduction of the taxation of goodwill, the taxation of a number of other intangible rights which previously were taxable under the special income tax act are now taxable as general taxable income. For individuals this implies that the 50 percent flat rate special income tax no longer applies. Gains are taxable as personal income for individuals.
As a general rule, the above applies to goodwill transferred after 19 May 1993. However, if goodwill is transferred in 1993 only 25 percent of the gain is taxable, if it is transferred in 1994 50 percent of the gain is taxable, and if transferred in 1995 75 percent of the gain is taxable. The amount on the basis of which depreciation is effected is the reduced amount.

If goodwill is transferred between 19 May 1993 and 1 January 1998, and if the principles of calculating goodwill have been agreed to between the parties under a binding contract, goodwill may be tax exempt according to the old rules. However, a binding ruling must be obtained from the authorities (and filed before 1 January 1994) to the effect that a binding contract has been entered into.

VI. TAXATION OF BUSINESS PROFITS

The taxation of business profits has been amended as follows:

A. *Investment funds*

Up to 25 percent of an individual's taxable business income may be allocated to an investment fund and deducted in calculating taxable income. The investment fund must be used within six years after the year of allocation as advance depre-

© 1993 International Bureau of Fiscal Documentation

ciation of any acquired tax-depreciable assets. These rules, which have already been abolished for companies, will be abolished gradually. With effect from the income year 1998 it will no longer be possible to obtain the deduction.

B. *Stock valuation*

Stock, i.e. the taxpayer's movable property which is to be sold in the course of the taxpayer's business or to be used in the production process which will be sold as part of the taxpyer's business, can be deducted at the rate of 23 percent of the value of the stock in 1993. This deduction will be gradually abolished, and with effect from 1998 it will no longer be possible to reduce the valuation of inventory.

C. *Depreciation*

Machinery and equipment, etc. and ships may be depreciated for tax purposes at a maximum of 30 percent per annum on a pooling basis. As from 1994 the transfer sum for such assets will be calculated on a cash basis. Special rules will apply for this calculation.

D. *Relief for foreign source income*[6]

A company having foreign branches or jointly taxed foreign subsidiaries may obtain relief amounting to 50 percent of the Danish corporation tax levied on the net taxable income of the foreign branch or subsidiary. The effect of this relief is that the effective Danish tax rate may be reduced for a company having branches or jointly taxed foreign subsidiaries. This foreign relief is gradually abolished at the rate of 1/7 each year between 1994 and 1999, and totally abolished as from the year 2000.

E. *Capital transfer duty*[7]

The 1 percent capital transfer duty has been abolished.

F. *Duty on the sale of shares*

The 1 percent duty on the sale of Danish or foreign shares and similar securities (where at least the seller is resident in Denmark) is reduced to 0.5 percent as of 1 January 1995.

VII. MEASURES TO PREVENT TAX AVOIDANCE

As part of the reform several measures have been introduced to prevent tax planning and other undesirable methods of exploiting the tax system.

A. *Partnership leasing*

Income from certain types of tax-effective investments in partnerships with more than ten partners are taxed as capital income, and losses can only be offset against other income from the same partnership. These restrictions apply as from 19 May 1993 to the leasing of equipment or ships where a partner does not take an active role in the leasing business and regardless of the number of partners.

B. *Leasing activities*

To counter the increasing trade in "surplus-generating companies", the possibilities of depreciating leasing assets have been restricted with effect from 19 May 1993. No companies – not only "surplus-generating companies" – acquiring machinery and equipment are allowed a first-year depreciation on such leased assets. In the following year 60 percent may be depreciated.

C. *Trade in loss-making companies*

To prevent an increasing trade in "loss-making companies" the existing rules in respect of tax losses have been restricted. Tax losses may be carried forward for five years to be offset against taxable income. If more than 50 percent of the share capital or more than 50 percent of the voting rights of a company have been transferred to new owners, tax losses cannot be set off against income from passive investments. In the future this will also apply to leasing income. However, a loss can still be offset against income from trading activities.

D. *Income from abroad*

To counter the rising tax planning in connection with the investment of capital in foreign financial assets, a net income principle has been introduced in calculating relief under a double tax treaty or under Danish domestic rules. When avoiding international double taxation, the income entitled to relief must be calculated on a net income basis. Accordingly, expenses related to the foreign income must be deducted from the foreign income before calculating the relief.

VIII. CONCLUSION

The Government has created a new tax system which provides for more symmetrical taxation and taxation of capital gains on all assets. The gap between the taxation of earned income and capital income has also been closed. Different types of income and capital gains will be taxed in the same manner.

The Government also aimed to approximate taxation in Denmark to that of the rest of Europe, e.g. by introducing a social

6. This rule applies only to companies.
7. *Id.*

© 1993 International Bureau of Fiscal Documentation

security contribution. However, a progressive taxation of capital income and capital gains up to 58 percent in 1998 does not provide for such approximation. Furthermore, taxation of capital gains on shares at a flat rate of 40 percent without any allowance or inflation deduction and double taxation up to 60.4 percent are putting Denmark into a special class. No other country in Europe appears to have such a heavy tax burden.

Denmark is not following its Nordic neighbours, Sweden, Norway and Finland, which levy a comparatively low flat rate of tax of 25-28 percent on capital income. If Denmark is numbered among the Nordic countries, one certainly cannot speak of a Nordic model of taxation of capital income.[8]

8. For a discussion of the Finnish tax reform, see Kari S. Tikka, "Fundamental Tax Reform", 47 *Bulletin for International Fiscal Documentation* (June 1993), at 348-353.

The 1993 European Tax Handbook

Fast access to European Tax Law in a single volume, neat enough to fit into a briefcase. The taxation systems in 30 West, Central and East European countries are covered in full, including rates.
A common chapter outline facilitates quick reference and easy comparisons.

Corporate Taxation
National corporate income tax
Other income taxes
Net worth tax
Payroll taxes
Social security contributions
Value added tax
Withholding taxes (plus treaty charts listing withholding tax rates)
Non-resident corporations

Individual Taxation
National income tax
Wages tax
Other income taxes
Net wealth tax
Social security contributions
Inheritance and gift taxes
Non-residents

All aspects of income taxes applying to corporations and individuals are covered. Particular attention is given to non-residents and relief from international taxation.

A special chapter on the EC is also included.

Price: 295 Dutch Florins
(1992 edition still available: 285 Dutch Florins)
Residents of the Netherlands, and residents of the EC without a VAT number, are liable to value added tax on the price of this item.

LIECHTENSTEIN:

PREFERENTIAL TAX TREATMENT OF HOLDING AND DOMICILIARY COMPANIES

Dr Norbert Seeger

Dr Seeger received his Licentiate of Economics from the St. Gallen School of Economics in 1978. He graduated from the University of Berne in 1980 with his Licentiate of Law and in 1986 was conferred his Doctorate of Law. He is a sole practitioner in Vaduz.

I. INTRODUCTION

Tax experts acquainted with the complex tax laws of most OECD countries would be amazed at the simplicity and clarity of Liechtenstein tax law. The entire tax system is clearly set forth in a mere 167 paragraphs. There exists no plethora of judgements and/or rulings on the interpretation of the various provisions and thus potential investors and businessmen are provided with a high degree of certainty as to the tax treatment of their projects.

The simple tax system which generally speaking does not know concepts such as "imputation", "deeming provisions" or "income attribution rules" nevertheless boasts low rates of personal and corporate tax, and has proven to be successful as an instrument of social and economic policy. Since the introduction of the basic tax scheme in 1923, which was overhauled by the tax law of 1961, the Liechtenstein economy has flourished. Unemployment is unknown and the government continues to balance its budget. Liechtenstein is one of the few modern states with both a highly developed social welfare system and an annual excess of state revenues over expenditures.

As mentioned above, the fundamental system of taxation was introduced through the tax law passed in 1923. Pursuant to this law, the tiny Principality adopted a system which, in providing for a universal tax on capital with only a supplementary tax on income, perceived capital as the main source of government revenue. This law was passed at a time when the economy was still land-based with many farmers producing mainly to satisfy their own needs so that only modest surpluses were transformed into cash. Thus, the administration of an income tax system was perceived to be unfair to the landless workers who, unlike the farmers, had become fully integrated into a cash economy. The administrative difficulty in introducing an income tax system in an agrarian economy was also taken into account. The system of tax on capital was intended to shelter capital growth through the imposition of very low rates.

The current tax law, introduced in 1961, is, as was its predecessor, based on a system of a general tax on capital with tax on income being treated as a supplementary source of revenue.

A tax system which is based on a universal tax on capital as opposed to income tax must by logical necessity prefer the concept of territoriality or "source", i.e. that a state is only entitled to tax those assets situated within its jurisdiction and such income as arises within its jurisdiction, to the concept of a levy on the worldwide income of its residents. This basic notion which lies at the heart of Liechtenstein tax principles has been misunderstood and led to the notion that the tax system was intentionally designed to encourage tax evasion on an international scale.

The general philosophy upon which the tax system is based has been extended in order to benefit corporate entities. The use of legal entities – whether or not wholly controlled by a single individual – is not considered tax evasion in Liechtenstein. Thus, various forms of Liechtenstein legal entities, as well as trusts, have been used to maximize estate and tax planning schemes, particularly by non-residents seeking effective tax shelters. As a result, encouraged by a preferential tax treatment, foreign-owned holding and domiciliary companies have flourished in Liechtenstein.

© 1993 International Bureau of Fiscal Documentation

Interestingly enough, holding and domiciliary companies were not originally attracted to Liechtenstein for tax reasons. After the collapse of the Austro–Hungarian Empire following the treaty of Versailles, many large enterprises were faced with a situation in which their various branches were scattered throughout the newly formed independent states. To consolidate operations they decided to transfer the company's administrative head office to a neutral state abroad.

The first such transfer was arranged on 18 January 1920 by the Liechtenstein envoy in Vienna, Prince Eduard von Liechtenstein. Seven months later the Bank of Liechtenstein, a holding company of the Anglo–Austrian bank, was opened. Through contacts maintained by this bank in Austria, many new holding and domiciliary companies were attracted to the politically stable Principality, whose monarchy had survived the collapse of all other German monarchies.

Liechtenstein provided a safe refuge from the continual threat of political instability and economic collapse which hovered over Austria in the 1920s and 1930s. The preferential tax treatment which holding and domiciliary companies enjoyed in Liechtenstein thus played little or no part in the decision to relocate. Taxation on income had been introduced as a temporary levy in most OECD countries during World War I to finance their respective military engagements.[1] The establishment of holding and domiciliary companies in Liechtenstein commenced at a time when the immutability and severity of personal/corporate income taxes was not foreseeable.

Essentially, Liechtenstein was to profit from the general shift west of the political and economic centre of gravity in Europe following World War I, and in particular the collapse of the Austro–Hungarian and Ottoman Empires, as well as the self-imposed isolation of Russia, factors which were subsequently exacerbated by the formation of the Iron Curtain.

The Liechtenstein fiscal authorities, however, soon became aware of the importance of holding and domiciliary companies, and guided by the action of some Swiss cantons to attract foreign investment, introduced tax legislation providing for the preferential treatment of holding and domiciliary companies. The tax law of 31 January 1921 was a self-declared instrument of economic policy, providing that the establishment of holding and domiciliary companies was to be encouraged, and a special flat corporate tax rate was introduced. This preferential tax treatment continues to this day.

II. HOLDING AND DOMICILIARY COMPANIES

Holding and domiciliary companies are special tax concepts and are not dependent on any particular special corporate structure as set forth in the civil law. Liechtenstein tax law distinguishes between companies which actively carry on business in Liechtenstein and domiciliary companies. The latter are only active abroad notwithstanding that their corporate headquarters are in Liechtenstein.

For tax purposes holding companies are defined as legal entities entered in the Public Register as well as non-registered foundations,[2] whose objects consist primarily or exclusively of portfolio management, the acquisition of equity participations in other corporate entities or the long-term management of other legal entities.[3] Such legal entities are exempt from property, income and capital earnings taxes. They are, however, subject to a tax on capital calculated as 0.1 percent of their paid-up capital and assets plus retained earnings or, in the alternative, less accrued losses.[4] The tax on capital may not be less than Sfr. 1,000 in each year.

To the extent that a holding company invests in operations or other assets in Liechtenstein and generates income therefrom, the holding company is subject to tax on its capital earnings as well as capital tax on the Liechtenstein assets at the same rate as legal entities which actively conduct business or hold assets exclusively in the Principality.

Domiciliary companies are defined as legal entities entered in the Public Register which merely maintain a domicile, i.e. an address with an agent for service, in Liechtenstein. Whether or not such companies maintain actual offices is irrelevant. Domiciliary companies may under no circumstances carry on business or engage in any commercial activities in Liechtenstein.

Companies which satisfy the foregoing criteria are exempt from property, income or capital earnings taxes. They are merely required to remit an annual capital tax which is calculated as 0.1 percent of the paid up capital and other assets held by the company, including retained earnings and taking into account any accrued losses. However, the tax may not be less than Sfr. 1,000 in any year.

The essential requirement that a domiciliary company refrain from any type of commercial activity in Liechtenstein is interpreted pragmatically by the tax authorities. Thus, international trading companies can maintain offices in Liechtenstein for the purpose of importing and exporting provided they do not sell, manufacture or finish any of their products in Liechtenstein, do not maintain inventory in Liechtenstein and do not solicit business there. Domiciliary companies may, however, purchase personal services, retain agents on a free-lance basis (who may only be active abroad), entertain customers from abroad and hold meetings at their Liechtenstein offices. The intent of this policy is clear: companies which benefit from preferential tax treatment may not compete with domestic companies whose tax burden is somewhat more

1. Liechtenstein maintained no army at this time so the state treasury was not confronted with exigencies similar to those of its neighbours.
2. Foundations are separate estates set up for specific purposes. The estate enjoys a distinct juridical personality. Foundations are excellent vehicles for portfolio management and estate planning. The usual purposes for which foundations are established are charitable or maintenance of one or more family members (family foundations). Foundations may not be formed for the primary purpose of undertaking any type of commercial or industrial activity.
3. Holding companies may, however, also own and administer movable and immovable property located within or outside Liechtenstein, including patents, trademarks, copyrights, models, etc.
4. The capital tax rate of 0.1% is reduced for holding companies which have considerable assets. The capital tax is reduced to 0.75% for foundations with assets in excess of Sfr. 2 million (including reserves and accumulated income), and to 0.5% for those with assets in excess of Sfr. 10 million, including reserves.

© 1993 International Bureau of Fiscal Documentation

onerous. At least one member of the board of directors of a domiciliary company must be a Liechtenstein resident and an agent must be appointed for service in Liechtenstein.

Capital tax for both holding and domiciliary enterprises is assessed and collected by the tax administration. The minimum amount of capital tax, i.e. Sfr. 1,000, is payable annually in advance according to law. If an enterprise which is required to submit its annual accounts to the tax administration has reserves that, together with its capital, amount to more than Sfr. 1,000,000, it will be subject to a tax assessment at the rate of 0.1 percent, or at a maximum, the preferential tax rate taking into account the prepayment.

Both holding and domiciliary companies must maintain fully paid-up capital at a Swiss or Liechtenstein bank of at least Sfr. 30,000 in the case of Anstalts, business trusts or foundations, or Sfr. 50,000 in the case of joint-stock companies.

It should be noted that with the exception of coupon tax (see below), Liechtenstein has no further taxes levied at source.

III. COUPON TAX

Introduced in 1966, the coupon tax is imposed on all coupons in respect of securities which have been issued by a resident company, a company having its official head office in Liechtenstein or a company which is registered in the Public Registry. The following coupons are subject to tax (when issued by residents): stocks, bonds, debts, debentures, medium term notes, annuity bonds, mortgage bonds, bills of exchange as well as discounted bills such as borrower's notes, which are issued in series for the purposes of trading.[5]

The coupon tax is levied on and is payable by the payer – thus the tax becomes due upon payment or distribution regardless of the identity or residence of the recipient.

Under Liechtenstein law it is possible to incorporate legal entities which enjoy a distinct juridical personality and whose capital is not divided into shares. Such entities (e.g. foundations) may serve as holding companies, or as in the case of Anstalts, as domiciliary companies. If the capital of an entity is not divided into shares and the right to participate in the equity is not evidenced by a certificate of title, the entity is not subject to any tax (in particular coupon tax) in respect of distributions made to beneficiaries or equity participants. Such distributions are tax-free.

From a legal perspective, the coupon tax is not a tax on profits, a tax on capital gains or a tax on income. It is the legal transaction itself which is taxed, as evidenced by the coupons described above, i.e. the transfer of monies which the issuer of the instrument of indebtedness is obliged to undertake in favour of the holder in consideration for having made capital available.

In practice the following types of distributions are relevant for coupon tax purposes:

- the distribution of dividends to shareholders by Liechtenstein joint stock companies;
- the remittance of other monetary payments by legal entities subject to Liechtenstein tax to the holder of any instrument of title which entitles the holder to participate in the equity or profits of the legal entity, or remittances to third parties closely related to the holder which are not recorded as a payment on account of dividends or profit sharing, such as the payment of a liquidation surplus, a bonus or a bonus in shares;
- interest on loans the principal balance which exceeds Sfr. 50,000, provided that one of the contracting parties is recorded in the Public Register or carries on business, and that according to its terms the loan has been made for a minimum of two years. Thus loans to or from shareholders or equity participants of a legal entity may be subject to coupon tax.

The rate of coupon tax is currently 4 percent. The amount repaid by the coupon debtor in redemption of the coupon, or a distribution on account thereof, forms the tax base for calculating the coupon tax. With respect to documents analogous to coupons, the tax is levied on the amount paid, compensated or credited (taxable distribution) as per the terms of the document.

IV. TRUSTS

Trusts, whether or not established under Liechtenstein law, which have a Liechtenstein resident trustee, are prima facie taxable in Liechtenstein. However, an exemption exists for trust property situated abroad. Trust property is subject to the same tax treatment as applies to assets held by domiciliary companies to the extent that it can be demonstrated to the tax authorities that the trust assets are situated abroad.

The concept of trust property is not defined in the tax law. The courts have extended the meaning of trust property beyond the Liechtenstein civil law concept which is an adaptation of the Anglo-Saxon concept. The courts have held that notwithstanding the absence of a definition of trust property in tax law, it must be defined in view of the provisions in the tax law concerning domiciliary companies with the result that the capital tax liability of trust estates does not depend exclusively on the civil law designation or legal construction or on a legal adjudication of the relationship between the settlor, trustee and beneficiary, but rather on the factual economic relationship. Thus, the preferential tax treatment granted to trust property has been extended to other types of separate estates which are managed on a fiduciary basis, meaning that management and control over the assets are removed from the economic ownership thereof.

5. If the securities were issued without coupons, they are considered to be replaced by such document as is required for the purposes of drawing upon, transferring, crediting or otherwise to receive dividends, interest, rents, profit participations or other income arising by virtue of title to the security in question.

V. CONCLUSION

Austria is the only country which has entered into a double tax treaty with Liechtenstein. Assets held by holding companies abroad and income earned by domiciliary companies may be subject to taxation in other jurisdictions. Moreover, shareholders or equity participants in Liechtenstein legal entities who are resident abroad may be subject to taxation in other jurisdictions with respect to the distributions made to them. Therefore the effective tax advantages in establishing a holding or domiciliary company in Liechtenstein cannot be assessed solely on the basis of the Liechtenstein tax implications, but must also be considered in light of the tax implications arising out of the relationship of the Liechtenstein company to persons, business activities and assets in other tax jurisdictions. Fortunately, in many OECD countries withholding taxes on income earned by non-residents, as well as branch taxes, are somewhat less onerous than the personal and corporate taxes levied on residents.

Inasmuch as Liechtenstein domiciliary companies are in most instances subject to at least some taxation in those jurisdictions where they carry on business through a branch office, and in view of the fact that holding companies may be subject to tax as non-residents with respect to income earned by the assets which they hold abroad, the preferential tax treatment of Liechtenstein holding and domiciliary companies is not an incitation to the flagrant evasion of taxes, but rather the embodiment of the principle of territoriality, namely that income ought to be subject to taxation in the territory where it is earned, and capital ought to be taxed in the jurisdiction where it is situated. This philosophy seeks to avoid double taxation as well as the need to enter into endless double tax treaties.

EUROPEAN TAXATION

The official journal of the Confédération Fiscale Européenne, European Taxation offers in-depth coverage of taxation in European countries:

- Current issues discussed in detailed articles
- An outline of the latest changes and developments in tax systems and treaties
- 'EC Update' section details developments from the European Community

The journal also includes case notes, rulings and decisions and is indexed.

INTERNATIONAL:

POSTSCRIPT TO JUNE 1993 ARTICLE ON DEVELOPMENTS IN TAX REVENUES AND FISCAL DEFICITS OF OECD COUNTRIES

Ken Messere

Since my June article, more recent estimates have become available on tax revenue developments[1] and fiscal deficits[2] in OECD Member Countries. This would not in itself justify a postscript so soon, but because a few countries considerably revised their total tax receipts to GDP ratio (TTR's) between 1990 and 1992, and because most countries have considerably revised upwards their fiscal deficits between 1992 and 1994, some of the commentary in the June article is already invalid, so I would like to make a few corrections.

Revisions of TTR's (Table 1)

It is normal that there should be some revision of TTR's for very recent years, because both tax receipts and GDP figures may have been over- or underestimated. However, most modifications of estimated TTR's for the years 1990 and 1991 have been very slight indeed, rarely exceeding 0.5 percent. Significant exceptions are flagged in Table 1 in footnotes 1 and 2. Among the G7 countries, Canada and Italy greatly overestimated their increase in TTR's for 1991 and Germany greatly underestimated it – probably due to the complications of integrating East Germany's data.

A comparison of columns (4) and (5) of Table 1, suggests that after a few years of stagnation overall TTR's are likely to be increasing in 1992 (pluses of some magnitude in Austria, Denmark, Germany, Iceland, Italy, Portugal, Spain, Switzerland and Turkey and a corresponding decline only in Japan and Sweden). This potential increase in TTR's may have more to do with sluggish growth in GDP than increased revenues but there has been no time to verify this.

Revisions of Fiscal Deficits (Table 2)

I suggested in my June article (Section IIE page 336), that recent estimates of the extent of deficits have been on the optimistic side, reflecting governmental wishes to let the world know that things are not as bad as they seem. Latest estimates for 1993 and 1994 (columns (4) and (7) of Table 2) as summarized in columns (9) and (10)) indicate a growing tendency of many governments for overoptimism. While for the most part deficits predicted for 1994 are slightly less than those for 1993 it will be interesting to see whether this remains so, when OECD Economic Outlook No. 54 is published in December 1993 and later estimates will presumably be revealed.

Revaluation of tax effort[3] of the G7 countries (Table 3)

Table 3 first reproduces my original assessment on the tax effort of the G7 countries[4] between 1989 and 1992 as given in my June article, secondly makes some revaluations to take account of revisions either to TTR, or the size of the deficit, or both, and thirdly provides an evaluation of measures so far taken in 1993. On this last there has been a notable improvement in tax effort in France, the United Kingdom and the United States, though it is doubted whether this will be sufficient greatly to reduce deficits. However, with most of the G7 in recession and the recovery rather fragile in the United Kingdom and United States, it is arguable that reducing deficits should not be given short- term priority. The increase in revenues and reduction in government expenditures guaranteed by growth could well reduce these deficits by a greater amount in the longer term, while immediate increases in TTR's could inhibit such growth.

1. Revenue Statistics of OECD Member Countries 1965-92 (Paris: OECD, August 1993).
2. OECD Economic Outlook (Paris: OECD, June 1993).
3. I recall that I am using normative 'tax effort' in the context that many governments' priorities have been to reduce their budget deficits reflected in Table 2, together with their acknowledgement that government expenditure reductions will be insufficient to achieve this aim.
4. As provided in Table 13 of the June article.

TABLE 3
TAX EFFORT TOWARDS REDUCING THE PUBLIC BORROWING SECTOR REQUIREMENT IN THE G7 COUNTRIES THROUGH INCREASES IN TOTAL TAX RATIOS (TTRs)

COUNTRY	(1) ORIGINAL ASSESSMENT* DURING THE PERIOD 1989-92(2)	(2) REVISED ASSESSMENT TO TAKE ACCOUNT OF DATA CHANGES FOR THE 1985-1992 PERIOD	(3) ASSESSMENT OF GOVERNMENT POLICIES SO TAKEN IN 1993 (AS AT 9/93)
CANADA	Good. Increases in TTR over recent years suggests that deficit is under greater control than in most countries	Bad in view of downward TTR's estimates (cols (3) and (4) of table 1 and higher budget deficit (cols (1 to 3) of table 2)	As column 2
FRANCE	Good. TTR has fallen slightly in recent years, but is appreciably higher than that of the other G7 and until very recently the deficit has remained stable and relatively small	Bad in view of much higher deficits than originally estimated (c.f. columns (1) and (3) and (4) and (5) of table 2)	Good but probably inadequate
GERMANY	Bad. TTR has fallen in recent years at a time when more revenues are needed for reunification costs as well as for the deficit	Good in view of substantial revision to 1991 TTRs (cols (3) and (4) of Table 1), but still inadequate	Good see cols (4) and (5) of table 1
ITALY	Good but inadequate. TTR has risen greatly in recent years, but not enough to reduce the very heavy deficit	As column 1	As column 1
JAPAN	Very good. Recent increases in TTR have enabled Japan to remain the only OECD country not in deficit	As column 1	Moderate as Japan is expected to join the rest of OECD in deficit and TTRs are estimated as static
UNITED KINGDOM	Very bad. TTR has consistently fallen since 1985, and since 1989 deficits have increased considerably	As column 1	Good but probably inadequate
UNITED STATES OF AMERICA	Very bad. No recent increase in TTR and budget deficit does not abate. (In 1991 has probably overtaken Turkey as the OECD country with the lowest TTR).	As column 1 except that Australia has joined Turkey and US as the lowest TTR countries. (Table 1 column 4)	Good but probably inadequate

I. Introduction
II. ASEAN Initiatives Towards Economic Integration
A. ASEAN Free Trade Area
B. Harmonization of tax treaties
III. Developments in Taxation Re Fiscal Harmonization
IV. Conclusion

I. INTRODUCTION

The importance of economic integration and fiscal harmonization was recognized by the countries in Asia as early as 1956. The meeting of the Economic Commission for Asia and the Far East (ECAFE which is the forerunner of the Economic Social Commission for Asia and the Pacific) in that year dealt with the establishment of intra-regional trade arrangements. The promotion of regional trade cooperation was again discussed extensively in the 1961 ECAFE meeting in India. Various forms of cooperation such as the establishment of an economic union, a customs union and free trade areas in Asia were also discussed. The meeting reviewed the structure of economic integration in Europe and Latin America in order to provide a basis for a similar structure in Asia.

The idea for economic integration was also discussed by other regional organizations such as the Asian Parliamentarians' Union (APU) in the 1970s. In the Vietnam meeting of the APU, the organization approved a study on the feasibility of an Asian payments union and schemes for regional cooperation for development and regional integration.

These initiatives, however, remained merely project proposals, and the feasibility of economic integration continued to be a topic of discussion for study groups and regional organizations. This does not indicate regional indifference towards the importance of economic integration, but rather is the product of diverse economic structures, particularly the diverse trade structures of the Asian countries. Striving for a common market when countries lack economic parity and when they have conflicting needs, priorities and problems is difficult. Further, many Asian countries have faced political problems which have adversely affected regional groupings, such as the Taxation and Customs Conference (TCCC) and the Study Group on Asian Tax Administration and Research (SGATAR).[1]

The TCCC was established in 1971 to enable member countries such as the Republic of China, Korea, the Philippines and Vietnam to discuss ways to improve customs and tax policies and practices in the region. The TCCC stopped meeting in 1975 because of the Philippines' one-China policy and the political problems in Vietnam. It is fortunate that SGATAR has survived political changes in the region, although Vietnam, Laos and the Khmer Republic have ceased participating in SGATAR meetings (Australia, New Zealand and Korea joined SGATAR in later years).

Of the other efforts to achieve a common economic direction for Asia, the most prominent is the Association of South East Asian Nations (ASEAN).

II. ASEAN INITIATIVES TOWARDS ECONOMIC INTEGRATION

ASEAN was organized on 8 August 1967 with Indonesia, Malaysia, the Philippines, Singapore and Thailand as founding members. Brunei Darussalam joined in January 1984 and Vietnam and Laos are expected to become members in 1993.[2]

The aims of ASEAN are diverse and encompass more than economic goals. For example:

1. SGATAR is one of the institutions in the Asia-Pacific region which facilitates the need of governments to cooperate with one another in the area of taxation.
2. At the time of writing, Vietnam and Laos had

© 1993 International Bureau of Fiscal Documentation

- to accelerate economic growth, social progress and cultural development in the region through joint endeavours;
- to promote regional peace and stability through abiding respect for justice and the rule of law in the relationships among countries in the region and adherence to the UN Charter;
- to promote active collaboration and mutual assistance on matters of common interest in economic, social, cultural, technical and administrative areas;
- to provide mutual assistance in the form of training and research facilities in educational, professional, technical and administrative areas;
- to collaborate more effectively for the greater utilization of agriculture and industry, expansion of trade, improvement of transportation and communication facilities and raising the standard of living;
- to promote Southeast Asian studies;
- to maintain close and beneficial cooperation with existing international and regional organizations with similar aims and purposes and explore all avenues for closer cooperation among member countries.

The potential of ASEAN is very promising. As a market, it has a population of about 311 million which makes it as large as the EC. If other countries in the Asia-Pacific region are included, such as the other SGATAR member countries (Japan, Australia and New Zealand), in addition to Laos and Vietnam, the total population would increase to 563 million. ASEAN had a total GDP of US$ 300 billion in 1989 with total imports of US$ 127 billion and exports of US$ 122 billion. With these resources, ASEAN can be considered a substantial market and a major producer. It will therefore derive many benefits from economic integration.

To achieve this goal, ASEAN has made initial strides which include the establishment of ASEAN Free Trade Area (AFTA) and the harmonization of tax treaties.

A. *ASEAN Free Trade Area*

The agreement to establish AFTA (using the Common Effective Preferential Tariff scheme) was adopted by ASEAN on 28 January 1992. Within 15 years, beginning 1 January 1993, the tariff rates in ASEAN will be reduced to a final tariff structure of zero to 5 percent. A reduction from the existing tariff rates to a maximum rate of 20 percent will be accomplished within five to eight years beginning 1 January 1993, followed by a subsequent reduction to 5 percent by the year 2000. Each member state may adopt individual reduction schemes to achieve these objectives. In addition, individual member countries may exempt "sensitive" products from the tariff cuts or suspend tariff preferences if a domestic industry is threatened.

ASEAN member countries have agreed to accelerate tariff reductions on 15 product groups, i.e. vegetable oil, cement, chemicals, pharmaceuticals, fertilizer, plastics, rubber products, pulp, textiles, ceramic and glass products, gems and jewellery, copper cathodes, electronics, wooden and rattan furniture. Member countries have also agreed to reduce or eliminate non-tariff barriers to facilitate foreign trade, including the lifting of quantitative restrictions. A ministerial-level council was established in 1992 (called the AFTA Council) to supervise, coordinate and review the development of the AFTA.

B. *Harmonization of tax treaties*

For a number of years ASEAN member countries have aimed to eliminate double taxation of income and investment in ASEAN through tax treaty negotiations. Treaty provisions generally follow the OECD model, although the UN model is also used because it takes account of the needs and conditions of developing economies. For example, the definition of a permanent establishment (PE) under the UN model is much broader than the OECD definition.[3]

Some treaties between ASEAN member countries contain deviations from both the OECD and UN models; e.g. the absence of the time test for a PE in the Malaysia/Singapore treaty with respect to construction activities. In the case of the Philippines/Thailand and Philippines/Indonesia treaties, the time test is reduced from six months to three months for assembly and installation projects.

With respect to the taxation of business profits, many of the tax treaties follow the "attribution rule" in the OECD model which means that only the portion of profits attributable to the PE will be subject to tax in the source country. However, the Indonesia/Philippines and the Thailand/Indonesia treaties follow the "force of attraction" rule under the UN model, i.e. business profits which are taxable in the host country include not only the profits attributable to the PE itself but also profits derived from sales in that country of goods or merchandise of the same or similar kind as those sold through the PE, and profits derived from other business activities carried on in that country, of the same or similar kind as those effected through the PE.

The general method for allocating profits to a PE in ASEAN tax treaties is also based on the OECD and UN models, i.e. the arm's length rule, under which the profits of a PE are profits which would be earned by the PE "if it were wholly an independent entity dealing with its head office as if it were a distinct and separate enterprise operating under conditions and at prices prevailing in the ordinary market".

ASEAN members, however, felt the need to develop a model convention which would also address the needs and circumstances which are peculiar to ASEAN. In 1985, the "Intra-ASEAN Model Double Taxation Convention on Income"

3. It covers not only a branch, a place of management, an office, a factory, a workshop, and a mine, or any other place of extraction of natural resources, but also extends to:
- a building site, a construction assembly or installation project or supervisory activities in connection therewith, but only where such site, project or activities continue for a period of more than six months;
- the furnishing of services, including consultancy services, by an enterprise through employees or other personnel engaged by the enterprise for such purpose, but only where activities of that nature continue within the country for a period or periods aggregating more than six months within any 12-month period.

© 1993 International Bureau of Fiscal Documentation

was developed and adopted by an Ad-Hoc Committee on the Harmonization of Tax Treaties of ASEAN countries. The model essentially follows the UN model but contains the following modifications:

- the convention does not include taxes on capital or taxes imposed by local governments;
- nationality is removed as a criterion in determining the residence of a taxpayer;
- the definition of a PE is broadened to include a farm, a plantation or any other place of extraction of natural resources including timber or forest products;[4]
- income derived by an enterprise from the operation of ships in international traffic may be taxed in the other contracting state but the tax imposed will be reduced by an amount equal to 50 percent;
- the criteria for determining taxation of a resident of a contracting state who provides services or independent personal services has been limited to specific tests such as the length of stay and the monetary test;[5]
- the purview of professional services has been broadened to include computer hardware and software engineers;
- the exemption of income derived from activities performed in a contracting state by public entertainers or athletes if their visit is substantially supported by public funds or a political subdivision or local authority;
- the exemption of payments from scholarship grants has been limited to scholarships granted by governmental institutions, research institutes or charitable organizations;
- an article regarding the exemption for teachers and researchers who are on an official fellowship or an exchange arrangement between universities.[6]

The modifications in the model were aimed towards granting ASEAN governments more power in taxing income from foreign investment. Although the model has not been formally adopted, it is considered a major step in the harmonization of tax treaties in ASEAN, particularly with respect to the rules and practices in defining income, locating source and avoiding double taxation, and is used as a guide by ASEAN members.

III. DEVELOPMENTS IN TAXATION RE FISCAL HARMONIZATION

Despite the absence of a formal mechanism to harmonize tax systems, the recent changes in taxation which have been introduced by governments in Asia all lead toward the evolution of similar tax structures. This is inevitable given the development of trade relationships among the Asian countries and the increased flow of international capital. It should also be mentioned that regional tax organizations such as SGATAR serve as "greenhouses" as well as clearing houses for the introduction of tax reforms. SGATAR conferences have provided opportunities for tax officials to learn about tax reforms in neighbouring countries. The introduction of tax reforms by one government serves as a stimulus for the introduction of similar reforms by other governments. The result is the evolution of a tax structure which is compatible with the structure of other governments in the region.

Foremost among the reforms introduced by Asian governments is the restructuring of income taxes towards lower tax rates and fewer tax brackets for individuals. The highest marginal rates, which are imposed in Indonesia, the Philippines and Malaysia, are aligned at 35 percent. The highest marginal rate in Singapore, which is 33 percent, is relatively lower. Among ASEAN countries, the highest marginal rate is imposed in Thailand at 37 percent.

There was also a marked reduction in the progressivity of the individual income tax structure because of the reduction in the number of brackets. Asian Governments followed similar trends in the adoption of wider and fewer tax brackets. Indonesia made the most radical change by replacing its 19-rate band with a 3-rate band. Other countries also undertook bold moves – Thailand and the Philippines reduced the number of taxable income bands from 11 to 5 and from 37 to 5, respectively. These measures are in response to the growing taxpayer disenchantment with tax structures that penalize productivity and growth. In addition, governments in the region had to confront problems of evasion which were bred by steeply progressive tax rates. As a safety net to the reform towards flatter rate structures, governments have increased income tax exemption levels for poor and low-income families.

Tax regimes have also moved towards the adoption of low corporate tax rates. Malaysia, Thailand, the Philippines and Singapore impose a uniform corporate tax rate with the lowest of 27 percent in Singapore and the highest rate of 34 percent in Malaysia and 35 percent in the Philippines. Thailand lowered its corporate tax rate to 30 percent in 1991. Although the highest corporate tax rate imposed in Indonesia is aligned with the rates in Malaysia and the Philippines, Indonesia maintains a three-tiered structure which is the same as the tax rates on individuals.

Reforms have also been introduced to eliminate double taxation particularly with respect to the taxation of dividends. Malaysia introduced an imputation system whereby corporate tax paid in respect of profits distributed to shareholders as dividends is creditable against the shareholder's liability. Where a credit cannot be absorbed by the tax which is due, any excess is refunded. In the Philippines, the elimination of the double taxation of dividends takes the form of the elimination of the tax on intercorporate dividends as well as the tax on dividends which are distributed to individual shareholders. In Singapore, the relief is in the form of "franked" dividends. If the corporate tax paid by the company exceeds the tax deducted from the dividends paid to the shareholders, the surplus is available for franking future dividends. Indone-

4. Under the convention, a PE also encompasses a firm which habitually secures orders wholly or almost wholly for the enterprise itself or for the enterprise and other enterprises which are controlled by it or have a controlling interest in it.
5. The concept of a "fixed base" has been excluded from the criteria.
6. The exemption does not apply to income from research which is primarily undertaken for the private benefit of a person or firm.

© 1993 International Bureau of Fiscal Documentation

sia also exempts intercorporate dividends from taxation subject to certain limitations.

Another current initiative is the formulation of a basic framework for the taxation of leasing activities. It has been observed that there is a spectrum of tax treatment on leasing by member countries. All ASEAN member countries, except Brunei Darussalam, impose a withholding tax on rental income paid to non-resident lessors with rates ranging from 4.5 to 35 percent. New guidelines are being formulated to determine how cross-border leasing among member countries should be treated for tax purposes.

The other area where tax systems are converging is in the adoption of the value added tax (VAT). Indonesia adopted VAT in 1985, and Korea shifted to VAT in 1976. The VAT was introduced in the Philippines in 1988 and in Japan in 1989. Thailand adopted VAT in 1991 and Malaysia is seriously considering implementing VAT in the near future. VAT in the region is of the consumption type, broad-based and is computed using the tax credit method. In most cases, Asian countries have adopted a uniform rate of VAT ranging from 3 to 12.5 percent, with provision for zero-rating and the imposition of an excise tax in addition to VAT for non-essential commodities.

Similar directions can also be observed with respect to simplification of the tax system and improvement of tax administration. Deductions are being rationalized in many countries, particularly deductions which are subject to abuse. The Philippines has disallowed many expenditures including representation, entertainment, travelling and bad debts in computing the taxable income of individuals with business income. No deductions are allowed for fixed income earners. Along the same line, Malaysia disallows entertainment expenses (with certain exceptions) as a deduction for income tax purposes. The broadening of the income tax base has been accomplished in a more radical way in Indonesia where virtually all tax incentives have been withdrawn. This was a dramatic attempt to simplify the tax system and move towards the adoption of low tax rates.

Increased use of withholding tax schemes has also been noted in ASEAN especially with respect to interest income, in response to the problems of evasion and avoidance through non-reporting or under-reporting of interest income. The withholding tax rates on interest income range from 15 to 20 percent. The separate taxation of interest income from global income (e.g. the Philippines and Japan) may be indicative of the growing importance of the schedular approach to taxation.

Governments have also made major strides in computerization to enhance information flows and streamline systems and procedures. There is also a movement to enhance the image of the tax administration as a service-oriented agency. Measures to develop a closer link between taxpayers and the tax office have been introduced, such as the establishment of mobile tax centres in shopping malls, the organization of public relations offices in tax agencies, the creation of one-stop shops in tax offices and frequent dialogues with taxpayers.

IV. CONCLUSION

The development of economic integration and fiscal harmonization in Asia can be looked at from two perspectives. One can be critical and note the slow pace towards integration. However, noting the diverse culture and stages of development of the Asian countries and understanding their political and economic problems, the attempts towards integration, small as they are, can be appreciated. One major block which must be overcome is parochialism. There must be a strong desire among governments not only to work for the good of their countries but for the good of the region as well. They must identify not only with their own countries but with the whole of Asia. There also must be mutual respect between developed and developing economies in the region. More importantly, regional meetings should not be perceived as ends in themselves but rather should be springboards of ideas which prod governments into action.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

ASIA & THE PACIFIC

TAXATION IN ASIA AND THE Southwest Pacific.
New York, Deloitte Touche Tohmatsu International, 1633 Broadway, New York, NY 10019-6754, USA. 1992, pp. 211.
The book is designed to provide potential foreign investors with fundamental information about the business environments in various countries, including information about forms of business available, the tax regimes and rates, any investment incentives offered, and the country's double tax treaty network.
(B. 57.900)

Australia

WARREN, Neil.
The looming fiscal crisis and Australia's indirect tax options.
Sydney, Australian Tax Research Foundation. 1993. Australian Tax Research Foundation Reseach Study No. 21. pp. 100.
This book considers the problem of how to fund Australia's federal government expenditure in the 1990s and discusses various options, in particular those offered by indirect taxes.
(B. 57.913)

Hong Kong

CHEN, Annie A.Y.; MARCOVICI, Philip.
Business operations in Hong Kong.
Washington, Tax Management Inc. 1993. Tax Management Foreign Income Portfolio No. 964. pp. 110.
This portfolio outlines matters of interest to those contemplating or involved in establishing business operations in Hong Kong. The portfolio discusses the political, economic and legal structure of Hong Kong and its investment climate. Forms of doing business, trade and commerce regulation, and business registration requirements are described. Particular emphasis is placed upon Hong Kong's tax system and the taxation of business profits. Estate duty and stamp duty considerations are also described.
(B. 57.904)

India

BHARGAVA, U.K.; BHARGAVA, Rakesh.
Income Tax Act.
New Delhi, Taxmann Publications Ltd. 1993. pp. 750.
Consolidated text of the Income Tax Act, 1961 as amended by the Finance Act, 1993.
(B. 57.910)

FOREIGN COLLABORATIONS AND investments in India. Law and procedure. 14th Edition.
New Delhi, Singhania & Co., B-92 Himalaya House, 23, Kasturba Gandhi Marg, New Delhi 110001, India. 1993, pp. 74.
(B. 57.909)

Japan

AN OUTLINE OF JAPANESE TAX administration 1992.
Tokyo, National Tax Administration. 1992, pp. 114.
Annual publication explaining the present state of tax administration in Japan, and providing an overview of organization and activities based on the latest statistics.
(B. 57.914)

Pakistan

BUSINESS PROFILE SERIES: PAKISTAN. 5th Edition.
Hong Kong, The Hongkong and Shanghai Banking Corporation Ltd. 1993, pp. 51.
Revised edition of this introductory guide to the economy, facts and figures, business ventures, taxation and travelling conditions etc. for businessmen.
(B. 57.897)

Papua New Guinea

INVESTMENT IN PAPUA NEW GUINEA. A KPMG Peat Marwick business guide.
Port Moresby, KPMG Peat Marwick. 1993, pp. 51.
This publication provides a summary of information and facts to be taken into account by foreign individuals and enterprises contemplating investment or undertaking business in Papua New Guinea. Chapters include: opportunities for international investors, exporting to and from PNG, business entities, business taxation, indirect taxes, taxation of individuals, labour.
(B. 57.907)

WHITWORTH, Alan.
Public enterprise policy: independence to 1991.
Port Moresby, INA The Institute of National Affairs Inc. 1993.
INA Discussion Paper No. 57. pp. 97.
Study reviewing the development of government (main financial) policies towards the four major public enterprises in Papua New Guinea from independence in 1975 until 1991. The four public enterprises are the Electric Commission, the Post & Telecommunication Corporation, Air Niugini and the Harbour Board.
(B. 57.912)

Singapore

GST GUIDE 1993 EDITION.
A simple guide to goods and services tax.
Singapore, Lee Fook Hong & Co. 1993, pp. 93.
(B. 57.918)

Vietnam

WHITE, Frazer.
Taxation aspects of foreign investment in Vietnam.
London, Sinclair Roche & Temperley, International Business Lawyers, Broadwalk House, 5 Appold Street, London EC2A 2NN, England. 1993, pp. 13.
Description of the taxes levied on foreign investment in Vietnam including tax incentives.
(B. 57.919)

EUROPE

Austria

WIESER, M.; TAKACS, P.; GEBHART, S.; LENNES, C.; WENINGER, R.
Steuerjahrbuch '92/93. Band 1: Einkommensteuer; Band 2: Sonstige Abgaben.
Vienna, Linde Verlag Wien GmbH. 1993, pp. 1820. 1185.- S.
Tax Yearbook 1992/1993 includes the law on rendering of accounts, changes in the law, decrees from the Ministry of Finance, case law and literature.
(B. 113.087)

© 1993 International Bureau of Fiscal Documentation

Belgium

AMAND, C.; BEHAEGHE, I.; DE LAME, J. a.o.
Fiscaal jaaroverzicht 1992.
Deurne, Kluwer Rechtswetenschappen. 1993.
De Fiscale Koerier 1-2-3. 1993, pp. 267.
Book containing a brief and clear overview of the changes which took place in the field of Belgian taxation in 1992.
(B. 112.778)

EULAERTS, Martine.
Fiscale aspecten van het ontslagrecht.
Gent, Martine Eulaerts. 1993, pp. 28.
Study describing the individual income tax considerations arising from termination of employment, with reference to case law.
(B. 112.943)

LES FINANCES COMMUNALES, 1992, no. 2.
Brussels, Tour Astro, Avenue de l'Astronomie 14, BP 25, 1030 Brussels. 1992, pp. 140.
Collection of 6 reports on the finances of municipalities.
(B. 112.895)

PEETERS, Tom L.
Gesellschaftsrecht in Belgien. Eine Einführung mit vergleichende Tabellen.
Munich, Verlagsgruppe Jehle-Rehm, Postfach 801940, 81619 München, Germany. 1993, pp. 93. 28.- DM.
An introduction to Belgian company law.
(B. 113.070)

Czechoslovakia

HEADY, C.; PEARSON, M.; RAJAH, N.; SMITH, S.
Tax reform in Czechoslovakia.
London, IFS The Institute for Fiscal Studies. 1992.
IFS Working Paper Series, No. W92/18, pp. 35.
This paper discusses the 1992 reform of the Federal tax system in Czechoslovakia.
(B. 113.071)

Eastern Europe

BIRENBAUM, David E.; RACKLIN, Dimitri P.
Business ventures in Eastern Europe and the Soviet Union: The emerging legal framework for foreign investment. Volumes I and II.
Englewood Cliffs, Prentice Hall Law & Business. 1990.
This loose-leaf publication is an ambitious attempt to analyse the legal and political climate for foreign investment in the USSR, Hungary, Poland and Czechoslovakia, and includes an analysis of privatization in Germany.
(B. 113.020)

EEC

EMPLOYEE SHARE PARTICIPATION in the European Community.
London, Clifford Chance, St. Peter's House, 130 Wood Street, London EC2V 6QQ, England. 1991, pp. 61.
This is a brochure which is intended to provide a synopsis of relevant investor protection law, company law, exchange control and tax information which should be considered when establishing employee share schemes in any of the twelve EC Member States.
(B. 113.007)

CALLEJA, D.; VIGNES, D.; WÄGENBAUR, R.
Dispositions fiscales. Rapprochement des legislations. 2nd Revised edition.
Brussels, Editions de l'Université de Bruxelles, Avenue Paul Héger 26, 1050, Brussels, Belgium. 1993.
Commentaire Megret. Le droit de la CEE, No. 5, pp. 427.
Considerations on the tax provisions in the treaty concerning the establishment of the European Community Market and tax harmonization in the EC.
(B. 112.814)

THE MERGER DIRECTIVE.
Practical tax issues.
Amsterdam, IBFD Publications BV.; Paris, Editions Francis Lefebvre. 1993, pp. 146.
The publication discusses the implementation of the Merger Directive in Belgium, France, Germany and in the Netherlands into their national laws. Chapter 6 covers a comparison of common transfer of assets and share exchange transactions in these four Member States. Text of the Merger Directive is attached.
(B. 112.960)

VAT BUSINESS STRATEGY.
Amstelveen, KPMG International Tax Centre. 1993, pp. 98.
Booklet examining in a brief but comprehensive way, the post-1992 VAT regimes in the European Community. It also discusses VAT recovery systems in the EC, and includes some closing comments on VAT regimes outside the EC.
(B. 112.927)

EG-VERTRÄGE. VERTRAG ZUR Gründung der Europäischen Wirtschafts-gemeinschaft; Vertrag über die Europäischen Union.
Herne, Verlag Neue Wirtschafts-Briefe. 1992, pp. 200.
EC Treaty. The book contains the texts of the Treaty of Rome (including protocols) establishing the European Economic Community and the Agreement on the Treaty for the European Union (Maastricht Treaty) in German.
(B. 112.720)

The use of inspectors by the financial courts, the admissibility of the delegation of judicial investigation tasks to non-judicial personnel.
(B. 112.623)

WICHTIGE VORSCHRIFTEN ZUR öffentlichen Auftragsvergabe. Eine Sammlung nationaler und EG-Vorschriften.
Herne, Verlag Neue Wirtschafts-Briefe. 1992, pp. 278.
The book is a collection of German laws and EC Directives. In addition there is a short introduction by Rolf Stober describing the various laws.
(B. 113.051)

HAURAND, Günter; VAHLE, Jürgen.
Bürgerrechte und Verwaltungshandeln. Regeln und Rechtsschutz, Muster und Empfehlungen.
Herne, Verlag Neue Wirtschafts-Briefe. 1990, pp. 478.
Civil rights and functioning of the public administration. Regulations and protection concerning taxpayers. Examples and recommendations. This manual explains the position of a citizen according to procedural law concerning various areas of public law, including data protection, environmental law, business law.
(B. 113.050)

KNOPP, Lothar.
Altlastenrecht in der Praxis. Unter Berücksichtigung des Rechts der neuen Bundesländer.
Herne, Verlag für die Rechts- und Anwaltpraxis GmbH & Co. 1992, pp. 186.
Practical application of laws referring to the legal treatment of scrap. First, the author describes the problem of scrap items and the various laws on the basis of which the items are handled. In detail, it refers to procedural law, judicial and extra-judicial remedies and liability. Referring to fiscal questions, he discusses the possibility of setting up reserves. He also provides an introduction to the legal situation in the five new Länder.
(B. 113.058)

LÖSCHAU, Martin.
Das neue Rentenrecht in West und Ost.
Herne, Verlag für die Rechts- und Anwaltspraxis GmbH & Co. 1992, pp. 152.
The new law on pensions under the social security benefit schemes in west and eastern Germany. From 1 January 1992, the same pension law is in force in both parts of Germany. This book explains to all interested persons to what kind of social security benefit they may be entitled and which time periods will be considered when calculating the actual pension and how to compute a person's own pension.
(B. 113.056)

KAISER, Hans; WOLLNY, Paul.
Kauf und Bewertung einer Anwaltspraxis.
Herne, Verlag für die Rechts- und Anwaltspraxis GmbH & Co. 1992, pp. 150.
The book explains, for both the sellers and buyers, how to determine the value of a law practice by valuing the tangibles and the goodwill of the office. At the end it describes the fiscal consequences of the purchase. Special reference is made to income tax and VAT consequences.
(B. 113.057)

BROOKS, Jermyn Paul; MERTIN, Dietz.
Deutsches Bilanzrecht/German accounting legislation. Synoptic translation with introduction. 2. Auflage.
Düsseldorf, IDW Verlag GmbH. 1993, pp. 204.
(B. 112.492)

EVERLING, Wolfgang; NIEDERREITER, Christine.

© 1993 International Bureau of Fiscal Documentation

Konzernrechnungslegung. Mutter- und Tochterunternehmen im neuen Recht.
Herne, Verlag Neue Wirtschafts-Briefe. 1990, pp. 206.
This book contains various chapters on group accounting, e.g. consolidated accounting following the German and the Anglo-Saxon methods, valuation provisions, the setting-up of the annex and the report of the economic situation including Community law.
(B. 113.054)

LANDSCHEIDT, C.
Das neue Produkthaftungsrecht. 2. Auflage.
Herne, Verlag Neue Wirtschafts-Briefe. 1992, pp. 240.
The new law concerning product liability. On 15 December 1989 Germany implemented the EC Directive of 25 July 1985 on product liability. The law became effective on 1 January 1990. This book gives an introduction to product liability according to both the previous and the new legal situation.
(B. 113.055)

BIRK, Hans-Jörg.
Bauplanungsrecht in der Praxis. Eine Einführung. 2. Auflage.
Herne, Verlag für die Rechts- und Anwaltspraxis. 1992, pp. 252.
The urban development planning law. The author introduces the subject starting with the legal basis set up in the form of a development plan and continuing through to the stage of applying legal remedies. He describes the safeguarding of the development planning. Important sections are the explanation of the procedure law and the permission of construction projects. He pays special attention to the legal situation since reunification.
(B. 112.721)
