INTERNATIONAL:
WHAT KIND OF CORPORATION TAX? — 3 *Sijbren Cnossen*

This article surveys and evaluates the various forms of tax that are imposed on corporate profits. The following is discussed: the role of the corporation tax in OECD countries, the classical system and the imputation system, schemes for integration at both the corporate level and the shareholder level, comparison of various systems and an evaluation of various systems.

RUSSIA:
TAX ASPECTS OF IMPROVING THE INVESTMENT CLIMATE IN RUSSIA — 17 *James Riordan and Charles E. McLure, Jr.*

In July 1992 a mission organized by the US Tax Foundation met with officials of the Russian government to convey their perceptions of problems with the Russian tax system that impede foreign investment in Russia. This report summarizes the views presented by the Foundation to the Russian government.

INTERNATIONAL:
THE US PROPOSED REGULATIONS DEALING WITH TAX ASPECTS OF TRANSFER PRICING WITHIN MULTINATIONAL ENTERPRISES — 21 *A Report by the Committee on Fiscal Affairs on the Proposed Regulations under Section 482 IRC*

This Report, prepared by a special Task Force established by the Committee on Fiscal Affairs of the OECD, aims to provide the US administration with the collective views of the OECD Member countries on the proposed Section 482 Regulations. The Report summarizes the main problems which arise with the proposed Regulations and then sets out the recommendations of the Task Force.

MALAYSIA:
THE 1993 BUDGET AND RECENT DEVELOPMENTS — 26 *Veerinderjeet Singh*

The budget strategy aimed at ensuring fiscal prudence, controlling inflation, and increasing efficiency and competitiveness of the private sector is considered appropriate both in the context of the encouraging growth of the Malaysian economy and the international economic situation. This article examines the various measures affecting direct and indirect taxation.

HONG KONG:
THE PRIVY COUNCIL WANDERS IN THE WILDERNESS — 33 *Jefferson P. VanderWolk*

Hong Kong imposes a 17.5 percent tax on corporations that carry on business in Hong Kong and earn profits that arise in or derive from Hong Kong – profits arising outside the territory are not subject to tax. This article takes a close look at recent case law which deals with questions regarding the distinction between onshore and offshore profits for Hong Kong tax purposes.

I. INTRODUCTION

Corporation taxes are important because corporations are social and economic institutions of great impact. As separate legal entities, corporations have the power to contract, the right to hold and convey title to property, the capacity to sue and to be sued, and the authority to make rules and bylaws. Corporations have a life independent of the lives of their shareholders, they beget offspring, called subsidiaries, and, in principle, corporations are legally immortal. The power of a large transnational corporation approximates that of the government of a medium-sized country. Although no doubt there are exceptions, the total impact of a corporation is truly more than the sum of the influence of the constituent parts.

The social and economic importance of the "finding" of the corporate form of business organization has rightly been compared to the discovery of steam and electricity.[1] Corporations have reshaped the world in which we live. In most countries, a large part of the national product is generated in the corporate sector and its activities exercise a profound influence on the remainder of the economy. Modern industrial development is absolutely unthinkable without the corporate business form in which capital and labour are combined for mutually beneficial productive purposes. Without exaggeration, the corporation may be characterized as "the central economic institution of modern society".[2]

This paper surveys and evaluates the various forms of tax that are imposed on corporate profits. As a tax on the return on equity, the corporation tax interacts with the individual income tax of shareholders entitled to corporate profits. In tax law and theory, such interaction may be denied or explicitly recognized and reflected in the form of the tax. Section II, therefore, delineates the various forms of corporation tax and reviews their role in the countries that are members of the Organisation for Economic Co-operation and Development (OECD). Section III discusses the two poles of the corporation tax philosophy: the classical system that views the corporation as an entity distinct from its shareholders, and the conduit system that regards it as an extension of those shareholders. In practice, the corporation tax and the income tax are integrated only with respect to the taxation of distributed profits. Consequently, Sections IV and V examine the schemes for such integration at the corporate level and at the shareholder level. Section VI compares the various systems, noting the degrees of dividend relief and the remaining discrimination of payout decisions and methods of finance. Finally, Section VII evaluates the various systems.

II. THE ROLE OF THE CORPORATION TAX

The role of the corporation tax in various countries, particularly as regards its relationship to the income tax, is reflected in the forms of the tax. Forms differ as shown by a survey of corporation taxes in OECD member countries. Their revenue importance is also noted.

A. *Forms of corporation tax*

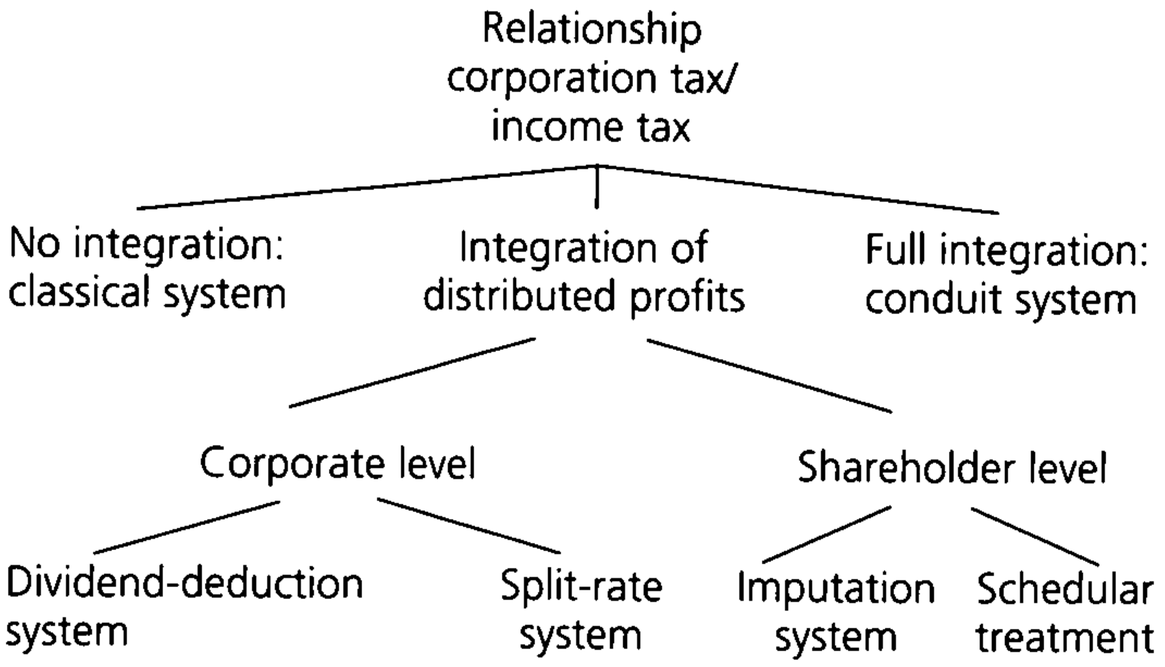

Figure 1 presents the various forms of corporation tax that can be distinguished depending on whether and to what extent they are integrated with the income tax of shareholders. At one extreme, the corporation is regarded as an entity entirely separate from its shareholders and taxed as such (classical system).[3] At the other extreme, the corporation is viewed as a pass-through, a conduit, of all corporate

1. For the reference, see Goode (1951), p. 11.
2. See Mason (1968), p. 396, in *International Encyclopedia of the Social Sciences.*
3. The label "classical system" was introduced by Van den Tempel (1970, p. 7). It should be noted, however, that, contrary to what the terminology suggests, the imputation system, discussed below, is of older date. In the 19th century, some German states already had some form of imputation and in 1922 it was incorporated as the withholding method in the Model Income Tax Ordinance of the United Kingdom, which was introduced in many colonies. For the classic treatment of the separate entity system, see Goode (1951).

© 1993 International Bureau of Fiscal Documentation

source income of shareholders – distributed as well as undistributed earnings. The corporation tax, if retained, serves solely as a prepayment for the income tax, just like a wage withholding scheme.

Figure 1

In practice, the integration of the corporation tax with the income tax of shareholders is limited to distributed profits (dividends). This form of partial integration, often referred to as dividend relief, can be achieved at either the corporate level or at the shareholder level. The most obvious method of dividend relief at the corporate level is to permit a deduction for dividends from taxable profits, as is commonly done for interest. This is called the dividend-deduction system. Another approach that can achieve the same result is the split-rate system, under which a lower rate of tax is levied on distributed profits. At the shareholder level, dividend relief may be achieved systematically under the imputation system, which permits shareholders a full or partial credit for the corporation tax that can be imputed to the dividends received by them. Alternatively, dividend relief may be provided by taxing dividend income on a schedular basis, e.g. by applying a separate flat tax to it or by allowing shareholders a tax credit against their income tax without regard to the underlying corporation tax. The workings of all of these systems will be discussed below.

The concern over the appropriate form of corporation tax arises because, under the classical system, corporate source income is taxed twice if it is distributed: once at corporate level and again at shareholder level. In the tax literature, this phenomenon is referred to as the "economic double taxation of dividends".[4] The existence of a separate corporation tax means that dividends will be `overtaxed' compared to other capital income, such as interest. The label is pejorative, however, in the sense that retained corporate source income may be `undertaxed' if the rate of corporation tax is lower than the rate of income tax at which dividends would be taxed at the shareholder level under full imputation. In the latter case, the separate corporation tax may be said to be biased in favour of retained profits. In a broader (and more correct) view, the real issue is not that dividend income is taxed twice or that the separate corporation tax exhibits a tax bias, but that corporate source income, distributed as well as retained earnings, is not taxed in accordance with the marginal income tax rates of shareholders.

B. *Survey of corporation taxes*

Table 1 shows the various corporation tax systems in OECD member countries, their rates (including the corporation tax, if any, levied by subordinate units of government) and contribution to revenue, and particulars about the way and the extent to which dividend relief is provided. Out of 24 countries, four countries levy the corporation tax in its pure classical garb: dividend income is subject to the twin yoke of the corporation tax and the personal income tax. In contrast, 20 countries permit some form of dividend relief either at the corporate level (3 countries) or at the shareholder level (17 countries). At the corporate level, the dividend-deduction system is found in three countries, while the split-rate system, as such, is not employed anymore. At the shareholder level, nine countries have a full or partial imputation system. Eight countries tax dividend income on a schedular basis. Germany has a mixed imputation/split-rate system: distributed profits are taxed at a lower rate than are retained profits, and the corporation tax attributable to distributed profits is fully eliminated at the shareholder level (at least if the local corporation tax is ignored). In contrast, France taxes distributed profits at a higher rate than retained profits. The domestic degree of integration or dividend relief can be made the same under the dividend-deduction system, the split-rate system, and the imputation system (but not the schedular methods), if it is assumed that the choice of the integration system does not affect the payout rate.[5]

As Table 1 indicates, most (total) corporation tax rates lie in the 35-45 percent range. The unweighted average rate (on retained profits, if differentiated) for all OECD countries is 39.7 percent. Since 1983, when the previous survey was undertaken, the average rate has fallen by some eight percentage points, reflecting the worldwide move of rate-lowering and base-broadening that occurred in the late 1980s.[6] Not surprisingly, the average corporation tax rate is somewhat higher in countries with some form of dividend relief than in countries with a pure classical system. Norway has the lowest overall tax rate of 28 percent.

In addition to the national corporation tax, several countries, often with federal forms of government, have local corporation taxes (see Appendix) which, if differentially applied, are generally condemned in the professional literature because of their distorting effects on the location of investment. The case is also weak for levying lower rates of tax, as many countries do, on small amounts of profits that are not necessarily characteristic of small companies. Such rates do impart a slight degree of progressivity to the corporation tax but, except by coincidence, this does not have to reflect the tax burden distribution at the shareholder level. It should be noted that effective rates of tax, i.e. actual tax payments expressed as a percentage of "economic income", may vary widely, within countries as well as between countries, on account of differences in the way in which taxable profits are determined.[7]

4. The classic treatment of the double-taxation issue is McLure (1979).
5. For the formal proof, see the Appendix in Cnossen (1983).
6. For an overview, see Cnossen and Bird (1990), Table 1.1.

Notes: a. See Appendix
b. CG = Central Government; SG = Subordinate Government; CT = Corporation Tax; PT = Personal Income Tax.
c. Revenue figures relate to fiscal years 1990 as reported in OECD (1992).
d. Subject to maximum, newly issued shares are deductible from taxable income.
e. Basic PT-exemption applies to dividend and interest income (usually doubled for married couples).
f. At the choice of the taxpayer. Credit for withholding tax if dividend included in taxable PT-income.

Several countries have changed their corporation tax system in the past decade. Australia and New Zealand moved away from the classical system to the full imputation system; Finland and Norway did so from the dividend-deduction system. The split-rate system was abandoned in Austria, Japan, and Portugal in favour of some form of relief at the shareholder level. Perhaps the most interesting development in the past years is the increasing schedular treatment of dividends under the personal income tax. Most changes reflect concern with the domestic effects of the corporation tax on payout and investment decisions rather than considerations pertaining to international neutrality.

With few exceptions, the corporation tax is not a major source of revenue. In 1990, the corporation tax, on average, contributed 7.7 percent of total tax revenue, or 2.9 percent of Gross Domestic Product (GDP), when total tax revenue, on average, was 38.8 percent of GDP. (Comparable figures for 1982 were 7.8, 2.8 and 36.2 percent, respectively). The yield of the corporation tax, of course, depends not only on the rate and the method and degree of dividend relief, but also on the extent of incorporation. Without further analysis, a comparison of inter-country yields, therefore, makes little sense. It should be noted that the yield of imputation systems includes the (creditable) `income tax' portion, whereas integration systems at the corporate level, of course, leave the income tax out of account. Although in most countries the corporation tax is not a negligible source of revenue, its yield seems disproportionately smaller than the attention, also in this paper, devoted to its form and structure. One reason may be that the corporation tax acts as a backstop to the income tax. Whatev-

© 1993 International Bureau of Fiscal Documentation

er the case, even corporations that pay little or no tax are still subjected to all its complexities, attendant compliance costs and excess burdens.

III. CLASSICAL SYSTEM VERSUS FULL INTEGRATION

The essence of the corporation tax debate can best be illustrated by contrasting the classical system with the conduit or full integration system. The case for full integration can be made on equity as well as efficiency grounds.

A. *Classical system*

Four OECD member countries have the separate entity system of corporation tax (Table 1), including a major economy such as the United States. (The Netherlands exempts a small amount of dividend income at the shareholder level, but this does not really affect the classical nature of the system.) In computing taxable profits, classical systems do not allow a deduction for profit distributions (dividends) to shareholders. Moreover, those distributions are taxed again in full in their hands at rates that differ from one shareholder to another – depending on the dividend amount and their other income – but that may range from the lowest to the highest marginal rate of the progressive income tax.

The workings of the classical system are illustrated in Example 1. It is assumed that the profits of a corporation before dividend distribution and corporation tax are £ 300, which are taxed at a rate of 40 percent. Remaining profits of £ 180 are distributed in full and taxed again at the shareholder level at individual income tax rates of, say, 30 percent or 50 percent, resulting in income tax liabilities of £ 54 and £ 90, respectively. Combined corporation and income tax payments are £ 174 or £ 210. When expressed as a percentage of original corporate source income, these payments translate into effective tax rates of 58 percent for the 30 percent bracket and 70 percent for the shareholder whose dividend falls in the 50 percent bracket. If these effective rates, in turn, are compared to the appropriate marginal tax rate of each shareholder, the dividend income of the 30 percent shareholder is `overtaxed' by 93 percent and that of the 50 percent shareholder by 40 percent.

Example 1
Classical system

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Corporation tax: 40% (1 x 2)	120	
B.	Shareholder level		
	3. Income tax rate	*30%*	*50%*
	4. Dividend income (1 – 2)	180	180
	5. Income tax (3 x 4)	54	90
C.	Combined tax burden		
	6. Total tax (2 + 5)	174	210
	7. Effective tax rate (6 ÷ 1)	58%	70%
	8. Overtaxation [(7 – 3) ÷ 3]	93%	40%

However, this is not the only possible outcome. As noted above, corporate source income, if retained, may also be undertaxed compared to the marginal tax rate of the shareholder. If, in Example 1, all profits would have been retained in the corporation, the effective tax rate for both shareholders would have been 40 percent. In other words, the 30 percent shareholder would still be overtaxed, namely 33 percent, but the 50 percent shareholder would be undertaxed by 25 percent. Furthermore, if half of profits after tax had been distributed (probably a more realistic situation than either no or full distribution), the 50 percent shareholder would be taxed roughly in accordance with his marginal income tax rate, but the 30 percent shareholder would still be overtaxed by 63 percent.

Proponents of the classical system deny the relevancy of the interaction between the two taxes. They point out that ownership and control functions have been completely divorced from each other in the large public corporation and that shareholders, except in rare instances, have no legal claim on earnings until dividends are declared by management. In their view, shareholders are little more than subordinate creditors. However, this argument does not provide an explanation for the difference in tax treatment of retained profits, dividends and interest.

B. *Economic distortions*

Whatever the argument that the separate personality of a corporation justifies a separate tax, the systematic overtaxation of distributed profits under the classical system brings a number of undesirable economic effects in its train, which deserve to be taken seriously.

The distortionary effect on investment of taxing profit distributions twice depends on the marginal source of equity finance, which may be retained profits or newly issued shares. If firms finance their investments through profit retention rather than new shares, they have to reduce dividends that would otherwise be available for distribution. Accordingly, the role of dividends is crucial. In this connection, the literature has developed two hypotheses, which are known as the `traditional view' and the `new view', respectively.[8]

The traditional view argues that dividend payouts offer non-fiscal benefits. Dividends may provide a signal to shareholders that all is well with the company, or they may limit financial discretion and, hence, potential misuse of funds by management. At the margin, therefore, companies equalize the tax advantages of profit retention and the non-fiscal disadvantages of reducing profit distributions. Accordingly, a new investment will in part be financed by issuing new shares, because dividends cannot be lowered without cost. This implies that the double tax on dividends discourages new investment and distorts the dividend-payout decision.

The new view denies the existence of non-fiscal advantages associated with profit distributions. Accordingly, the double tax on dividends should cause corporations to prefer profit retention over new share issues as the marginal source of

8. For a review and analysis, see Poterba and Summers (1985), Sinn (1985) and, more recently, Zodrow (1991).

© 1993 International Bureau of Fiscal Documentation

finance. Profit retention enables shareholders to enjoy the return on the new investment in the form of tax-preferred capital gains. Moreover, they save on the personal income tax on dividend income that they would have had to pay if profits had not been retained but distributed. The capitalized value of this tax saving is exactly equal to the discounted value of the tax on distributed profits that must be paid in the future. Therefore, the argument goes, the tax on dividends does not distort investment decisions – at least not as long as the company generates sufficient profits to finance marginal investments through retained profits and the tax rate on dividends is expected to remain constant over time.

Most empirical studies support the traditional view.[9] Companies clearly have alternative means of distributing funds other than taxable dividends. This weakens the new view. Furthermore, an important implication of the new view is that the market value of corporate assets exceeds existing share values. This does not seem to be the case. Whatever view is adopted, the double tax always harms investment by new businesses, which have to rely on new share issues to provide for their equity needs.[10] The discrimination of new equity under the classical system, therefore, contributes to the concentration of market power. The double tax is especially detrimental to small, growing firms that face difficulties in attracting debt, as they do not yet enjoy a high credit rating or generate sufficient taxable profits to be able to deduct interest. Consequently, these firms, which provide an important impetus to technological innovation, have to incur higher capital costs on account of taxation than do older, established firms with easier access to debt financing, or with sufficient retained profits to finance new investments.

C. *Full integration*

The economic distortions caused by the classical system should not occur in a fully transparent, competitive world in which the corporation tax would be integrated with the income tax of shareholders. The corporation would then serve only as a conduit, a pass-through, of corporate source income, which would be taxed fully at the appropriate marginal income tax rate in the hands of the shareholders. Example 2 illustrates the workings of full integration. For income tax purposes, it is irrelevant whether a corporation distributes profits and, if so, to what extent. Retained as well as distributed profits are fully taxed according to the partnership method; that is, they are allocated in proportion to each shareholder's holding in the corporation's equity. The corporation tax is simply a prepayment for the income tax. It follows, of course, that effective rates are equal to respective bracket rates; there is no overtaxation.

Full integration is one of the normative implications of the accretion concept of income, as formulated by Schanz, Haig and Simons (S-H-S concept). Its advocates point out that ability-to-pay, being an equity notion, can only be related to natural persons. It follows that if income is chosen as the best index of that ability, the equal treatment rule requires that income should be defined all-inclusive. For tax purposes there should be no difference between corporate profits and other capital income, such as interest and rents, or labour income, such as wages and salaries, which is solely subject to the individual income tax. There is no place, therefore, for an extra tax on distributed profits nor, it should be added, for the preferential treatment of profits retained by the corporation and taxed below the marginal income tax rate of shareholders.

Example 2
Full integration

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Corporation withholding tax: 40% (1 x 2)	120	
B.	Shareholder level		
	3. Income tax rate	*30%*	*50%*
	4. Attributed profits (1)	300	300
	5. Income tax (3 x 4)	90	150
	6. Corporation withholding tax (2)	120	120
	7. Net income tax (5 – 6)	– 30	30
C.	Combined tax burden		
	8. Total tax (5 or 2 + 7)	90	150
	9. Effective tax rate (8 ÷ 1)	30%	50%
	10. Overtaxation [(9 – 3) ÷ 3]	0%	0%
	11. Tax relief [(classical overtaxation – 10) ÷ classical overtaxation)]	100%	100%

Full integration of retained as well as distributed profits has been proposed by the Royal (Carter) Commission in Canada, the US Treasury (*Blueprints*) and the Campbell Committee in Australia. Under both the voluntary and mandatory plans, all corporate source income would be included in the income of shareholders, while a full credit would be permitted for the corporate tax paid on their behalf. To prevent double taxation of retentions, the basis for corporate shares would be written up by the amount of retained profits. These plans, however ingenious, have never left the drawing board, primarily because they are considered impractical. In particular, it has been pointed out that full integration would be costly to the treasury, that delays in completing corporation tax assessments would have repercussions on the filing of shareholders' income tax returns, that it would be difficult to deal with different types of equity, that an undesirable side-effect might be that preferential income items would be passed through to shareholders, and last but not least, that shareholders might have to pay additional income tax, although no cash had in fact been received.[11]

Full integration has been characterized as the search for a perfect solution in an imperfect world. Yet at the same time it has been considered important to eliminate or mitigate the economic distortions of the classical system. As a halfway house to the ideal, various dividend relief systems have been introduced under which at least distributed profits can be taxed in accordance with the shareholder's marginal income tax rate. These dividend relief systems are discussed in the following sections.[12]

9. See Zodrow (1991) for a review of empirical work.
10. It applies also to firms in which management is far removed from shareholders and a dividend reduction in any one year would thus be costly to management.
11. See, especially, McLure (1979), ch. 5.
12. A useful discussion of the nature and history of various dividend relief systems may be found in Norr (1982). For an up-to-date analysis, see also US Department of the Treasury (1992).

© 1993 International Bureau of Fiscal Documentation

IV. DIVIDEND RELIEF AT THE CORPORATE LEVEL

The most obvious approach to the double-taxation issue is to permit dividends as a deduction from taxable profits, as is the case with interest. An alternative would be to tax distributed profits at a lower rate. The dividend-deduction system and the split-rate system are analysed in turn.

A. *Dividend-deduction system*

As shown in Table 1, the dividend-deduction system is found in Greece, Iceland and Sweden. Finland and Norway also had a dividend-deduction system before these countries moved to (full) imputation. Greece allows profit distributions to be deducted in full subject, however, to withholding rates (creditable against the personal income tax at the choice of the taxpayer) ranging from 42-50 percent (depending on the nature of the shares and on whether they are quoted on the Athens Stock Exchange), which exceed the usual corporation tax rate on large, open companies of 40 percent. Hence, the country's corporation tax is still biased in favour of retained profits.

Example 3 shows the workings of the dividend-deduction system. As in the previous examples, the illustration is based on profits before corporation tax of £ 300 and a corporation tax rate of 40 percent. It is assumed that the intention is to provide dividend relief for all shareholders at a rate of 50 percent measured against the overtaxation under the classical system (Example 1, line 8). To achieve this, one-half of profits marked for distribution should be made deductible in determining taxable profits. It is possible, of course, to vary the degree of dividend relief. A full deduction makes the system equivalent to an undistributed profits tax with which the United States briefly, and not altogether favourably, experimented in the late 1930s. A small deduction moves the system closer to the classical corporation tax.

Example 3
Dividend-deduction system

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Dividend deduction (1/2 x 1)	150	
	3. Profits after deduction (1 – 2)	150	
	4. Corporation tax: 40% (3 x 4)	60	
B.	Shareholder level		
	5. Income tax rate	*30%*	*50%*
	6. Dividend income (1 – 4)	240	240
	7. Income tax (5 x 6)	72	120
C.	Combined tax burden		
	8. Total tax (4 + 7)	132	180
	9. Effective tax rate (8 ÷ 1)	44%	60%
	10. Overtaxation [(9 – 5) ÷ 5]	47%	20%
	11. Tax relief [(classical overtaxation – 10) ÷ classical overtaxation)]	50%	50%

Iceland and Sweden limit the dividend deduction to what might be called a normal or primary dividend of 15 percent of the value of the shares or 10 percent of the paid-up capital, respectively.[13] The corporation tax becomes then akin to an excess profits tax. Conceptual difficulties arise in determining the base on which the relief must be computed. Equity capital placed and paid up, the Swedish criterion, has only historical significance. Certainly, it does not represent the amount that subsequent shareholders have paid for the acquisition of their holding. Another base, namely equity for tax (book) purposes (including retained profits and reserves), implies that the primary dividend is calculated by reference to an accounting item which may differ markedly from the market value of equity. The relief is then an arbitrary reduction of the corporation tax rate which varies with the (accounting) relationship between the business's equity and its total worth.

In Sweden, the relief is limited to dividends paid on newly issued shares for a maximum of 20 years (the total deduction cannot exceed the paid-in capital). In 1979, the American Law Institute (ALI) also suggested a limited deduction at the corporate level for dividends on new equity, as well as a corporate excise tax on redemption, in order to achieve a more even handed treatment of dividend and interest payments. An able lawyer, who compared the proposal to the imputation system, however, concluded that the latter was "preferable in theory and workable in practice".[14] Moreover, some arbitrary line must be drawn in deciding when shares stop being `newly issued.' Also, there is always the danger that old equity will be liquidated and converted into new issues. In 1992, in sharp contrast to its previous position, the ALI issued a study favouring the imputation system.

Unless the goal is to stimulate domestic investment, a drawback of the dividend-deduction system is that the relief is automatically extended to foreign shareholders (and exempt entities) who do not pay the (additional) national income tax incurred by domestic shareholders. To prevent this, the dividend withholding tax for profits transferred abroad might be increased, but experience in Germany has taught that it is nearly impossible to get such an increase incorporated in existing or new treaties for the prevention of double taxation. Another possibility is to disallow the deduction for dividends paid to (foreign) shareholders, who are not subject to the national dividend withholding tax. This does not require a renegotiation of treaties. It is the route followed by Sweden under the coupon tax. A final objection to the dividend-deduction system is that the corporation tax cannot serve as a means to verify the correct return of dividend income for the income tax. Its major advantage, of course, is that dividends are clearly treated at par with interest.

B. *Split-rate system*

The split-rate system used to be employed in Austria, Japan, and Portugal. Currently, under the German imputation system, distributed profits are taxed at a lower rate than are retained profits. Just as under the dividend-deduction system, it has been proposed in the literature in these countries to limit the lower rate to a so-called normal or primary dividend, or, more generally, to a specified part of distributed profits. Of course, if the rate differential is small, the split-rate system resembles the classical corporation tax, and if the differ-

13. For a description of the arrangements, see OECD (1991), pp. 351, 354-55, and 418. The primary dividend-deduction system receives a favourable review in a recent study of the Institute for Fiscal Studies (1991).
14. See Warren (1981), commenting on American Law Institute (1979).

ential is large it again becomes an undistributed profits tax. In contrast to usual practice, France taxes distributed profits at a higher rate in order to stimulate retentions.

Example 4 gives an illustration of a split-rate system that taxes distributed profits at a lower rate of 20 percent (and retained profits at 40 percent). Following, profits after corporation tax are distributed. At the shareholder level, they fall in either the 30 percent income tax bracket: £ 72 tax, or the 50 percent bracket: £ 120 tax. The combined liability (line 6) is £ 132 or £ 180, and the corresponding effective rates are 44 percent and 60 percent. If the degree of overtaxation is now compared to the overtaxation inherent to the classical system, then a dividend relief of 50 percent has been extended, the same as under the dividend-deduction system.

Example 4
Split-rate system

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Corporation tax: 20% (1 x 2)	60	
B.	Shareholder level		
	3. Income tax rate	*30%*	*50%*
	4. Dividend income (1 – 2)	240	240
	5. Income tax (3 x 4)	72	120
C.	Combined tax burden		
	6. Total tax (2 + 5)	132	180
	7. Effective tax rate (6 ÷ 1)	44%	60%
	8. Overtaxation [(7 – 3) ÷ 3]	47%	20%
	9. Tax relief [(classical overtaxation – 8) ÷ classical overtaxation]	50%	50%

A disadvantage of the pre-1977 German split-rate system (without imputation) was that foreign parent companies with German subsidiaries could avoid the high split-rate on retained profits by first distributing the subsidiary's earnings and then channeling them back as equity for reinvestment purposes. The effect might have been considered less serious if other countries, such as the United States, levied corporation tax on profits transferred from Germany, while crediting the corporation tax paid in Germany. After all, the US Treasury would then recoup the difference between its tax and the German tax. But aside from the question whether this effect was intended by the German legislator, it could be avoided by placing a Dutch or Swiss holding between the subsidiary and the parent. As a remedy, Germany attempted to negotiate increases of dividend withholding taxes on earnings transferred abroad, but this required changes in treaties already agreed to – always a laborious exercise.

V. DIVIDEND RELIEF AT THE SHAREHOLDER LEVEL

As noted, there are two basic approaches to the integration of the corporation tax and the personal income tax at the shareholder level: the imputation system and various schedular methods of dividend relief.

A. *Imputation system*

The imputation system appears the most important form of dividend relief. It is, therefore, reviewed in somewhat greater detail than are the other systems.

1. Workings

The imputation system has long been dominant in the European Community (EC). The most important member states, namely, France, Germany, Italy and the United Kingdom (together accounting for 80 percent of the EC's GDP) all employ this system. In the EC, economic rather than equity considerations played an important role in the decision to adopt the imputation system. Foremost among these was the desire to promote profit distributions in order to stimulate stock markets and, to a lesser extent, to reduce the tax-induced preference for the corporate form of doing business. The fact that the relief was not automatically extended to foreign shareholders strengthened the grip of many countries on their international tax rights and obligations.[15] Since 1983, the imputation system has also been introduced in Australia, Finland, New Zealand and Norway.

As shown in Example 5, imputation is achieved by requiring the shareholder to partly gross up his net dividend of £ 180 (line 4) by one-third, representing the corporation tax attributable thereto. This achieves the same degree of dividend relief as under the dividend-deduction system and the split-rate-system. The grossed-up dividend of £ 240 is then added to his other income and subjected to the progressive income tax. Next, the gross tax: £ 72 or £ 120 (line 7), is credited with the corporation tax, with which the net dividend was grossed up in the first place. The balance represents the net tax payable (or refundable). Imputation, therefore, has the same gross-up and tax credit features as a dividend withholding tax. Moreover, it provides the tax administration with a similar means of checking the income tax return for the proper reporting of dividends. The withholding technique works as an anti-evasion device because nationals holding stock through nominee accounts do not benefit from the relief.

Example 5
Imputation system

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Corporation tax: 40% (1 x 2)	120	
B.	Shareholder level		
	3. Income tax rate	*30%*	*50%*
	4. Net dividend (1 – 2)	180	180
	5. Imputed corporation tax (1/3 x 4)	60	60
	6. Dividend income (4 + 5)	240	240
	7. Income tax (3 x 6)	72	120
	8. Tax credit (5)	60	60
	9. Net income tax (7 – 8)	12	60
C.	Combined tax burden		
	10. Total tax (2 + 9)	132	180
	11. Effective tax rate (10 ÷ 1)	44%	60%
	12. Overtaxation [(11 – 3) ÷ 3]	47%	20%
	13. Tax relief [(classical overtaxation – 12) ÷ classical overtaxation]	50%	50%

15. The interest in the imputation system was also stimulated by the 1975 draft directive of the European Commission on the most appropriate harmonized form of corporation tax for the Community. The directive proposed that the corporation tax rate should be harmonized between 45 percent and 55 percent and that member countries should agree on a tax credit of 45 percent to 55 percent of dividends paid. Source countries would bear the revenue cost of cross-border tax credits. The directive was withdrawn in 1990.

© 1993 International Bureau of Fiscal Documentation

The tax credit under an imputation system may be expressed as a percentage of the net dividend, indicating the usual legal form of the dividend relief, or as a percentage of the corporation tax, showing the extent to which the double tax is mitigated. The tax credit may also be calculated as a percentage of the grossed-up dividend, representing the comparable tax-inclusive income tax rate. In Ireland and the United Kingdom, the latter percentage equals the basic rate of income tax. A tax assessment is then not required if taxpayers' other income is also subject to the basic rate.

2. Technical aspects

Table 2 shows details of the various imputation systems. Because they do not want to provide a tax credit for profit distributions on which national corporation tax has not been collected, most countries levy a compensatory tax at the company level on dividends paid out of earnings that are wholly or partially exempt from corporation tax, such as profits remitted from abroad, earned under a tax incentive scheme, or arising in the form of lower taxed capital gains. Alternatively, as in Australia, the tax credit is reduced or denied at the shareholder level. In France, the compensatory tax applies also to profits retained longer than five years, even though corporation tax has already been paid thereon at the full rate. In Ireland and the United Kingdom, the withholding tax for the "mainstream" corporation tax, called advance corporation tax (ACT), has been assigned the role of compensatory tax, because the offset is limited to 25 percent of a corporation's taxable profits. Although the imputation system is meant to promote profit distributions, the compensatory tax, of course, forms an inducement to retain exempt profits in the corporation as a means to minimize the corporate tax liability. Also, to the extent exempt profits are distributed, the tax nullifies the intended effect of tax holidays and other tax incentives.

Countries with a compensatory tax must provide rules for the sequence in which profits are presumed to be distributed (Table 2). In order to mitigate the effect of the compensatory tax, profits that have been subject to the highest rate of corporation tax are generally deemed to be distributed first when dividends are paid. In addition, in France, current profits are presumed to be distributed before retained profits, and among retained profits, the latest profits are deemed to be paid out first. In Germany, profits are allocated to three accounts: profits to which the 50 percent rate has been applied, profits that have been subject to the 36 percent rate, and profits fully exempt from tax. Profits subject to an intermediate rate must be apportioned between a higher- and a lower-rated account.

In five countries, domestic corporate portfolio shareholders are treated the same as individual shareholders, i.e. they are permitted to deduct the tax credit attached to dividends received from other companies from their own corporate tax liability. In Germany, the lower rate on distributions implies that an additional 20 percent tax is charged on the receiving company if the dividend is not passed on to individual shareholders. In fact, the introduction of the imputation system made the old "affiliation privilege" for domestic companies obsolete. Ireland, New Zealand and the United Kingdom exempt all intercompany dividends in the hands of receiving companies. Under the legislation in Ireland and the United Kingdom, however, the tax credit on "franked investment income" slumbers and may be used to offset the compensatory tax payable upon redistribution of that income to individual shareholders. That arrangement applies also in other countries; France, for example, exempts dividends received from subsidiary companies under an affiliation privilege (Table 2). The use of such a privilege is necessary because if imputation is partial, deduction of the tax credit attached to a subsidiary's dividend from the parent's tax liability would result in a higher aggregate corporate tax liability than if the total profit had been wholly earned by the parent company.[16]

No country permits foreign shareholders to share automatically in the relief. France, Ireland and the United Kingdom, however, extend the tax credit on a bilateral basis to individual and corporate portfolio investors in a large number of countries (listed in Table 2). Thus, under its double taxation agreements, France provides an additional payment (which is generally subject to withholding tax) to foreign shareholders who, in turn, make the appropriate gross-up adjustment with respect to the individual or corporate income tax liability in their country of residence. As regards Germany, France makes a direct payment to the German government, and German shareholders in French companies apply the regular gross-up and credit procedure. Under other treaties, corporate portfolio shareholders receive a refund of the compensatory tax, if any, that has been paid by a French distributing company; in that case, however, shareholders are not entitled to the tax credit.

Generally, tax credits are not granted with respect to foreign direct investments. Only the United Kingdom has concluded a number of treaties under which profits on such investments, when remitted, are entitled to a tax credit at half the rate available to portfolio shareholders. The half rate is based on the argument that the credit should be extended only to non-resident direct investors to the extent earnings are redistributed to individual shareholders. Since it is estimated that approximately one-half of corporate profits are so distributed, the tax credit for direct investments has been set at one-half of the credit for portfolio shareholders.

Finally, most countries with an imputation system give a refund to individual shareholders if the tax credit exceeds the gross income tax liability. On the other hand, exempt entities, such as pension funds and educational and charitable institutions, are not entitled to a refund, except in Ireland and the United Kingdom.

B. *Schedular methods*

The separate tax on dividends received and the tax credit method (Table 1) are less structured forms of dividend relief. Under the separate tax, all corporate source income, including profit distributions, is taxed at the normal corporation tax rate, but dividend income is partially exempted from the shareholder's income tax by taxing it at a lower (flat) rate.

16. To illustrate, assume a rate of corporation tax of 40 percent, while half of dividends are grossed up and credited if profits are distributed. Then, if an affiliation privilege would not apply, a parent and its subsidiary would have to pay £ 46 tax on each £ 100 profits (before tax) earned by the subsidiary and paid out to the parent. Of course, this does not make sense.

Note: a. Refund of compensatory tax under all other treaties, and to all direct corporate shareholders under any treaty.

© 1993 International Bureau of Fiscal Documentation

Austria achieves this by taxing dividends at one-half of the shareholder's income tax rate, other countries by applying a final "withholding" tax. Turkey exempts dividends fully in the hands of shareholders. Alternatively, Canada and Spain permit shareholders a tax credit, specified as some fraction of dividends received, against their income tax. Unlike the imputation system, the tax credit is available regardless of whether or not corporation tax has been levied, usually the net dividend is not grossed-up before the income tax rate is applied, and no refund is given if the tax credit exceeds the gross income tax liability.

Example 6 shows the arithmetic of the tax credit method. Clearly, an objection to this form of dividend relief, as well as the separate tax approach, is that the benefit is distributed regressively with respect to income. As the example makes clear, a dividend relief from classical overtaxation of one-half for the shareholder in the 50 percent bracket corresponds to a relief of only 35 percent in the 30 percent income tax bracket. Essentially, the goal of dividend relief (the prevention of double taxation) interferes with the objective of progressivity (tax increases that rise proportionately faster than income). The effect would not occur if the income tax is levied at a proportional rate. Belgium, Japan and Portugal mitigate the resulting regressivity by permitting low-income shareholders to include the dividend in income with a credit for the withholding tax against the gross income tax liability.

Another, in some respects similar, concession permits a deduction from income of a specified net amount spent for the purchase of (new) shares. Austria, Iceland and Luxembourg have this kind of scheme to stimulate share ownership. However, a similar relief scheme in France in the 1980s, usually referred to as the *Monory*-deduction, appears hardly to have had any influence on the volume of new share issues or on the number of shareholders, particularly if it is considered that 75 percent of all new shareholders preferred investments in participation trusts, or so-called Sicav's-Monory. Moreover, small and medium-sized companies usually do not benefit from these kinds of measures.

Example 6
Tax credit method

		(£)	
A.	Corporate level		
	1. Profits before corporation tax	300	
	2. Corporation tax: 40% (1 x 2)	120	
B.	Shareholder level		
	3. Income tax rate	*30%*	50%
	4. Dividend income (1 – 2)	180	180
	5. Gross income tax (3 x 4)	54	90
	6. Tax credit (1/6 x 4)	30	30
	7. Net income tax (5 – 6)	24	60
C.	Combined tax burden		
	8. Total tax (2 + 7)	144	180
	9. Effective tax rate (8 ÷ 1)	48%	60%
	10. Overtaxation [(9 – 3) ÷ 3]	60%	20%
	11. Tax relief [(classical overtaxation - 10) ÷ classical overtaxation]	35%	50%

Note: The tax credit has been computed by assuming a total combined tax liability of £ 180 in the 50% bracket (line 8), equal to the liability in the other examples. The corresponding net income tax levied at the rate of 50% can then be calculated, as well as the tax credit itself. Next, the same amount of tax credit has been taken for the shareholder in the 30% bracket, which in turn forms the basis for computing the combined tax figures in this bracket.

VI. CROSS-COUNTRY COMPARISON[17]

This section assesses the degree of dividend relief under the various corporation tax systems on a comparative basis. Dividend relief is rarely provided in full. Also, income tax rates applicable to dividends received are seldom the same as corporation tax rates applied to profits. Hence, various non-neutralities remain.

A. *Degrees of dividend relief*

Table 3 shows the degree of dividend relief, or the absence thereof, under the various corporation tax systems. For the computations, the following simplifying assumptions were made:

- the corporation tax is fully borne by profits;
- all profits after corporation tax are distributed;
- distributed profits are taxed in the hands of individual shareholders who face the top marginal income tax rate; and
- the effective income tax rate on capital gains is nil.

As in the Examples in the previous sections, the degree of dividend relief is computed as the ratio of the difference between the classical overtaxation and the actual overtaxation over the classical overtaxation (all in percentage terms). Simplified, this can be expressed by the following formula:

$$\text{Degree of dividend relief} = \frac{\text{Total CT+PT if no relief} - \text{Actual CT+PT}}{\text{Total CT+PT if no relief} - \text{PT if full relief}}$$

Table 3 shows the data and the various degrees of dividend relief. For the calculation of the total tax burden under the no relief situation, i.e. the classical tax burden, the figures for "Total PT" in the Appendix are used rather than the reduced schedular rates shown in Table 3. Obviously, the same applies to the PT-figures in the above formula. As expected, the degree of dividend relief varies widely, from zero percent in countries with classical systems to 100 percent in Greece, Australia, Finland and New Zealand. In contrast to what the classification suggests, relief is not provided in full under the imputation systems in Germany and Italy, because non-creditable local taxes have to be taken into account. Full relief is considered provided if the total tax on dividends equals the top income tax rate. Judged against this benchmark, Norway, Belgium and Denmark provide more than full relief.

B. *Remaining discrimination*

As indicated above, the central issue in the debate over the most appropriate corporation tax system is the normative rule that corporate profits, whether retained or distributed, should be taxed like all other income at the marginal personal income tax rates of shareholders. In other words, dividends, interest and retained profits should bear the same total tax burden. If so, the choice between new share issues, debt and retentions to finance new investments would not be influ-

enced by the tax system. The corporation tax would be neutral regarding financing and payout decisions and, by extension, investment location decisions.

In the real world, corporation taxes, in conjunction with income taxes, discriminate against financing and payout decisions. Three measures of discrimination may be distinguished. First, the dividend/retention differential measures the percentage excess by which profit distributions are overtaxed compared with retentions. This measure is important for the choice between new shares and retained profits. Second, the dividend/interest differential measures the percentage excess by which profit distributions are overtaxed compared with interest. It is relevant for the choice between new shares and debt. Third, the retention/interest differential measures the percentage excess by which retentions are overtaxed (or, as often, undertaxed) compared with interest. This measure, which can readily be deduced from the preceding measures, affects the choice between retained profits and debt.

The calculations for the dividend/retention differential in Table 3 indicate that most corporation tax systems, particularly if classical in nature, discriminate heavily against profit distributions. Basically, the systems favour established firms

© 1993 International Bureau of Fiscal Documentation

that have sufficient profits to finance new investments and discriminate against starting firms that need new equity. Exceptions are the corporation taxes of New Zealand, Norway and Greece, where the differential is nil because dividends bear the same tax as retentions. Basically, the computations for the dividend/interest differential carry the same message. Some countries, such as Finland, France, Belgium, Japan and Turkey, discriminate heavily in favour of debt, however, because interest is taxed at a mere 10 or 20 percent under the personal income tax. The interest/retention differential varies most. The number of corporation taxes that is biased against debt is the same as the number that favours debt over retentions. Three countries (Sweden, New Zealand and Norway) are neutral as regards the choice between debt and retained profits.

The figures indicate that hardly any corporation tax system achieves neutrality in the taxation of the returns to current equity (retained profits), new shares (dividends) and debt (interest). For neutrality to occur (in other words, for all differentials to be zero), dividend relief should be given in full and the top rate of the income tax at which dividends and interest are taxed should equal the corporation tax rate. The corporation and personal income taxes in New Zealand and Norway meet these requirements, but only for the top marginal rate.

Although the figures form a useful indication of the remaining non-neutralities under the various corporation tax systems, it should be emphasized that they cannot explain why investors do not use opportunities for arbitrage. Thus, returns may not be taxed at shareholder or debtholder level because they are channeled through tax havens or received by tax-exempt entities, such as pension funds. Financial liberalization and innovation have greatly increased the opportunities for tax arbitrage. As a result, remaining non-neutralities may be accentuated or, more likely, mitigated in comparison with the figures shown in Table 3.

VII. EVALUATION AND CONCLUSION

The appropriate place of the corporation tax in an equitable and efficient tax system plays an important role in the tax debate in most OECD member countries. Should corporations be taxed as such or should their earnings be allocated to shareholders? If full integration is not feasible, is integration of the corporation tax on distributed profits a second-best alternative? If so, should dividend relief be provided at corporate or at shareholder level? How much weight should be given to the international repercussions of partial integration? And above all, even if some form of dividend relief appears desirable in theory, are the transition costs worth the trouble?

In an equitable tax system, the case for a separate corporation tax (classical system) is somewhat uneasy. Surely, corporations have an independent legal existence, as well as the capacity to pay tax in the sense that the corporation tax does not force them into bankruptcy. But the conclusion that they also have ability-to-pay is a *non sequitur*. The incidence of all taxes, whatever their name and form, is always on natural persons. The search for the answer to the question of who bears the tax burden must start and end with individuals of flesh and blood. The more nearly tax burdens are imposed on them in line with the ability-to-pay principle and government's redistributive objectives, the better the tax system is.

Also, the classical corporation tax does not appear a particularly efficient tax. There are indications that the tax distorts the optimal allocation of resources because it (a) stimulates the retention of profits, thus interfering with competitive conditions and hampering the entry of new firms; and (b) discriminates against new shares by treating interest favourably compared to dividends, thereby imposing relatively higher capital costs on starting firms that have difficulty attracting debt. In short, financing and payout decisions are distorted.

The equity shortcomings and economic distortions of the classical system, therefore, appear to point the way to integration. Full integration and retention of the corporation tax as a withholding device – to protect the workings of the income tax and to levy tax on foreign companies whose shareholders do not fall under the national income tax – does not appear feasible. Partial integration or dividend relief seems a viable alternative, however, as evidenced by the experience of 20 OECD member countries. Moreover, it has been pointed out that full integration might then, in practice, be achieved if the top marginal rate of the income tax would be set at the same level as the corporation tax rate, as in New Zealand and Norway. Shareholders in low-income tax brackets would then push for profit distribution, while high-income shareholders would not benefit from profit retention.[18]

If payout rates would not be influenced by the choice of the integration system, the degree of dividend relief can be made the same under a dividend-deduction system, a split-rate system and an imputation system. Any one of these systems distributes the tax on distributed corporate source income more systematically in line with marginal individual income tax rates than does the classical system. If the objective is to stimulate the stock market, relief at the shareholder level would seem most appropriate. If the goal is to increase the liquidity position of corporations (as an indirect investment incentive), a dividend-deduction or split-rate system might be called for. An advantage of the imputation system is that it functions as a withholding device, which should further taxpayer compliance with the income tax.

It should be noted that the case for or against dividend relief is not contingent upon the assumption made with respect to the incidence of the corporation tax.[19] If, as some argue, the tax is borne by consumers (in the form of higher prices) or workers (in the form of lower wages either immediately or, more likely, in the long run through the reduced availability of capital), it should be considered an inferior sales tax or payroll tax: inferior because its burden distribution varies arbitrarily from one corporation to another depending on the ratio between profits and sales or between profits and payrolls. Of course, there is no rationale for such taxes in an equitable tax system. Similarly, the efficiency case for integration does not depend on incidence assumptions.[20]

© 1993 International Bureau of Fiscal Documentation

Dividend relief, like other tax changes, cannot be imposed on a *de novo* basis. Changes in the existing tax burden distribution, transition costs and revenue effects must be accounted for. In classical countries, shareholders have long become accustomed to the system and it is likely that the tax, including its double levy, has been capitalized in earlier years in the form of reduced share prices. In other words, the tax has been borne by original shareholders who are not necessarily the same persons as present holders. Removal of the tax would then result in unwarranted windfall gains to existing shareholders. Nonetheless, this does not mean that change should not be contemplated, because distorting effects linger on. Dividend relief mitigates these effects.

Whatever the advantages of dividend relief in the domestic context, however, its international implications are a drawback.[21] Without corrections effected through double taxation treaties, the dividend-deduction or split-rate system unduly favours foreign investors, and the imputation system discriminates against them. This is not equitable and detrimentally affects cross-border ownership of equity. Indeed, the growing internationalization and liberalization of capital markets, which increases opportunities for tax arbitrage and tax evasion, may force the focus of attention on schedular systems under which corporate profits would be taxed in full in the source country, while distributed profits (and interest) would be subject to a final flat low-rate income tax (deducted at source), which might be reduced on a bilateral basis.[22]

Notes:
a. Corporations are also liable to net wealth or capital tax in Austria, Canada, Germany, Iceland, Luxembourg, Norway, Switzerland, and Turkey.
b. Lower or graduated CT-rates are applied to lower amounts of profits or to small businesses in Belgium, Canada, Finland, Japan, Luxembourg, Portugal, Switzerland, the United Kingdom, and the United States. The Netherlands levies a higher rate.
c. Taxes, surcharges or surtaxes differ between subordinate units of government. Therefore, an average or representative rate has been chosen. Italy has a uniform SG-CT rate and Iceland has a uniform SG-PT rate.
d. In Austria, Germany, Japan (12%), and Luxembourg, the SG-CT is formulated on a tax-exclusive basis. In these countries, as well as in Italy (¾), Switzerland, and the United States, the SG-CT is deductible in ascertaining profits for the CG-CT.
e. CG-PT includes 1.25% surtax.
f. SG-rates are for Ontario. Rates include 5% CG-PT surcharge and 10% SG-PT surcharge. SG-PT applied to basic CG-PT of 29%.
g. Rates between brackets apply to manufacturing corporations.
h. SG-rates include church tax of 1.2%.
i. Higher rate applies to distributed profits.
j. CG-PT includes CSG-surtax of 1.1%.
k. Lower rate applies to distributed profits. CG-rates include 3.75% surcharge.
l. CG-CT includes 2.75% surcharge.
m. Rate includes 1% CG-CT surcharge.
n. Rate includes 2.5% CG-PT surcharge.
o. CG-CT includes 1.5% deductible surcharge.
p. All typical rates. SG-rates are for Zürich.
q. Rate includes CG-CT surcharge of 7%.
r. Rate allows for CG-PT rebate of 5%.

RUSSIA:

TAX ASPECTS OF IMPROVING THE INVESTMENT CLIMATE IN RUSSIA

James Riordan and Charles E. McLure, Jr.

Initiated by Russia's State Committee on Taxation and the Ministry of the Economy to assemble a delegation of tax experts which could guide the new Russian government in the most efficient, reasonable way to tax foreign investment the Tax Foundation agreed and submitted this statement on 7 July 1992, in Moscow to Vice President Aleksandr V. Rutskoi and I.A. Lazarev, chairman of the Russian State Tax Committee.

Mr. Riordan is former Vice Chairman, Mobil Oil, and current Co-Chairman of the Tax Foundation.

Mr. McLure is a Senior Fellow at the Hoover Institution, and a Foreign Advisor to the Supreme Economic Council of the Supreme Soviet of Russia.

I. PREFACE

The Tax Foundation delegation wishes to see the Russian transition to a free market succeed. Successful transition is important for many reasons, most notably the improvement in the living standard of the Russian people and enhancement of prospects for world peace.

The delegation wants American companies, by investing in Russia, to be partners in the success of transition. For this to be achieved, the Russian tax system must satisfy the objectives of both taxpayers and the government.

Economic progress in Russia requires that the tax system not discourage the saving and investment that are necessary for economic progress.

In the delegation's meetings with representatives of the Government, the Parliament and the State Tax Service it has shared its views in three areas: (1) the long-term goals for a tax system that is appropriate for a market economy, especially one that does not discourage investment; (2) aspects of the existing tax system that are of immediate concern to foreign investors; and (3) policies that would facilitate foreign investment during the interim period when the Russian tax system is in flux as a system suitable to the long term is being developed. In all cases these views are consistent with the Tax Foundation's long-established "Principles of Taxation". These principles include stability, reliability, simplicity, clarity, economic neutrality, the need for open discussions of policy, free and fair taxation of international transactions, moderate tax rates and the importance of applying these principles to the taxes of subnational as well as national governments. For over 50 years they have guided the Tax Foundation in its similar consultations with the government of the United States.

II. LONG-TERM POLICY GOALS

A. *Stability*

Stability is a critical feature of a tax system that will encourage investment. An unstable system creates uncertainty that discourages investment.

B. *Reliability*

Investors should be able to rely on continued application of the tax laws in existence at the time they make their investments. New and heavier burdens should not be imposed after an investment is made. Taxpayers must be able to rely on, published laws, decrees, regulations and rulings. Laws must be administered fairly and consistently, with only limited administrative discretion. Procedures for resolving tax disputes should include administrative hearings and court proceedings. Taxpayers should be protected from unreasonable and capricious interpretations of the law. Changes in laws should only be applied prospectively; changes in laws should not be applied retroactively. Subnational governments must not be allowed to deviate from (or unilaterally modify) legislation adopted by the federal government.

C. *Certainty*

Laws and regulations interpreting them must state precisely the tax consequences of various actions. This contributes to economic transparency (to be defined in E

© 1993 International Bureau of Fiscal Documentation

below). Adoption of Western accounting conventions and their incorporation into the tax system will increase clarity. Legally binding advance rulings interpreting new provisions of the tax system that might otherwise be unclear must be readily available.

D. *Simplicity*

Russia should avoid the complexity found in the tax systems of many Western countries. Such complexity is extremely troublesome even in advanced Western countries with substantial experience in tax administration and compliance. It would be far worse in Russia, which does not yet have the tax administration and experience in taxpayer compliance required to cope with a complex system.

E. *Economic transparency*

Under current Russian law the economic consequences of certain actions are not immediately clear either to taxpayers or the government. Because the tax base differs from economic income, as measured by Western accounting principles, the effective rate of taxation can depart radically from the statutory rate. Examples that increase the effective rate substantially (to be discussed in greater detail below) include the unrealistically long useful lives of depreciable assets, the use of historical cost in the calculation of depreciation allowances, and the disallowance of deduction of some ordinary and reasonable business expenses, such as interest expense and labour payments in excess of four times minimum wages.

F. *Satisfactory definition of taxable profits/income*

The measurement of profits (income) for tax purposes should be based on standard Western accounting principles. All reasonable and necessary expenses should be deductible. This is necessary to facilitate economic transparency, to avoid disincentives for investment and to assure foreign tax credits in the United States and perhaps elsewhere.

G. *Moderate tax rates*

Tax rates (both statutory and effective rates) should be moderate, so as not to discourage investment. (The top individual income tax rate of 60 percent[1] and the VAT rate of 28 percent[2] are high by international standards.)

The delegation appreciates the need to control deficits and the difficulty of reducing public expenditures (including subsidies to state enterprises) under current circumstances. It is equally important, however, to remember that in the long run only a growing private sector can provide productive employment, a rising standard of living and the tax revenue needed to finance essential government services. An overburdened private sector will not experience the investment needed for dynamic growth.

III. AREAS OF IMMEDIATE CONCERN

A. *High tax rates*

The Tax Foundation delegation believes the 60 percent[3] top statutory tax rate applied to individual income to be much too high. The combined effective rate paid by enterprises and their employees, including the effect of the disallowance of deductions for labour payments in excess of four times minimum wages, is even higher, approximately 73 percent. Attention should also be paid to the marginal effective tax rates on income from capital invested in Russia resulting from the low rates of depreciation allowed under Russian law and the failure to take account of inflation in calculating taxable profits (income).

B. *Foreign tax credits*

Ratification of the double taxation treaty with the United States will alleviate some concerns about the creditability of the current Russian profits tax, but does not assure creditability under all circumstances. Moreover, some foreign investors wish to use organizational structures for which issues of creditability will remain. The only satisfactory way to deal with the issue of creditability is to allow deductions for all reasonable and necessary expenses of earning income.

C. *Labour payments*

Wages and salaries are generally deductible, without limit, in advanced Western countries. Placing limits on the deductibility of labour payments is not a satisfactory means of dealing with the tendency for the management of state enterprises to grant unjustified and inflationary wage increases. At best such a policy is only appropriate for state enterprises and then only if reforms of managerial compensation policy are not adequate to provide incentives for cost control. This policy distorts the tax base, raises enterprises' cost of managers and skilled workers, discourages foreign economic activity in Russia and thereby the process of technological transfer, and raises questions of creditability. In the case of service industries the disallowance of deductions for labour payments is particularly problematical, since it can produce a definition of the tax base that approaches gross income.

D. *Capital recovery*

It is appropriate to allow tax-free recovery of the cost of capital investments. The generally accepted method of doing this throughout the world is the deduction of depreciation allowances (in the case of investment in tangible assets) and amortization (for intangible assets). The useful lives assumed in calculating depreciation allowances under Russian tax law are much too long (and the implied depreciation rates much too low) to allow timely recovery of capital, especially since inflation reduces the real value of such allowances. It is necessary to have more rapid depreciation and to prevent the loss of real value of allowances caused by inflation. The conceptually correct way of achieving the second of these objectives, indexation of the cost basis of assets, is extremely complicated. An alternative approach that deals with both problems simultaneously in a relatively simple manner is to allow immediate write-off (expensing) of investment.

1. Changed to 40% on 15 July 1992.
2. Changed to 14% on most products on 15 July 1992.
3. See *supra* note 1.

© 1993 International Bureau of Fiscal Documentation

E. *Discrimination against "middlemen"*

Many foreign multinational corporations may operate in Russia through organizations that would be defined as middlemen, subjecting them to the 45 percent profits tax rate. This will place them at a competitive disadvantage relative to organizations that can avoid such characterization. This discriminatory provision, which reflects a continuation of the socialist mentality under that commerce is unproductive, should be eliminated.

F. *Loss carryforward*

In order to avoid disincentives for investment, losses incurred in one year should be available to offset income earned in subsequent years. It is especially important that it be possible to carry losses incurred during the typically unprofitable start-up period forward to offset taxable profit/income once the enterprise becomes profitable. Most other countries allow net operating losses to be carried forward for extended periods. It would also be desirable to prevent inflation-induced declines in the real value of deductions for past losses, perhaps by indexing such losses (or paying market interest rates on them) or by denominating them in hard currency.

G. *Uniform treatment*

The tax law should treat all forms of enterprise in the same way.

H. *Export taxes*

Russia must export in order to earn the foreign exchange needed to import capital and technology. Export taxes discourage exports and should be eliminated. Since the world market price of most goods and services is beyond the control of one country, export taxes cause an involuntary reduction in net selling prices and thus the profits of exporters. They can discourage potential investors from investing in Russia. Russia can design other mechanisms to prevent windfalls from the export of subsidized raw materials.

I. *Mandatory conversion of hard currency earnings*

The requirement for mandatory conversion of hard currency earnings is a troublesome policy that resembles a discriminatory tax on the exports and other hard currency earnings of foreign investors. All investors considering projects in Russia must be concerned with risks of exchange rate fluctuations. Mandatory conversion aggravates such risks for those contemplating investments in export industries in Russia. Mandatory currency conversion is essentially an involuntary loan made in a currency other than that in which the foreign investor calculates and reports his profits. As such it subjects the investor to additional unwanted risk of fluctuations in the exchange rate. The delegation hopes that the exchange rate can be stabilized, that such risk will be reduced and that foreigners will find investing in rubles will become attractive. This is currently not the case; moreover, ruble investments cannot be hedged. It is important that this onerous requirement for mandatory conversion be eliminated, thereby removing a troublesome source of inconsistency with the Law on Foreign Investment.

J. *Import duties*

It is important that any import duties be levied at a single rate and that the rate of import duty be kept low, in order to avoid uneconomic and unfair protection of selected industries resulting from high rates of effective protection. Russia has not followed this policy in the recent past.

K. *Value added tax*

Most countries that levy value added taxes (VATs) employ consumption-based VATs. As a result, the aggregate base of the VAT is limited essentially to the value of final products sold to consumers. This is achieved by allowing businesses to offset (credit) all taxes paid on purchases – including taxes on capital goods (such as machinery and equipment) – against tax due on sales. Russia should follow standard international practice in this regard.

L. *VAT on financial services*

The application of VAT to financial services and credit card services involves extremely complex issues. This problem should be discussed with the representatives of these industries, especially those actively considering doing business in Russia.

M. *Actions of subnational governments*

Subnational governments have been engaging in actions that are extremely troublesome to potential investors; it appears that some of these may be inconsistent with current federal law. For example, they have been imposing taxes not allowed under federal law, they have required that potential investors engage in joint ventures with them or with state enterprises under their jurisdiction, and they have refused to allow local banks to remit tax revenues to the central government. This type of behaviour is extremely inimical to investment.

N. *Risk of confiscatory taxation*

Almost all companies doing business in Russia are subject to several forms of taxation (or tax-like provisions), including not only the profits tax and the value added tax, but also excises, export taxes and mandatory conversion of hard currency. In some cases the combination of taxes is confiscatory, or nearly so. It is important to analyse the consequences of policy to be sure that in total taxes and similar measures do not absorb all of the profits – or even almost all of them – and do not impinge so heavily on the markets for the products of some industries as effectively to destroy them.

IV. INTERIM SUGGESTIONS

Based on the delegation's meetings it understands that establishment of the type of system suggested above will be politically difficult. Thus it offers several suggestions for an inter-

© 1993 International Bureau of Fiscal Documentation

im policy that will facilitate the process of foreign investment while the permanent system is being developed.

A. *Review of proposed legislation*

Views of foreign investors should be sought as new legislative proposals are being developed. Written drafts of proposals should be readily available for analysis, discussion and comment. It is especially important that such drafts be widely distributed to interested foreign investors (actual or potential). Adequate time should be allowed for translation, analysis and the submission of comments. Ideally one Russian agency would be responsible for this activity, in order to simplify communication and increase efficiency and consistency. The Tax Foundation would be pleased to facilitate this process in the case of American investors.

B. *Advanced interpretive rulings*

It should be possible for investors to obtain legally binding rulings interpreting existing laws. It is especially important to reduce uncertainty during the next few years when investment is badly needed and there is a high risk that legislation will be unclear.

C. *Guarantees against adverse fiscal changes*

A procedure should be instituted that would provide investors with guarantees that tax rules (including maximum rates) will apply for specified periods of time.

D. *Uniformity and consistency*

Ruling letters (B above) and guarantees (C above) should treat similarly situated taxpayers in a similar manner. All ruling letters and the terms of all guarantees should be published promptly and have general applicability.

INTERNATIONAL:

THE US PROPOSED REGULATIONS DEALING WITH TAX ASPECTS OF TRANSFER PRICING WITHIN MULTINATIONAL ENTERPRISES[1]

A Report by the Committee on Fiscal Affairs on the Proposed Regulations under Section 482 IRC

EXECUTIVE SUMMARY

A. *Introduction*

1. The spread of the activities of Multinational Enterprises (MNEs) poses particularly difficult problems for all tax authorities in that it is not easy to determine the allocation of taxable profits in highly integrated groups. Whenever goods and services cross national boundaries within a multinational group, a transfer price is required in order to determine the division of the tax base between the countries in which the MNE is operating. Because that transfer price may be manipulated in order to affect the division of the tax base between the different countries involved, it is generally agreed that, for tax purposes, it may be appropriate to correct the allocation of profits between members of a corporate group to eliminate the effect of such manipulations. However, determining a proper allocation of profits is – both for the taxpayers and tax administration – particularly difficult for intangible property and it is primarily this problem which the United States has sought to address in its proposed income tax regulations relating to intercompany transfer pricing and cost-sharing arrangements under Section 482 of the US Internal Revenue Code.

2. The problems currently being encountered in the transfer pricing area by the United States are not new and are similar to those encountered by the other Member countries of the OECD. These difficulties, which are inherently global in nature, cannot be resolved unilaterally. A multilateral approach is required which builds upon widely accepted principles of international taxation. The recent discussions in the United States regarding the proposed Regulations provide a perspective to the determination of transfer prices which is useful and interesting in many ways. Nevertheless, the implementation of the proposed 482 Regulations in their present form could risk undermining the consensus that has been built up over a number of years on the application of the arm's length principle and thereby increase the risk of economic double taxation.

3. The purpose of the present report, which has been prepared by a special Task Force established by the Committee on Fiscal Affairs of the OECD, is to provide the US administration with the collective views of the OECD Member countries on the proposed Regulations.

4. The following paragraphs provide a brief summary of the main problems which arise with the proposed Regulations and set out the recommendations of the Task Force. The Member governments of the OECD stress that they are prepared to work further with the United States, both bilaterally and in such international fora as the OECD, to address the problems to which the Regulations are directed.

B. *The Existing International Rules*

5. Since 1956 the OECD has sought to build up a set of internationally accepted "rules of the game" which govern the ways in which Member countries tax profits arising from international transactions. The main instrument used to achieve an internationally consistent approach to the taxation relating to such international transactions has been the development of an OECD Model Tax Convention, the latest version of which was published in 1992.[2]

6. The purpose of the OECD Model Tax Convention is the avoidance of international double taxation and to assist tax authorities in counteracting tax evasion and avoidance. Article 9 (Associated Enterprises) of that Convention recognizes that Member countries can correct the allocation of taxable profits between associated enterprises. This Article, and Article 25 dealing with the Mutual Agreement Procedure, aim at ensuring that such corrections are made on the basis of the generally agreed arm's length principle.

7. The provisions set out in the OECD Model Tax Convention were supplemented in 1979 by guidelines for the practical application of the arm's length principle in respect of different types of cross-border transactions within a multinational group.[3] That report sets out the methods that OECD Member governments should use in applying the arm's length principle, namely:

a) The comparable uncontrolled price method.
b) The cost plus method.
c) The resale price method.
d) Other reasonable methods which produce an acceptable figure.

1. The full report was published by the OECD on 10 January 1993.
2. Published under the title, "Model Tax Convention on Income and on Capital", OECD, Paris (September 1992).
3. The 1979 Report was entitled "Transfer Pricing and Multinational Enterprises".

© 1993 International Bureau of Fiscal Documentation

The principles set out in the 1979 Report have been widely followed by Member countries, including the United States, and are strongly endorsed by the business community and tax practitioners.

C. *The Importance of Maintaining an International Consensus*

8. OECD Member countries wish to stress the importance of maintaining the international consensus that has been reached on how to deal with transfer pricing issues. The adoption by one country of rules which are inconsistent with this accepted standard and which were not generally accepted by other Member countries, would raise a very high risk of economic double taxation which could lead to increased uncertainty for the business community with a consequent disruption of international trade.

9. The proposed Regulations raise two fundamental issues as regards this international consensus. The first issue is whether the methodology put forward in the proposed Regulations is consistent with the arm's length principle which underlies the Article on Associated Enterprises. The second is that of the application of the Regulations in the context of a tax convention's mutual agreement procedure and arbitration mechanism.

(i) Relationship between the proposed Regulations and the arm's length standard

10. The arm's length standard is recognized in Article 9 of the OECD Model Tax Convention and allows for the re-allocation of profits which would be earned by one enterprise within a group of associated companies but for any special conditions that would not apply as between independent persons. The OECD 1979 Report emphasized that for this purpose arm's length profits are those that would be earned if transactions between associated enterprises were undertaken at their fair market values and sets out acceptable methods of determining the arm's length or fair market value of transfers of property and services. Matching or comparable transactions with unrelated parties will generally govern and, where these are not available, the cost plus, or the resale price method or other methods are used depending on the circumstances. The 1979 Report recognized the "many conceptual and practical difficulties" which arise in applying transaction-based methods and noted that it may be acceptable in certain cases to have regard to profits in determining whether transactions between associated enterprises were in fact based on the arm's length standard. The profits examined may be those of the various enterprises within the group of associated companies (subsequently referred to in this Report as the "profit split" approach) or the profits of independent entities carrying out the same or similar activities (the comparable profits approach). It is this latter approach which has been given a central role in the proposed Regulations along with periodic adjustments as a means of implementing the concept of commensurate with income introduced in Section 482 by the 1986 Tax Reform Act.

11. An examination of the current profit experience may often be useful as part of the evidence as to whether a transaction was made on arm's length terms. However, it may not be in accordance with arm's length standards to make an adjustment to tax liability in every case based on the overall current income earned. A major difficulty with the comparable profits approach is that the incomes of taxpayers engaged in the same or similar activities do not vary only because of differences in price, but are highly dependent upon other factors such as differences in cost structures, locational differences, the cost of capital, the degree of business experience, the quality of the management, the objectives of the firm, etc. Unless these differences are taken into account, there may be a fundamental inconsistency between the outcome under the arm's length standard and a methodology based on comparable profits.

12. To the extent that a commensurate with income approach involves the application of hindsight, there is a danger of a fundamental contraction between the arm's length standard which depends on evaluating bargains at the time they take place and the commensurate with income concept to the extent that it involves a year by year retrospective reappraisal based on profits. The question that needs to be asked is what profits could have been reasonably foreseen? As long as the objective is to exclude from consideration all events which were not known and could not reasonably have been predicted by the parties at the time the transfer was made, the Task Force would not regard the arm's length standard as having been necessarily breached.

13. Whilst it may be appropriate to use comparable profits to arrive at an arm's length price and to cross-check other methods, the 1979 Report stresses that comparisons of this sort should be made with care and that "exceptional profits or losses" may not necessarily indicate that income was being shifted by artificial transfer prices. The Task Force endorses strongly this warning since profit comparisons are valid only if the comparable is a true one and if they accord with commercial reality.

14. The Task Force believes, however, that an approach that considers the totality of profit with respect to the transactions made by the related enterprises under consideration (the profit split approach) could mitigate – at least insofar as it is not based on some arbitrary division of profits – some of the problems associated with the comparable profit method. The main advantages of the profit split are that it is based on the commercial activity of the entity itself and therefore less likely to penalize the commercially unsuccessful (through comparisons with more successful rivals) and it reduces the number of uncontrolled factors such as poor management and locational differences affecting the entity. Revenue authorities may therefore find it easier to agree on a profit split than reconciling the various comparable profit interval (CPI) calculations for entities in each country. For those reasons, profit splits have sometimes been used in preference to the comparable profit method where a transaction-based approach is not feasible. It should be stressed that this approach is based on an analysis of the economic activities of particular groups of companies and thus should not be confused with unitary methods which are based on pre-determined formulae and

© 1993 International Bureau of Fiscal Documentation

which the Task Force would regard as being contrary to the arm's length principle. However, the Task Force also recognizes a number of limitations to this approach and that substantially more work is required to evaluate the widespread application of the profit split approach. The Committee on Fiscal Affairs intends to examine this issue as part of its review of the OECD 1979 Report.

15. In conclusion, the Task Force considers that even if in theory the comparable profit method underlying the proposed Regulations could reflect an arm's length profit analogous to the way that a comparable price can reflect an arm's length price, there are serious difficulties in putting the theory into practice. The considerable weight given in the proposed Regulations to the comparable profits approach increases the danger of arriving at a result that would not comply with the arm's length principle.

(ii) The mutual agreement procedure and arbitration process

16. The proposed Regulations as presently drafted are likely to result in adjustments that will not be accepted by other countries, which would lead to economic double taxation and a consequent disruption of international trade. These concerns could be somewhat alleviated in the case of direct transactions with associated enterprises resident in countries with which the United States has a tax convention if the United States expressly confirms that an agreement reached under the mutual agreement procedure provided for by these conventions would take precedence over the application of the proposed Regulations and that when concluding such mutual agreements, the IRS would not have to comply with the proposed Regulations. Similar remarks apply in the case of the arbitration process which is increasingly being advocated as a way of solving disagreements between countries on issues of transfer pricing. However, it is necessary that decisions under the mutual agreement procedure and under arbitration be based on internationally agreed standards and that the countries involved be in a position to implement those decisions even where they depart from their internal rules.

D. *An Overall Assessment of the Proposed Regulations*

(i) The need for amendments

17. The Task force shares the stated objectives of the United States to counter abusive transfer pricing practices, to reduce the scope and the number of controversies between taxpayers and the IRS and to implement the commensurate with income requirement in a manner that is consistent with the internationally accepted arm's length standard. Any regime for preventing abuses of transfer pricing should, however, operate fairly and should not lead to international double taxation or impose excessive compliance or administrative burdens. The Task Force believes that the proposed Regulations make some progress towards reconciling the stated objectives but, in their present form, do not meet these objectives and may in fact frustrate them. Accordingly, substantial amendments are required.

(ii) The need to concentrate on abusive cases

18. One of the goals of the proposed Regulations is to reduce the scope for disputes with taxpayers, thereby enabling resources to be concentrated on truly abusive cases. Therefore the proposed Regulations should be explicitly directed towards such cases and confine as far as possible the applications of the comparable profits methodology and of periodic adjustments to these cases.

(iii) The need for flexibility

19. The Task Force believes that some of the difficulties that are identified in this Report could be alleviated if the Regulations were drawn up and implemented in a more flexible manner than is presently the case.

(iv) The need for a short-term review following the implementation of the proposed Regulations

20. Whilst it is acknowledged that profit comparisons have a legitimate role in reviewing transfer pricing cases and that the comparable profit methodology suggested in the proposed Regulations is far more sophisticated than anything previously attempted, the work in this area remains at the experimental stage and requires further testing before its precise impact in the transfer pricing area can be determined. Therefore, the Task Force considers that the importance of these concerns requires that the proposed Regulations, amended as suggested in this Report, should ideally be implemented on a temporary basis and, in any event, be subject to a review after a short period of time. The Task Force also believes that treaty partners of the United States should be invited to collaborate in this review process through the work of the OECD's Committee on Fiscal Affairs.

(v) Encouraging a more intensive use of existing international instruments

21. The Task Force considers that at least some of the problems addressed by the proposed Regulations and the risks of economic double taxation could be alleviated by making more intensive use of existing instruments for international cooperation. These would include:

- Intensifying the use of existing bilateral and multilateral instruments for the exchange of information. The Task Force has recommended to the Committee on Fiscal Affairs that its Working Party on Tax evasion and Avoidance should speed up and intensify its work in this area.
- Considering more closely the use of simultaneous examinations of related enterprises operating in different countries since this can be an effective means of obtaining information on the activities of MNEs and of countering abusive transfer pricing practices. The OECD has recently adopted a standard working agreement for such examinations and hopes that his will encourage the more frequent use of this technique by those Members countries which are in a position to carry out such examinations.
- Considering further the use of advance transfer pricing agreements, which could avoid some of the problems for MNEs addressed by the proposed Regulations. These

© 1993 International Bureau of Fiscal Documentation

agreements can be an effective way of introducing greater certainty into the transfer pricing area, especially if they continue for a relatively long period of time. It is, however, recognized that these agreements are time-consuming to conclude for both the taxpayer and the tax authority.

E. *Specific Recommendations*

22. The following paragraphs set out the specific recommendations that are proposed by the Task Force and these should be read as a whole. In making these recommendations, the Task Force emphasizes once again that all Member countries share many if not all of the concerns of the United States and that they are prepared to work closely with the IRS and the Treasury to address the problem of abusive transfer pricing practices. The Task Force believes that the suggestions set out below are constructive and, if adopted, would enable the international consensus on the approach to transfer pricing problems to be maintained and developed.

a) *Recommendations dealing with the application of the proposed Regulations in the context of a mutual agreement procedure or arbitration process:*
It is recommended that the United States confirm that it will not be bound by the proposed Regulations in the mutual agreement procedure or any arbitration process under an arbitration clause provided for in its tax conventions.

b) *Recommendation dealing with the application of the proposed Regulations to abusive cases:*
Whilst the comparable profit method must remain a method of last resort, it is recommended that its application be explicitly directed towards abusive cases and that the IRS examiners be instructed to exercise care and discretion in the selection of transfer pricing cases and in their subsequent application of the method set down in the Regulations so as to focus on abusive situations. It is further recommended that general information on these instructions be published.

c) *Recommendation on priority of methods*
It is recommended that the Regulations should allow the evidence of all methods to be used in conjunction to determine transfer pricing adjustments. In the view of the Task Force, the role of comparable profits should be primarily to complement or to cross-check other methods of determining transfer prices and as a useful tool for selecting cases for audit. Therefore, to the extent that the comparable profit method is used to determine the amount of the adjustment to be made in a particular case, it should be regarded as a method of last resort and it should not take priority over transaction-based methods or other methods including the profit split approach, in those cases where these methods can reasonably be applied on the basis of the available information.

It is also recommended that the Regulations should not in practice compel IRS examiners to go too quickly to a comparable profit method.

d) *Recommendation that the results of the comparable profit method be rebuttable*:
It is recommended that, to the extent that the comparable profit method is used to determine the amount of the adjustment to be made in a particular case, the results of applying that method should be regarded as a presumption that the taxpayer would have the right to rebut and that, for that purpose, the taxpayer should be entitled to present evidence to demonstrate either that the price charged is an arm's length price, or can be accepted as such, and results in an arm's length allocation of profit between the two parties to the transaction, or, in the absence of a comparable price or transaction, that the allocation of profits between the two entities is reasonable having regard to the arm's length standard.

e) *Recommendations on the availability of data required for the application of the CPI method*:

The Task Force recommends that the data used to construct a comparable profit interval range should be data drawn from information that is available to the public or to which the taxpayer could reasonably be considered to have access or from other information which is available to the tax authorities and which could be shared with the taxpayer. All such data used by an examiner in constructing the CPI should be shared with the taxpayer and, if necessary, with the competent authority of the appropriate tax administration in accordance with the provisions of tax treaties relating to mutual agreements and the exchange of information.

It is also recommended that where the controlled party is a foreign entity, the CPI should be determined from data on similar independent entities which carry on business in the same or similar markets.

It is further recommended that the Regulations should not force the application of the comparable profit method in those cases where sufficient data are not available to permit valid profit comparisons.

f) *Recommendation dealing with difficulties in the application of the CPI*:

Whilst the Task Force considers that safe-harbours would provide certainty to taxpayers and therefore overcome the difficulties in the comparable profit method, it believes, as stated in the OECD 1979 Report on Transfer Pricing, that designing effective safe-harbours involves a number of difficulties. The Task Force is recommending that the Committee on Fiscal Affairs undertake further work in this area in the context of its review of the 1979 Report. The Task Force believes, however, that the United States should develop some mechanism to enable small businesses to avoid the compliance burden, including computational complications, arising out of the comparable profit method.

Where a comparable profit method is used and to the extent that the result produced conflicts with the result obtained under other methods, it is also recommended that, rather than move immediately to determining a fixed point in the comparable profit interval, an explicit obligation be placed on the examiner to check that the methods have been applied correctly and in particular that the right comparables have been selected and the appropriate adjustments made and, as already stated, to share the results, plus the underlying data, with the taxpayer.

© 1993 International Bureau of Fiscal Documentation

g) *Recommendation on the concept of sound business judgement*:
The Task Force recommends that the sound business judgement concept used in the proposed Regulations should be refined to include only the facts which were known to the taxpayer (for example a trade secret) and also any other facts which were in existence at the time and which could reasonably be expected to be known by a taxpayer, even if he maintains to the contrary. In assessing the exercise of this judgement, account should be taken of the nature and the size of the enterprise, what type of information would normally be available to an unrelated party to the transaction or what type of information could be ascertained by the taxpayer with reasonable effort and care or could be estimated by him, either through the use of financial forecasting or other normal business planning methods, including the use of external data such as market reports. The Task Force does not consider that it is realistic to postulate that all taxpayers should have full knowledge of all relevant facts.

h) *Recommendations on periodic adjustments*:
While it is recognized that retrospective adjustments are in some cases justified, it is recommended that they be confined to truly abusive cases and in order to do so the scope of the exceptions to the requirement to make periodic adjustments should be broadened. In particular, it is recommended:

- that the ten-year period used as a test for the second exception be reduced to five years;
- that the limitation to changes in economic conditions be broadened to cover all factors which were neither anticipated nor reasonably foreseeable and that clearer guidance be provided as to what is meant by the expression "beyond the control of any member of the group";
- that the criterion of the method by which an arm's length amount is determined be removed from the test applicable to the consideration in the second and third exceptions.

i) *Recommendation on the treatment of tangibles*:
It is recommended that the extension of the proposed Regulations to the transfer of tangible property be limited to cases where the property derives its value primarily from its intangible component.

It is also recommended that tangibles should not be subject to less generous treatment than intangibles. Thus, for example, the discretion to limit adjustments in the case of intangible transfers where the reported operating income of the tested party is not significantly outside the comparable profit interval should be extended to tangible transfers.

j) *Recommendation dealing with the allocation of costs in cost-sharing arrangements*:
It is recommended that reasonable methods of allocating costs under a cost-sharing arrangement that are applied consistently should not be disturbed simply on the basis that they fail the application of the cost/income test.

It is further recommended that any changes to a reasonable cost-allocation formula should be made prospectively only and not retroactively as suggested in the proposed Regulations except in those circumstances where the formula adopted is clearly deficient.

k) *Recommendation dealing with buy-in/buy-out rules*:
It is recommended that the requirement for "buy-in" or "buy-out" payments should be decided on a case by case basis, at the moment of entry to or departure from the cost-sharing arrangement, taking into account all relevant circumstances.

l) *Recommendation on application of deemed intangible transfer rule*:
It is recommended that any adjustments regarding bona fide cost-sharing arrangements should generally be limited to a re-allocation of costs amongst the participants and that the use of a deemed intangible transfer rule should normally be directed towards abusive cases.

m) *Recommendation dealing with eligible participants*:
It is recommended that the definition of an eligible participant should be clarified and made more flexible to recognize the many different arrangements that are in common use in cost-sharing arrangements.

n) *Recommendation on ownership of intangibles under cost-sharing arrangements*:
It is recommended that the rules relating to cost-sharing arrangements be clarified to ensure that they apply only to allocate income and deductions for tax purposes and not for the purposes of assigning legal title to the intangibles.

o) *General recommendation dealing with cost-sharing arrangements*:
Further consultation with OECD Member countries in the context of the Committee on Fiscal Affairs are recommended before final changes are made to the rules relating to cost-sharing arrangements.

It is also recommended that a longer transitional period be provided to permit multinational companies to adapt their existing arrangements to any new rules that may be introduced and that the United States work with its treaty partners to develop appropriate transitional arrangements, including the possibility of grandfathering, particularly for bona fide existing cost-sharing arrangements.

p) *Overall recommendation:*
It is recommended that the proposed Regulations should be substantially amended according to the suggestions set out in this Report and, even after such amendments, that they should ideally be implemented on a temporary basis. In any event, their application should be reviewed, after a short period of time, in collaboration with the OECD Committee on Fiscal Affairs.

VIII. Conclusion

I. INTRODUCTION

The Honourable Minister of Finance, Datuk Seri Anwar Ibrahim presented the 1993 Budget on 30 October 1992. The budget was presented at a time when the growth of the Malaysian economy is very encouraging and increasingly resilient having registered strong growth for five consecutive years.

The economy grew at the rate of 8.5 percent in 1992. The current account deficit in the balance of payments is expected to decline to M$ 7.9 billion in 1992 as compared to M$ 12.5 billion in 1991. This reduction is due to the continued strength of merchandise exports over imports which has resulted in a surplus in the merchandise account for 1992. Further, the growth of the tourism industry has contributed significantly to the moderation of the deficit in the services account. As a result, the overall balance of payments position has strengthened further. However, the rate of inflation is a cause of concern and measures were introduced to keep the rate below five percent.

The budget strategy aimed at ensuring fiscal prudence, controlling inflation, increasing efficiency and competitiveness of the private sector and enhancing the quality of life and national prestige is appropriate in the context of the current local and international economic scenario. It is also intended to accelerate efforts to achieve the objectives of 'Vision 2020' (under which Malaysia aims to achieve developed nation status) and to increase the resilience of the economy through internal discipline.

In the light of the international economic scene, it is expected that the Malaysian economy will grow at the rate of eight percent in 1993. Measures were introduced to curb inflation (both through tight control over government expenditure as well as monetary and fiscal measures to curtail aggregate demand) and to improve the savings-investment gap. What is also interesting is the continuing process of tax reform and the commitment to change the tax mix so as to place a greater reliance on indirect taxation in the future.

This article examines the various measures introduced in the Budget and the Finance (No. 2) Bill 1992 with regard to direct and indirect taxation as well as other recent tax developments.

© 1993 International Bureau of Fiscal Documentation

II. BUSINESS TAXATION

A. *Corporate tax rate*

Currently, the rate of income tax and development tax applicable to companies is 35 percent and two percent, respectively thus giving a corporate tax rate of 37 percent. With effect from the year of assessment 1993, the income tax rate will be lowered to 34 percent and the development tax (in line with the commitment made in the 1992 Budget) will be abolished. As such, the corporate tax rate would be 34 percent.

Table I compares Malaysia's corporate tax rate with rates in the other ASEAN countries. With the proposed changes, Malaysia's corporate tax rate would be fairly competitive.

Corporate Tax Rates of ASEAN Countries

Country	*Rate (%)*
Brunei	30
Singapore	30
Thailand	30
Malaysia	34
Philippines	35
Indonesia	35

It is encouraging to note that the Minister has indicated further reductions in tax rates depending on circumstances and developments. It is felt that with the eventual withdrawal of investment incentives and the shift towards indirect taxation, the corporate tax rate may be in the region of 25 to 28 percent which would be very competitive.

B. *Tax rates for cooperative societies*

Currently, cooperative societies are subject to income tax on a graduated scale ranging from four to 35 percent. In line with the general lowering of tax rates, the rate of income tax will range from two to 34 percent with effect from the year of assessment 1993.

C. *Franking of dividends*

Malaysia adopts the imputation system whereby the income tax chargeable on a resident company is available to frank dividends paid, credited or distributed to its shareholders. In line with the proposed reduction in the corporate income tax rate from the year of assessment 1993, the rate of tax deductible from dividends will be 34 percent. This will apply to dividends paid, credited or distributed from 1 January 1992.[1]

D. *Deduction for expenses incurred on translation or publishing of books*

Currently, expenses incurred in translating into or publication in the national language of cultural, literary, professional, scientific or technical books are not tax deductible unless undertaken by businesses which are in the publishing industry. With effect from the year of assessment 1994, such expenses would be tax deductible so long as the translation or publication is approved by the Dewan Bahasa dan Pustaka.[2]

This proposal is intended to encourage the publication of more books in the national language. As such, it is likely that private sector companies would sponsor intellectual works, writings and translation into the national language.

E. *Double deduction for research expenditure*

Revenue expenditure incurred on research by way of cash contributions to an approved research institute or payments for the use of services of an approved research institute or an approved research company was to be eligible for double deduction with effect from the year of assessment 1991.
It is proposed to change the effective date of this incentive to the year of assessment 1992.

F. *Operational headquarters company (OHQ)*

Currently, Section 60E of the Income Tax Act, 1967 (hereinafter ITA) provides the following incentives to multinationals to locate their regional head offices or regional offices in Malaysia to service their affiliated companies in the region:

- a preferential income tax rate of ten percent on chargeable income from providing qualifying services;
- tax-free dividends can be paid put of the above income (after payment of the ten percent tax);
- dividend income received from foreign-related companies is tax exempt and tax-free dividends can be paid therefrom.

However, companies in the finance and service sectors are excluded from this incentive.

It is proposed that, with effect from 1 January 1993, the scope of OHQ incentives be extended to the services sector. The type of qualifying activities under the services sector will be determined later. Further, it was also announced that the Gov-

---

1. As such, dividends paid before budget day on which tax at 35 percent has been deducted will be recalculated as shown in the illustration below:

(a) *Shareholder's position*	M$
Gross dividend	5,000
Less: Tax deducted at 35%	(1,750)
Net dividend received by shareholder	3,250
Re-grossing of net-dividend:	
100/66 x 3,250	4,924.24
Less: tax deemed deducted at 34%	(1,674.24)
Net dividend received by shareholder	3,250.00

With the proposed change, the tax deducted of M$ 1,674.24 would be allowed as a set-off (under section 110 of the Income Tax Act, 1967) against the tax chargeable on the shareholder.

(b) *Company's Section 108(6) account*

The company's Section 108(6) account with the distribution of a gross dividend of M$ 5,000 would be as follows:

	Existing M$	Proposed M$
Balance of tax credit b/f say	10,000.00	10,000.00
Less: Tax deducted/deemed deducted from dividend	(1,750.00)	(1,674.24)
Balance of tax credit c/f	8,250.00	8,325.76

2. A Government agency involved in promoting the use of the national language through publishing and translating books into the national language.

© 1993 International Bureau of Fiscal Documentation

ernment is considering relaxing the terms concerning expatriate employment as an added incentive to attract more multinationals to establish OHQ's in Malaysia.

G. *Investment holding company*

Currently, the deductibility of expenses incurred by an investment holding company is determined by the general deduction rule in ITA Section 33(1), i.e. expenses which are wholly and exclusively incurred in the production of income are deductible. The position of the Inland Revenue Department is that a pure investment holding company does not carry on a business for tax purposes. As such, the deductible expenses are normally restricted to interest incurred on loans obtained to finance income-producing investments and other direct expenses. As a concession, certain expenses incurred in complying with statutory requirements are granted a deduction, i.e. audit, accounting and secretarial fees.

With effect from the year of assessment 1993, it is proposed to introduce ITA Section 60F. Under this proposal, resident investment holding companies are allowed to deduct a certain portion of permitted expenses (which are normally not allowable for tax purposes). The deduction is to be made in arriving at the total income (before deduction of approved donations) of the company.

"Permitted expenses" means expenses incurred by an investment holding company in respect of:

- directors' fees;
- wages, salaries and allowances;
- management fees;
- secretarial, audit and accounting fees, telephone charges, printing and stationery costs and postage; and
- rent and other expenses incidental to the maintenance of an office.

The amount of permitted expenses allowable shall be determined in accordance with the following formula:

$$A \times \frac{B}{4C}$$

Where A is the total of the permitted expenses incurred for that basis period reduced by any receipt of a similar kind;

B is the gross income consisting of dividend, interest and rent chargeable to tax for that basis period; and

C is the aggregate of the gross income consisting of dividends (whether exempt or not), interest and rent, and gains made from the realization of investments for that basis period.

The amount of expenses allowable is further limited to a maximum of five percent of the gross income consisting of dividends, interest and rent for that basis period. It is not stated whether this includes tax-exempt income. The view is taken that tax-exempt income would be included in determining this limitation.

"Investment holding company" is defined as a company whose activity consists wholly in the making of investments and whose income is derived therefrom. As such, companies which have mixed activities, i.e. business source and investment holding, are not eligible for this deduction.

Where there is insufficient income to fully utilize the fraction of permitted expenses, the unabsorbed expenses are not available for carryforward to future years of assessment.

This proposed amendment removes the arbitrary determination of the deductibility of certain administrative expenses by the tax authorities. However, the maximum deduction would be 25 percent of permitted expenses. It will benefit an investment holding company with a high level of income.

H. *Contribution to the employees provident fund (EPF)*

Currently, the statutory contribution to the EPF is 11 percent by the employer and nine percent by the employee. With effect from 1 January 1993, the contribution is increased to 12 percent by the employer and ten percent by the employee.

The increase in contribution by the employer is an additional cost of doing business and would affect labour-intensive businesses more than capital-intensive businesses. The current tax deduction for contributions by an employer is limited to 15 percent of remuneration. No change has been proposed to this limit. This will affect companies who are currently contributing 11 percent to the EPF and four percent to an approved scheme for the benefit of their employees. Such companies would be required to contribute 12 percent to the EPF, thus pushing total contributions to 16 percent one percent above the limit of 15 percent in the ITA.

III. PERSONAL TAXATION

A. *Income tax rates*

Currently, resident individuals are subject to income tax on a graduated scale ranging from four to 35 percent. With effect from the year of assessment 1993, the income tax rates will be lowered. The rates will range from two to 34 percent. This is in line with the general reduction in tax rates. The reduction of the maximum tax rate to 34 percent is in line with the proposed corporate tax rate and will negate any advantage of sheltering personal income through a corporate body.

The rebate of M$ 60 for a resident individual and M$ 30 for a wife will continue to be given to those having chargeable income not exceeding M$ 10,000.

In line with the reduction in tax rates; the income tax rate will be lowered to 34 percent in respect of a non-resident individual, a trust body, an executor of an estate of a deceased individual who was domiciled outside Malaysia at the time of his death, and a receiver.

B. *Contribution to EPF*

As stated earlier, the contribution by an employee will be increased by one percent to ten percent with effect from 1 January 1993. This enforces compulsory savings and is intended to curb inflation. However, with the reduction in income tax rate, the net effect on disposable income is not significant. It would

© 1993 International Bureau of Fiscal Documentation

have been more equitable to have increased the personal relief in respect of contributions to EPF and insurance premiums.

C. *Exemption of interest on bonds*

Currently, interest income earned by individuals in respect of securities or bonds issued by the Government, and bonds (other than convertible loan stock) issued by public companies listed on the Kuala Lumpur Stock Exchange (KLSE) is exempt from income tax.

It is proposed that, with effect from the year of assessment 1993, interest earned by individuals from bonds (other than convertible loan stocks) issued by companies not listed on the KLSE but rated by Rating Agency Malaysia Berhad (an independent credit rating agency) will also be exempted from income tax. It is also proposed that, with effect from 30 October 1992, all such interest paid to non-resident individuals will not be subject to withholding tax.

The proposed change reflects the continuing effort by the Government to promote savings by individuals and to develop the corporate bond market. A developed bond market will lead to a financial system that is more flexible and diversified and will assist the private sector to raise capital for investment. The exemption of interest for non-resident individuals will attract capital inflow into Malaysia's bond market and develop the domestic capital market.

Furthermore, it is also proposed that savings bonds up to M$ 1 billion would be issued by Bank Negara Malaysia (the Central Bank of Malaysia) to individuals and institutions. This will further increase investment opportunities for such persons.

D. *Exemption for scientists, writers and artists*

Currently, cash awards received by scientists, writers and artists are subject to tax. It is proposed that, with effect from the year of assessment 1993, all official cash awards received by scientists, writers and artists be exempt from income tax. This exemption is intended to further motivate efforts to develop knowledge, culture and creativity so as to produce more original and quality works as well as new scientific and technological discoveries which will enrich our heritage.

E. *Cash award in lieu of leave for public servants*

Currently, sums received by way of gratuity paid out of public funds on retirement from an employment under any written law are exempt from income tax. Cash payments received by public servants on retirement on conversion of unutilized leave are subject to income tax. With effect from the year of assessment 1993, cash awards paid out of public funds (in lieu of leave) to such employees will be tax exempt. The above proposal applies only to employees in the public service.

IV. INDIRECT TAXATION

A. *Reduction/Abolition of import duties*

With effect from budget day, the import duties on about 600 items were either reduced or abolished. This is part of an ongoing process over the past four years to review the level of tariff protection and to focus on the efficiency and competitiveness of the manufacturing sector. With the reduction, it is hoped that the prices of imported consumer goods in the domestic market will be lowered. Besides combating inflation by lowering prices of consumer goods and increasing competitiveness of local manufacturers, the changes are also in line with the trade liberalization measures proposed under the GATT negotiations and the commitment towards implementing the Common Effective Protection Tariffs Scheme under the proposed ASEAN Free Trade Area arrangement.

The above changes will involve a revenue loss of about M$ 369 million to the Government.

B. *Increase in import duties/excise duties*

As part of the Government's continuing efforts to discourage smoking and consumption of alcohol, import duties and excise duties were increased as follows with effect from Budget day:

Item	Import duty increase	Excise duty increase
Cigarettes	M$27 per kg.	100%
Beer, stout and other alcoholic beverages	15%	30%

Through this increase, additional revenue of M$ 344 million is expected.

C. *Expansion of scope of service tax*

Currently, service tax of five percent is charged on and paid by any person who carries on the business of providing taxable services or selling or providing taxable goods either in any prescribed establishment or prescribed professional establishment. With effect from 1 January 1993, service tax will be extended to cover the additional prescribed professional establishments and prescribed services shown below:

(1) *Prescribed professional establishments*
- estate agents who are licensed or registered under the relevant laws in force for the time being, excluding estate agents having an annual sales turnover of less than M$ 300,000 of prescribed services;
- companies, firms and sole proprietors dealing in or providing telecommunication services;
- private agencies licensed under the Private Agency Act, 1971, excluding private agencies having an annual sales turnover of less than M$ 150,000 of prescribed services.

(2) *Prescribed services*
- provision of all types of surveying services normally provided by the surveyors, including valuation, appraisal, estate agency and professional consultancy services;
- provision of sports and recreational services by private clubs, including the entitlement to use such services by club members for which membership subscription fees are charged;

© 1993 International Bureau of Fiscal Documentation

- provision of telecommunication services in the form of telephone, facsimile, telemail, paging, cellular phone and telex by companies, firms and sole proprietors dealing in or providing telecommunication services;
- provision of guards and protection for the personal safety and security of another person or for the safety and security of the property or business of such other person by private agencies licensed under the Private Agency Act, 1971.

The above proposals are a continuation of the widening of the service tax base which commenced on 1 January 1992. This extension is estimated to bring in about M$ 180 million in revenue to the Government.

The proposals with regard to charging service tax on telecommunication services will affect most businesses and will be a significant source of revenue for the Government. The expanded service tax base is a prelude to the introduction of a comprehensive consumption tax through the intended integration and restructuring of the existing sales and service taxes into the Sales and Service Tax (discussed below).

D. *Sales and service tax*

In the 1989 Budget, the Government announced its intention to introduce value added tax (VAT) to overcome inherent weaknesses in the sales tax system as well as to expand the revenue base. Since then, service tax has been extended and the broadening of the scope of service tax was seen as laying the foundation for the eventual introduction of VAT. Among ASEAN countries, Indonesia (1985), Philippines (1988) and Thailand (1992) have introduced a VAT system. As a consumption tax, VAT provides a stable source of revenue which should be less sensitive to economic fluctuations than direct taxes.

In order to increase revenue commensurate with the growth in the economy and to overcome several weaknesses in the present structure of sales and service taxes, e.g. tax pyramiding, the narrow base of sales tax, multiple taxation of certain goods, transfer pricing, bias towards imports and other abuses, the Government announced the intention of integrating and restructuring the existing sales tax and service tax into a consolidated tax to be called the Sales and Service Tax (SST).

The proposed features of the SST are as follows:
- the SST will be imposed on the sales of a firm and a credit will be allowed for SST on inputs of production;
- the SST rate will not be more than ten percent;
- exports will be zero-rated (i.e. the exporter can claim a credit in respect of the inputs on which the SST has been imposed);
- in order to avoid burdening the lower income group, several essential goods and services will be exempted from SST;
- a threshold level will be set to exempt small enterprises from charging and accounting for SST;
- the invoice method will be used;
- it will be a multi-stage tax.

For all ends and purposes, the SST is a form of VAT despite the effort to make it look different. As a tax on consumption, it is also expected to stimulate greater savings and investments.

It is encouraging to note that the Ministry of Finance will consult all relevant parties before implementing the SST. Meanwhile, the Royal Customs and Excise Department will be strengthened. It is understood that the Department will complete its computerization programme in 1995. No indication was given about when SST would be implemented. Normally, a substantial lead-in time is needed before such a tax is implemented.

Some of the aspects that must be looked into before implementing the SST are:
- the scope/coverage of tax,
- exemptions for small businesses,
- impact on the general price level,
- education of the public,
- training of the officers involved in the implementation,
- effective computerization,
- the treatment of exports,
- transitional provisions arising from the changeover to the SST.

Malaysia should be able to have an effective and efficient SST system if similar systems in other countries are studied thoroughly.[3]

E. *Stamp duty*

Stamp duty is levied on instruments of transfer of property under Item 32(a) Schedule I of the Stamp Act, 1949 at the following rates:
- one percent on the first $ 100,000 of the amount of the money value of the consideration or the market value of the property, whichever is the greater;
- two percent on the amount in excess of the $ 100,000.

With effect from 1 January 1993, stamp duty is increased to a maximum of four percent as follows:
- one percent on the first $ 100,000;
- two percent on any amount in excess of $ 100,000 but not exceeding $ 500,000;
- three percent on any amount in excess of $ 500,000 but not exceeding $ 2,000,000;
- four percent on any amount in excess of $ 2,000,000.

The proposed amendment seeks to levy stamp duty at progressive rates on transfer of property. However, the imposition of higher duty will not burden the general public as only properties valued above $ 500,000 will be affected. It is expected that the Government will earn additional revenue of about M$ 120 million from this change.

It is proposed that with effect from 1 January 1993, the dates on which the market value of property transferred by way of gift, settlement or sale is to be determined would be as follows:

3. For further details on the issues that must be looked into before introducing a broad-based consumption tax or VAT in Malaysia, see Veerinderjeet Singh, *Malaysian Taxation: Administration & Technical Aspects*, Longman, 1992.

© 1993 International Bureau of Fiscal Documentation

Situation	Date for determining the market value
Settlement or gift	Date of execution of the instrument of trust or settlement or gift
Transfer implementing a sale under a duly stamped agreement of sale and purchase	Date of execution of such agreement
Transfer of any property granted by a statutory body, a local authority or any cooperative society registered under any laws relating to cooperative societies	Date when the final terms of transfer had been communicated to the transferee, and in the case of subsequent resale of that property, the date of consent by the statutory body or local authority or the board of the cooperative society for that resale
Transfer under a duly stamped sale and purchase agreement where financial arrangements have been made in accordance with the Syariah	Date of execution of such agreement
In any other cases	Date of execution of the instrument of transfer

Any banker, stockbroker or insurer authorized by the Minister of Finance has to pay on 1 January and on 1 July in each year to the Collector of Stamp Duty, the amount due and collected thereon as duties on unstamped cheques, contract notes or policies of insurance. No penalties, however, are specified for late payment of such duties.

The Finance (No. 2) Bill 1992 seeks to provide (with effect from 1 January 1993) a deadline of eight days from each specified date for the authorized banker, stockbroker or insurer to remit the stamp duty due to the Collector, failing which a penalty of $ 500 or ten percent of the amount due, whichever is the greater, will be imposed.

The proposed amendment seeks to ensure timely settlement of stamp duty by an authorized banker, stockbroker or insurer.

V. OTHER CHANGES

A. *Export rebate scheme on agricultural products*

This scheme was introduced in 1987 to encourage the export of agricultural products and penetration into external markets. Under this scheme, exporters of agricultural products are given an export rebate based on a certain formula.

With effect from 31 October 1992, this scheme has been withdrawn. This scheme has contributed towards a shortage of agricultural products in the domestic market thus aggravating inflationary pressures.

B. *Fund for food production*

The increase in food prices appears to be highest compared to other categories in the Consumer Price Index. The Government has decided that stronger efforts be made to increase food production.

A fund for food production will be set up (by Bank Negara Malaysia and chanelled through all commercial banks) to provide credit facilities to finance the cultivation, production and distribution of food. The object of this fund is to increase food production and supply. This fund will have a capital of M$ 300 million and will lend at a fixed interest rate of 7.75 percent per annum for a period of five years.

C. *Shipping Fund*

A M$ 800 million Shipping Fund is to be established out of which M$ 500 million will be used for new investments in the shipping industry. The purpose of the fund is to encourage new entrepreneurship and to provide long-term financing of up to ten years to existing entrepreneurs in the industry at reasonable interest rates.

As a further measure to improve shipping capacity, the import duty on vessels exceeding 26 gross tonnage has been abolished.

D. *Housing Loan Facilities*

As a measure to ensure that banks and financial institutions give priority to the provision of housing loans for medium and low-cost houses so that the public has access to such facilities, the current ceiling rate of nine percent for housing loans below $ 100,000 is retained.

As an incentive to continue the loan scheme, the Government will provide an interest subsidy of one percent to the banks and financial institutions.

E. *Human Resource Development Fund*

The establishment of a Human Resource Development Fund was announced in 1991 to finance training of labour and upgrading of labour skills. To launch the Fund, the Government has allocated M$ 16.3 million to the Fund for 1993 and will make contributions for the next two years. The private sector is expected to match this contribution. From 1996, the Fund will be financed wholly by contributions from the private sector.

F. *Corporatization of the Inland Revenue Department*

It was announced that the Government is studying the possibility of corporatizing the Inland Revenue Department to promote a more effective machinery for the collection of revenue. It is hoped that if this move materializes, it would result in a better work culture, greater efficiency and a faster response time in attending to objections and appeals by taxpayers.

G. *Zakat*

Currently, the collection of a Zakat (an obligatory payment by persons of the Muslim faith) is managed separately by the various religious authorities of the States and the Federal Territories.

© 1993 International Bureau of Fiscal Documentation

To avoid overlapping of Zakat and existing taxes, the Government is considering the collection of the Zakat to be coordinated through the Inland Revenue Department and to be distributed to States based on an agreed formula.

VI. RECENT DEVELOPMENTS

A. *Reinvestment allowance*

The Inland Revenue Department has issued guidelines and forms to facilitate the processing of a claim for reinvestment allowance (under ITA Schedule 7A). The guidelines provide the following additional information:

(1) meaning of the terms "expansion, modernization and diversification":
   (a) expansion: increase in production capacity;
   (b) modernization: where manufacturing equipment and processing are upgraded resulting in greater efficiency in production, quality improvement of product and/or reduction in costs; and
   (c) diversification: where additional/related products within the same industry are being manufactured, e.g. a manufacturer of household/industrial gloves diversifying into the production of surgical gloves.

(2) excluded capital expenditure – expenditure on replacement of machine parts will not be considered unless it can be shown that such expenditure would result in the expansion, modernization or diversification of the existing business.

The acknowledgement letter from the Malaysian Industrial Develop-ment Authority which was previously required, is no longer necessary for the purposes of reinvestment allowance.

B. *Venture capital companies*

The venture capital incentive was introduced in 1989 via ITA Section 60D and was amended in 1992. A venture capital company (VCC) which holds shares in a venture company (VC) involved in high risk ventures or new technology enjoys this incentive.

It was not until recently that the guidelines and application form relating to this incentive were finalized by the Ministry of Finance. The guidelines outline the qualifying criteria of a VCC and provide clarifications as to what constitutes "new technology" and "high-risk ventures".

Some salient features of the guidelines include:

(1) the funds of the VCC should have a seven to ten year lifespan and should be invested in VCs on a medium to long-term basis, i.e. from three to eight years;
(2) the funds of the VCC should be from individual or corporate investors and the amount invested in each VC should not be less than M$ 0.5 million;
(3) no more than ten percent of the funds of a VCC should be invested in one single company and also not more than 25 percent of its funds should be invested in one industry.

"New technology" refers to incremental improvements in existing processes and products and the use of technologies which are new to Malaysia even if these technologies are technically mature and commonly used elsewhere. New technologies refer to emerging technologies such as:

(i) automated manufacturing technology,
(ii) advance material technology,
(iii) biotechnology,
(iv) electronics,
(v) information technology, and
(vi) renewable energy technology.

"High risk ventures" include ventures which encounter risks over and above those experienced by more traditional small and medium enterprises. In general, the ventures would incorporate the following characteristics:

- high investment cost/capital investment,
- new project/product,
- new market,
- long gestation period,
- specialized skills/trained manpower,
- specific location,
- specific equipment,
- lack of or no Government protection,
- highly competitive,
- highly classified.

The Ministry of Finance is the approving authority and he will decide as to whether the VC is involved in any high risk venture or new technology.

C. *Research incentives*

The Minister of Finance has issued guidelines on the research incentives available under Section 34B (i.e. approved research company/institute and a new technology-based firm). It sets out the criteria to be met by an approved research company/institute which includes:

- wholly carrying out research work and commercially exploiting the benefit of such research;
- doing research in new emerging, advanced or high technology;
- the company should have a minimum paid-up capital of M$ 500,000;
- carrying out research in any area of the Industrial Technology Development plan or other approved fields;
- being allowed to employ foreign researchers provided there is a training programme for locals to gain the skills related to the relevant industry.

The above criteria would also apply to private research institutes. In the case of a public research institute, the only criterion is that the research institute must be administered by public funds.

A new technology-based firm is defined as a company engaged in the development or commercialization of technological innovations in fields designated as new and emerging technologies. Twenty percent of the workforce should be technological professionals and the research expenditure should exceed four percent of its turnover. New technology-based firms should have shareholders' funds of more than M$ 500,000 and there should be at least 50 percent local equity participation by the end of the third year.

VII. The Commissioner's Practice Note

I. INTRODUCTION

Hong Kong imposes a 17.5 percent tax on corporations that carry on business in Hong Kong and earn profits that arise in or derive from Hong Kong.[1] Profits arising outside Hong Kong are not subject to tax. This territorial tax system, a relic of Hong Kong's colonial past, has given Hong Kong the reputation of a tax haven and helped to attract thousands of foreign investors to the territory. Unlike other jurisdictions that impose no tax on corporate profits from offshore business, Hong Kong is a major centre of international trade and finance. Therefore, when questions arise as to how to distinguish between onshore and offshore profits for Hong Kong tax purposes, the stakes are quite high.

For many years, there was little doubt, in most cases, about whether a Hong Kong taxpayer's profits arose onshore or offshore. In the few court cases that had been decided prior to 1985, the Hong Kong courts had taken the common sense approach of asking whether the profits arose from business done in Hong Kong. Thus, for example, it was held that Hong Kong tax applied to commission income earned by a Hong Kong-based ship broker that earned the commission by arranging a charter party between its offshore customer and an offshore shipowner solely by means of telecommunications with the parties from its Hong Kong office.[2] In another case, it has held that a profit derived from salvaging a disabled vessel on the high seas arose offshore, because the services were rendered offshore (literally!)[3] A third decision held that commissions received by a Hong Kong company that was a mere "letter-box" company administered by an accounting firm in Hong Kong arose offshore because all of the economic activity that produced the commissions – namely, the making of the agency and sub-agency agreements and the relevant selling activities by sub-agents – occurred outside Hong Kong.[4]

II. THE SINOLINK DECISION

In 1985, the Hong Kong High Court decided a case in a manner that caused many Hong Kong traders and their tax advisors to wonder whether Hong Kong tax might now be applied to profits derived from business done *outside* Hong Kong. The case, *Commissioner of Inland Revenue v. Sinolink Overseas Limited*,[5] involved profits earned by a Hong Kong-based company which bought goods from a European supplier and sold the goods to customers in China. It was alleged that employees of the company travelled to China where they negotiated and concluded the contracts of sale, although the judge was not satisfied on this point. The goods were shipped directly to the Chinese buyers by the European supplier.

The court held that, in the absence of convincing proof that anything of substance was done by the taxpayer offshore to earn the profits, the source of the profits was the taxpayer's Hong Kong operation.

Hong Kong tax practitioners were alarmed by the *Sinolink* decision, not so much because of the result in the case, but because of the court's analysis of the facts in determining where the profits arose. The court clearly was focusing on the taxpayer's *overall* base of administration in Hong Kong, rather than on where the particular sales transactions had been effected. This approach was a departure from the standard analysis of the issue, which was to ask where the business was done which produced the particular profits in question, regardless of where the taxpayer's other operations (including its administrative centre) might be located. The consequences of taxation based on the taxpayer's headquarters or general operations being in

1. Sec. 14, Inland Revenue Ordinance (Laws of Hong Kong, Cap. 112) (hereinafter "IRO").
2. *CIR v. Karsten Larssen & Co. (HK) Ltd.* (1951) 1 HKTC 11.
3. *CIR v. The Hong Kong & Whampoa Dock Co. Ltd.* (1960) 1 HKTC 85.
4. *CIR v. International Wood Products Ltd.* (1971) 1 HKTC 551.
5. (1985) 2 HKTC 127.

© 1993 International Bureau of Fiscal Documentation

Hong Kong would be severe, because Hong Kong's tax law generally does not provide a foreign tax credit or an exemption for foreign-taxed profits.[6]

III. THE HANG SENG BANK CASE

There ensued, between 1988 and 1992, a confusing series of court decisions on the question of locality of profits. [7] Two of these decisions were rendered by the Privy Council in London, which is Hong Kong's court of last resort. The first case to reach the Privy Council was *Commissioner of Inland Revenue v. Hang Seng Bank Limited.*[8] The facts of the case were well suited to test whether one should look at the taxpayer's overall operations as opposed to particular transactions in determining where the taxpayer's profits arise. Hang Seng Bank's operations were almost entirely in Hong Kong. The bank's internal investment division had made investments in securities, through independent brokers in London and Singapore. The securities were purchased and sold by the brokers, on behalf of the bank, in the London and Singapore securities markets, pursuant to instructions received from bank officers in Hong Kong. The profits from these purchases and sales were at issue in the Privy Council.

The Privy Council, in an opinion by Lord Bridge, decided that the profits had arisen outside Hong Kong. Lord Bridge began his analysis by stressing the territorial nature of the statutory charge to Hong Kong profits tax, reaffirming that a Hong Kong-based business can indeed earn profits from its business which arise outside Hong Kong and therefore are not subject to tax.[9] He then noted that the locality of a taxpayer's profits must be determined on a transaction-by-transaction, gross-profits basis. [10] Then he stated:

> The question whether the gross profits resulting from a particular transaction arose in or derived from one place or another is always in the last analysis a question of fact depending on the nature of the transaction. It is impossible to lay down precise rules of law by which the answer to that question is to be determined. The broad guiding principle, attested by many authorities, is that one looks to see what the taxpayer has done to earn the profit in question. If he has rendered a service or engaged in any activity such as the manufacture of goods, the profit will have arisen or derived from the place where the service was rendered or the profit making activity carried on. But if the profit was earned by the exploitation of property assets as by letting property, lending money or dealing in commodities or securities by buying and reselling at a profit, the profit will have arisen in or derived from the place where the property was let, the money was lent or the contracts of purchase and sale were effected.[11]

Clearly, Hang Seng Bank's purchases and sales of securities were effected outside Hong Kong by the brokers in London and Singapore. Therefore, the bank's profits from those transactions were not taxable in Hong Kong.

IV. THE TVB CASE

The Hong Kong tax community praised the Privy Council for clarifying the issue of whether one should look at overall operations or particular transactions in determining where a Hong Kong-based taxpayer's profits arise. The effect of the Privy Council's decision was first seen in a decision of the Hong Kong Court of Appeal in 1991. The case was Commissioner of Inland *Revenue v. HK-TVB International Limited.*[12] The taxpayer (TVBI) was a Hong Kong-based company earning royalty income from sub-licensing to offshore parties the right to exhibit copyrighted films and television programmes outside Hong Kong. TVBI had acquired from the copyright owner (its parent company) the exclusive right to exhibit the films and other programmes outside Hong Kong. Employees of TVBI travelled to various countries where they negotiated sub-licensing agreements. Most of these agreements were concluded by both parties' signing the agreement in the sub-licensee's country; a minority of the agreements were concluded by TVBI's signing the agreement in Hong Kong and sending it to the licensee who then signed in its own country. The films or tapes were sent to the sub-licensees from TVBI's office in Hong Kong, and periodic fixed-fee payments were sent by the sub-licensees to TVBI in Hong Kong.

The tribunal of first instance (the Inland Revenue Board of Review) had found that TVBI's profits arose offshore, on the ground that the profits arose from the exploitation of intellectual property rights that were exercisable only offshore.[13] This decision was reversed by the High Court, which held that TVBI had earned its profits from business that was done "in and from" its base of operations in Hong Kong.[14] (Remember that the High Court was writing prior to the Privy Council's decision in the *Hang Seng Bank* case.) TVBI appealed to the Court of Appeal, which had the benefit of the Privy Council's authoritative decision in *Hang Seng Bank* to guide it in deciding TVBI's case.

The Court of Appeal held that TVBI's profits had arisen offshore, saying "the profit making activity was carried on and the services, being the provision of the rights, were rendered outside Hong Kong".[15] Alternatively, said the Court of Appeal, the profits could be viewed as arising outside Hong Kong because the licensed rights could be exercised only outside Hong Kong.[16]

The Commissioner of Inland Revenue appealed to the Privy Council. In the meantime, the Commissioner announced that he was preparing a statement of departmental practice regarding the determination of where profits arise in various

6. IRO Sec. 45 provides relief in respect of income taxes levied by a number of Commonwealth countries, none of which are major trading partners of Hong Kong. In addition, foreign taxes are generally deductible under IRO Sec. 16(1) if paid in respect of profits subject to tax in Hong Kong.
7. *Bank of India v. CIR* (1988) 2 HKTC 503; *CIR v. Hang Seng Bank Ltd.* (1989) 2 HKTC 614; *Exxon Chemical International Supply SA v. CIR* (1989) 3 HKTC 57; *CIR v. HK-TVB International Ltd.* (1990) 3 HKTC 301; *CIR v. Hang Seng Bank Ltd.* (1990) 3 HKTC 351 (PC); *CIR v. HK-TVB International Ltd.* (1991) 2 HKLR 215 (CtApp); (1992) Privy Council Appeal No. 28 of 1991, 1 HKRC para. 90-064 (CCH). See also J.P. circumstances, but that he would not issue the statement until after the Privy Council's decision in the *TVB* case.

This raised the stakes somewhat in respect of the upcoming decision, which most observers thought would be a rather unexciting affirmation of the Court of Appeal's holding in favour of TVBI.

V. THE PRIVY COUNCIL'S DECISION

In July 1992, the Privy Council handed down its decision in the *TVB* case, and it was a shocker. [17] In an opinion authored by Lord Jauncey (the only member of the *TVB* panel who was also on the panel that decided the *Hang Seng Bank* case), the Privy Council held that TVBI's profits had arisen in Hong Kong. Lord Jauncey referred to the *Hang Seng Bank* analysis set out above, and said:

> The proper approach is to ascertain what were the operations which produced the relevant profits and where those operations took place. Adopting this approach, what emerges is that TBVBI, a Hong Kong-based company, carrying on business in Hong Kong, having acquired films and rights of exhibition thereof, exploited those rights by granting sub-licences to overseas customers. The relevant business of TVBI was the exploitation of film rights exercisable overseas and it was a business carried on in Hong Kong. The fact that the rights which they exploited were only exercisable overseas was irrelevant in the absence of any financial interest in the subsequent exercise of the rights by the sub-licensee. Their Lordships therefore consider that the profits accruing to TVBI on the grant of sub-licences during the relevant years of assessment arose in or derived from Hong Kong and as such were subject to profits tax under section 14.
>
> In the view of their Lordships it can only be in rare cases that a taxpayer with a principal place of business in Hong Kong can earn profits which are not chargeable to profits tax under section 14 of the Inland Revenue Ordinance.[18]

This passage appears to disregard entirely the fact, found by the Inland Revenue Board of Review, that TVBI's sub-licensing agreements were negotiated and often concluded outside Hong Kong. Rather, Lord Jauncey seems to have focused on the fact that TVBI's base of operations was in Hong Kong. The *other dictum* regarding "rare cases" in which Hong Kong tax is not payable bodes ill for Hong Kong business, which, if the dictum proves to be accurate, will often be subject to double taxation of their profits (as TVBI surely was, having undoubtedly suffered withholding taxes on its royalty income), since Hong Kong has no foreign tax credit mechanism and no exemption for foreign-taxed profits.

In addition, the Privy Council rejected the Court of Appeal's alternative ground, namely that TVBI earned its profits by exploiting property that was located outside Hong Kong. The Privy Council said that this view "erroneously presupposes that the rights in question had a fixed situs outside Hong Kong".[19] It was conceded that profits from the exploitation of real property located outside Hong Kong would necessarily arise outside Hong Kong, but any analogy between real property and intellectual property was said by the Law Lords to be "a false analogy".[20] No reasons were given, however, in support of these statements. It is difficult, if not impossible, to imagine what the reasons could be.

Intellectual property rights which can be exercised only in a stated jurisdiction are inextricably tied to that jurisdiction; they do not exist anywhere else. Thus the Privy Council's statements in this regard can only be described as baffling.

The *TVB* decision therefore has undone much of the work of Lord Bridge in his opinion in *Hang Seng Bank*. The scope of Hong Kong's profits tax remains unclear. The Privy Council's analysis raises interesting questions about the taxability of foreign investors in Hong Kong who have their base of operations elsewhere. Can foreign licensors now receive royalties from Hong Kong licensees free of withholding tax?[21] Will foreign-based businesses be able to sell goods in Hong Kong free of Hong Kong tax? After all, if Hong Kong-based businesses' profits arise entirely in Hong Kong due to their Hong Kong operations, then foreign-based businesses' profits should arise entirely offshore.

VI. IS THE PRIVY COUNCIL OUT OF TOUCH?

It has been suggested that the Law Lords in London do not fully comprehend the nature of business activity in Hong Kong, which results in inappropriate decisions in Hong Kong tax cases. [22] The dictum in the *TVB* opinion regarding "rare cases" in which profits arise outside Hong Kong supports this notion. It has been pointed out in a recent article that the Privy Council's statements regarding the frequency with which Hong Kong-based taxpayers might derive offshore income were "unfortunate" and "widely contrary to practice".[23] The same writer notes that counsel representing both TVBI and the Commissioner of Inland Revenue in the Privy Council practise almost exclusively in London, the implication being that counsel were unable to enlighten their Lordships as to the true state of affairs in Hong Kong.[24]

It is also worth noting that only one of the Law Lords who judged the *Hang Seng Bank* case was on the panel that judged the *TVB* case. This lack of continuity in personnel was almost certainly a factor in the lack of continuity in the Privy Council's approach to the legal issue before it.

VII. THE COMMISSIONER'S PRACTICE NOTE

As he had promised, the Commissioner of Inland Revenue issued a statement of practice following the *TVB* decision. The document, entitled, *Departmental Interpretation & Practice Notes No. 21 – Locality of Profits* and dated November 1992, restates the general principles enunciated

17. (1992) Privy Council Appeal 28 of 1991, 1 HKRC para. 90-064 (CCH).
18. 1 HKRC, at 100, 542.

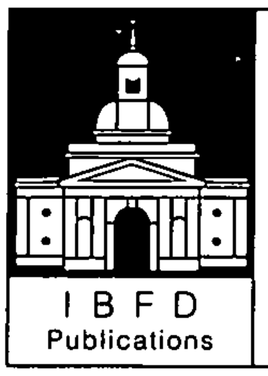
by the Privy Council in the *Hang Seng Bank* decision and then outlines the Commissioner's view of how the principles apply to particular types of income. Surprisingly, royalties are not discussed.

The practice note is a peculiar document. The general rules for determining where profits arise are drawn from the *Hang Seng Bank* case (although no distinction is made between income from activity and income from property) and thus are unassailable. The Commissioner's applications of the rules, however, are sometimes inconsistent with the general principles. For example, the Commissioner states that he will view all of the profits from a purchase and sale of goods as arising in Hong Kong if either the purchaser or the sale of the goods was negotiated and concluded in Hong Kong. Clearly, it is theoretically impossible for all of the profits to arise from both the place of purchase and the place of sale, because they might be different places.

The practice note also suffers from ambiguous language concerning the locality of profits arising in the context of common business arrangements in Hong Kong, such as the use of a Hong Kong company for reinvoicing within a multinational corporate group, and the use of contract manufacturers in China to produce goods under a processing agreement. Thus, although the Commissioner is to be praised for rejecting the "base of operations" approach to determining where profits arise, his practice note appears unlikely to clarify the tax exposure of Hong Kong businesses with international operations in many cases.



Only time will tell what the outcome of the current confusion is. Whatever course the Commissioner's practice ultimately takes, it seems likely that further litigation will ensue, as more and more Hong Kong-based businesses are investing their resources in China and elsewhere outside Hong Kong.

INDIA:

RECENT COURT DECISION AFFECTING NON-RESIDENTS

Har Govind

INTRODUCTION

The first appellate authority under the Indian Income Tax Act 1961 ("ITA") is either the Deputy Commissioner (Appeals) or the Commissioner (Appeals).[1] Broadly speaking, appeal lies to the Deputy Commissioner (Appeals) where the order under appeal is imposed by the Income Tax Officer or the Assistant Commissioner on a non-corporate taxpayer. It lies to the Commissioner (Appeals) where the appellant is a company, where the order is imposed by, under the direction of or with the approval of the Deputy Commissioner, or where the assessment is made by an Income Tax Officer or Assistant Commissioner and the amount of income assessed or loss computed exceeds 100,000 Rs.

Either party is entitled to a further appeal to the Appellate Tribunal from a decision of the Deputy Commissioner (Appeals) or the Commissioner (Appeals).[2] Decisions of the Appellate Tribunal can be appealed to the High Court by the taxpayer or the Commissioner of Income Tax.[3] The Tribunal is the final fact-finding authority, and an appeal from its decision is only permitted on questions of law, not questions of fact. A final appeal only on questions of law lies to the Supreme Court of India.[4]

A recent High Court decision is of general interest to international readers. A well-recognized legal position in many countries is that in the case of a conflict between the provisions of domestic tax law and the provisions of a tax treaty, the provisions of the latter prevail. In *Commissioner of Income Tax v. Davy Ashmore India Pvt. Ltd.*,[5] the Revenue authorities attempted to alter this rule, by contending that in cases of inconsistency, the provisions of the ITA prevail over treaty provisions.[6] The High Court rejected the Revenue's arguments.

FACTS

The assessee, an Indian company, Davy Ashmore India Ltd. ("DA"), received a letter of intent from another Indian company, Light Metal Industries Ltd ("LM"), for the maintenance and supply of terminal equipment for a second-hand cold-rolling mill being imported by LM from a non-resident UK company, Davy Makes (Pools) Ltd. ("DM"). A purchase order was also issued by LM whereby DA was to arrange for the import of concept designs and drawings to enable LM to prepare the detailed manufacturing drawings for terminal equipment which was to be supplied by DA.

Upon receipt of the purchase order and the letter of intent, DA placed an order with DM for the supply of one print each of the concept designs and drawings for the terminal equipment. The letter of intent specifically stated that the purchase price was to be made by bank remittances in favour of DM, subject to the approval of the Reserve Bank of India, and that the concept designs and drawings would be imported by DA upon approval of the Ministry of Industries for lump-sum payment of £ 36,470, net of taxes. The assessing officer concluded that the payment of £ 36,470 made to the non-resident company DM was taxable as "royalty" income within the meaning of Explanation 2 to ITA Section 9(1)(vi). Accordingly, he applied tax at the rate of 20 percent to £ 36,470 and demanded the tax from DA, treating it as an agent of the non-resident company DM. DA appealed to the Commissioner of Income Tax (Appeals).

Mr Govind holds a Master's Degree in science and a Bachelor's Degree in law. He is former Chief Commissioner of Income Tax in New Delhi. Mr Govind currently practices as an advocate at the Supreme Court of India, New Delhi. He was the UN Consultant on taxation to the government of Iraq. He was also Director of Investigation, Monopolies Commission. Mr Govind contributes articles on a regular basis to various international law journals.

Comment

1. Sec. 246. Unless otherwise stated all references are to the ITA.
2. Secs. 250 and 253. The assessing officer, however, may only appeal to the Tribunal under the direction of the Commissioner of Income Tax.
3. Sec. 256.
4. Sec. 261. The questions of law are framed by the Tribunal at the request of the parties or at the direction of the Court.
5. 190 ITR 626 (Calcutta).
6. The decision does not disclose any cogent reasons advanced by the Revenue in support of its argument that domestic law prevails over treaty provisions. According to the Revenue, the definition of the term "royalty" in the ITA was broader than the definition of the term under the India–UK tax treaty. By raising this argument, the Revenue perhaps wanted to make this a test case to collect a higher amount of tax.

© 1993 International Bureau of Fiscal Documentation

DECISION OF LOWER APPELLATE AUTHORITIES

On appeal, the Commissioner (Appeals) took the view that the transfer as approved by the government of India was merely for the import of designs and drawings from the non-resident against a lump-sum payment of £ 36,470. He further observed that an import licence was obtained under the import policy, and concluded that the payment to the non-resident company DM was not a payment in the nature of a royalty. The Tribunal confirmed the order of the Commissioner (Appeals). It recorded a finding that there was a transfer of drawings and designs to the assessee DA against a lump-sum payment of £ 36,470 which amounted to an outright sale. The Tribunal held that the payment of £ 36,470 could not be taxed under Explanation 2 to ITA Section 9(1)(vi).

ISSUE

From the order of the Tribunal the following question of law was referred to the High Court at Calcutta: "Whether, on the facts and in the circumstances of the case, the Appellate Tribunal was correct in law in holding that the payment of £ 36,470 made by the assessee company to the foreign party as consideration for outright sale of drawing and design was not "royalty" exigible to tax under the IT Act?"

NATIONAL LAW

The term "royalty" is defined in Explanation 2 of ITA Section 9(1)(vi) as follows:

> For the purposes of this clause, "royalty" means consideration (including any lump-sum consideration but excluding any consideration which would be the income of the recipient chargeable under the head, "capital gains") for:
> (i) the transfer of all or any rights (including the granting of a licence) in respect of a patent, invention, model, design, secret formula or process or trade mark or similar property;
> (ii) the imparting of any information concerning the working, or the use of, a patent, invention, model, design, secret formula or process or trade mark or similar property;
> (iii) the use of any patent, invention, model, design, secret formula or process or trade mark or similar property;
> (iv) the imparting of any information concerning technical, industrial, commercial or scientific knowledge, experience or skill;
> (v) the transfer of all or any rights (including the granting of a licence) in respect of any copyright, literary, artistic or scientific work including films or video tapes for use in connection with radio broadcasting, but not including consideration for the sale, distribution or exhibition of cinematographic films; or
> (vi) the rendering of any services in connection with the activities referred to in sub-clauses (i) to (v).

TREATY LAW

The term "royalty" is also defined in Article XIII(3) of the double taxation agreement between India and the United Kingdom as follows:[7]

> The term "royalties" as used in the Article means payment of any kind including rentals received as consideration for the use of, or the right to use:
> (a) any patent, trademark, design or model, plan, secret formula or process;
> (b) industrial, commercial or scientific equipment, or information concerning industrial commercial or scientific experience;
> (c) any copyright of literary, artistic or scientific work, cinematographic films, and films or tapes for radio or television broadcasting, but does not include royalties or other amounts paid in respect of the operation of mines or quarries or of the extraction or removal of natural resources.

A comparison shows that the two definitions are not the same. The differences in the definitions were dealt with at great length by the High Court.

HIGH COURT DECISION

The Revenue contended that the sale of designs and drawings by the foreign company was equivalent to a transfer of all rights concerning the designs and drawings, and the payment made to the non-resident company DM was in the nature of a royalty as defined in Explanation 2 to ITA Section 9(1)(vi) because that definition includes the *transfer of all or any rights* in technical know-how, i.e. designs and drawings. Accordingly, the tax was correctly levied by the assessing officer. The Revenue also argued that if there were any inconsistencies between the treaty and the ITA the ITA would prevail.[8]

The High Court dealt with the second contention first. It referred to the preamble to the treaty and pointed out that the charging provisions in ITA (Sections 4 and 5), defining "total income" of residents and non-residents, are subject to the provisions of the ITA, which include the double tax treaty entered into under ITA Section 90.

The terms of the treaty deviate from the general principles of taxation applicable to each country; if this were not the case the treaty would not be necessary. It therefore follows that in determining the liability of a non-resident company, if a treaty exists, it must prevail over provisions of domestic law.

The High Court further supported its view by referring to a 1982 Circular issued by the Central Board of Direct Taxes, concluding that the Circular reflected the correct legal position.[9] According to the Circular, where a treaty provides for a particular method for the computation of income, that method should be followed regardless of the provisions in the ITA. In the absence of a specific treaty provision, however, the ITA governs the taxation of income. But since the term royalty is defined in the India–UK treaty, Explanation 2 to ITA Sec. 9(1)(vi) has no application.[10]

---

7. Notification 501/6/75-FTD dated 23 November 1981.
8. See *supra* note 6.
9. Circular 333 dated 2 April 1982, 137 ITR 1(St). The Revenue took the position before the High Court that the Circular was not binding on the High Court, and requested the Court to enunciate the correct law, i.e. that the provisions of the ITA should prevail over the tax treaty.
10. The Calcutta High Court also referred to a decision in the case of *CIT v. Visakhapatnam Port Trust*, 144 ITR 146, in which the Andhra Pradesh High Court, when considering the India–Germany tax treaty, held that in cases of inconsistency between the treaty and the ITA, the treaty prevails.

© 1993 International Bureau of Fiscal Documentation

The High Court next discussed the definition of the term "royalty" in the India–UK treaty. It observed that the term has been defined to mean, inter alia, the payment of any kind, including rentals received as consideration for the use or right to use any patent, trade mark, design or model, plan, secret formula or process (i.e. "know-how"). A careful reading of this definition shows that a payment may be treated as a royalty for treaty purposes if the owner of the know-how retains ownership of the know-how and merely permits the use or the right to use it. In other words, where the transferor retains a property right in the know-how and allows the use of such right, the consideration received is in the nature of a royalty. Where, however, there is an outright sale or purchase, the consideration is for the transfer of know-how and cannot be treated as a royalty. The High Court pointed out the difference between renting the know-how and an outright sale. In the present case, the High Court held that the non-resident company did not retain ownership of the know-how. Importing the know-how constituted an outright transfer or sale, so the consideration paid was not taxable as a royalty.

COMMENT

The non-resident company DM made an outright sale in the United Kingdom. It also received payment in the United Kingdom by bank transfer. The non-resident company had no permanent establishment in India as defined in Article V of the treaty. The payment was therefore not assessable as business income in India.

This decision has important application in all cases where there is a double taxation agreement with India. India currently has tax treaties with more than 50 countries. Non-resident companies will be well advised to ensure that when entering into technology transfer agreements with Indian companies, the transfer of the property in the know-how and the payments for the same are made outside the taxable territory of India to avoid taxation under other provisions of the ITA.

The relevance of this decision is that a judicial authority – the High Court – has rejected the Revenue's attempt to apply an extended definition to the term "royalty", as it appears in domestic law to a payment for an outright sale of know-how outside India. Under ITA, royalty income is deemed to be taxable in India regardless of the place of its accrual or receipt. Under the High Court decision, a payment for an outright sale of know-how outside India for which payment was also received outside India is not "royalty" income under the India–UK tax treaty. The treaty prevails over the provisions of ITA and the payment is not taxable in India. This decision is of special interest to non-residents because the provisions of the treaties are generally more favourable to them as compared to provisions of domestic tax law.

I. INTRODUCTION

The thrust of the 1992 budget is to consolidate the gains of the economic restructuring programme which are aimed at promoting greater efficiency, productivity and increased employment. Consequently, in the 1992 fiscal year, the government intends to follow policies which:

(a) curb the population growth rate;
(b) reduce the level of inflation to five percent;
(c) achieve a target real GDP growth rate of 4.6 percent;
(d) strengthen the relationship between the public and private sectors;
(e) focus on the creation of wealth;
(f) integrate the informal sector into the economic mainstream; and
(g) implement a balanced budget.

II. REFORMS IN THE TAX STRUCTURE AND POLICY

It is claimed that the structural adjustment programme (SAP) introduced in Nigeria in 1986 has transformed the national economy to a point where the private sector has become a very significant participant in economic activity. This transformation has helped to strengthen the relationship between the public and private sectors. The 1992 fiscal policy measures will embrace activities aimed at promoting the private sector as well as ensuring that the heavy dependence on oil as a single source of revenue is reversed. Accordingly, for the 1992 fiscal year government has built in some basic reforms in the tax system and administration, and these measures are the subject of this article.

The reforms to the personal and companies income taxes and the reform in the tax administration are sequel to the recommendations of a study group set up by government to review the entire tax structure and administration.

III. CHANGES IN THE COMPANY INCOME TAX

A. *Definition of profits chargeable to tax*

In order to show clearly that "royalty" is taxable, the word "royalty" will be expressly included in Section 8(1) Company Income Tax Act (CITA) which deals with the definition of profits chargeable to tax.

B. *Payment of tax by government-owned commercial enterprises*

Henceforth, the Federal Savings Bank and other banks operating as commercial enterprises, whether owned by the state or federal government, are required to pay tax and dividends like any other enterprise. This includes all privatized or commercial enterprises; in other words, all government enterprises engaged in any form of business activity must pay tax on such activities, notwithstanding that such enterprises were primarily established as not-for-profit or are themselves exempted from tax. Any balance of profits after tax is available for transfer to the owner-government.

C. *Claim of capital allowance on equipment leasing*

Due to the popularity of equipment leasing, and in view of the methods of accounting and recording adopted by the operators of leases, it became necessary to clarify

1. This paper draws from the press briefing of the Honourable Minister of Finance on the 1992 Budget Speech well as on the excerpt relating to the tax structure and administration prepared by the Federal Board of Inland Revenue Headquarters.

© 1993 International Bureau of Fiscal Documentation

the issue of who is entitled to claim the capital allowance. The lessee may claim the capital allowance in the case of "finance leases", while the lessor may claim it in "operating leases".

D. Deductions and allowances

1. Research and development (R&D) expenses

With respect to R&D expenses, only actual expenditure incurred during the year is henceforth allowed, putting to rest the previous arrangement which took effect from the 1989 fiscal year, whereby a reserve or general provision for R&D against profits was allowed. Under the current dispensation, R&D expenses may be capitalized and written off over a number of years if the R&D expenditure has long-term benefits.

2. Pioneer status relief

The pioneer status granted under the Industrial Development (Income Tax Relief) Act 1971 and administered by the Industrial Development Co-ordination Committee (IDCC) is to be refined, so that it will not only recognize the newness of the enterprise or its products, but also recognize and consider enterprises that are located in rural areas totally devoid of essential infrastructures, such as electricity, water, tarred roads and telephones. Henceforth, pioneer exemption from tax will be granted not only by a tax holiday, but also by tax relief for lack of infrastructural facilities, at rates ranging from five to 50 percent of the tax payable depending on the type of infrastructure.

To benefit from the relief the enterprise must be located at least 20 kilometres away from the infrastructural facilities. This relief, which is claimable for only three years, is available to companies that normally do not qualify for pioneer status, but which are established in rural areas where such facilities are lacking.

3. Rural investment allowance

Section 27 CITA grants an investment allowance in addition to the initial and annual allowances as follows:

- 25 percent of the expenditure incurred on a new asset as a replacement of a damaged or destroyed asset;
- 10 percent of the expenditure incurred on plant and equipment used in agricultural production.

With effect from fiscal year 1992, a rural investment allowance has also been introduced. This allowance which will be based on the capital expenditure incurred by enterprises established in rural areas will be granted to certain infrastructural facilities at rates ranging from five to 100 percent depending on the type of infrastructure.

E. Rates of tax

The following new rates of tax on companies profits are effective as from the 1992 fiscal year:

- flat rate for all companies: 35 percent
- small companies: 20 percent as in CITA, subject to a renewal for two years, provided that such small companies show evidence of good records and management and are engaged in activities considered to be in the preferred sectors of the economy as defined by government.

IV. CHANGES IN THE PERSONAL INCOME TAX

A. Minimum tax

To ensure that all income earners pay tax, the existing provision on minimum tax remains in force. In effect, an individual who earns ₦3,000 or less must pay a minimum tax of 0.5 per cent of income.

B. Children allowance

The children allowance previously set at ₦ 400 per child, subject to the maximum of four children, is increased to ₦ 500 per child.

C. Wife allowance

The wife allowance of ₦ 500 which was claimable only by a male individual with a dependent wife has been abolished, and the effect of the abolition is offset by the enhanced personal allowance claimable by any person (male or female) who has income subject to personal income tax.[2]

D. Fringe benefits

Fringe benefits are not to be paid in kind but rather monetized and paid to the employees in both the private and public sectors as allowances. Such benefits will be taxed, subject to non-taxable allowances recommended for rent. Specifically, the following will apply:

- where an employer builds houses for its employees' use, capital allowances are claimable by the employer on such housing estates. The employee is not taxed on such benefits;
- where an employer rents houses for staff accommodation, the amount paid as rent by the employer is taxed as part of the profits of the employer, less the maximum rent allowance as provided in Section 20(b) CITS;
- where an employer pays a rent allowance directly to its employees or where benefits in kind are monetized and paid to employees, such allowances are taxed in the hand of the employees, less approved deductible rent allowances.

E. Tax rates

The ceiling for the tax rates for individuals has been reduced from 55 to 45 percent.

F. Withholding tax

In 1989, withholding tax on dividends, interest, rents and royalties was regarded as a final tax for individuals. With

2. The abolition of wife's allowance was necessary to remove the apparent controversy and misconception that it generated as being discriminatory against wives.

© 1993 International Bureau of Fiscal Documentation

effect from the 1992 fiscal year, the withholding tax regime which prevailed before 1989, i.e. where such taxes were regarded as tax payment on account, is reinstated. However, this does not affect foreign investors. The withholding tax on foreign dividends will continue to remain a final tax, and the rate will be either 15 percent as provided in the CITA or the rate under a double taxation agreement, whichever is applicable. Section 15(a) CITA, which deems dividends as "franked investment income" remains in operation.

G. *Tax clearance certificate (TCC)*

As regards TCCs the following directives take effect from the 1992 fiscal year:

- where tax has been duly deducted from a taxpayer, tax clearance will not be denied if the tax deducted is not remitted by the employer;
- persons seeking public office must present their TCC for the last three years (as has been the case);
- on application the tax office must issue a TCC within two weeks or give written reasons for any denial;
- defaulting agents of deductions must pay the commercial rate of interest, and will be prosecuted accordingly.

V. OTHER TAX LAWS

A. *Petroleum profits tax*

The following amendments took effect as from 1 January 1992:

- the Memorandum of Understanding between the federal government and operators in the oil industry will be reviewed regularly to reflect developments in the oil industry. [3]
- whereas transactions in the oil industry are in dollars and operators are allowed to keep their accounts overseas in dollars, it is a new requirement that both the estimated and final tax be computed in dollars and payment thereafter be in dollars without conversion under the old system. Reconciliation will continue to be made during the 13th instalment payment.

B. *Modified value added tax (MVAT)*

The proposed introduction of MVAT has been addressed by the 1992 fiscal measures. Government has decided in principle to adopt the MVAT with a lead period of two years during which necessary machinery will be set in motion to enable the scheme to develop. Accordingly, the following guidelines have been approved by government:

- to avoid a multiplicity of tax structures, MVAT will replace the sales tax in its entirety;
- MVAT will only have a single rate;
- MVAT will cover manufacturers and importers in respect of goods;
- MVAT will cover professional services, except for medical and pharmaceutical services;
- MVAT legislation will pay special attention to the state and federal fiscal relationship;
- MVAT scheme will become fully operative in 1994.

Proponents expect that the MVAT will increase the government's revenue, provide incentives to manufacturers of priority or desirable goods to increase their output, discourage manufacturers of undesirable commodities, and possibly induce higher exports of Nigerian goods which would then be relatively cheaper after the VAT refund.[4]

Opponents of the MVAT argue that it will make locally produced commodities more costly, take a long period to manifest an increased output from the manufacturing community, and have an inflationary effect on the already hyper-inflated economy.[5]

Additionally, given the present low levels of infrastructural facilities, administrative machinery, technological development and scientific base, as well as the inflationary component of the economy, Nigeria may not be able to properly manage a new MVAT system.

C. *Capital transfer tax*

There are no changes in the provisions of the law relating to capital transfer tax, and states are urged to enforce the existing law.

VI. JOINT TAX BOARD (JTB)

The JTB has already produced a uniform personal income tax law which will be promulgated this year. The JTB is authorized to impose its decisions on matters of interpretation of the personal income tax law and procedure on any state for purposes of conforming with such interpretation. Redress from the board on matters of interpretation and procedures may be sought by taxpayers.

VII. GENERAL ADMINISTRATION

The following operational arms have been introduced for the general adminstration of tax:

- at the federal level, there will be a Federal Inland Revenue Service which will be the operational arm of the Federal Board of Inland Revenue;
- at the state level, each state will have a State Internal Revenue Service which will be the operational arm of the State Internal Revenue Board;
- at the local government level, each local government will have a Revenue Committee to be supervised by the Councillor for Finance.

In addition, each service will have a board which will constitute its governing body. There will also be a technical committee of the Boards at both the federal and state levels, which will attend to regular technical and professional matters affecting the operations of the Revenue Service and where necessary make recommendations to the Inland Revenue Board.

---

3. This is in keeping with the long practice whereby the Federal Government keeps close surveillance over the operations in the industry with a view to taking cognizance of the external and internal influences in the oil industry.
4. The Guardian, "The VAT Project" 11 June 1992, at 12.

VIII. CONCLUSION

The main thrust of the 1992 fiscal measures relating to the tax structure and policy is the government's desire to review all tax legislation with a view to re-organizing the tax structure and tax administration in Nigeria. This measure is aimed at enhancing reliefs and allowances in order to attract foreign and local investment.

Additionally, the measures will reduce the complexity of the tax system and tax administration, and broaden the tax base. To achieve this goal, government is willing to implement the recommendations of the study group on the Nigerian tax structure and tax administration, and to back them up by appropriate legislation.

It is hoped that the bold measures taken to reform Nigeria's tax structure and tax administration will be a worthwhile bequeathment of the present military administration to the incoming civilian administration.

[continued from page 32]

THE 1993 BUDGET AND RECENT DEVELOPMENTS

Veerinderjeet Singh

D. *Overseas investment in approved projects*

As announced in the 1991 Budget, with effect from year of assessment 1992, income earned from approved overseas investment projects remitted back to Malaysia would be abated by 50 percent, and dividends paid from the tax-exempt income would be tax free in the hands of the shareholders. The exemption is for a period of five years after the company commences operations and earns profit. In addition, pre-operating expenses such as the cost of market research are also allowed as a tax deduction.

A policy has recently been formulated by the Ministry of International Trade and Industry. To enjoy the incentives, the overseas project or investments must meet the following criteria:

- the project must be undertaken to overcome market access problems and must utilize Malaysian raw materials or components; or the project will help generate sufficient supply of essential raw materials and components required by the domestic industries in Malaysia; and
- the project will contribute further to South-South economic cooperation, (i.e. cooperation among countries in the South).

E. *Double tax treaties*

Malaysia has signed double tax treaties with Indonesia and Mauritius recently. A protocol amending the double tax treaty between Malaysia and France was signed on 31 January 1991. With the exception of Article 3, the protocol took effect from year of assessment 1990. Article 3 of the protocol which reduced the tax on fees for technical services (under ITA Section 4A) from 15 to ten percent of the gross fee applies to amounts paid on or after 1 January 1986. Therefore, a refund may be claimed where withholding tax had been previously deducted on Section 4A income at 15 percent.

F. *Promotion of investments (amendment) bill*

It is understood that the above bill is currently in Parliament and would probably be enacted before mid-1993. This bill codifies the proposals made in the 1992 Budget to withdraw or curtail various incentives such as pioneer status, investment tax allowance and abatement of adjusted income.

VIII. CONCLUSION

Overall, the 1993 Budget is generally a mild one with a few sweeteners thrown in. The sweeteners are mainly in the form of reduction in tax rates and some exemptions. These are largely seen as being necessary to make the introduction of a broad-based consumption tax more palatable.

What is very clear is the shift towards a broad-based consumption tax and the need for a consultative process as announced by the Minister. In the long-term, it is hoped more measures would be introduced to improve the deficit in the services account which is mainly due to outflows arising from freight, insurance and repatriation of profits.

In the final analysis, the budget is a well-planned one and with careful monitoring of this situation, the projected growth rate of eight percent for 1993 would be achieved.

IFA News

Some Highlights From the Secretary General's 1991/92 Annual Report Presented at the Cancún Congress 1992

J. Frans Spierdijk

INTRODUCTION

The beginning of the 12-month period covered in this report was sadly marked by the passing away on 2 October 1991 of Professor Dr J.H. Christiaanse, my predecessor as Secretary General. He was commemorated at the Opening Session of the Barcelona Congress by our President Mr Karl Beusch and at many more meetings of the various Committees held during the Congress week. Our Honorary President Dr Alun G. Davies CBE wrote a moving obituary note which is published in the IFA Yearbook 1991. Surely Jan Christiaanse will be sorely missed by his many IFA friends.

At the time of writing this report we received the sad news of the death of Mr Francisco Fernández Ordoñez on 7 August 1992. He was the Chairman of our Spanish IFA Branch and member of our Executive Committee from 1987 until 1991. At the Stockholm Congress in 1990 he was appointed President-Elect of IFA but in the course of 1991 he had to resign from that position and from his membership of the Executive Committee due to the fact that he accepted to continue serving his country as Minister of Foreign Affairs. Those of us who have known him well cherish his memory with friendship and respect.

The General Assembly in Barcelona unanimously confirmed the appointment of Mr Karl Beusch as IFA President for a second term of two years. Another unanimous appointment made by the General Assembly in Barcelona was Mr David Tillinghast (USA) in the new function of Vice-Chairman of the Permanent Scientific Committee (PSC). Our congratulations to both gentlemen and our thanks for their willingness to accept these demanding positions.

The first issue of the IFA Newsletter, prepared by the General Secretariat, saw the light in May 1992. It reports among other matters on forthcoming activities of IFA Branches which have been communicated to the Rotterdam office and will intendedly be published regularly and mailed to all Branch Chairmen and Secretaries. They are requested to further distribute any news contained in the Newsletter which they consider to be of interest to their members. It is hoped that the Newsletter will have a stimulating effect on the activities of a number of National Branches, which are often not aware how active IFA is elsewhere on the national and the bilateral level.

Other matters requiring special attention at the General Secretariat this year were the drafting of amendments to IFA's Articles of Association, the implementation of some stricter rules regarding the collection of membership fees as prescribed by the General Treasurer and the coordination of the work for the PSC, which by its continuous efforts to create greater depth and variety in IFA's scientific programme at Congresses, provides our office in Rotterdam with a lot of interesting tasks to fulfil.

BARCELONA CONGRESS

The third IFA Congress in Spain – the two previous ones convened in Madrid in 1959 and 1972 – was held in Barcelona at the Palacio de Congresos where ample facilities were available. It attracted a total number of 1765 participants, including accompanying persons. We were honoured by the presence of HRH the Prince of Asturias at the Opening Ceremony which took place in the architectural beauty of the Palau de la Música Catalana.

General Reporters on main Subject I, "The determination of the tax base for real property", were Prof. Dr J. Ramallo Massanet (Spain) and Prof. L. Penuelas y Reixach (Spain). Twenty-six National Reports had been submitted in time to be published in the "Cahiers". Discussion Leader was Prof. Dr K. Vogel (Germany). Panelists were Dr M. Flubacher (Switzerland), Prof. H. Kitchen (Canada), Mr R. Leitner (Austria) and Prof. O. Oldman (USA). The meeting was chaired by Prof. E. Albi Ibáñez (Spain). Ms I. Espejo (Spain) acted as Secretary of the Subject. The Résumé Committee for Subject I was composed as follows: Mr M. Laxan (France) as Chairman and Mr G. Coulombe (Canada) as Vice-Chairman. Members of the Committee were Messrs R.A. Dales (United Kingdom), U. Lehner (Germany) and Prof. Dr R. Valdés Costa (Uruguay) as members.

Subject II, "Protection of confidential information in tax matters", was treated by Prof. J. Malherbe (Belgium) in his General Report. Thirty National Reports were included in the "Cahiers". Prof. J. Bischel (USA) was Discussion Leader for the Subject and chairing the Panel, whose members were Mr P. Gillioz (Switzerland), Mr P. Gjesti (Norway), Mr E. Honorat (Luxemburg), Dr M. Pagani (Italy) and Prof. D.W. Williams (United Kingdom). Chairman of the Working Session was Prof. Dr J.L. Lampreave Pérez (Spain), whereas Prof. J. Arrieta Martinez de Pison (Spain) acted as Secretary of the Subject. The Résumé Committee for Subject II was chaired by Mr J. Avery Jones CBE (United Kingdom). Members of the Committee were Dr S. Eilers (Germany), Mr J. Mattsson (Sweden), Mrs P. Molina (Spain), Ms S.M. Pires Nelson de Mello (Brazil) and Mr G. Tixier (France).

I refer to the Reports of Proceedings written by Dr J.B. Bracewell-Milnes (United Kingdom) on Subject I and Subject II and to the Précis on Subject I and the Resolution of Subject II and the review of same by the Chairmen of the Résumé Committees as published in the IFA Yearbook 1991 for more information.

I would like to express our gratitude to the General Reporters and the National Reporters on Subjects I and II for their con-

© 1993 International Bureau of Fiscal Documentation

siderable efforts. With their work they have added two important works of reference to the *Cahiers de Droit Fiscal International*. Our thanks also to the Discussion Leaders, the members of the Panels, the Chairmen and the members of the Résumé Committees and all other persons, including those from the floor, who actively contributed to the discussions.

Of the Seminars, the one on "Financing of Large Metropolitan Areas" was sponsored by the City of Barcelona and we owe particular gratitude to the Mayor, H.E. Sr. P. Maragall i Mira and his devoted associates. This Seminar (A) was chaired by Prof. J.J. Ferreiro Lapatza (Spain) and his Panelists were Mrs A. Agulló (Barcelona), Mr A. Castells (Barcelona), Mr F. de Grave and Mr H. Moor (Amsterdam), Prof. O. Oldman (Cambridge, Mass) and Mr R. Prud'homme (Lyon). Seminar B was on "The taxation of venture capital", which was chaired by Mr R. Baconnier (France). Panelists were Mrs C. Cloquet (Belgium), Mr R. Favreau (Canada) and Mrs J. Viegener (Germany). Seminar C dealt with "Tax treaties and local taxes", and was chaired by Mr F. White (USA). Members of the Panel were Prof. B. Arnold (Canada), Mr W.H. Boss (Switzerland), Mr E.A. da Silva (Brazil) and Mr U. Wolff (Germany). The "Limitation of treaty benefits for companies (Treaty Shopping)" seminar consisted of Mr P. Sundgren (Sweden) as Chairman, and Dr H. Becker (Germany), Mr A.W. Granwell (USA), Mr D. Hund (Netherlands), Mr D. Luethi (Switzerland) and Mr J.D.B. Oliver (United Kingdom) as Panelists. A Seminar on the "Spanish tax system" was held, chaired by Mr M.A. Lasheras Merino (Spain). Panelists were Ms I. Espejo, Messrs L. Fernández Briones, J.A. López-Santacruz Montes and G. Pérez Rodilla all from Spain.

The amount of work to prepare a Seminar and its presentation is considerable. We thank all those who were involved in the Barcelona Seminars sincerely for their contributions.

The contribution by the Chairman of the Organizing Committee and President of the Congress, Mr M. Marin Arias, has been immense. There is no doubt that he was the driving force during the many months of preparation, during the Congress itself and thereafter. On behalf of all of us I want to pay him our respect and gratitude. At the General Secretariat it has been a pleasure working with him. In this connection I would mention that we are also indebted to the Spanish Branch and Mr Marin in particular on quite a different matter, i.e. that he has been providing us for many years, free of charge, with the Spanish translations of the summaries which are printed in the "Cahiers".

PERMANENT SCIENTIFIC COMMITTEE

Hosted in a perfect manner by the Mexican and UK Branches, the PSC convened in London in February 1992 for a lengthy and interesting meeting.

The scientific proceedings of the Barcelona Congress were reviewed, including the experience of having a Seminar only in French. It was agreed that as a rule non-interpreted seminars would be held only in English, since this appealed to the majority of the IFA membership. However, the option of organizing Seminars in French, German and Spanish would be kept open, but such Seminars would be organized only in special circumstances, depending on the country where the Congress was held and the topic selected.

It was noted with regret that the response to the questionnaires, distributed during the Barcelona Congress, was small. I would like to encourage all members to communicate their observations, suggestions and proposals to the General Secretariat, either by way of the questionnaire or directly. IFA and the PSC in particular are doing their utmost to accommodate members' wishes but this is not always an easy task. We have many members, speaking many languages and coming from many different backgrounds.

Every effort is undertaken to try and select the right topics for the right people for Main Subjects and Seminars and to enliven the discussions. Special sub-committees of the PSC have been established to this end who have come up with valuable suggestions. New and more detailed letters of guidance for Discussion Leaders and Seminar Chairmen have been developed. Prof. Hugh Ault (USA), chairing the Research subcommittee helps in the selection of topical subjects, supervising at the same time the young researcher in the joint research project with the International Bureau of Fiscal Documentation (IBFD). Dr A. Manganelli (Italy) performed some very valuable work in this respect last year and we also have great expectations from Mr Peter Harris (Australia), presently working for us at the IBFD in Amsterdam.

Any suggestions and/or criticisms from members and others aimed at further improving IFA's performance are certainly most welcome. One should keep in mind, however, that IFA is an independent body with no sectional interest to promote which provides a forum for discussion to the entire international tax community – consisting of representatives from taxpayers, governments, the courts and academia – whose aim it is to promote an international tax environment which is fair to all concerned.

With regard to the selection of the Seminars, the policy was adopted for every Congress of having an "open slot" so that a "hot" topic of lively current interest can be introduced at a relatively late date, as was done with the Seminar on East-West joint ventures during the 1990 Stockholm Congress.

Preparations for the 1992 Cancún Congress are well under control. Apart from the two main Subjects, five Seminars will be held, as follows:

A. Advance ruling: practice and legality
   Chairman: Prof. Dr J.M. Rivier (Switzerland)
B. Branch Tax
   Chairman: C.L. Estes (USA)
C. Tax treatment of international loans
   Chairman: Dr R. Asorey (Argentina)
D. Consequences under tax treaties of operating through a dependent or independent agent
   Chairman: Prof. C. van Raad (Netherlands)
E. Mexican tax reaties
   Chairman: Mr R. Aguirre (Mexico)

Twenty-six National Reports were submitted for Subject I, "Transfer pricing in the absence of comparable market

© 1993 International Bureau of Fiscal Documentation

prices", and 27 for Subject II, "Tax consequences of international acquisitions and business combinations". Many thanks to Avv. G. Maisto (Italy) and Mr W.B. Taylor (USA) for all their hard work.

The Subjects and Seminars for the 1993 Florence Congress were finalized. The titles of the Subjects are "Interpretation of double taxation conventions" and "Non-discrimination rules in international taxation". The Seminars will treat: arbitrating conflicts with regard to treaties; corporate tax on distributions (equalization tax); EC corporate tax law; employee fringe benefits; environmental taxation; and new issues in Italian taxation.

In order to try and make the discussions of the two main Subjects more lively and meaningful, a new structure of the Working Sessions of the two Main Subjects was discussed at length. It was decided that this new structure would be implemented for the 1993 Florence Congress on a trial basis only, and the results would be carefully analysed afterwards. The new procedure will be explained in detail in the invitation programme of the Florence Congress.

The Subjects for the 1994 Toronto Congress were definitely fixed. Subject I will deal with "Deductibility of interest and other financing charges in computing income", with Prof. B.J. Arnold (Canada) as General Reporter. Prof. Dr A.J. Rädler (Germany) agreed to be General Reporter for Subject II, "National and international consequences of demergers".

Initial discussions were held concerning the 1995 Cannes Congress. Some interesting topics came up which will be developed further with the help of the researcher.

EXECUTIVE COMMITTEE

At the invitation of the Mexican and Dutch Branches, who proved to be perfect hosts, the Executive Committee met in the Netherlands on 3 May 1992. It gave us at the General Secretariat a nice opportunity to show the Executive Committee the "headquarters" of IFA at the World Trade Centre in Rotterdam. Mr M. Dominjon (France), Prof. L. Hinnekens (Belgium) and Mr C. Pereira de Rezende (Brazil) attended for the first time as fully fledged members.

Regarding the composition of the Executive Committee, it will be proposed to the General Council in Cancún to re-elect the following members for another statutory term of two years: Prof. Avv. P. Adonnino, J.F. Avery Jones CBE, A. Overbosch and K. Stocker. One of our dedicated members is due for statutory resignation: Mr D.A. Ward Q.C. (Canada). Subject to the approval by the General Council Mr Ward will be replaced by a member from Canada. Moreover, a new member from Spain will be proposed to fill the vacancy created by the resignation of Mr F. Fernandez Ordoñez.

With regard to the future IFA Presidency, the Committee decided to recommend to the General Council and General Assembly in Cancún to nominate Prof. Avv. P. Adonnino as President-Elect, to succeed Mr Beusch at the close of the 1993 Florence Congress.

A lengthy discussion was held on the amendments to the IFA Articles, as drafted by the General Secretariat. Apart from some editorial changes some amendments concerning the content of various articles were made, and proposals will be made to the Cancún General Council and the General Assembly for final approval.

The "Manual" for the organization of an annual IFA Congress was approved by the Executive Committee during their October 1991 meeting. It has been distributed to a number of future Congress organizers. Various requirements and recommendations are stipulated, and we are confident that it will be helpful for our future Congress organizers.

Close cooperation with the General Secretariat is surely to result in considerable time savings and efficiency gains for Organizing Committees.

THINK TANK

Since a large and growing international organization such as IFA cannot afford to stand still, and should remain critical and open to suggestions from its members, Branches and Congress participants, the Executive Committee recommended to the 11 October 1991 General Council meeting to create a committee of small composition for a period of two years, whose task would be as follows:

- to make recommendations regarding the organizational and procedural aspects of IFA's scientific programme;
- to try and establish the desires and objectives of National Branches regarding activities and come up with recommendations or suggested discussion points for the Executive Committee and the PSC;
- to consider the extension of IFA membership into new countries throughout the world.

The composition of this "Think Tank" which was approved by the General Council is:

Mr J.F. Avery Jones (United Kingdom)	Chairman
Dr R. Lenz (Switzerland)	Special Advisor
Prof. L. Fischer (Germany)	
Mr D.R. Tillinghast (USA)	
Prof. Avv. A. Fantozzi	ex officio
Mr J.F. Spierdijk	ex officio

Although some notes have been exchanged and some informal talks have taken place during the year, the first official meeting of the Think Tank Committee is scheduled during the Cancún October 1992 Congress.

MEMBERSHIP FEES

The General Treasurer will propose to maintain the membership fees for 1993 at the level of the previous year, i.e.:

- Dfl. 105 for individual members of National Branches, and
- Dfl. 115 for direct individual members,
- Dfl. 250 for corporate members, both direct and of National Branches.

To further improve on the collection of membership fees the General Treasurer has developed some stricter guidelines

© 1993 International Bureau of Fiscal Documentation

concerning the deletion of non-paying members from the files of National Branches and of Central IFA. Great care is exercised to promptly discontinue the mailing of the "Cahiers" to non-paying members. Also, the mailing of the Yearbook and the invitation programme is stopped timely.

NATIONAL BRANCHES AND MEMBERSHIP

Our 40th Branch in Egypt was officially recognized during the Barcelona Congress. Recently, a meeting with Branch officials took place in Rotterdam to discuss organizational and membership matters.

In October 1991 I attended the Technical Meeting of CIAT (Inter-American Center of Tax Administrators) in Taipei, Republic of China (Taiwan) where I met with many IFA members and potential IFA members. With active support from the Taiwanese authorities, in particular Vice Minister of Finance Cheng-I Wang, a group of members is enthusiastically engaged in forming a local IFA Branch and we look forward to further developments there. Expansion of our Association in the Far East is most important.

Our Executive Committee member from Hong Kong, where an active IFA Branch has existed for many years, Mr Ian Harris, is making every effort to promote our Association in that region. Regional Conferences (see hereafter) are also very important in this respect. After my visit to Taiwan I took the opportunity to visit the Branches in Hong Kong and Japan. It is gratifying to see how active these Branches are and to meet many members who may not always be in a position to attend our annual Congresses. Other Branch meetings I attended were in the United Kingdom, Germany and the Netherlands. On a trip to Moscow (as member of an EEC mission to Russia put together by the IBFD) I had the chance to meet with some members including Dr Irina Rusakova, who tried to bring together a nucleus of people interested in forming an international tax group. Personal contacts and correspondence are taking place with members in Ireland, Panama, Costa Rica and Jamaica about the possible formation of Branches. The influx of new members from East European countries is as yet small but hopefully this will change in due course.

At the General Secretariat we continue to be interested in what takes place in our Branches. IFA means much more to many of our members organized in active National Branches than our annual Congresses alone and we like to spread whatever useful information we receive for the benefit of other Branches through the Newsletter and otherwise.

REGIONAL CONFERENCE

After the success of the 1991 Hawaii Regional Conference, the Executive Committee officially approved the holding of another Pacific Region Conference, which will be the 3rd IFA Regional Conference. This Conference will be held in Singapore from 26-29 May 1993, at the invitation of the Singapore Branch, who is organizing this event in close cooperation with and sponsored by the US Branch. The following Branches (countries) will be represented at the Conference: Australia, Hong Kong, Indonesia, Japan, Korea, Malaysia, New Zealand, Singapore, Taiwan and the United States. Representatives will also be invited from Canada, Mexico, Thailand, Vietnam, China (PRC) and other countries.

The two main topics on which the Conference will focus are:
- Tax incentives and other considerations in establishing industrial operations in the Pacific Basin; and
- Outbound investments from the Pacific Basin.

One of the major objectives of this Conference is to try and introduce more people from Asia to our Association and to the kind of discussions that are held at IFA Congresses, in the hope that this will eventually lead to a more numerous active participation from this area.

MITCHELL B. CARROL PRIZE 1991

Out of three candidates Dr Yves Noël (Switzerland) was elected the winner of the Prize for 1991 for his legal dissertation entitled "La double imposition internationale résultant des redressements comptables entre sociétés apparentées et son élimination". The Prize was awarded during the official Opening Ceremony of the Barcelona Congress by Prof. DDr H.G. Ruppe (Austria), Chairman of the Jury. Another work submitted to the Jury deserves special mention. In his dissertation, Dr Michael Lang of Vienna, Austria, considered problems of double taxation that occur in forms of hybrid financing. Little attention has been paid to this highly topical area and Dr Lang has made a valuable contribution to preparatory work in this field. Thus the Jury was of the opinion that Dr Lang's work deserved an honourable mention.

THE 46TH CONGRESS IN CANCUN

We are all looking forward with great anticipation to Cancún, our second IFA Congress in Mexico (The first Mexican Congress was in 1974, in Mexico City). It is our first Congress with the excursions on Friday and with a tropical time schedule as another unusual feature. It will be most informal, as dictated by the climate. The two main Subjects are very interesting indeed, both from a theoretical and a practical viewpoint. The Seminars will no doubt attract a great number of interested participants.

The Organizing Committee under the enthusiastic leadership of Mr Carlos Sellerier has been working very hard to make sure that everything will run smoothly and I am certain that they will succeed.

INTERNATIONAL BUREAU OF FISCAL DOCUMENTATION

The relationship with the IBFD continues to be a very fruitful one. We value the input of Mr Hamaekers in our PSC meetings and I take pleasure in being aware of the many interesting developments at the IBFD through my membership on the Board of Trustees. The joint research project is proceeding in a way satisfactory to both our organizations. Prof. H. Ault, Chairman of our Research sub-committee as previously mentioned, is also a member of IBFD's Board of Trustees. He plays a key role in formulating recommendations in this area to the PSC.

© 1993 International Bureau of Fiscal Documentation

CONTACT WITH INTERNATIONAL ORGANIZATIONS

A word of gratitude to our Ambassadors for their reports as published in the IFA Yearbook. We are glad that Mr Jerome Libin (USA) was prepared to be the new Liaison Officer with the OAS.

Finally, I would mention the continuous contacts with the ICC Tax Committee and with CIAT. At the Annual CIAT Conference in Jamaica in June 1992 I was a guest speaker to address the Conference on international tax aspects which gave me an opportunity to focus the attention of the participants, among other matters, on a number of topics dealt with at recent IFA Congresses. At the Technical Conference in Benalmádena (Spain) in September I will act as General Reporter. It is important for IFA to be present and active at a forum where the interests of the international business community are represented, such as the ICC Tax Committee, and at places where the voices of government representatives can be clearly heard, such as CIAT Conferences.

OTHER IFA NEWS

SINGAPORE/US BRANCHES

The 1993 Pacific Basin Conference will be held 27-29 May 1993 in Singapore. Jointly sponsored by the US and Singapore branches the format of the conference will focus on tax incentives and other considerations in establishing industrial operations in the Pacific Basin, outbound investments from the Pacific Basin and inbound investments from Australia, Canada, New Zealand, the United States and Europe. The conference will take the form of plenary sessions on each of the topics with a discussion leader and a panel of speakers. Between the plenary sessions will be separate sessions with speakers from a number of countries giving presentations on their own territories.

US BRANCH

The 1993 Annual Meeting will be held 4-5 March 1993 at the Copley Plaza Hotel in Boston, Massachusetts. Topics to be discussed include: current judicial and administrative developments, income tax treaty and competent authority developments, transfer pricing issues, advance pricing agreements, arbitration and controversies, directions in US International tax legislation and policy, Europena income tax developments and Mexican and Canadian tax developments, combining operations from classical and integrated tax systems, and knowledge and technology transfers to and from the United States. Speakers will include government officials, practitioners and academics.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

ASIA & THE PACIFIC

Australia

TAXPAYER 1992 TAX SUMMARY.
Melbourne, Australian Taxpayers' Association, 1992, pp.1232, $29.-.
Annual publication designed to provide, in a comprehensive but concise form, the main features of the various taxes levied by the Commonwealth and the States (corporate income tax, individual income tax, fringe benefits, capital gains tax, land tax, stamp duty, sales tax, payroll tax). Superannuation funds, foreign tax credits, paartnerships and trusts are also dealt with.
(B. 57.793)

SECURITY IN RETIREMENT.
Planning for tomorrow today.
Canberra, Australian Government Publishing Service, 1992, pp. 84.
Statement by the honourable John Dawkins, M.P., Treasurer of the Commonwealth of Australia, 30 June 1992.
(B. 57.761)

Japan

GOMI, Yuji.
Guide to Japanese taxes 1992-93.
Tokyo, Zaikei Shoho Sha, 1-2-14 Higashi Shimbashi, Minatoku, Tokyo, 1992, pp.440.
Practical, extensive and up-to-date information on Japanese taxes (drawn from laws, regulations, circulars, etc. in effect as of April 1992). The basic structure of the Japanese tax system (income tax, withholding income tax, corporation tax, assessment income tax, inheritance and gift tax, consumption tax, local tax, etc.) is explained.
(B. 57.791)

CONTENTS

VOL. 47 NO. 2 **FEBRUARY 1993**

INTERNATIONAL:
100 YEARS OF INCOME TAX — 59 *John Prebble*

This article attempts to explain by reference to history and to principle why it is that tax law tends to be more complex and internally consistent than other law.

INTERNATIONAL:
A TAX ON GROSS ASSETS
OF ENTERPRISES AS A FORM
OF PRESUMPTIVE TAXATION — 66 *Efraim Sadka and Vito Tanzi*

Both Mexico and Argentina levy an assets tax, and a number of other Latin American countries are considering the introduction of such a tax. This articles analyses the assets tax within the context of presumptive taxation in general. Set against the historical background of a tax on assets some aspects of presumptive taxation are discussed.

US/NETHERLANDS:
THE NEW US/NETHERLANDS
DOUBLE TAX CONVENTION:
AN INTRODUCTORY NOTE — 74 *Wim Wijnen*

On 18 December 1992 the United States and the Netherlands signed the new double tax treaty. The most important feature of the treaty is without a doubt the limitation on benefits provision. Following Mr. Wijnen's introduction we have printed a number of provisions of the treaty.

UNITED STATES:
DETERMINING RESIDENCY FOR
FEDERAL INCOME TAX PURPOSES — 84 *Leonard W. Rothschild, Jr. and Michael G. Schinner*

On 24 April 1992, the IRS issued final regulations under Code Section 7701(b) concerning the definition of residency for federal income tax purposes. This article analyses the final regulations and discusses the IRS' revisions to the proposed regulations. The article also discusses the IRS' new proposed regulations on treaty-based determinations of residency, which it issued simultaneously with the final regulations.

PEOPLE'S REPUBLIC OF CHINA:
A BRIEF INTRODUCTION TO
TIANJIN PORT BONDED ZONE — 90 *Li Zhi Hui*

Established in 1991 the Tianjin bonded zone offers competitive advantages over the special economic zones and economic development zones. This article highlights a number of the preferential investment policies and tax privileges of the zone.

INTERNATIONAL:

100 YEARS OF INCOME TAX

John Prebble

This article is based on an address delivered by the author at the fifth New Zealand-Pacific Conference and Workshop of the Institute for Taxation and Business Law, held at Port Vila, Vanuatu, on 8 to 10 July 1991. (The Institute was reconstituted as the Centre for Australian and New Zealand Law in 1992.) The paper marked the centenary of income taxation in New Zealand, which was inaugurated by the passage of the Land and Income Assessment Act 1891. The article attempts to explain by reference to history and to principle why it is that tax law tends to be more complex and internally inconsistent than other law. Several themes in the article are developed by the author in a monograph entitled "Why is Tax Law Incomprehensible?" shortly to be published in the collection, Victoria University of Wellington Inaugural Addresses (New Series). While completing this article the author was a visiting professor at the International Bureau of Fiscal Documentation, Amsterdam.

BA, LLB (Hons) (Auckland); BCL (Oxon); JSD (Cornell) Inner Temple (London). Barrister, and Professor of Law at Victoria University, Wellington, New Zealand.

XIX. Results of Strict Interpretation

I. INTRODUCTION

Of all branches of the law, income tax is the most notorious for its complexity. David Walker, editor of The Oxford Companion to English Law, is uncompromising in his opinions when it comes to income tax. He says:

> More than any other branch of municipal law, tax law is open to the reproach of being utterly incomprehensible by the individuals affected, and even frequently by their legal advisers. The enormous complexity of the rules of law on each kind of tax gives rise to an enormous volume of dispute and argument, and a great deal of litigation by way of appeal from assessments. Neither justice nor reason has any place in tax law, and many decisions of the superior courts are in plain conflict with all sense...

One question that immediately springs to mind is, what sort of person could make a career practising in that unpromising farrago, much less in studying it? Many people are familiar with the old definition of a tax lawyer: someone who is quite interested in tax, but who lacks the personality to become an accountant. Prompted by the entry in the Oxford Companion to English Law, the author suggests another definition: a tax lawyer is someone who is quite interested in law, but tolerably indifferent to justice or reason.

II. HISTORY

Parliament created income tax in New Zealand by the Land and Income Assessment Act 1891. At that stage, the country relied principally on customs duties for its revenues, though land tax, an annual tax on the value of land, was of some significance.

The second reading debate when the bill was introduced on 4 August 1891 was sandwiched unpropitiously between a discussion about inferior British mutton that was being passed off as good New Zealand product on the London market, and a depressing debate about a new law on bankruptcy. The reporter of parliamentary debates noted that John Ballance, who spoke first in the taxation debate as both Colonial Treasurer and Premier, was frequently inaudible in the gallery.

As explained by William Pember Reeves, a member of Ballance's recently installed Liberal cabinet, the principal reason for the introduction of an income tax was the oppressive and economically inexpedient impact of land tax. Land tax was all very well for taxing agriculture, where people's ability to pay was roughly proportionate to the value of their farms. Furthermore, if you had a very large and very valuable farm that did not produce enough income to pay your tax, then that was all to the good because in those circumstances the land tax promoted the government's general policy of encouraging the disintegration of large estates.

© 1993 International Bureau of Fiscal Documentation

But in respect of commerce, land tax could be a decided dampener on economic activity. Businesses generally struggle in the early years of their existence, but land tax charged them on the value of their real property whether they could pay or not. An income tax, that would vary with improving fortunes, was clearly more appropriate for businesses.

Leading for the opposition, John Bryce MP explained that he was theoretically and constitutionally opposed to all taxation, but aside from that his main objection to income tax was that it would lead to public immorality. This would come about as a result of people having to lodge returns of their income, and yielding to the temptation to lodge false ones.

One aspect of Ballance's income tax that may appeal to readers of this *Bulletin* is that it was charged at one shilling in the pound on business and commercial profits, but at only six pence in the pound (that is, half as much) on professional incomes. The subsequent departure from this self-evidently right-minded standard is something that now one can only deplore.

Apart from the United Kingdom, among Anglo-American jurisdictions New Zealand was relatively early in introducing an income tax. The United Kingdom had had an income tax for most of the 19th century, though it was not until Harcourt's budget of 1894 that the tax became a significant and permanent part of the country's economy. In fact Gladstone, under whom Harcourt originally served, had in 1853 spent three hours addressing the House of Commons about income tax in a budget speech, terminating by telling the House of Commons that the tax was 'not well adapted for a permanent portion of your fiscal system'.

Tasmania introduced a tax on some forms of income in 1880, and South Australia followed with a fully fledged income tax in 1884. The New Zealand Act of 1891 was to some extent modelled on the South Australian legislation. The other Australian states followed with income tax legislation between 1894 and 1907 and the Australian federal government introduced its income tax in 1915. The United States did not introduce a federal income tax until this century.

Since 1891, New Zealand's income tax laws have been the subject of more commissions of inquiry, amendments and consolidations than any other area of legislation. In recent decades, there has usually been at least one amending Act each year, and during the latter 1980s there were sometimes four or five. Full consolidations, with re-numbering of sections, were enacted in 1900, 1908, 1916, 1923, 1954 and 1976. Commissions of inquiry of different statuses were held in 1922, 1924 (a full Royal Commission), 1937, 1951, 1952, 1967 and 1982. From 1985 to 1990, five or six consultative committees were appointed to advise on separate elements of the Income Tax Act, and one was still sitting in 1992.

There are two reasons for all this activity. The first is the obvious one, that income taxation is fundamental to the economic systems of modern western nations, so it is worth while to make the tax as efficient as possible. The second is that the subject is inherently unduly complex, and that is the theme of this article. Why is income tax law so complicated?

III. TENSION BETWEEN NATURAL AND ARTIFICIAL LAW

A fundamental difficulty in any taxation system is to fit the laws of nature into the matrix that we recognize as the laws of men and women. One law of nature that may be accepted as an *a priori* truth is that it is possible for people to experience gains in their wealth. We know by observation that sometimes businesses are able to meet their expenses out of current earnings. Sometimes they are even better off at the end of a year than they were at the beginning. That is, they experience a gain. It does not happen often nowadays in these times of recession, but it can occur.

Gains, therefore, are a part of nature in the largest sense of the word. On the other hand, the income tax system demonstrably cannot cope with economic gains in a way that can be understood by ordinarily literate people, and the system often has difficulty in dealing with gains at all. One can reasonably ask, with all the opportunity that tax law has had to evolve, why has someone not made a better job of the legislation?

One answer to that question is that the tax system cannot be understood in logical, principled terms that stem from generally accepted truths and propositions. It is much more amenable to analysis that uses the reasoning of self-validating formalism. It is one thing to have a gain, which nature and economics and most humans recognize as a gain. It is another to define the gain in legal terms, and a third to measure it by accountancy. There is a fundamental tension between the natural law of economic activity and the man-created law of lawyers.

IV. NO DEFINITION OF 'INCOME'

In enacting income tax legislation, parliaments are faced with the ultimately impossible task of describing an economic concept in legal terms. Commonly, they avoid the task, and do not include a full definition of 'income' in tax legislation at all. They rely instead on a list of things that are stated to be income, with a final catch-all to the effect of "and any other income of any other kind".

New Zealand's income tax legislation follows this pattern, though in New Zealand's case there is a theory that the lack of a definition of 'income' in the Act has a more mundane explanation. It is a matter of history and a question of grammar. The draftsman of the 1891 Act did in fact attempt a definition of 'income', but he failed to ensure that the subject and the verb in the definition clause agreed with one another. He provided in Section 3 that 'income' means "any gains or profits derived... by any...person...which is (sic) made the subject of taxation under this Act.'

The theory is that as a result of the original draftsman's grammatical mistake in what on one view was the central provision of his Act, later drafters have not been game to have another try.

V. THE CAPITAL/REVENUE DISTINCTION

Return to the question of the tension between natural law and lawyers' law. This tension is seen in many areas, but nowhere so markedly as in the distinction between capital and income.

© 1993 International Bureau of Fiscal Documentation

Broadly speaking, the Income Tax Act taxes income, not capital. But the lawyers' and accountants' distinction between income and capital is not a distinction that is fundamental to natural law, nor to economics, for that matter. One result is that a good deal of income tax legislation, and even more of the income tax law that is set down by the judges in their reported decisions, is taken up with rules that help people to distinguish between capital and income. Even more of the legislation is taken up with rules that hamper people in their efforts to convert a taxable income gain into a non-taxable capital gain. One says 'hamper' rather than 'prevent', because these rules are far from successful. They are not successful because their objective is ultimately illogical. That is, in the end there is no logically sustainable distinction between capital gains and income gains. It follows that, in the end, rules that try to draw that distinction are often incomprehensible.

VI. ILLUSTRATIONS

The problem may be illustrated by two common legal notions, the share, that produces dividends, and the loan, that produces interest. First, take a company share that is pregnant with heavy profits. That is not something one sees in these recessionary times, but older readers may have heard of the phenomenon. There are two ways in which the shareholder can enjoy these profits. Either she can wait for a dividend to be declared, in which case she will be liable to tax on the income; or she can sell the share for a price that reflects the presence of the profit.

In the latter case, in New Zealand there is no tax, on either the underlying value of the share or on the accumulated profit, because the gain is a capital gain and New Zealand has no capital gains tax. (In jurisdictions where there is a capital gains tax there will no doubt be an impost, but often at a lower rate than on receipts that are regarded as being income gains.)

As one might expect, there are provisions in the New Zealand Income Tax Act that minimize this different treatment, and other provisions that hamper shareholders who try to take advantage of it. But these provisions highlight the problem rather than solve it. There is no logic in treating the gain in the value of the share as anything but a gain, though political considerations might lead a jurisdiction to afford concessional treatment in one way or another.

As a second illustration, suppose a lender has $ 100 to lend to a borrower. One course is to lend the money for a year, and for the borrower to promise to pay interest of $ 12. At the end of the year the borrower pays $ 112, and the lender pays tax on the $ 12 interest.

Another approach is for the borrower to write an IOU for $ 112, payable in a year's time. The borrower then sells the IOU to the lender for $ 100. A year later, the lender causes the borrower to redeem the IOU for $ 112. Then, the lender has simply sold an asset, the IOU, and there is no interest and no tax. To prevent this sort of thing happening, particularly in its more sophisticated forms, New Zealand has 38 pages of provisions in its Income Tax Act called the 'accruals regime', inserted in 1986, which is so hard to understand that the first efforts by the Inland Revenue Department to translate it into some sort of rules that people could comprehend had to be redone immediately.

While improvements could no doubt be made, the law drafters are not fundamentally to blame. What is to blame is the unsound premise of the Income Tax Act that capital can be distinguished from income. The more we try to rationalize that distinction, the more complex, and often incomprehensible, the drafting becomes.

VII. REASONS FOR THE DISTINCTION

Why is it that New Zealand, in common with many other jurisdictions, draws a distinction in its tax law between capital and income? After all, economists have known for years that the distinction is without a difference.

The traditional answer is that when 19th century judges in the United Kingdom faced the question of defining income they turned to trust law, which seemed to provide a useful analogy. Trust lawyers have been obliged for centuries to distinguish between capital and income in order to know what belongs to a life tenant, entitled to the income of an estate, and what belongs to those who will succeed to the capital on the death of the life tenant.

It was a short step to apply these centuries of law to the new idea of income tax, though a moment's thought shows that the analogy is not apposite. Judges in trust cases divide gains between two citizens. But judges in tax cases decide what portion of a citizen's property is taken for the state by legislation.

Be that as it may, the author believes that the influence of the old trust cases is far from the only reason why judges in tax cases developed the legal concept of income as we know it, though it is true that the old cases provided the rationale for judges' decisions. An equally significant factor was human nature. No matter how often the economists prove to us that there is no rational distinction between capital and income, we still believe that there is.

For instance, in the middle of the 19th century the UK income tax was still in an early stage of development. The lawyers had not yet wrenched policy away from the economists, and Peel in his 1848 budget still espoused a tax that was a tax on gains simpliciter, and a tax that did not act as an implement of social engineering, in that the tax was proportional rather than progressive.

The statesman Cobden found fault with both these features of the tax. Because he was a statesman he used words that are sonorous and impressive, but presumably because he was talking about income tax the words he chose are barely recognizable as English. He said: "If a distinction were made between permanent and precarious incomes, if a graduation of duty were established, you would have no remonstrances."

Many Victorians were quite capable of making themselves understood in the English language. But this did not apply to Cobden, so a translation is necessary. What he meant to say was that he thought there should be no tax on capital gains or windfalls, and that the rich should pay proportionately more tax than the less rich. (He could not in this context have been concerned for the poor because they did not pay income tax at all in those days.)

© 1993 International Bureau of Fiscal Documentation

Like Cobden, and like us, English judges of the latter 19th century were human, at least many of them were. To use Cobden's word, their 'remonstrance' against income tax was to make sure that it applied only to regular, annual gains, rather than to windfalls or to gains on assets held for long periods.

VIII. ADOPTION BY THE LEGISLATURE

In New Zealand, Ballance's government of the early 1890s was, like many liberal governments, often influenced by principle. Thus, New Zealand's 1891 Act charged all business profits and gains to income tax, making no distinction between capital and income. To drive the point home, Section 17(4) of the 1892 amendment Act provided that "income from a business" included gains "from the purchase, sale, or other disposition of real or personal property, or of any right, estate, or interest therein". Strictly speaking, this provision applied whether or not the gains on the sale of property accrued within or outside the regular, day-to-day operation of the business.

Of course, no-one took all this seriously, and New Zealand practice followed the law as interpreted by the English judges. But in case of excessive zeal on the part of the fiscal authorities, Parliament knocked most of the provisions that taxed capital gains out of the Act when it was consolidated in 1900.

By Section 59(3) of the consolidated Act, gains from the sale of real property were not taxable, unless the taxpayer was a dealer in land. Gains from the sale of personal property remained taxable, but there was a specific exemption for shares, the form of personal property most likely to yield a gain on sale. Gains on other forms of personal property were rare, and remain so. But one suspects that returns of income from the sale of, say, jewellery or pictures that had appreciated were rare, notwithstanding that they were taxed by the Act of 1900.

IX. TAX PLANNING

Nowadays, the distinction between capital and income gains is firmly entrenched in the tax legislation of most jurisdictions, not least of New Zealand. One result is that people spend a great deal of time and effort organizing their affairs so that they derive capital gains rather than income. They succeed in this endeavour because, economically, the two sorts of gain amount to the same thing. Without going into detail, the lists below set out a number of strategies available to the New Zealand taxpayer to minimize tax, strategies that depend on the distinction between capital and income, and a number of parts of the Income Tax Act that exist partially or wholly to frustrate people who would take advantage of the distinction.

X. AVOIDANCE STRATEGIES THAT DEPEND ON THE DISTINCTION BETWEEN CAPITAL AND INCOME

A. *Avoidance of Section 67*

Section 67 of the New Zealand Act taxes the profits derived on the sale of land in some circumstances. The section may be avoided by holding land that may be vulnerable to Section 67 in a company, and selling the shares in the company. Ordinarily, profit on the sale of shares in these circumstances is not taxable.

B. *Avoidance of Section 129*

Formerly, farmers were permitted to deduct expenditure incurred on capital development of their farms in calculating their assessable income. Section 129 was calculated to prevent them from reducing their income by spending on capital development, and then selling the farm for a tax-free capital gain. Like Section 67, Section 129 can be avoided by holding the farm in a company and selling the shares instead of the land.

C. *Avoidance of Section 188A*

Section 188A was introduced into the Income Tax Act in 1982. The primary object of Section 188A was to prevent people using farming as a tax shelter. One way to avoid Section 188A, at least partially, was again to form a company and to borrow to capitalize the company. Interest on the borrowing was fully deductible, being interest on money used to buy shares that one day might produce a dividend, and the company could spend the money on farming. If instead of forming a company to own his farm the taxpayer owned the farm as an individual and borrowed and spent the money directly, the deductibility of the interest was subject to an overall limit of $ 10,000 a year incurred in farming or other "specified activities".

Section 188A so incensed people whose support for the principle of the separation of capital and income exceeded even their support of the principle of the separation of church and state that some of them formed a whole new political organization, the New Zealand Party, that nominated candidates throughout the country in the general election of 1984. None were successful, but the party contributed to the downfall of the then populist centre-right government by capturing some of its support in key electoral constituencies.

D. *Avoidance of assessability of the benefits of trade discounts*

A retailer who is in a strong position *vis-à-vis* her supplier can often negotiate substantial reductions in the prices that she pays to the supplier. One result is that the retailer's costs go down and her profits, and thus her tax, go up. An alternative to demanding price reductions is for the retailer to persuade the supplier to make capital improvements to the retailer's premises, which results in a gain that in New Zealand is not taxable.

As far as the supplier is concerned, the cost of the improvements to the retailer's premises is a cost of marketing and thus an item that is deductible in calculating the supplier's assessable profit. Consequently, there is an asymmetry in the tax system, in favour of the taxpayer, with the item in question deductible as an expense but not taxable as a receipt.

XI. REGIMES IN THE INCOME TAX ACT THAT ATTACK INCOME-TO-CAPITAL CONVERSIONS

A. *Sections 67, 129 and 188A*

Sections 67, 129 and 188A, mentioned above, would not themselves need to exist if it were not for the fact that the Income Tax Act does not tax gains that we call capital.

© 1993 International Bureau of Fiscal Documentation

B. *The accruals regime*

The New Zealand accruals regime has been mentioned already. It is the only part of the Income Tax Act where there is a conscious, express denial of the distinction between capital and income. An important effect of the regime is, broadly speaking, to categorize all gains and losses on debt and other financial instruments as on income account. The regime has a similar effect on many other transactions that involve credit or extended payment.

C. *The controlled foreign company regime*

One way of avoiding tax is to establish a company in a tax haven as a vehicle for investment activities. The company derives income free of tax in its jurisdiction of residence, and reinvests the money. When the owner of the shares in the company wants his money he can sell shares in the company to a compliant bank that is itself based in the tax haven. The sale price is a capital receipt that is not taxable as income. The bank recovers its money by liquidating the company.

Several jurisdictions, including New Zealand, have enacted controlled foreign company regimes in order to deter their residents from carrying out this strategy. Broadly speaking, these regimes operate by taxing the profits of controlled foreign companies in the hands of their shareholders, being residents of the jurisdiction that enacts the regime.

D. *Ordering rules in company tax regimes*

Ordinary, domestic companies offer many opportunities for revenue to capital conversions. To take one example, suppose that company A and company B both need capital of $ 1000. Company A issues 1000 $ 1 shares, but company B raises its $ 1000 by issuing 100 $ 1 shares at a premium of $ 9 each. Suppose that after a year each company has distributable profits of $ 200. Company A pays an ordinary dividend of $ 200, which is taxable in the hands of its shareholders. Company B, on the other hand, reduces its share premium account by $ 200, and makes a non-taxable distribution of capital of $ 200.

Both companies retain the $ 1000 that they need as operational capital. For company A the sum is made up of 1000 $ 1 shares. For company B the operational capital is 100 $ 1 shares, $ 700 in the share premium account, and $ 200 in retained profits. Because money is fungible, the economic position of company B is the same as the economic position of company A, but the tax position of the shareholders in company B is superior.

Eventually, if the companies are wound up, the shareholders in company B will have to pay tax on the distribution of the retained profits of $ 200, whereas the shareholders in company A will recover their total capital of $ 1000 without tax. But the shareholders in company B will still be better off because their tax has been deferred, and, indeed, may in practice be avoided forever.

Like other jurisdictions, New Zealand has in its tax laws fairly elaborate rules to prevent taxpayers from effecting intra-company revenue-to-capital conversions both like the example described in the previous paragraph and that take other forms. The New Zealand legislation is in the form of ordering rules that deem distributions from companies to shareholders to be debited first to revenue sums and, only when these are exhausted, to capital items.

E. *'Golden hello' rules*

One way to reduce tax is for an employee to take some of his remuneration in the form of a lump sum as a fee for joining his employer, rather than as taxable salary. The New Zealand Income Tax Act contains rules to frustrate this practice, but not everyone agrees that they work.

XII. THE TAX SYSTEM AS AN INSTRUMENT OF SOCIAL POLICY

The second aspect of the tax system that leads to its complexity is that taxation is often used as an instrument of social policy. The most pervasive example is the progressive rate. Taxation by progression is so widespread among the tax systems of the world that one could be forgiven for suspecting that it is dictated by fiscal imperatives. But this is far from the case. In fact, income tax systems are much easier to design and to operate if they are strictly proportional in their impact. The reason for taxation by progression is to redistribute wealth. Richer people are supposed to pay proportionately more tax than poorer people. As is explained later in this article, a progressive scale of taxation by itself makes tax law complicated.

Other social engineering that is carried out through the tax system has a similar complicating effect on tax laws. When the tax system is used to deliver incentives for farm development, export encouragement, building hotels or anything else, the legislation and its administration become more complicated, to say nothing of the distorting effect on the economy as a whole.

The author's favourite incentive is in Section 114A of the New Zealand Income Tax Act 1976, which encourages taxi proprietors to attach "safety devices" to their cabs by allowing the immediate expensing of the cost of this capital equipment. The Section does not define "safety device", and one might wonder whether parliament was referring to such undoubtedly safety-promoting items as windscreen wipers or headlights.

In fact, in this context, though the reader cannot tell it from the Act, a "safety device" is a fence that is erected between driver and passenger to keep them from attacking one another. Sadly, Section 114A has had almost no impact. People riding as a passengers in New Zealand taxis who are overcome by an urge to attack their drivers do not find safety barriers standing in their way.

There is no need to go into the many incentive provisions that are found in the income tax legislation of the world, nor into the difficulties of administration and interpretation that they impose. They are not hard to imagine. In fact, most of the incentive provisions of the New Zealand legislation were removed during the late 1980s, chiefly to eliminate economic distortion. However, the question of the progressive rate is another matter. It has been a feature of tax systems for so long that many people take it for granted, rather than recognize it for what it is: an instrument of social engineering, rather than a necessary part of a tax system.

© 1993 International Bureau of Fiscal Documentation

XIII. PROGRESSIVE RATES OF TAX

It is fundamental to a progressive system of taxation that different parts of one's income bear tax at different rates: in New Zealand, the taxpayer's first dollar is taxed at a lower rate than dollar number 30,876, because after earning $ 30,875 people move into a higher tax bracket.

It is also fundamental that the same dollar of income will be taxed at different rates according to who derives the dollar. Thus, if a New Zealand parent puts money on deposit in a bank and derives a dollar of interest, the dollar will be taxed at 33 cents, assuming that the parent has used up his tranche of income that qualifies to be taxed at a lower rate. But if the parent gives the money to his infant daughter and she deposits it the interest belongs to the daughter, and she is taxed at only 24 cents. These differences are greater in New Zealand when one takes account of rebates and family support credits for people who do not earn very much. They are even more exaggerated in jurisdictions that have more steeply progressive tax scales.

These aspects of the progressive tax system present many possibilities for the tax planner. The more that income can be split among a number of people, the lower will be the total tax. In fact, the very second reported case on New Zealand's 1891 Act concerned income splitting. This was *Bell and another v. Commissioner of Taxes*.[1] This was a case of a widow who split herself into two taxpaying entities and thereby took advantage twice of the lower rates of graduated tax on the land from which she derived her income. Mrs. Bell was the beneficiary for her life of the income of two landholding trusts. Prendergast CJ held that tax had to be assessed separately on the trustees of each trust. The case involved land tax, but the questions involved have equal relevance for income tax.

Not surprisingly, the current Income Tax Act contains provisions that prevent people getting the advantage that Mrs. Bell was able to enjoy, and there are many other rules calculated to frustrate income splitting of one kind or another.

Nowadays New Zealand has a relatively flat tax scale, and the advantages obtainable from income splitting are less than they were. Nevertheless, the rules must remain in place. Saving the difference between 24 and 33 cents in the dollar (the two rates that apply in New Zealand) can still be worthwhile. In other countries income splitting produced even more fiscal savings for the taxpayer.

Income splitting is the most significant problem that results from a progressive tax scale, but it is by no means the only one as will appear from what follows.

XIV. IMPUTATION SYSTEMS OF COMPANY TAXATION

Imputation systems for company taxation impute to shareholders the tax paid by their companies. Thus, when a company pays a dividend to a shareholder the dividend can carry with it a credit for the tax that was paid on profits earned by the company, out of which the company pays the dividend. If all shareholders paid the same rate of tax, and if all companies shared that rate, the rules of imputation systems could be much simpler than they are. As it is, these rules must allow for times when company tax is lower than individual tax and for times when it is higher, as well as for variations in the rates of tax that apply to individual shareholders.

XV. FRINGE BENEFIT TAX

The New Zealand fringe benefit tax applies to most non-cash benefits that are delivered by employers to employees. The tax is imposed on the employer, as a fraction of the value of the benefit.

The theory of the fringe benefit tax is that it should cost an employer the same to provide a non-cash benefit to an employee as it would to pay the employee enough extra salary to buy the benefit out of the employee's after-tax income.

In practice, this theory cannot be worked out exactly, because an employer who wants to deliver the same benefit to each of two staff members, one with a marginal tax rate of 33 percent and the other with a marginal tax rate of 24 percent, must pay more to the first employee than to the second for the two of them to finish with the same after-tax income. The result is that whatever rate is chosen for fringe benefit tax it will be wrong for some employees.

Parliament solved the problem by setting the level at the rate appropriate for higher paid employees, that is, those whose marginal rate of tax is 33 percent. Thus, employers who provide taxable fringe benefits to employees who enjoy a marginal rate of 24 percent are losing money by the arrangement: more so if the employees' rebates place them in an even lower bracket. From a policy perspective, this is not a result that causes concern to the government, because it is usually preferable from an economic point of view to encourage employers to remunerate their staff in cash rather than in kind.

XVI. CURRENT SOCIAL POLICIES WITHIN THE NEW ZEALAND INCOME TAX ACT

The difficulties that arise from using income taxation as an instrument of social and economic policy have long been recognized. The distorting effect on the economy, which is not discussed in detail in this article, is of course the most serious. A second difficulty is that incentives delivered through the income tax system are partially hidden and their cost is difficult to measure. The third contributes to the theme of this article: using income tax legislation for incentives leads to complexity in the legislation.

New Zealand's tax reforms in the late 1980s removed the bulk of the economic and social incentives from the Income Tax Act, together with some of the redistributive effects of the Act. The reasons for these changes were primarily to remove economic distortions. But a welcome by-product was a degree of simplification of the legislation, though simplification by removal of economic incentives was more than offset by base-broadening measures such as the controlled foreign company regime that is mentioned earlier in this paper.

XVII. INTERPRETATION OF THE ACT

In New Zealand, as in other common law countries, the courts have responsibility for the interpretation of income tax legislation. This responsibility is discharged in the context of disputes between the Commissioner of Inland Revenue, formerly the Commissioner of Taxes, and taxpayers, where there is a disagreement about the meaning of one provision or another. The first reported case on the 1891 Act, *Commissioner of Taxes v. The Gear Meat Preserving and Freezing Co. of NZ Ltd.*,[2] involved the question of whether the Gear Meat Company could deduct its interest payments in calculating its assessable income. This is a question that is still being litigated in its various forms. Only in mid-1991 the Commissioner of Inland Revenue withdrew an appeal to the Privy Council that he had lodged against a Court of Appeal decision on the point in favour of Sir Ronald Brierley, one of New Zealand's leading businessmen.

Be that as it may, in the Gear Meat Company case Richmond J in the Supreme Court made a strong start on the question of the interpretation of income tax legislation. He said at page 525: "One would also expect to find observed in any scheme of taxation adopted in a civilized country the equitable principle that no interest in property assessed and liable to taxation as belonging to A should be at the same time assessed and liable to taxation as belonging to B."

The relevance of this passage to the deductibility of interest is not important in the present context. What is important is that Richmond J approached the interpretation of tax legislation from the point of view of principle, of equity, and of the standard of conduct that people might expect of a civilized country.

Most people would think this an entirely proper way to proceed. However, any tax lawyer from a common law jurisdiction knows that it is quite against the law as propounded by other judges. In fact one of the most frequently quoted aphorisms of tax law interpretation is that there is no equity about a tax.

Three years after the Gear Meat Company case, Prendergast CJ put New Zealand tax jurisprudence back on track in *Commissioner of Taxes v. Duthie & Co. Ltd.*,[3] where he said: "However unequal or unreasonable this legislation may be, that does not permit that the true interpretation of the Act should be departed from."

Broadly speaking, that has been the principle of interpretation of tax law by the judges ever since, except that in recent years some judges have been willing to allow questions of principle a greater role.

XVIII. REASONS FOR STRICT INTERPRETATION

The most often quoted reason for the strict interpretation of tax legislation is that tax law is essentially confiscatory and therefore ought to be interpreted strictly, like a penal statute, to minimize the encroachment on the rights of the citizen. This reason is not so often called in aid nowadays, when it is appreciated that taxation is an essential operation of the body politic. Also, the reason is contrary to Section 5(j) of the New Zealand Acts Interpretation Act 1924. Broadly speaking, Section 5(j) requires statutes to be interpreted liberally. Section 5(j) governs the interpretation of all statutes, though its ostensibly comprehensive coverage has not always been an impediment to literally minded judges.

There are less obvious, but more influential, reasons for the practice of strict interpretation of tax statutes. They are related to, indeed a consequence of, the causes of complexity of tax law that have been discussed in this article: first, that income tax law is founded on a distinction without a difference, namely the purported separability of capital gains and income gains, and, secondly, the practice of using the tax system to achieve social and economic goals.

On one hand, judges seeking an ultimate foundation of principle for the fact that some gains are taxed and some are not realized that they were on a fruitless quest. On the other hand, they were faced with provisions in fiscal legislation that, far from promoting the major purpose of the legislation (assessing and gathering tax) are calculated to furnish benefits to the citizen pursuant to economic or social goals of the government that are not always fully articulated and that are often inconsistent with one another. All that judges could do was to conclude that tax law is, as it were, itself an *a priori* truth. It must be treated as a first cause that owes no debt of logic or paternity to fundamental principle. Consequently, rationalization and principle can be taken only so far; tax law must be interpreted strictly, within the confines of its own statutes.

XIX. RESULTS OF STRICT INTERPRETATION

The first result of the judges' strict interpretation of tax law is the obvious one, that it is often very difficult to reconcile one case with another, even on the facts, let alone according to principle.

The second result is indirect. Because of the strict interpretation of revenue statutes parliaments have felt compelled to draft laws in exquisite, elaborate and often incomprehensible detail, in an effort to ensure that the courts interpret them according to what was intended. Even then, the effort is sometimes in vain.

This reason helps further to explain the incomprehensibility of tax law. Incomprehensibility is something that feeds on itself. The Income Tax Act is based on a mistake of principle, and is employed to pursue goals that sit uneasily with taxation. These factors in themselves make the Act hard to understand. This lack of understanding leads judges to confine themselves to the strict words of the Act because there is no over-arching principle to which they can turn. To ensure that the courts get it right, Parliament is forced to go into increasing detail with its laws. And so the treadmill goes on.

INTERNATIONAL:

A TAX ON GROSS ASSETS OF ENTERPRISES AS A FORM OF PRESUMPTIVE TAXATION

Efraim Sadka and Vito Tanzi

I. INTRODUCTION

In 1988 Mexico adopted a new tax on enterprises and individuals who engage in business activities. The base of the tax was broadly the gross assets of the taxpayer. The tax became effective in 1989 and was imposed at the rate of two percent. For technical reasons it was extensively amended on 26 December 1990. In 1989 Argentina introduced a similar tax, which became effective in 1990 at the rate of one percent. Both are annual taxes calculated on the basis of the assets declared by the enterprises or other taxpayers who own real assets. Bolivia, Costa Rica, Peru and Uruguay have been considering the introduction of similar taxes. In Costa Rica in 1990 the government proposed such a tax to Congress but the proposal was rejected. It is likely that over the next decade the tax on gross assets will spread to other Latin American countries and perhaps to countries in other parts of the world.

There have been two basic reasons for the introduction of this tax in Latin America: first, the need for additional revenue in countries undergoing major adjustment programmes; second, the realization that traditional taxes on the income of enterprises do not fare well in situations of substantial inflation. Inflation generally destroys the taxable base for the traditional taxes on business income. Furthermore, enterprises accumulate large losses that can be carried forward to future years and that guarantee that the enterprises will escape paying any taxes for several years.[1] There has been a negative popular reaction in many countries to apparently viable enterprises that had over several years been declaring losses to the tax authorities.

The tax on the gross assets of commercial or business activities may appear as a recent technological development in the tax field and, in a way, it is. However, as with many "new" ideas in economics, it has a quite respectable background, a background that goes back to the 17th century and that, in this century, has received the attention of two prominent economists, namely Luigi Einaudi and Maurice Allais. Some version of this tax also featured in earlier years in the tax systems of the centrally planned economies.

In this paper we provide an analysis of this tax within the context of presumptive taxation in general.[2] The next section will survey briefly the historical background. Sections III and IV will discuss some aspects of presumptive taxation of which the tax on gross assets is an example. Section V will address more directly the tax on gross assets while Section VI will draw a few conclusions.

II. HISTORICAL BACKGROUND

The idea of a tax on the value of assets, rather than on the income that the assets generate, seems to have originated in the 17th century in the Principality of Milan when in 1760 a cadastre listing land values was enacted into law and agricultural activities were no longer taxed on some estimate of actual income generated but on the value of the land.[3] This new tax ignored the personal conditions of the owners. Writing in 1839, Carlo Cattaneo, a prominent Italian economist of the period, wrote:

> The principal effect [of this tax] was to weigh on leisure and to stimulate enterprise and effort; since, once the tax was estimated on the base of the cadastral value, all successive improvements were exempt; the better is the land cultivated, the lower is the tax.[4]

Efraim Sadka received his Ph.D. in economics from the Massachusetts Institute of Technology. He is Professor of Economics and Director of the Sapir Center for Development at the Tel Aviv University. He has been visiting professor at various universities in the United States, and he has also been a Visiting Scholar at the International Monetary Fund. He has published several articles in leading journals. His major interests are public finance, welfare economics, human resources, urban economics and health economics.

Vito Tanzi received his Ph.D. in economics from Harvard University. He is Director of the Fiscal Affairs Department of the International Monetary Fund. He has also been on the faculty of various universities and a consultant for the World Bank, the United Nations, the Organization of American States and the Stanford Research Institute. He has published nine books, the most recent of which is Public Finance in Developing Countries (Edward Elgar, 1991). He has also written a large number of articles in leading journals. His major interests are public finance, monetary theory and macroeconomics. He is currently the President of the International Institute of Public Finance.

Cattaneo added that "with a single operation one can punish leisure and stimulate effort".[5] He attributed to this tax the economic prosperity that followed its introduction in the Principality of Milan.

The principles espoused by Cattaneo were accepted and developed by Luigi Einaudi, the distinguished Italian policy maker and economist who, after World War II, became Governor of the Central Bank of Italy and President of the Italian Republic. Einaudi was one of the most respected public finance scholars in the first half of this century and to this day remains very influential in Italy and in Latin America. Unfortunately, because his work is available only in Italian, it has not had the influence it deserves in the Anglo-Saxon world.

Almost 60 years ago Einaudi presented his ideas about what he called the optimum tax (or "imposta ottima").[6] He argued against a tax based on the effective income of a taxpayer, a tax that he described as "technically impossible" and "economically disastrous" because of its effects on incentives. He favoured an income tax based on "average income" by which he meant the income that would be received in a given year by a taxpayer who (a) worked an average number of hours, (b) contributed an average level of effort, (c) took an average risk and (d) used the average technology of the time. He argued that an income tax based on "average income" (or using Einaudi's preferred terminology, on "normal income") would stimulate production and contribute to growth. The concept of "normal income" is still frequently discussed in Italy where it has many supporters and has had some effect on recent Italian tax legislation.[7] The presumptive taxes in several other countries [8] are often an application of this concept (see Tanzi and Casanegra, 1989).

Einaudi stressed that "the fertility of the idea is not limited to land. [But it can be applied] to the taxation of commercial, industrial, and professional incomes" (Einaudi, pp. 226-27). He argued that, when taxpayers are taxed on the basis of an average income and not on their actual income, they have an incentive to produce above the average, as this excess would be taxed with a marginal rate of zero. He maintained that the determination of the "normal income" *for a given category of taxpayers* should be easier than trying to ascertain the effective income of each taxpayer as is done in modern income tax systems.

Another casualty of linguistic provincialism is Maurice Allais's book, *L'Impôt sur le Capital et la Réforme Monétaire* (Tax on Capital and Monetary Reform). This book, written by a Nobel Prize winner, is unknown to English readers. It was first published in 1977 and was reissued, also in French, in 1988. It proposes a tax system based on a general tax on physical assets, a general tax on consumption and a few other revenue sources. For us the interesting tax is the one on physical assets.

The general tax on physical assets would be levied with a uniform rate of two percent (interesting enough, this is the level of the Mexican tax on gross assets) and would replace existing income taxes on individuals and enterprises. The base of the tax would be only physical assets. It would thus not include bonds, shares, money holdings and other non-physical assets (such as patents, copyrights or brand names). No deductions would be allowed. Allais proposed an ingenious system for presenting the annual declaration and for determining the value of the assets. Because of space limitations only a brief description is provided here.

The taxpayer would present an annual declaration in which she would list and provide an estimated value *for each and all* assets located in a given municipality or district. A tax payment equal to two percent of the declared value of the assets would accompany the declaration. The taxpayer could choose to remain anonymous, if she wished, as long as she provided the full list of the assets she owned and sent the full payment. Thus, in a way, the tax would be *ad rem* rather than *ad personam*. The tax administration would make public the list of all assets reported and the declared values. It would not challenge the declared values but would have the power to buy any asset which it considered undervalued provided that it paid a price equivalent to 140 percent of the declared price. Any person could also propose to buy any asset on the published list at 150 percent of the declared value. Any such proposal, however, would be accompanied by a substantial deposit in order to discourage frivolous offers. The taxpayer who owned the asset under consideration would have the option to respond by paying five percent of the declared value if the proposal to buy was made by the tax administration, and by paying ten percent of the value if the proposal to buy was made by someone else. In this latter case, half of the payment by the taxpayer would go to the person who offered to buy the asset at 150 percent of its price.

Allais argues that his general tax on physical assets would stimulate investment, would be equitable and would reduce tax evasion to practically zero. In fact, if the system worked, the job of the tax administration would be reduced largely to ascertaining that all assets were reported, a function much easier than ascertaining values.

To complete this brief historical survey, a mention should be made of the taxes on the book values of the fixed assets of state enterprises introduced in the 1960s by several centrally planned economies. These taxes, levied with rates of five to six percent, were intended to stimulate a more efficient use of capital and to provide a sort of dividend to the state which provided the capital to the enterprises. These taxes were eventually phased out.

III. A MODEL OF PRESUMPTIVE TAXATION

Suppose an individual possesses some endowment of a productive good or service. This commodity could be, for instance, land, or capital, or leisure. We assume that this

5. *Id.*, at 214.

6. Einaudi's basic ideas, together with a discussion of the experience in the Principality of Milan and of the work of Cattaneo, are outlined in Chapter 10 of Einaudi (1959). Chapter 10 is entitled, "The Italian Science and the Optimum Tax" and was first published in 1938 although the basic ideas are contained in earlier writings of 1924.

7. A recent Italian book has analysed the concept and the experiences with taxes on "normal income". See Leccisotti (1990).

8. Until 1975, presumptive income taxes were imposed in Israel on many types of self-employed individuals. Today, these taxes apply only when the taxpayers' records are poorly maintained.

© 1993 International Bureau of Fiscal Documentation

endowment generates some non-market benefit to its individual owner. For instance, she may enjoy the self-consumed landscape services, or recreational services, or crops of some piece of land, or the self-consumed housing services of a house. In the case of leisure, the individual may enjoy the direct consumption of it. Another possibility is to assume that for the endowment to produce a market good or service, the individual owner has to put some effort in the production process. She may have to hire workers and supervise them. She may have to search for the best or most efficient uses of her capital, etc.

In any event, we assume that for the endowment of the productive good or service to produce a market good, the individual owner must give up some non-market benefit which is not taxable, or invest some effort in the production process. In both cases there is a loss of utility. In order to avoid needless repetition we will simply say that the individual must make some effort in order to obtain a market, consumable, good or service from her productive endowment, and that effort is a "bad", not a "good", in that it generates disutility. We think that this is a fair description of the productive characteristics of capital, and especially land, in many developing countries. For developed countries, this setup is more suitable for the study of the labour-leisure trade-off.

Denote the consumption of the market good by x, and effort by y. We then say that individual utility (u) is some function, $u = u(x,y)$, of x and y. Utility depends positively on x, but negatively on y. Thus, the individual faces the following choice or trade-off: in order to enjoy x, she must suffer from y.

Specifically, suppose that if the individual makes a "normal" (or "average") effort, she earns from her productive endowment an actual income of n. We refer to this level of income as normal (or average) income. Of course, she can make more or less than a normal effort, in which case her actual income will be more or less than the normal income, respectively. Let us calibrate the level of effort so that a normal effort will be designated by $y = 1$. Thus, actual income (denoted by z) is given by:

(1) $z = yn$.

When normal (or average) effort is made (i.e. $y = 1$), actual income, according to equation (1), is indeed equal to normal income (i.e. $z = n$). When more than a normal effort is made (i.e. $y > 1$), then actual income exceeds normal income (i.e. $z > n$). Similarly, when less than a normal effort is made (i.e. $y < 1$), then actual income falls short of normal income (i.e. $z < n$).

The consumption that an individual can enjoy is equal to net, after-tax actual income, that is:

(2) $x = z\text{-}T \equiv yn\text{-}T$,

where T is the tax payment.

Now, suppose that the government can choose between two alternative income tax schemes. The conventional scheme is a tax on actual income, that is, a tax on z. In this case, T is some function, say T_A, of z, that is:

(3) $T = T_A(z)$.

An alternative scheme is a tax on normal (or average) income, that is, a tax on n.[9] Such a tax on normal or average income may be termed also as a tax on *presumptive* income (see Tanzi and Casanegra de Jantscher (1989)). In this case, T is some function, say T_N, of n, that is:

(4) $T = T_N(n)$.

According to this tax scheme, the individual who makes more than a normal effort and earns an actual income (z) in excess of normal income (n) gets to keep all of the excess income to herself. In this way, the individual is not penalized by the state with a higher tax liability for making more effort. Making more effort produces a higher actual income without creating a higher tax liability, unlike the case when the tax is levied on actual income. In the latter case, more effort, which means more actual income, generates also a higher tax liability. Put differently, with a tax on normal income, the marginal tax rate on actual income is zero.

The detailed derivation of our analytical model is relegated to the Appendix. In the next section, we will only state and explain heuristically the results.

IV. PROPERTIES OF PRESUMPTIVE TAXATION

Several useful and interesting comparisons can be made between the tax on normal or presumptive income and the tax on actual income. Since normal income is exogenously given (at least in the short run), it follows that the base for the normal income tax is fixed and thus does not depend on individual behaviour. In this way the normal income tax works like a lump sum tax: it imposes no marginal tax burden on actual income. Thus, it maintains Pareto efficiency. This is not to say that the tax does not change individual behaviour. To the contrary, when effort is a normal "bad" (that is, the individual will make less effort to increase actual income, if she is given a lump sum transfer – a commonly accepted assumption in the labour supply literature), then a tax on normal income increases effort and, consequently, actual income. What is implied by the efficiency of the normal income tax is that no wedge is created by the tax between the individual marginal rate of substitution between consumption (x) and effort (y), on the one hand, and the marginal productivity of her effort (n), on the other hand.[10] This is unconditionally true in the short run, since normal income is fixed in the short run.

In the longer run, individuals can invest in their human capital and increase their productive capacity. That is, they can increase normal income (n), which is the income that can be obtained by a normal level of effort (namely, $y = 1$). Hence, a tax on normal income tends to discourage investment in human capital in the long run. But so does the tax on actual income. This is because an increase in normal income means an increase in actual income as well. This disincentive effect of both forms of taxation on investment in human capital may be alleviated, in principle, and even totally eliminated, by allowing appropriate tax deductions for investment in human capital.

9. Many aspects of such a tax, in one version or another, were discussed by Tanzi (1980) and by Tanzi and Casanegra de Jantscher (1989).

10. Notice that the marginal productivity of effort is equal to normal income (n). This is because, by (1), increasing effort (y) by one unit increases actual income (z) by n.

© 1993 International Bureau of Fiscal Documentation

In contrast, the tax on actual income has the familiar disincentive effects on effort. Therefore, its redistributive capacity is severely restricted. One always has to consider the tradeoff between the size of the national pie and its distribution when employing a tax on actual income in order to reduce income inequalities.

Furthermore, actual income (or consumption) is not a good measure of utility or well-being. Utility depends not only on actual income but rather also (negatively) on work effort. Therefore, when individual A has a higher actual income than individual B, it does not necessarily mean that individual A is better off than individual B, if individual A had to make a much greater effort than individual B in order to obtain a higher actual income. Thus, to tax more heavily people with higher actual income is not necessarily equitable. For instance, John Stuart Mill (1923, p. 808) wrote:

> I am as desirous as anyone that means should be taken to diminish... inequalities, but not so as to relieve the prodigal at the expense of the prudent. To tax the larger incomes at a higher percentage than the smaller is...to impose a penalty on people for having worked harder....[11]

Therefore, because of the disincentive effects on effort and because actual income is not necessarily a good indicator of well-being, it follows that an optimal tax on actual income is not necessarily progressive, that is, the average tax rate on actual income (namely, $T_A(z)/z$) need not increase in line with actual income (namely, z). In his pioneering work, Mirrless (1971) concluded that the tax is almost linear for the bulk of the income range, that is, the marginal tax rate is almost constant (a flat rate income tax). Sadka (1976) showed that the marginal tax rate on actual income should gradually decline to zero at the top end of the income distribution.

In contrast, the optimal tax on normal income should always be progressive. That is, the average tax rate on normal income (namely, $T_N(n)/n$) increases in normal income (namely, n). Apparently, this result obtains because the normal income tax creates no disincentive effects on effort.

Another result which is most important for our purposes is that it is often the case that when actual income serves as the tax base, people with low actual incomes will not be taxed at all and may even be offered some kind or another of income supplements (a negative income tax). This creates a strong incentive not to make any effort at all to produce actual income. Most studies of optimal taxation on *actual* income suggest that people at the bottom end of the distribution of *normal* income find it in their interest to have no actual income and they in fact choose to have no income. This is socially inefficient. With a tax on normal income, this is never the case. Everyone will produce an efficient amount of actual income, given his or her normal or presumptive income.[12]

V. A TAX ON GROSS ASSETS OF ENTERPRISES

In many countries, mostly developing ones, the tax on the *actual* income of enterprises had led to many problems. A major problem is the inflationary environment of these countries which allowed companies to change true sizable profits, via nominal interest deductions, into reported losses for tax purposes (see Sadka, 1991). The enterprises simply stopped contributing to tax revenues and the withholding tax on wage earners became the major source of direct tax revenues. For instance, during the high inflation periods in the early 1980s in Israel, and before a comprehensive tax indexation scheme could exert its influence on tax revenues, wage earners accounted for roughly two thirds of all income tax revenues, compared with about 40 percent at present. Furthermore, since accumulated losses are in many cases carried forward with indexation for inflation, enterprises could go on without any contribution to tax revenues for many years.

Second, in some developing countries capital is not always allocated to its most efficient uses. The reason might be that there are alternative, socially inefficient uses by the owners of capital, which are intangible and thus untaxable; consequently, such uses become attractive to the individual, private owner, even though they are socially inefficient.

In such cases, a tax on gross assets of individuals and enterprises may serve as a tax on normal or presumptive income, as compared with a tax on actual income. This is because gross assets may be a good indicator of *normal* or *average* income. Thus, a tax on gross assets has in the long run similar effects on employment and capital accumulation as a tax on actual income, but it enhances more efficient uses of capital[13] and is easier to administer in developing countries, especially in inflationary environments.

Indeed, economic theory suggests that the market value of the firm's assets is equal to the net present value of the future (after tax) cash flows generated by these assets. That is, the market value of the assets reflects more the high *true* profits to be generated by them, rather than the low profits or even losses *reported* for tax purposes.

As mentioned earlier, a tax on gross assets of enterprises has been introduced in Mexico and Argentina, and has been under consideration in Costa Rica, Peru and Uruguay. So it is very likely that this tax will spread to other developing countries. (One may view the property tax in developed countries

11. A similar argument may apply to risk-taking when losses cannot be fully offset for tax purposes. In this case, one can argue that "to tax the larger incomes at a higher percentage than the smaller is...to impose a penalty on people for having taken a greater risk". This argument is nullified when losses are fully offset. In the latter case, the tax refund in the event of a loss compensates for the higher tax in the event of a big gain.

12. Finally, one can equivalently replace the notion of normal (or average) income by the notion of *potential* income, where the latter is defined as the income the individual can achieve when she makes the *maximum* level of effort. Whether the tax is levied on normal or potential income -- in both cases the tax base does not depend on individual behaviour. Normal income as well as potential income are both exogenously given, at least in the short run. Hence, a tax on normal income can be equivalently replaced by a tax on potential income (with a lower rate) and vice versa (see the Appendix for a formal proof). Thus, all the advantages of the normal income tax pertains to the potential income tax as well. However, normal income being an average for many taxpayers is easier to measure.

13. A tax on gross assets is neutral with respect to risk-bearing because the tax liability is then a priori given, independently of whether a high return or a low return is actually experienced. In contrast, a tax on actual income, without a loss offset, discourages risk-bearing since it cuts into the owner's high return in case of "success" without offering a tax refund in case of "failure" (loss). With full loss offset, a tax on actual income encourages risk-bearing, since it reduces the risk to the owner, by taking an equal share in profits and losses.

© 1993 International Bureau of Fiscal Documentation

as a kind of tax on gross assets, though it does not serve in lieu of a tax on the income generated by the property.) It will be therefore useful to study the main practical issue associated with a tax on gross assets. As with the implementation of any tax, key elements are the definition of the tax base and the determination of the tax rate.

A. *Tax base*

In determining the tax base, one has to pay attention to two issues: which assets to include in the base and how to evaluate them. The two issues are not totally independent of each other. For instance, one may wish to exclude a certain asset from the tax base not on theoretical grounds, but rather simply because there is no practical, meaningful way to evaluate it.

When dealing with the issue of evaluating assets, the first aspect that comes to mind is inflation. However, in order not to be overwhelmed with the effect of inflation and distract attention from other, perhaps even more complicated issues, we shall leave aside discussion of the effect of inflation for later on, and assume for the moment that the rate of inflation is negligible.

In principle, we think that the tax base should include all fixed assets, such as land, structures, machinery and equipment. These assets are essential to the production process of the firm. Coupled with labour, raw materials, energy and other variable inputs, these fixed capital assets generate a stream of incomes to the firm. The idea is then to calculate and tax the *normal*, additional (marginal) contribution of these assets to the firm's stream of incomes.

In order to avoid double taxation, the firm's holdings in fully or partially owned subsidiaries or any other companies should not be included in the firm's tax base because the subsidiary itself is liable to pay the tax on its gross assets. An exception to this rule is the firm's holdings in foreign entities. These holdings should be taxed with proper credit afforded against foreign-paid taxes. A difficulty may arise regarding enterprises that are owned by foreign firms. In this case, it is essential to work out a tax treaty with the foreign countries that will accept the tax on gross assets as an income tax, which qualifies for a foreign tax credit in the foreign countries. For otherwise, enterprises owned by foreign firms will be taxed twice: by the home country (through the tax on gross assets) and by the foreign country (via the income tax). So far, the US Internal Revenue Service has refused to grant credits against foreign taxes on gross assets, claiming that such taxes cannot be viewed as income taxes. For this reason, Mexico, for instance, made the tax on gross assets a minimum *income* tax, so that US firms will qualify for credits against taxes on gross assets paid by their subsidiaries in Mexico. We shall discuss this issue further in the concluding section.

Cash balances, accounts receivable, inventories and other current assets should not be included in the tax base. The rationale for this is that these assets are not inherent in the production process, nor do they constitute an integral part of the real economic nature of the firm's activity. They are there because production and transactions are not timeless and because of the institutional framework in which the firm operates. If the firm were always to sell its products and to pay for its labour, raw materials, etc., at exactly the same point in time, then it would hold no cash and there would be no accounts receivable (nor accounts payable on the liability side). Similarly, if production were timeless, the firm would hold no inventories. Current assets tend, by their very nature, to fluctuate considerably during the year in response to various transitory phenomena and they could not serve as a measure of the firm's "ability to pay", when the latter concept is understood to be tantamount to the firm's potential income.

In principle, the tax base should include not only tangible assets but intangible assets as well. For instance, intangible assets, such as goodwill, brand name and market power, certainly have their own contribution to the firm's ability to pay or potential income. Thus, they should, in principle, be taxed. However, there does not seem to be a practically meaningful way to establish arm's length prices for these intangibles[14] and hence they should be excluded from the tax base for practical reasons. An exception to this rule arises when the firm is sold to an arm's length party. In the latter case, it is very likely that the price paid for the firm will reflect, in addition to the production costs of the firm's *net* tangible assets plus some adjustment costs and the like (Tobin's q), also the value of the firm's intangibles. It is interesting to note in this case that the buying firm (the parent company) will include the value of the intangibles of the purchased firm (the daughter company) in its consolidated balance sheet, either as a separate item or as an imputation to the other tangible assets of the daughter firm. But the daughter company will still have no mention of the value of the intangibles in its balance sheet. Thus, when computing the value of the gross assets of the daughter firm, one has to resort to the parent company's financial statements in order to compute the value of the intangibles. Notice that our recommended treatment of intangibles creates some inequity: in one case (when they are realized), they are subject to tax; in another case, they are not. In this respect, our treatment of intangibles is no different than the conventional treatment of capital gains: when they are realized, they are taxed; when they only accrue, but are not realized, they escape the tax.

Having established what assets to include in the tax base, one has to determine what value to assign to them. Now we drop our assumption that the rate of inflation is negligible. One cannot simply rely on the (historic) book value (i.e. purchase price or production cost) of the assets. A minimal requirement will be to adjust the (depreciated) value of the assets by the rate of inflation. The latter is most commonly measured by the Consumer Price Index (CPI). The market value or replacement cost of many fixed assets, such as machinery, equipment or structures, which are relatively elastically supplied, is closely related to their production costs. In many high inflation, developing countries, wages and other input costs are indexed to the CPI. These other costs may include the cost of energy whose price is set by the government and indexed to the CPI, loans provided either directly or indirectly by the government and indexed (principal and interest) to

14. In fact, in many countries a firm would not officially admit it possesses any kind of market power, since it may invite in such a case one sort or another of government intervention to nullify such a market power.

© 1993 International Bureau of Fiscal Documentation

the CPI, imported raw materials with the rate of foreign exchange closely following the CPI and other items.

In this case, the depreciated book value of the asset, adjusted by the CPI, may be indeed a good estimate of the market value of the asset. However, for a relatively inelastically supplied factor of production, such as land, the CPI-inflated book value may deviate considerably and consistently from the market value. For such assets, one may consider adjusting the book value by a *regional* index of real estate prices or by asset-specific indexes (see Tanzi, 1981).

Lastly, since some fixed assets may be purchased and some sold during the tax year, the tax base should be a *weighted average* of the stock of gross assets that existed during the tax year. The weight assigned to each asset would be the proportion of the year the asset was owned by the firm.

An alternative would be to tax the assets owned by the firm on a specific day of the year (say, the last day of the fiscal year).

B. *Tax rate*

The first issue that we encounter when discussing the tax rate is somewhat related to the issue of the tax base: whether *gross* assets or *net* assets (that is, gross assets less debt) should be taxed. We advocate gross assets as the tax base. We prefer to impose a relatively *low* tax rate on *gross* assets than a relatively *high* tax rate on *net* assets. Suppose, for instance, that all assets (of firms and individuals) are financed 50 percent by debt (a debt-to-equity ratio of one). In this case a tax on gross assets at the rate of t is equivalent to a tax on net assets at the rate of 2t. Thus, if all firms and individuals use the same rate of debt financing, it would make no economic difference whether gross assets or net assets are taxed (since the tax rate can be adjusted accordingly). Now, firms may employ different debt-financing ratios. We nevertheless still recommend that the tax be imposed on gross assets. In this way, we eliminate any tax advantage to debt over equity financing. All gross assets, no matter how financed, are equally taxed.

This is not to say that we ignore the fact that the firm must pay interest on its debt, which reduces the amount of funds available to pay the tax. To the contrary, the rate of tax will be designed as if the assets were fully financed by debt. This amounts to exempting, at the corporate level, equity holders from tax on a return on their equity, which is equal to the interest on debt. To put it differently, dividends (up to a rate which equals the interest rate) and interest are treated equally, both being tax deductible. Of course, they should both be taxed at the individual level (through interest, dividend and capital gains taxes). In this way, one can achieve an integration of the corporate tax with the individual income tax.

Suppose that the expected real return on capital is estimated to be ρ. Assume further that the *real* rate of interest is r. Under these circumstances, the presumptive "profit" of the firm is taken to be ρ-r per one unit of value of gross assets (after allowing for an imputed interest on equity). If the existing statutory corporate tax rate is τ, then our recommended rate of tax (t) on the gross assets is given by $t = \tau (\rho - r)$.

When resources are (economy-wide) efficiently allocated, ρ and r are uniform across all firms. And to maintain interfirm and interindustry efficiency, the tax rate on gross assets must be uniform too. However, at present it is likely that capital is not efficiently allocated (and one of the aims of the tax on gross assets is to improve efficiency). Therefore, in order to allow a more gradual, smoother transition toward a more efficient resource allocation, interindustry variation in the tax rate on gross assets might be justified. This variation, if introduced, should be gradually eliminated in the longer run.

Lastly, in many countries, with a corporate income tax in place, accelerated depreciation allowances, investment tax credits and the like are often used as counter-cyclical macroeconomic policy tools intended to stimulate a sluggish economy. These tools may be preserved in our case of a tax on gross assets too, in the form of a lower tax rate for new capital assets.

VI. CONCLUSION

We outlined two purposes for a tax on presumptive income. One purpose is to extract some taxes from firms or individuals who managed to take advantage of certain economic conditions (e.g. high inflation) in order to report losses and escape the traditional income tax. Another purpose is to enhance economic efficiency in the spirit of the writings of Einaudi and Allais.

In view of the first purpose, a tax on gross assets can merely serve as a minimum income tax. Thus, the tax on gross assets does not come in lieu of the tax on *actual* income. However, the second purpose dictates that a tax on normal income should not serve as a minimum tax on income. The efficiency advantage of the tax on normal income is that it gives an incentive to the economic agents to produce above the average, as this excess would not be taxed at all (i.e. zero marginal tax rate). Hence, if the presumptive tax only serves as a minimum tax, it loses a great deal of its efficiency advantage, since all income in excess of the income level which generates the minimum tax is then subject to an ordinary tax on actual income.

Nevertheless, practical considerations tilt the balance in favour of the tax on gross assets as a minimum tax and not as a final tax in lieu of the ordinary tax on actual income. Developing countries can vastly benefit from direct foreign investments and are eager to attract such investments. The US Internal Revenue Service is unlikely to accept a tax on gross assets, when it is a final tax, as an income tax. This may be the case in other economic powers. As a result, firms located in the United States, Europe and Japan, may not be entitled to tax credits against foreign taxes on gross assets paid by their subsidiaries in foreign countries. Such firms will be doubly taxed on their investments in countries with gross asset taxes. This could be detrimental for direct foreign investment. Therefore, the tax on gross assets should serve only as a minimum tax and not as a final tax.

APPENDIX

A. *A basic income tax model*

Following the same notation employed in the text, we note that the individual faces a standard consumer's utility maximization problem, subject to a budget constraint, that is:

(A1) $\max_{\{x,y\}} u(x,y)$
subject to: $x = z\text{-}T \equiv ny\text{-}T$.

It is assumed that u is strictly increasing in x, strictly decreasing in y, and strictly concave in (x,y). It is further assumed that consumption (x) is a normal good, while effort (y) is a normal "bad," that is: a lump sum transfer made to the individual lowers her effort.

Our analysis compares two different income tax schemes. The conventional scheme is a tax on actual income, that is, a tax on z. In this case, T is some function, say $T_A(\cdot)$ of z, that is:

(A2) $T = T_A(z)$.

An alternative scheme is a tax on normal or average income, that is, a tax on n. In this case, T is some function, say $T_N(\cdot)$ of n, that is:

(A3) $T = T_N(n)$.

In order to compare these two tax schemes, one has to specify the objective of the government, the government's revenue needs and the productive capacity of the economy. Suppose that the range of normal incomes in this economy is between $N_1 > 0$ and $N_2 < \infty$, and let F(n) describe the cumulative distribution function of normal incomes, that is: F(n) is the number of individuals with a normal income below n, or equal to n. Denote the level of effort that an individual with a normal income of n (henceforth, an n-individual) makes by y(n), so that her actual income is then $z(n) \equiv ny(n)$.

Suppose also that the government has to finance an amount G of public expenditures by income tax revenues. Let T(n) be the tax payment made by an n-individual, whether through a tax on actual income or on normal income.

The government then faces a budget constraint

(A4) $\int_{N_1}^{N_2} T(n)dF(n) = G.$

which states that tax revenues (the left-hand side of (A4)) must equal public expenditures.

In designing the tax scheme, the government attempts to maximize some social welfare function which we assume to be of the commonly employed form

(A5) $\int_{N_1}^{N_2} \frac{1}{1-\sigma} [u(n)]^{1-\sigma} dF(n),$

where $0 = \leq \sigma \neq 1$, and u(n) is the utility level enjoyed by an n-individual.

The above social welfare function is very general. Two extreme, special cases are worth mentioning. When $\sigma = 0$, we have the classical Benthamite, utilitarian sum-of-utilities social welfare function. When σ approaches infinity we have the Rawlsian max-min social welfare function, which exhibits the highest degree of egalitarianism. Thus, depending on the specific value of σ, the social welfare function (A5) can exhibit any degree of egalitarianism, from the lowest level to the highest level. In what follows, we do not assume any specific value of σ, so that our results hold in general for any degree of egalitarianism.

Our aim is to compare a tax on actual income, in which case

(A2′) $T(n) = T_A(z(n))$,

and a tax on a potential income, in which case

(A3′) $T(n) = T_N(n)$.

The optimization problem faced by the government when designing an optimal tax scheme on actual income is to choose such a tax scheme which maximizes the social welfare function (A5), subject to the budget constraint (A4). In doing so the government faces also a *market* economy implementability constraint which states that the government can dictate neither the level of effort (i.e. y(n)), nor the actual income (i.e. $z(n) \equiv ny(n)$), nor the consumption (i.e. x(n)) of an n-individual. Rather, once the government chooses a tax scheme on actual income (i.e. T_A), it is left up to an n-individual to choose her level of effort, actual income, and consumption so as to maximize her utility subject to her budget constraint (see A(1)). A similar optimization problem is faced by the government in designing an optimal tax on normal income.

Fortunately, it turns out that our basic model is isomorphic to the optimal tax model developed by Mirrlees (1971), and then further analysed for our purposes by Sadka (1976a and 1976b), and by Helpman and Sadka (1978). The results reported in the text draw on these studies.

B. *An extension: a diversity of distastes for effort*

A useful extension of the model employed so far is to let variations of actual incomes for any given level of normal income. Specifically, let us assume that for each level of normal income there are many people with different tastes for consumption and distastes for effort. That is, utility (u) becomes a function not only of consumption (x) and effort (y), but rather also of some taste parameter (α), that is $u=u(x,y,\alpha)$. For each level of normal income (n), denote the cumulative distribution function of the taste parameter by $H_n(\cdot)$.

Here again we may consider a tax on actual income and a tax on potential income. Under the latter tax, people with the same normal income (n) may generally have different actual incomes, depending on their taste parameter (α), but they are all liable for the same amount of tax.

This extended model is also isomorphic to a model of income taxation studied by Helpman and Sadka (1978). It turns out that the results presented in the text (for the original model) are valid in our extended model as well.[15]

15. Strictly speaking, we have to assume that the distributions of normal incomes and of tastes are statistically independent (that is: H_n is independent of n).

© 1993 International Bureau of Fiscal Documentation

C. *An extension: a tax on potential income*

We have so far calibrated the level of effort so that y = 1 was designated as a "normal" level of effort. Hence, an income level of n which equals ny when normal effort (i.e. y = 1) is made, was designated as normal income. Thus, a tax on n was a tax on normal income.

One may alternatively calibrate effort so that y = 1 is the maximum level of effort or potential effort. In this case, an income level of n which equals ny when the maximum effort (i.e. y = 1) is made may be interpreted as potential income. With this interpretation in mind, a tax on n is a tax on potential income (see Tanzi, 1980).

THE NEW US/NETHERLANDS DOUBLE TAX CONVENTION: AN INTRODUCTORY NOTE

Wim Wijnen

On 18 December 1992 the Netherlands and the United States signed a new tax treaty which will replace the existing 1948 treaty. The new treaty has to be submitted for parliamentary approval in both countries, meaning that its earliest effective date is 1 January 1994. The new treaty provides for a transitional period of one year.

The most important feature of the new treaty is undoubtedly the limitation on benefits provision, an anti-abuse provision which is more or less common in recent US tax treaties. This provision restricts the benefits of the new treaty to persons who meet the requirements of a stock quotation test, an activities test or a shareholders/base erosion test. A new feature is a separate test for headquarter companies.

The limitations on benefits provisions are much more detailed and complicated than is usual in US treaties for two reasons. First, related companies are taken into account to a much larger extent. Further, these tests also take into consideration activities and related companies in other EC member states. However, it should be noted that this EC extension is limited to situations in which the treaty between the United States and the respective EC member state would have offered the same treaty benefits.

The rate of withholding taxes remains unchanged, i.e. five percent for participation dividends (participation of at least ten percent) and 15 percent for other dividends. The 15 percent rate is also available in certain circumstances for distributions by Real Estate Investment Trusts or Netherlands real estate investment companies. The withholding tax rate for interest and royalties remains at zero percent. Under certain conditions no secondary withholding tax will be levied on royalties. A branch profits tax of five percent is new.

Mr. Wijnen was head of the bilateral affairs division of the International Fiscal Affairs Department of the Ministry of Finance and has worked as a tax adviser with Loyens & Volkmaars in Rotterdam since 1991.

Other salient features of the new treaty include:
- the definition of US and Netherlands territory includes the continental shelf;
- the treaty applies to the Netherlands state profits share;
- the treaty provides for a deemed permanent establishment with respect to offshore activities continuing for more than 30 days;
- the treaty applies to the insurance excise tax;
- there is no tie-breaker rule for dual resident companies;
- capital gains on shares in real estate investment companies are taxable in the situs state; under certain conditions step-up to the value of 1984;
- lump-sum payments within five years after migration are taxable in the source state;
- exemption from dividend withholding tax for pension funds;
- exemption from tax in both states for charitable, scientific, educational and public purpose organizations.

Finally, the Netherlands will introduce legal measures to prevent the use of foreign permanent establishments as financial instruments by Netherlands incorporated companies (triangular cases). These measures are to be taken before the new treaty is sent for approval to the US Senate Foreign Relations Committee. However, if such anti-avoidance measures are not adopted into Netherlands law by that time, such measures will be set forth in a separate protocol to the new treaty.

EXCERPTS FROM US/NETHERLANDS DOUBLE TAXATION CONVENTION

Article 2
TAXES COVERED

1. The existing taxes to which this Convention shall apply are in particular:

a) in the Netherlands:
- de inkomstenbelasting (income tax),
- de loonbelasting (wages tax),
- de vennootschapsbelasting (company tax),

including the government share in the net profits of the exploitation of natural resources levied pursuant to the Mining Act 1810 (Mijnwet 1810) with respect to concessions issued from 1967, or pursuant to the Netherlands Continental Shelf Mining Act of 1965 (Mijnwet Continentaal Plat 1965) hereinafter referred to as "profit share",
- de dividendbelasting (dividend tax),

(hereinafter referred to as "Netherlands tax");

b) in the United States: the Federal income taxes imposed by the Internal Revenue Code (but excluding social security taxes), and the excise taxes imposed on insurance premiums paid to foreign insurers and with respect to private foundations (hereinafter referred to as "United States tax").

© 1993 International Bureau of Fiscal Documentation

The Convention shall, however, apply to the excise taxes imposed on insurance premiums paid to foreign insurers only to the extent that the risks covered by such premiums are not reinsured with a person not entitled to the benefits of this or any other convention which provides exemption from these taxes.

2. The Convention shall apply also to any identical or substantially similar taxes which are imposed after the date of signature of the Convention in addition to, or in place of, the existing taxes. The competent authorities of the States shall notify each other of any substantial changes which have been made in their respective taxation laws.

Article 4
RESIDENT

1. For the purposes of this Convention, the term "resident of one of the States" means any person who, under the laws of that State, is liable to tax therein by reason of his domicile, residence, place of management, place of incorporation, or any other criterion of a similar nature, or that is an exempt pension trust, as dealt with in Article 35 (Exempt Pension Trust) and that is a resident of that State according to the laws of that State, or an exempt organization, as dealt with in Article 36 (Exempt Organizations) and that is a resident of that State according to the laws of that State. If, under the laws of the two States, an individual is a resident of both States, his residence for purposes of the Convention shall be determined under the rules of paragraph 2. An individual who is a resident of one of the States under the law of that State, or who is a citizen of the United States, and who is not a resident of the other State under its law, will, for the purposes of this paragraph, be treated as a resident of the State of which he is a resident or citizen only if (i) he would be a resident of that State and not a third State, under the principles of subparagraphs (a) and (b) of paragraph 2 of this Article, if that third State is one with which the first-mentioned State does not have a comprehensive income tax Convention, or (ii) he is a resident of that State and not a third State, if that third State is one with which the first-mentioned State does have a comprehensive income tax Convention, under the provisions of that Convention. However,

a) the term "resident of one of the States" does not include any person who is liable to tax in that State in respect only of income from sources in that State; and
b) in the case of income derived or paid by an estate or trust, the term "resident of one of the States" applies only to the extent that the income derived by such estate or trust (other than an exempt pension trust or an exempt organization organized in the form of a trust, described above in this paragraph), is subject to tax in that State as the income of a resident, either in its hands or in the hands of its beneficiaries.

2. Where by reason of the provisions of paragraph 1, an individual is a resident of both States, then his status shall be determined as follows:

a) he shall be deemed to be a resident of the State in which he has a permanent home available to him; if he has a permanent home available to him in both States, he shall be deemed to be a resident of the State with which his personal and economic relations are closer (centre of vital interests);
b) if the State in which he has his centre of vital interests cannot be determined, or if he has not a permanent home available to him in either State, he shall be deemed to be a resident of the State in which he has an habitual abode;
c) if he has an habitual abode in both States or in neither of them, he shall be deemed to be a resident of the State of which he is a national;
d) if he is a national of both States or of neither of them, the competent authorities of the States shall settle the question by mutual agreement.

3. Where by reason of the provisions of paragraph 1, a person other than an individual or a company is a resident of both States, the competent authorities of the States shall settle the question by mutual agreement and determine the mode of application of the Convention to such person.

4. Where by reason of the provisions of paragraph 1, a company is a resident of both States, the competent authorities of the States shall endeavour to settle the question by mutual agreement, having regard to the company's place of effective management, the place where it is incorporated or otherwise constituted and any other relevant factors. In the absence of such agreement, such company shall not be entitled to claim any benefits under this Convention, except that such company may claim the benefits of paragraph 4 of Article 25 (Methods of Elimination of Double Taxation) and of Articles 28 (Non-discrimination), 29 (Mutual Agreement Procedure) and 37 (Entry into Force).

Article 10
DIVIDENDS

1. Dividends paid by a company which is a resident of one of the States to a resident of the other State may be taxed in that other State.

2. However, such dividends may also be taxed in the State of which the company paying the dividends is a resident and according to the laws of that State, but if the beneficial owner of the dividends is a resident of the other State, the tax so charged shall not exceed:

a) 5 percent of the gross amount of the dividends if the beneficial owner is a company which holds directly at least 10 percent of the voting power of the company paying the dividends;
b) 15 percent of the gross amount of the dividends in all other cases.

The provisions of subparagraph (b) instead of the provisions of subparagraph (a) shall apply in the case of dividends paid by a United States person which is a Regulated Investment Company or Real Estate Investment Trust or in the case of dividends paid by a Dutch company, which is a "beleggingsinstelling" in the sense of Article 28 of the Netherlands Corporation Tax Act (Wet op de vennootschapsbelasting 1969) (hereinafter referred to as "beleggingsinstelling").

However, neither the provisions of subparagraph (a) nor (b) shall apply in the case of:

i) a dividend paid by a United States person which is a Real Estate Investment Trust, if such dividend is beneficially owned by a resident of the Netherlands, other than a Dutch company which is a "beleggingsinstelling" or other than an individual holding a less than 25 percent interest in the Real Estate Investment Trust; such dividends shall instead be taxable at the rate provided in the domestic law of the United States;
ii) a dividend paid by a Dutch company, which is a "beleggingsinstelling", and which invests in real estate to the same extent as is required of a Real Estate Investment Trust, if the dividend is beneficially owned by a resident of the United States, other than an individual holding a less than 25 percent interest in the Dutch company, or other than a Regulated Investment Company or Real Estate Investment Trust; such dividends shall instead be taxable at the rate provided in the domestic law of the Netherlands.

3. The provisions of paragraph 2 shall not affect the taxation of the company in respect of the profits out of which the dividends are paid.

© 1993 International Bureau of Fiscal Documentation

4. The term "dividends" as used in this Convention means income from shares or other rights participating in profits, as well as income from other corporate rights which is subjected to the same taxation treatment as income from shares by the laws of the State of which the company making the distribution is a resident. For the purposes of this paragraph, the term "dividends" also includes, in the case of the Netherlands, income from profit sharing bonds ("winstdelende obligaties") and, in the case of the United States, income from debt obligations carrying the right to participate in profits.

5. The provisions of paragraphs 1 and 2 shall not apply if the beneficial owner of the dividends, being a resident of one of the States, carries on business in the other State of which the company paying the dividends is a resident, through a permanent establishment situated therein, or performs in that other State independent personal services from a fixed base situated therein, and the holding in respect of which the dividends are paid forms part of the business property of such permanent establishment or pertains to such fixed base. In such case the provisions of Article 7 (Business Profits) or Article 15 (Independent Personal Services), as the case may be, shall apply.

6. Where a company which is a resident of one of the States derives profits or income from the other State, that other State may not impose any tax on the dividends paid by the company, except insofar as such dividends are paid to a resident of that other State or insofar as the holding in respect of which the dividends are paid forms part of the business property of a permanent establishment or pertains to a fixed base situated in that other State, nor, except as provided in Article 11 (Branch Tax), subject the company's undistributed profits to a tax on the company's undistributed profits, even if the dividends paid or the undistributed profits consist wholly or partly of profits or income arising in such other State.

Article 11
BRANCH TAX

1. A corporation which is a resident of one of the States and which has a permanent establishment in the other State or which is subject to tax on a net basis in that other State under Article 6 (Income from Real Property) or under paragraph 1 of Article 14 (Capital Gains), may be subject in that other State to a tax in addition to the tax allowable under the other provisions of this Convention. Such tax, however, may be imposed only on that portion of the business profits of the corporation attributable to the permanent establishment under this Convention or the income subject to tax on a net basis under Article 6 (Income from Real Property) or under paragraph 1 of Article 14 (Capital Gains) and reduced for all taxes chargeable in that State on such profits and income, other than the additional tax referred to herein, and further reduced (but not below zero) for any increase in the net equity attributable to such permanent establishment at the end of the taxation year, as measured from the end of the preceding taxation year, and increased (but not in excess of the accumulated profits) for any decrease in the net equity attributable to such permanent establishment at the end of the taxation year, as measured from the end of the preceding taxation year.

2. Notwithstanding paragraph 4, for purposes of this Article, the term "accumulated profits" means the excess of the aggregate profits referred to in paragraph 1 of this Article for all the preceding taxation years during which this Convention was in effect, over the aggregate profits taxed under this Article during such preceding taxation years.

3. The tax referred to in paragraph 1 shall not be imposed at a rate exceeding the rate specified in paragraph 2(a) of Article 10 (Dividends).

4. In the case of the United States, the additional tax described in paragraph 1 may be imposed upon the "dividend equivalent amount" (as that term is defined in the law of the United States as on the date of signature of this Convention and as that law may be amended from time to time, but only to the extent that this definition, as amended, is in conformity with the principles of this Article).

5. Notwithstanding paragraph 4, no additional tax may be imposed under paragraph 1 with respect to income subject to tax under paragraph 1 of Article 14 (Capital Gains) which is derived from the disposition of shares or other comparable corporate rights in a company.

CHAPTER V
SPECIAL PROVISIONS

Article 26
LIMITATION ON BENEFITS

1. A person that is a resident of one of the States and derives income from the other State shall be entitled, in that other State, to all the benefits of this Convention only if such person is:

a) an individual;
b) a State, or a political subdivision or local authority thereof;
c) a company meeting any of the following tests:
   i) the principal class of its shares is listed on a recognized stock exchange located in either of the States and is substantially and regularly traded on one or more recognized stock exchanges;
   ii) A) more than 50 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies which are resident of either State, the principal classes of the shares of which are listed and traded as described in subparagraph (c)(i), and
   B) the company is not a conduit company, as defined in subparagraph 8(m); or
   iii) in the case of a company resident in the Netherlands,
   A) at least 30 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies resident in the Netherlands, the principal classes of the shares of which are listed and traded as described in subparagraph (c)(i);
   B) at least 70 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies that are residents of the United States or of member states of the European Communities, the principal classes of shares of which are substantially and regularly traded on one or more recognized stock exchanges; and
   C) the company is not a conduit company, as defined in subparagraph 8(m); or
   iv) in the case of a conduit company (as defined in paragraph 8(m)) that satisfies the requirements of subparagraph (c)(ii)(A) or (c)(iii)(A) and (B), such company satisfies the conduit base reduction test set forth in paragraph 5(d).
d) a person:
   i) more than 50 percent of the beneficial interest in which (or, in the case of a company, more than 50 percent of the aggregate vote and value of all of its shares, and more than 50 percent of the shares of any "disproportionate class of shares") is owned, directly or indirectly, by qualified persons; and
   ii) which meets the base reduction test described in paragraph 5; or
e) a not-for-profit organization that, by virtue of that status, is generally exempt from income taxation in its State of residence, provided that more than half of the beneficiaries, mem-

© 1993 International Bureau of Fiscal Documentation

bers, or participants, if any, in such organization are qualified persons.

2. a) A person resident in one of the States shall also be entitled to the benefits of this Convention with respect to income derived from the other State if such person is engaged in the active conduct of a trade or business in the first-mentioned State (other than the business of making or managing investments, unless these activities are banking or insurance activities carried on by a bank or insurance company), and
   i) the income derived in the other State is derived in connection with that trade or business in the first-mentioned State and the trade or business of the income recipient is substantial in relation to the income producing activity, or
   ii) the income derived in the other State is incidental to that trade or business in the first-mentioned State.

   b) Income is derived in connection with a trade or business if the income-producing activity in the other State is a line of business which forms a part of or is complementary to the trade or business conducted in the first-mentioned State by the income recipient.

   c) Whether the trade or business of the income recipient is substantial will generally be determined by reference to its proportionate share of the trade or business in the other State, the nature of the activities performed and the relative contributions made to the conduct of the trade or business in both States. In any case, however, the trade or business of the income recipient will be deemed to be substantial if, for the preceding taxable year, the average of the ratios for the following three factors exceeds 10 percent (or in the case of a person electing to apply subparagraph (h), 60 percent) and each of the ratios exceeds 7.5 percent (or in the case of a person electing to apply subparagraph (h), 50 percent), provided that for any separate factor that does not meet the 7.5 percent test (or in the case of a person electing to apply subparagraph (h), the 50 percent test) in the first preceding taxable year the average of the ratios for that factor in the three preceding taxable years may be substituted:
      i) the ratio of the value of assets used or held for use in the active conduct of the trade or business by the income recipient in the first-mentioned State (without regard to any assets attributed from a third state under subparagraph (h), except in the case of a person electing to apply subparagraph (h)) to all, or, as the case may be, the proportionate share of the value of such assets so used or held for use by the trade or business producing the income in the other State;
      ii) the ratio of gross income derived from the active conduct of the trade or business by the income recipient in the first-mentioned State (without regard to any gross income attributed from a third state under subparagraph (h), except in the case of a person electing to apply subparagraph (h)) to all, or, as the case may be, the proportionate share of the gross income so derived by the trade or business producing the income in the other State; and
      iii) the ratio of the payroll expense of the trade or business for services performed within the first-mentioned State (without regard to any services attributed from a third state under subparagraph (h), except in the case of a person electing to apply subparagraph (h)) to all, or, as the case may be, the proportionate share of the payroll expense of the trade or business for services performed in the other State.

   d) Income derived from a State is incidental to a trade or business conducted in the other State if the income is not described in subparagraph (b) and the production of such income facilitates the conduct of the trade or business in the other State (for example, the investment of the working capital of such trade or business). In the case of a person electing to apply subparagraph (h), the income that is considered incidental to the trade or business shall not be greater than four times the amount of income that would have been considered incidental to the trade or business actually conducted in the Netherlands.

   e) A person that is a resident of one of the States is considered to be engaged in the active conduct of a trade or business in that State (and is considered to carry on all, or, as the case may be, the proportionate share of such trades or businesses) if such person:
      i) is directly so engaged;
      ii) is a partner in a partnership that is so engaged;
      iii) is a person in which a controlling beneficial interest is held by a single person which is engaged in the active conduct of a trade or business in that State;
      iv) is a person in which a controlling beneficial interest is held by a group of five or fewer persons each member of which is engaged in activity in that State which is a component part of or directly related to the trade or business in that State;
      v) is a company that is a member of a group of companies that form or could form a consolidated group for tax purposes according to the law of that State (as applied without regard to the residence of such companies), and the group is engaged in the active conduct of a trade or business in that State;
      vi) owns, either alone or as a member of a group of five or fewer persons that are qualified persons, residents of a member state of the European Communities, or residents of an identified state, a controlling beneficial interest in a person that is engaged in the active conduct of a trade or business in the State in which such owner is resident; or
      vii) is, together with another person that is so engaged, under the common control of a person (or a group of five or fewer persons) which (or, in the case of a group, each member of which) is a qualified person, a resident of a member state of the European Communities or a resident of an identified state.

   For purposes of subparagraphs (e) (vi) and (e) (vii), an "identified State" includes any third country, identified by agreement of the competent authorities, which has effective provisions for the exchange of information with the State in which the person being tested under this paragraph is a resident.

   f) For purposes of subparagraph (e), a person (or group) shall be deemed to own a "controlling beneficial interest" in another person if it holds directly or indirectly a beneficial interest which represents more than 50 percent of the value and voting power in such other person, provided that:
      i) an interest consisting of 50 percent or less of the value and voting power of any third person shall not be considered for purposes of determining the percentage of indirect ownership held in such other person; and
      ii) no person shall be considered to be part of a group owning a controlling beneficial interest in an entity unless such person holds directly a beneficial interest which represents at least 10 percent of the value and voting power in such entity.

© 1993 International Bureau of Fiscal Documentation

g) For purposes of subparagraph (e), a person (or group) shall be deemed to have "common control" of two persons if it holds a controlling beneficial interest in each such person.

h) For purposes of applying the rules of this paragraph, where a person that is a resident of the Netherlands is engaged in the active conduct of a trade or business in the Netherlands (or considered to be so engaged under the rules of subparagraph (e)), and activity that is a component part of, or directly related to that trade or business, consistent with the rules of subparagraph (e), is also conducted in other member states of the European Communities, that person may elect to treat all, or, as the case may be, the proportionate share of such activity as if it were conducted solely in the Netherlands, provided that each of the following three ratios exceeds 15 percent:

i) the ratio of the value of assets used or held for use in the active conduct of the trade or business within the Netherlands (without regard to any assets attributed from a third state under this subparagraph) to all, or, as the case may be, the proportionate share of the value of such assets so used or held for use within all such member states;

ii) the ratio of gross income derived from the active conduct of the trade or business within the Netherlands (without regard to any gross income attributed from a third state under this subparagraph) to all, or, as the case may be, the proportionate share of the gross income so derived within all such member states; and

iii) the ratio of the payroll expense of the trade or business for services performed within the Netherlands (without regard to any services attributed from a third state under this subparagraph) to all, or, as the case may be, the proportionate share of the payroll expense of the trade or business for services performed within all such member states.

3. A person that is a resident of one of the States shall also be entitled to all the benefits of this Convention if that person functions as a headquarter company for a multinational corporate group. A person shall be considered a headquarter company for this purpose only if:

a) it provides a substantial portion of the overall supervision and administration of the group, which may include, but cannot be principally, group financing;

b) the corporate group consists of corporations resident in, and engaged in an active business in, at least five countries, and the business activities carried on in each of the five countries (or five groupings of countries) generate at least 10 percent of the gross income of the group;

c) the business activities carried on in any one country other than the State of residence of the headquarter company generate less than 50 percent of the gross income of the group;

d) no more than 25 percent of its gross income is derived from the other State;

e) it has, and exercises, independent discretionary authority to carry out the functions referred to in subparagraph (a);

f) it is subject to the same income taxation rules in its country of residence as persons described in paragraph 2; and

g) the income derived in the other State either is derived in connection with, or is incidental to, the active business referred to in subparagraph (b).

If the gross income requirements of subparagraphs (b), (c) or (d) of this paragraph are not fulfilled, they will be deemed to be fulfilled if the required ratios are met when averaging the gross income of the preceding four years.

4. a) A company resident in the Netherlands shall also be entitled to the benefits of Article 10 (Dividends), 11 (Branch Tax), 12 (Interest), or 13 (Royalties) if:

i) more than 30 percent of the aggregate vote and value of all of its shares (and more than 30 percent of the shares of any "disproportionate class of shares") is owned, directly or indirectly, by qualified persons resident in the Netherlands;

ii) more than 70 percent of all such shares is owned, directly or indirectly, by qualified persons and persons that are residents of member states of the European Communities; and

iii) such company meets the base reduction test described in paragraph 5.

b) In determining whether, pursuant to subparagraph (a) (ii), a company's shares are owned by residents of member states of the European Communities, only those shares shall be considered which are held by persons that are residents of states with a comprehensive income tax Convention with the United States, as long as the particular dividend, profit or income subject to the branch tax, interest, or royalty payment in respect of which treaty benefits are claimed would be subject to a rate of tax under that Convention that is no less favorable than the rate of tax applicable to such company under Articles 10 (Dividends), 11 (Branch Tax), 12 (Interest) or 13 (Royalties) of this Convention.

5.a) A person meets the base reduction test described in this paragraph if:

i) less than 50 percent of such person's gross income is used, directly or indirectly, to make deductible payments in the current taxable year to persons that are not qualified persons; or

ii) in the case of a person resident in the Netherlands,

A) less than 70 percent of such gross income is used, directly or indirectly, to make deductible payments to persons that are not qualified persons; and

B) less than 30 percent of such gross income is used, directly or indirectly, to make deductible payments to persons that are neither qualified persons nor residents of member states of the European Communities.

b) For purposes of this paragraph, the term "gross income" means gross income for the first taxable year preceding the current taxable year; provided that the amount of gross income for the first taxable year preceding the current taxable year will be deemed to be no less than the average of the annual amounts of gross income for the four taxable years preceding the current taxable year.

c) For purposes of this paragraph, the term "deductible payments" includes payments for interest or royalties, but does not include payments at arm's length for the purchase or use of or the right to use tangible property in the ordinary course of business or remuneration at arm's length for services performed in the country of residence of the person making such payments. Types of payments may be added to or eliminated from the exceptions mentioned in the preceding definition of "deductible payments" by mutual agreement of the competent authorities.

d) For purposes of paragraph 1(c), the conduit base reduction test means the base reduction test described in this paragraph, except that the term "deductible payments" for this purpose means only those payments described in subparagraph (c):

© 1993 International Bureau of Fiscal Documentation

i) that are made to an associated enterprise (as described in Article 9 (Associated Enterprises), except that whether two enterprises are associated will be determined for this purpose without regard to the residence of either enterprise; and

ii) that are subject to an aggregate rate of tax (including withholding tax) in the hands of the recipient that is less than 50 percent of the rate that would be applicable had the payment been received in the State of residence of the payer, and subject to the normal taxing regime in that State.

6. A person, resident of one of the States, which derives from the other State income mentioned in Article 8 (Shipping and Air Transport) and which is not entitled to the benefits of this Convention because of the foregoing paragraphs, shall nevertheless be entitled to the benefits of this Convention with respect to such income if:

a) more than 50 percent of the beneficial interest in such person (or in the case of a company, more than 50 percent of the value of the stock of such company) is owned, directly or indirectly, by qualified persons or individuals who are residents of a third state; or

b) in the case of a company, the stock of such company is primarily and regularly traded on an established securities market in a third state,

provided that such third state grants an exemption under similar terms for profits as mentioned in Article 8 of this Convention to citizens and corporations of the other State either under its national law or in common agreement with that other State or under a Convention between that third state and the other State.

7. A person resident of one of the States, who is not entitled to benefits of this Convention because of the foregoing paragraphs, may, nevertheless, be granted benefits of this Convention if the competent authority of the State in which the income in question arises so determines. In making such determination, the competent authority shall take into account as its guideline whether the establishment, acquisition, or maintenance of such person or the conduct of its operations has or had as one of its principal purposes the obtaining of benefits under this Convention. The competent authority of the State in which the income arises will consult with the competent authority of the other State before denying the benefits of the Convention under this paragraph.

8. The following provisions apply for purposes of this Article:

a) The term "principal class of shares" is generally the ordinary or common shares of the company, provided that such class of shares represents the majority of the voting power and value of the company. When no single class of shares represents the majority of the voting power and value of the company, the "principal class of shares" is generally those classes that in the aggregate possess more than 50 percent of the voting power and value of the company. In determining voting power, any shares or class of shares that are authorized but not issued shall not be counted and in mutual agreement between the competent authorities appropriate weight shall be given to any restrictions or limitations on voting rights of issued shares. The "principal class of shares" also includes any "disproportionate class of shares". Notwithstanding the preceding rules, the "principal class of shares" may be identified by mutual agreement between the competent authorities of the States.

b) The term "shares" shall include depository receipts thereof or trust certificates thereof.

c) The term "disproportionate class of shares" means any class of shares of a company resident in one of the States that entitles the shareholder to disproportionately higher participation, through dividends, redemption payments or otherwise, in the earnings generated in the other State by particular assets or activities of the company.

d) The term "recognized stock exchange" means:

i) any stock exchange registered with the Securities and Exchange Commission as a national securities exchange for purposes of the Securities Exchange Act of 1934;

ii) the Amsterdam Stock Exchange;

iii) the NASDAQ System owned by the National Association of Securities Dealers, Inc. or the parallel market of the Amsterdam Stock Exchange; and

iv) any other stock exchange agreed upon by the competent authorities of both States, including, for this purpose, any stock exchanges listed in an exchange of notes signed at the later of the dates on which the respective governments have notified each other in writing that the formalities constitutionally required for the entry into force of the Convention as meant in Article 37 (Entry into Force) in their respective States have been complied with.

However, with respect to closely held companies, the term "recognized stock exchange" shall not include the stock exchanges mentioned under subparagraph (iii), or if so indicated in mutual agreement between the competent authorities, under subparagraph (iv).

e) The term "closely held company" means a company of which 50% or more of the principal class of shares is owned by persons, other than qualified persons or residents of a member state of the European Communities, each of whom beneficially owns, directly or indirectly, alone or together with related persons more than 5% of such shares for more than 30 days during a taxable year.

f) The shares in a class of shares are considered to be substa ntially and regularly traded on one or more recognized stock exchanges in a taxable year if:

i) trades in such class are effected on one or more of such stock exchanges other than in de minimis quantities during every month; and

ii) the aggregate number of shares of that class traded on such stock exchange or exchanges during the previous taxable year is at least 6 percent of the average number of shares outstanding in that class during that taxable year.

For purposes of this subparagraph, any pattern of trades conducted in order to meet the "substantial and regular trading" tests will be disregarded.

g) The term "qualified person" means:

i) a person that is entitled to benefits of this Convention pursuant to the provisions of paragraph 1; and

ii) a citizen of the United States.

h) The term "member state of the European Communities" means, unless the context requires otherwise:

i) the Netherlands; and

ii) any other member state of the European Communities with which both States have in effect a comprehensive income tax Convention.

i) The term "resident of a member state of the European Communities" means a person that would be considered a resident of any such member state under the principles of Article 4 (Resident) and would be entitled to the benefits of this Convention under the principles of paragraph 1, applied as if such member state were the Netherlands, and that is otherwise entitled to the benefits of the Convention between that person's state of residence and the United States.

j) The not-for-profit organizations referred to in subparagraph 1 (e) of this Article include, but are not limited to, pension funds, pension trusts, private foundations, trade unions, trade associations, and similar organizations, provided, however, that in all

© 1993 International Bureau of Fiscal Documentation

events, a pension fund, pension trust, or similar entity organized for purposes of providing retirement, disability, or other employment benefits that is organized under the laws of a State shall be entitled to the benefits of the Convention if the organization sponsoring such fund, trust, or entity is entitled to the benefits of the Convention under this Article.

k) The reference in subparagraph (c)(ii) and clauses (A) and (B) of subparagraph (c)(iii) of paragraph 1 to shares that are owned, directly or indirectly, shall mean that all companies in the chain of ownership that are used to satisfy the ownership requirements of the respective clause or subparagraph, must meet the residence requirements that are described in such clause or subparagraph.

l) For the purpose of paragraphs 2, 3 and 5, the competent authorities may by mutual agreement, notwithstanding the provisions of these paragraphs, determine transition rules for newly-established business operations, newly-established corporate groups or newly-established headquarter companies.

m) For purposes of subparagraph (1)(c)(ii)(B) and (1)(c)(iii)(C), the term "conduit company" means a company that makes payments of interest, royalties and any other payments included in the definition of deductible payments (as defined in subparagraph (5)(c)) in a taxable year in an amount equal to or greater than 90 percent of its aggregate receipts of such items during the same taxable year. Notwithstanding the previous sentence, a bank or insurance company shall not be considered to be a conduit company if it (i) is engaged in the active conduct of a banking or insurance business and (ii) is managed and controlled by associated enterprises (within the meaning of Article 9 (Associated Enterprises), except that whether two enterprises are associated will be determined for this purpose without regard to the residence of either enterprise) that are qualified persons.

EXCERPTS FROM MEMORANDUM OF UNDERSTANDING

I. *In reference to paragraph 1 of Article 4 (Resident).*
It is understood that for purposes of the Convention, the Government of one of the States, its political subdivisions or local authorities are to be considered as residents of that State.

II. *In reference to paragraph 4 of Article 4 (Resident).*
It is understood that, if a company is a resident of the Netherlands under paragraph 1 of Article 4 (Resident) and, because of the application of Section 269B of the Internal Revenue Code, such company is also a resident of the United States under paragraph 1 of Article 4 (Resident), the question of its residency for the purposes of the application of this Convention shall be subject to a mutual agreement procedure as laid down in paragraph 4 of Article 4 (Resident).

VI. *In reference to subparagraph 2(a) and paragraph 4 of Article 10 (Dividends).*
It is understood that a beneficial owner of the dividends, who holds depository receipts or trust certificates evidencing beneficial ownership of the shares in lieu of the shares themselves in the company in question, may also claim the treaty benefits of subparagraph 2(a) of Article 10 (Dividends). In addition, it is understood that where a person loans shares (or other rights the income from which is subject to the same taxation treatment as income from shares) and receives from the borrower an obligation to pay an amount equivalent to any dividend distribution made with respect to the shares or other rights loaned during the term of such loan, such person shall be treated as the beneficial owner of the dividend paid with respect to such shares or other rights for purposes of the application of Article 10 (Dividends) to any such equivalent amount.

X. *In reference to Article 26 (Limitation on Benefits).*
It is understood that a taxpayer claiming benefits under the Convention must be able to provide upon request sufficient proof to establish the taxpayer's entitlement to such benefits. It is further understood, however, that the need to provide proof that a taxpayer fulfills the requirements of Article 26 (Limitation on Benefits) can impose a severe administrative burden on the taxpayer.

It is understood, therefore, that the competent authorities will endeavor to develop by mutual agreement reasonable procedures for the periodic reporting of the facts necessary to support entitlement to benefits. In developing such procedures, the competent authorities will strive to minimize the frequency of reporting. For example, once an entitlement to benefits has been documented and in the absence of relevant changes in the facts and circumstances, a taxpayer should not be required annually to provide proof that he is entitled to the benefits of the Convention, provided he reports relevant changes in facts and circumstances.

XI. *In reference to paragraphs 1(d) and 4 of Article 26 (Limitation on Benefits).*
It is understood that the proof a Dutch resident investment organization (a "beleggingsinstelling" in the sense of Article 28 of the "Wet op de vennootschapsbelasting 1969") has of the number of its Dutch resident individual and corporate shareholders as a result of the procedure used by such Dutch resident investment organization when claiming a reimbursement of tax withheld on its foreign dividend and interest income under paragraph 1(b) of Article 28 of the "Wet op de vennootschapsbelasting 1969", can be used by such Dutch investment organization to show that it fulfills the requirements of paragraph 1(d), respectively paragraph 4 of Article 26 (Limitation on Benefits).

XII. *In reference to paragraph 2 of Article 26 (Limitation on Benefits).*
As illustrated by the following examples, it is understood that in applying the rules of paragraph 2 of Article 26 (Limitation on Benefits), the proportionate share of activities of a resident of one of the States that are a component part of or directly related to a trade or business conducted by another resident of that State who claims treaty benefits may be attributed to the latter resident under subparagraph 2(e) for purposes of applying the substantial trade or business test under subparagraph 2(c). In addition, for purposes of subparagraph 2(c), the proportionate share of activities of a resident of one of the States attributable to a trade or business conducted in the other State will be used for purposes of the test under subparagraph 2(c).

Example 1
NLCo, a Netherlands corporation, owns 100 percent of the stock of USCo, a U.S. corporation, and 50 percent of the stock of NLSub, a Netherlands corporation. FCo, a French corporation, holds the remaining 50 percent of the stock of NLSub. NLCo and FCo do not directly conduct an active trade or business. USCo and NLSub are engaged in the same active trade or business. For each of the four most recently concluded taxable years, the asset values, gross income and payroll expenses of these corporations that are attributable to the trade or business were as follows:

	USCo	*NLSub*
Assets	$300	$50
Income	50	10
Payroll	60	10

© 1993 International Bureau of Fiscal Documentation

NLCo receives payments of interest and dividends from USCo. In order for these payments to be entitled to treaty benefits under paragraph 2 of Article 26, NLCo must be considered to be engaged in the active conduct of a substantial trade or business in the Netherlands. Under subparagraph 2(c), the ratios of the assets, income and payroll attributable to NLCo to the assets, income and payroll attributable to USCo must be at least 10 percent.

NLCo has no assets, income or payroll that are attributable to the trade or business. The assets, income and payroll of NLSub that are related to the trade or business may be attributed to NLCo, however, under subparagraph 2(e)(vi), since NLCo and FCo together have a controlling beneficial interest in NLSub and FCo is a resident of a member state of the European Communities. In accordance with subparagraph 2(e), therefore, 50 percent of NLSub's assets, income and payroll are attributed to NLCo for purposes of paragraph 2(c). The amounts attributed to NLCo and the percentage of USCo's corresponding amounts are as follows:

NLCo		*NLCo as a Percentage of USCo*
Assets	$25	8.3
Income	5	10.0
Payroll	5	8.3

Since none of these percentages is greater than 10 percent, NLCo is not entitled to benefits under Article 26 under the general test of paragraph 2(c). Moreover, application of the three-year average rule under that paragraph does not change the result, since the relevant amounts for the three preceding years (and the resulting ratios) are equal to those for the first preceding taxable year.

Example 2

The facts are the same as in Example 1, except that NLCo owns only 80 percent of the stock of USCo. For purposes of subparagraph 2(c), the measures of USCo's assets, gross income and payroll expense must be multiplied by NLCo's percentage ownership interest in the stock of USCo. Consequently, the values attributable to USCo and NLSub after taking into account NLCo's percentage ownership interest in the stock of these companies, and the ratio of the amounts attributed from NLSub to NLCo to the amounts attributable to USCo are as follows:

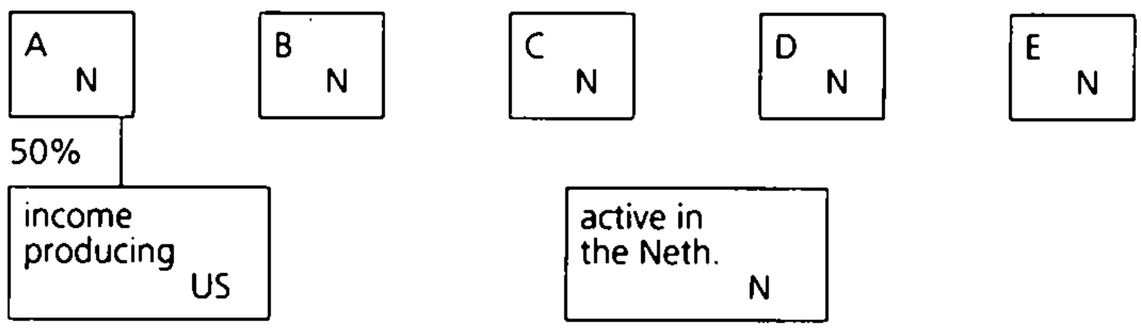
	USCo	*NLSub*	*NLCo as a Percentage of USCo*
Assets	$240	$25	10.4
Income	40	5	12.5
Payroll	48	5	10.4

Since all of these percentages exceed 10 percent, NLCo would be entitled to treaty benefits with respect to the payments received from USCo under paragraph 2.

XIII. *In reference to subparagraph (a) of paragraph 2 and subparagraph (m) of paragraph 8 of Article 26 (Limitation on Benefits)*

It is understood that for purposes of subparagraph (a) of paragraph 2 and subparagraph (m) of paragraph 8 of Article 26 (Limitation on Benefits), a bank only will be considered to be engaged in the active conduct of a banking business if it regularly accepts deposits from the public or makes loans to the public, and an insurance company only will be considered to be engaged in the active conduct of an insurance business if its gross income consists primarily of insurance or reinsurance premiums, and investment income attributable to such premiums.

XIV. In reference to paragraph (1) of Article 9 (Associated Enterprises) and subparagraph (d)(i) of paragraph 5 of Article 26 (Limitation on Benefits)



It is understood that for purposes of paragraph 1 of Article 9 (Associated Enterprises), in determining whether an enterprise participates directly or indirectly in the management, control or capital of another enterprise, an enterprise may be considered an associated enterprise with respect to an enterprise in which its only interest is represented by evidences of indebtedness where such indebtedness provides the holder of the indebtedness with the right to participate in the management, control or capital of the enterprise that issued the indebtedness, or such holder in practice participates in such management, control or capital.

XV. *In reference to paragraphs 2(a)(i) and 2(c) of Article 26 (Limitation on Benefits).*

It is understood that in applying the measurement of "substantiality" as referred to in subparagraph 2(a)(i) of Article 26, the factors referred to in subparagraph 2(c) of Article 26 as used in a specific case will take into account the fact that there might be a less than 100% participation in the income-producing activity.

For example, if a Dutch resident corporation has a 10% interest in a US corporation, in applying the substantiality test to - for instance - dividends received from the US corporation, each of the US corporations' factors as referred to in subparagraph 2(c) of Article 26 must be multiplied by the Dutch resident's percentage share in the US corporation.

The above also applies to subparagraph 2(e)(vi) of Article 26 (Limitation on Benefits). For example, take the case where both the income-producing corporation, resident of the US, and the corporation which is engaged in an active trade or business in the Netherlands are controlled by five Netherlands investment companies.

One of the investors (A) owns a 50 percent interest in the income-producing corporation; the other four investors (B, C, D and E) each own a 12.5 percent interest in the income- producing corporation. The Dutch investor (E) owns a 50 percent interest in the corporation engaged in an active trade or business; the other four investors (A, B, C, and D) each own a 12.5 percent interest in the corporation engaged in an active trade or business.

The corporation engaged in an active trade or business in the Netherlands has assets valued at $ 1 million, and the assets of the U.S. corporation are valued at $6 million. The Netherlands corporation has gross income of $ 10 million, and gross income of the U.S. corporation is $40 million. The payroll of the Netherlands corporation is $1 million, and the U.S. corporation's payroll is $5 million.

In applying the substantiality test to the dividends paid by the US corporation and received by the five Dutch investors, each of the factors must be multiplied by the investor's percentage share in the corporation engaged in an active trade or business in the Netherlands, respectively by the investor's percentage share in the US corporation. The dividends paid to the Netherlands investors (B, C and D) and the dividends paid to the 50 percent owner of the corporation engaged in active trade or business in the Netherlands (E) would pass the substantiality test. The three ratios described in the preceding paragraph as applied to the three Netherlands investors (B, C and D) would

© 1993 International Bureau of Fiscal Documentation

remain 16.7 percent, 25 percent, and 20 percent, respectively. The three ratios described in the preceding paragraph as applied to the Dutch investor (E) are 66.7 percent, 100 percent, and 80 percent.

The dividends paid to the Netherlands investor (A) will not pass the substantiality test; since in this case the three ratios are 4.2 percent, 6.25 percent, and 5 percent.

XVI. *In reference to paragraph 2(e) of Article 26 (Limitation on Benefits).*

For the purpose of subparagraphs 2(e)(vi) and 2(e)(vii) of Article 26 the following states are regarded as an "identified State" having effective provisions for the exchange of information at the date of signature of the Convention with the United States:

Australia
Austria
Barbados
Belgium
Bermuda
Canada
Costa Rica
Cyprus
Denmark
Dominica
Dominican Republic
Egypt
Finland
France
Germany
Grenada
Honduras
Iceland
Ireland
Jamaica
Korea
Malta
Marshall Islands
Mexico
Morocco
New Zealand
Norway
Pakistan
Philippines
St. Lucia
Sweden
Trinidad & Tobago

and with the Netherlands:

Aruba
Australia
Austria
Belgium
Brazil
Bulgaria
Canada
China
Czechoslovakia
Denmark
Finland
France
Germany
Greece
Hungary
India
Ireland
Indonesia
Israel
Italy
Korea
Luxembourg
Malaysia
Malta
Morocco
Netherlands Antilles
New Zealand
Norway
Pakistan
Philippines
Poland
Romania
Singapore
South Africa
Spain
Sri Lanka
Surinam
Sweden
Thailand
Turkey
United Kingdom
Zambia
Zimbabwe

It is understood that states may be added to or eliminated from the preceding lists by agreement between the competent authorities of both States.

XVII. *In reference to paragraph 2(h) of Article 26 (Limitation on Benefits).*

It is understood that in treating an activity conducted in another member state of the European Communities as conducted in the Netherlands under subparagraph 2(h) of Article 26 (Limitation on Benefits) (and subject to the restrictions therein), the activity in such other state may be conducted by any person which, if it conducted such activity in the Netherlands, would have its proportionate share of such activity attributed to the resident of the Netherlands considered to conduct such activity under subparagraph 2(e) of Article 26 (Limitation on Benefits).

XVIII. *In reference to paragraph 3(a) of Article 26 (Limitation on Benefits).*

It is understood that for purposes of paragraph 3(a) of Article 26 (Limitation on Benefits) a person will be considered to be engaged in "supervision and administration" activities, only if it engages in a number of the kinds of activities listed below. For example, a person will be considered a headquarters company if it performs a significant number of the following functions for the group: group financing (which cannot be its principal function), pricing, marketing, internal auditing, internal communications and management. A simple comparison of the amount of gross income that the headquarters company derives from its different activities cannot be used alone to determine whether group financing is, or is not, the company's principal function. The above-mentioned functions are intended to be suggestive of the types of activities in which a headquarters company will be expected to engage; it is not intended to be exhaustive.

Furthermore, it is understood that in determining if a substantial portion of the overall supervision and administration of the group is provided by the headquarters company, the activities it performs as a headquarters company for the group it supervises must be substantial in comparison to the same activities for the same group performed within the multinational.

For example, a Japanese corporation establishes a subsidiary in the Netherlands to function as a headquarters company for its European and North American operations. The Japanese corporation also has two other subsidiaries functioning as headquarter companies; one for the African operations and one for the Asian operations. The Dutch headquarters company is the parent company for the subsidiaries through which the European and North American operations are carried on. The Dutch headquarters company supervises the bulk of the pricing, marketing, internal auditing, internal communications and management for its group. Although the Japanese overall parent sets the guidelines for all of its subsidiaries in defining the world-wide group policies with respect to each of these activities, and assures that these guidelines are carried out within each of the regional groups, it is the Dutch headquarters company that monitors and controls the way in which these policies are carried out within the group of companies that it supervises. The capital and payroll devoted by the Japanese parent to these activities relating to the group of companies the Dutch headquarter company supervises is small, relative to the capital and payroll devoted to these activities by the Dutch headquarters company. Moreover, neither the other two headquarter companies, nor any other related company besides the Japanese parent company, perform any of the above-mentioned headquarter activities with respect to the group of companies that the Dutch headquarter company supervises.

In the above case the Dutch headquarters company will be considered to provide a substantial portion of the overall supervision and administration of the group it supervises.

XIX. *In reference to paragraph 7 of Article 26 (Limitation on Benefits).*

For purposes of paragraph 7 of Article 26 (Limitation on Benefits), in determining whether the establishment, acquisition, or maintenance of a corporation resident of one of the States has or had as one of its principal purposes the obtaining of benefits under this Convention, the competent authority of the State in which the income in question arises may consider the following factors (among others):

(1) The date of incorporation of the corporation in relation to the date that this Convention entered into force;
(2) the continuity of the historical business and ownership of the corporation;

© 1993 International Bureau of Fiscal Documentation

(3) the business reasons for the corporation residing in its State of residence;
(4) the extent to which the corporation is claiming special tax benefits in its country of residence;
(5) the extent to which the corporation's business activity in the other State is dependent on the capital, assets, or personnel of the corporation in its State of residence; and
(6) the extent to which the corporation would be entitled to treaty benefits comparable to those afforded by this Convention if it had been incorporated in the country of residence of the majority of its shareholders.

XX. *In reference to paragraph 7 of Article 26 (Limitation on Benefits).*

It is understood that a company resident of one of the States will be granted the treaty benefits under paragraph 7 of Article 26 (Limitation on Benefits) with respect to the income it derives from the other State, if such company:
(1) holds stocks and securities the income from which is not predominantly from sources in the other State;
(2) has widely dispersed ownership; and
(3) employs in its state of residence a substantial staff actively engaged in trades of stocks and securities owned by the company.

It is further understood that paragraph 7 of Article 26 (Limitation on Benefits) will not apply if any of the above-mentioned factors is absent.

XXI. *In reference to paragraph 7 of Article 26 (Limitation on Benefits).*

It is understood that in applying paragraph 7 of Article 26 (Limitation on Benefits), the legal requirements for the facilitation of the free flow of capital and persons within the European Communities, together with the differing internal income tax systems, tax incentive regimes, and existing tax treaty policies among member states of the European Communities, will be considered. Under such paragraph, the competent authority is instructed to consider as its guideline whether the establishment, acquisition or maintenance of a company or the conduct of its operations has or had as one of its principal purposes the obtaining of benefits under this Convention. The competent authority may, therefore, determine under a given set of facts, that a change in circumstances that would cause a company to cease to qualify for treaty benefits under paragraphs 1 and 2 of Article 26 (Limitation on Benefits) need not necessarily result in a denial of benefits. Such changed circumstances may include a change in the state of residence of a major shareholder of a company, the sale of part of the stock of a Netherlands company to a person resident in another member state of the European Communities, or an expansion of a company's activities in other member states of the European Communities, all under ordinary business conditions. The competent authority will consider these changed circumstances (in addition to other relevant factors normally considered under paragraph 7 of Article 26) in determining whether such a company will remain qualified for treaty benefits with respect to income received from United States sources. If these changed circumstances are not attributable to tax avoidance motives, this also will be considered by the competent authority to be a factor weighing in favor of continued qualification under paragraph 7 of Article 26.

XXII. *In reference to paragraph 8(d)(iv) of Article 26 (Limitation on Benefits).*

For purposes of subparagraph 8(d)(iv) of Article 26 (Limitation on Benefits), the stock exchanges of Frankfurt, London and Paris will in any case be listed.
The competent authorities of both States may agree to add or remove stock exchanges from the list.

XIII. *In reference to paragraph 8(e) of Article 26 (Limitation on Benefits).*

It is understood that the term "related persons" as used in subparagraph 8(e) of Article 26 (Limitation on Benefits) means associated enterprises under Article 9 (Associated Enterprises) and their owners.

XXIV. *In reference to paragraph 8(f) of Article 26 (Limitation on Benefits).*

In order to meet the "substantial and regular trading" tests under subparagraph 8(f) of Article 26 (Limitation on Benefits), a person claiming benefits under the Convention need not prove that it has not engaged in, but may need to rebut evidence that it has engaged in, a pattern of trades on a recognized stock exchange in order to meet these tests.

XXV. *In reference to paragraph 8(k) of Article 26 (Limitation Benefits).*

When a corporation resident in one of the States that is entitled to benefits under Article 26 (Limitation on Benefits) acquires a controlling interest in a corporation resident in a third state that in turn owns a controlling interest in a second corporation resident in the first-mentioned State, that second corporation may not be entitled to the benefits of the Convention due to the provisions of subparagraph 8(k) of Article 26 with respect to income derived from sources within the other State. It is understood that in these circumstances the competent authority of the other State, in considering a request for benefits under the Convention under paragraph 7 of Article 26 (Limitation on Benefits), will consider favorably a plan of reorganization submitted by the second corporation resident in the first-mentioned State, if such plan would result in the second corporation being entitled to the benefits of the Convention within a reasonable transition period (determined without regard to paragraph 7 of Article 26 (Limitation on Benefits)).

UNITED STATES:

DETERMINING RESIDENCY FOR FEDERAL INCOME TAX PURPOSES

Leonard W. Rothschild, Jr. and Michael G. Schinner

In the July 1988 issue of the *Bulletin*, Leonard W. Rothschild, Jr. and Robert J. Magilligan presented an analysis of the proposed regulations under IRC Section 7701(b) concerning the definition of residency for federal income tax purposes. On 24 April 1992, the IRS issued final regulations under Section 7701 (b). This article analyses the final regulations and discusses the IRS' revisions to the proposed regulations. The article also discusses the IRS' new proposed regulations on treaty-based determinations of residency, which it issued simultaneously with the final regulations.

Leonard W. Rothschild, Jr. is an attorney with Bancroft & McAlister in San Francisco, and was formerly an international tax partner with the CPA firm of Deloitte Haskins & Sells. He is the Bulletin *correspondent for the United States and has published several articles in* The Tax Advisor, Tax Notes, State Tax Notes *and the* Journal of State Taxation. *Mr. Rothschild advises many non-residents with respect to pre-immigration tax planning matters, as well as structuring US acquisitions by foreign entities and individuals.*

***Michael J. Schinner** is an associate with the law firm of Bancroft & McAlister in San Francisco, California. He has been Chair of the Taxation Committee of the Barrister's Club in San Francisco and has published articles in* The Journal of Taxation *and* The American Journal of Tax Policy.

I. INTRODUCTION

Residency status is critical to the determination of an individual's US tax liability. US residents, whether citizens of the United States or other countries, are taxed on worldwide income. Non-residents, in contrast, are taxed on income from US sources (with limited exceptions) but are denied several tax deductions allowed to US residents.

Prior to the enactment of the Deficit Reduction Act of 1984, the Internal Revenue Code (IRC) of the United States did not contain any rules for determining whether an individual was a US resident. Instead, regulations issued by the Internal Revenue Service (IRS) provided a subjective test for determining US residency which was based on an individual's intentions with regard to the length and nature of the individual's stay in the United States.

The Deficit Reduction Act of 1984 set forth in IRC Section 7701(b) a new, objective test for determining US residency for income tax purposes.[1] An individual who is not a citizen of the United States is considered to be a resident if he or she satisfies either of two tests: the "green card" test or the substantial presence test. The "green card" test is based on an individual's immigration status; the substantial presence test is based upon the number of days an individual is physically present in the United States during a three-year period.

On 9 September 1987, the IRS issued proposed regulations which discussed in detail the "green card" and substantial presence tests. Although the regulations added significant complexity to this area of the law, they also provided objective criteria with which to determine an individual's US residency status for income tax purposes.

A public hearing concerning the proposed regulations was held on 15 June 1988. After consideration of all the comments concerning the proposed regulations, the IRS issued final regulations on 24 April 1992. The final regulations adopt, with some important revisions, the proposed regulations issued on 9 September 1987.

II. DETERMINING WHETHER AN INDIVIDUAL IS A RESIDENT ALIEN

A. *"Green card" or lawful permanent resident test*

Under the "green card" test an alien individual is considered a resident if the alien is a lawful permanent resident of the United States according to its immigration

1. Different rules apply for determining United States residency for federal estate and gift tax purposes. Moreover, each state may have different rules for determining residency.

© 1993 International Bureau of Fiscal Documentation

laws at any time during the calender year. Resident status is deemed to continue unless it is rescinded or administratively or judicially determined to have been abandoned. Resident status is considered to be rescinded if an administrative or judicial order that is no longer subject to appeal is issued regarding the alien individual. An administrative or judicial determination of abandonment of resident status may be initiated by the alien individual, the Immigration and Naturalization Service (INS) or a US consular officer. If initiated by the individual, resident status is considered abandoned when the appropriate documentation is filed with the INS or a consular officer. If the determination is initiated by the INS or a consular officer, resident status is considered abandoned upon the issuance of a final administrative or judicial order.[2]

B. *Substantial presence test*

Individuals who are present in the United States for at least 183 days during the most recent three-year period, including the current year, are generally classified as resident aliens. Each day of presence in the current year is counted as full day; each day of presence in the first preceding year is counted as one-third of a day; and each day of presence in the second preceding year is counted as one-sixth of a day. Partial days of presence are counted as full days. The regulation does not permit an individual to round off any fractional days to the nearest whole number.[3] For example, if an alien spends 122 days in each of the current, first preceding and second preceding years in the United States, the total days are 183 (122 x 100% or 122; plus 122 x ⅓ or 40⅔; plus 122 x ⅙ or 20⅓). Accordingly, the individual meets the requirements of the substantial presence test and is considered a resident alien for the current year.[4]

If an individual is not physically present in the United States for at least 31 days during the current year, the individual will not be considered a US resident for the current year, regardless of whether the individual satisfies the three-year total of at least 183 days. However, an individual can be present in the United States for less than 31 days in the first or second preceding years and still satisfy the test.[5]

The term "United States" is defined to include the states and the District of Columbia, but does not include the possessions and territories of the United States. The term also includes the territorial waters of the United States and the seabed and subsoil of the submarine areas over which the United States has jurisdiction under international law. The term, however, does not include the air space over the United States.[6]

III. DAYS EXCLUDED FOR PURPOSES OF THE SUBSTANTIAL PRESENCE TEST

For purposes of the substantial presence test, the following days are not counted as days of presence in the United States:

- any day that an individual is present in the United States as an exempt individual;
- any day that an individual is prevented from leaving the United States because of a medical condition that arose while the individual was present in the United States;
- any day that an individual is in transit between two points outside of the United States; and
- any day on which a regular commuter residing in Canada or Mexico commutes to or from employment in the United States.

A. *Exempt individuals*

The following are exempt individuals: (1) foreign government-related individuals; (2) teachers, trainees and students; and (3) professional athletes.

1. Foreign government-related individuals

Days spent in the United States as a full-time employee of an international organization, or as an individual with diplomatic or consular status, are not counted as days of presence in the United States for purposes of the substantial presence test. Members of such persons' immediate families also qualify for this exception. Any individual who is present in the United States as a lawful permanent resident does not qualify for this exception.[7]

2. Teachers, trainees and students

Teachers, trainees and students (and their immediate families) who are admitted temporarily to the United States under a non-immigrant J, F or M visa are considered exempt individuals if they substantially comply with the visa requirements.[8] The test of compliance is made independently by the IRS. Thus, the IRS may determine that an individual is not in substantial compliance with the requirements of his or her visa, even though the visa has not been revoked.[9]

There are several limitations on the use of this exception. A teacher or trainee will not be able to exclude days of presence if the individual has been exempt as a teacher, trainee or student for any part of two of the six preceding calender years. A teacher or trainee must *include* days of presence in the current year if (i) all of an individual's compensation in the current year is income described in IRC Section 872(b)(3) (compensation paid by a foreign employer); (ii) the individual was present in the United States as a teacher or trainee in any prior year within the last six years and during such year or years all of an individual's compensation was income described in IRC Section 872(b)(3); and (iii) the individual has been exempt as a teacher, trainee or student for any part of four of the six preceding calender years.[10]

An individual will not be able to exclude days of presence as a student if the individual has been exempt as a teacher, trainee or student for any part of more than five calender years, unless the individual can show that he or she does not intend to reside

2. Reg. 301.7701(b)-1(b)(1, 2, 3).
3. Reg. 301.7701(b)-1(c)(1).
4. Reg. 301.7701(b)-1(e), ex.1.
5. Reg. 301.7701(b)-1(c)(4).
6. Reg. 301.7701(b)-1(c)(2)(ii).
7. Reg. 301.7701(b)-3(b)(2)(i).
8. Reg. 301.7701(b)-3(b)(3 and 4).
9. Reg. 301.7701(b)-3(b)(6).
10. Reg. 301.7701(b)-3(b)(7)(i), (ii).

© 1993 International Bureau of Fiscal Documentation

permanently in the United States and that he or she has complied with the requirements of the student visa.[11]

3. Professional athletes

Days spent in the United States as a professional athlete actually competing in a charitable sports event are excluded for purposes of the substantial presence test.[12]

B. *Medical condition*

An individual will not be considered present in the United States for purposes of the substantial presence test on any day that the individual intends to leave the United States and is unable to do so because of a medical condition that arose while the individual was present in the United States.[13] A medical condition will not be considered to arise while the individual is present in the United States if the condition existed prior to the individual's arrival in the United States and the individual was aware of the pre-existing medical condition.[14]

The medical condition exception is not available in the following cases: (1) where an individual who was initially prevented from leaving the United States is subsequently able to do so yet remains in the United States beyond a reasonable time for making travel arrangements to depart; and (2) where an individual returns to the United States for treatment of a medical condition that arose during the individual's prior stay in the United States.[15]

C. *Days in transit*

An individual may exclude days of presence in the United States if the individual is in transit between two foreign points and is physically present in the United States for fewer than 24 hours. The exception does not apply if an individual attends a business meeting during the 24 hour-period.[16]

D. *Commuters residing in Mexico or Canada*

An individual will not be considered present in the United States on days that the individual commutes to the United States from the individual's home in Mexico or Canada if the individual commutes to the United States on more than 75 percent of his or her working days during the working period.[17] Whereas the proposed regulations required an individual to commute on more than 80 percent of work days of the calender year, the "75 percent of work days during the working period" requirements contained in the final regulations will permit seasonal employees, as well as those who begin employment in the United States in mid-year, to exclude the days of presence on which they commute to the United States.

IV. CLOSER CONNECTION EXCEPTION TO THE SUBSTANTIAL PRESENCE TEST

An individual who satisfies the substantial presence test may nevertheless be considered a non-resident for the current year if the following conditions are met:

- the individual is present in the United States for fewer than 183 days in the current year;
- the individual maintains a tax home in a foreign country during the current year; and
- the individual has a closer connection to the foreign country in which the individual maintains a tax home than to the United States.[18]

The possessions and territories of the United States are considered foreign countries for purposes of the closer connection exception.[19]

An individual's tax home is considered to be located at his regular or principal place of business. If the individual has no regular or principal place of business or is not engaged in carrying on any trade or business, then the individual's tax home is his regular place of abode.[20]

In order to use the closer connection exception, the individual must maintain his or her tax home for the entire year. Further, the tax home must be located in the same foreign country for which the individual is claiming to have a closer connection.[21]

Regulation 301.7701(b)-2(d) sets forth some of the facts and circumstances that are considered in determining whether an individual has a closer connection with another country:

(1) the location of the individual's permanent home;
(2) the location of the individual's family;
(3) the location of personal belongings, such as automobiles, furniture, clothing and jewellery owned by the individual and his or her family;
(4) the location of social, political, cultural or religious organizations with which the individual has a current relationship;
(5) the location of the individual's personal bank accounts;
(6) the location where the individual conducts business activities (other than those that constitute the individual's tax home);
(7) the location of the jurisdiction in which the individual holds a driver's licence;
(8) the location of the jurisdiction in which the individual votes;
(9) the country of residence designated by the individual on forms and documents; and
(10) the type of official forms and documents filed by the individual, such as Form 1078 (Certificate of Alien Claiming Residence in the United States), Form W-8 (Certificate of Foreign Status) or Form W-9 (Payer's Request for Taxpayer Identification Number).

The individual's permanent home of residence must be available at all times and not solely for stays of short duration. This implies that an individual cannot rent out his home in a foreign country and claim the closer connection exception.[22]

11. Reg. 301.7701(b)-3(b)(7)(iii).
12. Reg. 301.7701(b)-3(b)(5).
13. Reg. 301.7701(b)-3(c)(1).
14. Reg. 301.7701(b)-3(c)(3).
15. Reg. 301.7701(b)-3(c)(1).
16. Reg. 301.7701(b)-3(d).
17. Reg. 301.7701(b)-3(e).
18. Reg. 301.7701(b)-2(a).
19. Reg. 301.7701(b)-2(b).
20. Reg. 301.7701(b)-2(c)(1).

22. Reg. 301.7701(b)-2(d).

© 1993 International Bureau of Fiscal Documentation

An individual may demonstrate, subject to certain conditions, that he or she has a closer connection to two foreign countries (but not more than two) within the calender year.[23]

Assuming that an individual qualifies for the closer connection exception, the individual must file a statement as prescribed in Reg. 301.7701(b)-8. The filing requirements for non-resident aliens are discussed in more detail below.

Individuals who have applied for permanent residence in the United States may not claim the closer connection exception.[24]

V. RESIDENCY STARTING AND ENDING DATES

A. *Starting date*

Under the "green card" test, an individual's residency in the first year is deemed to begin on the first day the individual is physically present in the United States as a lawful permanent resident. Similarly, under the substantial presence test, residency is deemed to begin the first day the individual is present in the United States during the year in which the test is satisfied. If an individual satisfies both tests, residency is deemed to begin with the earlier of the two residency starting dates.[25]

B. *Ending date*

Generally, an individual's residency termination date will be the last day of the calendar year. However, for an individual who meets the substantial presence test and establishes that (i) his or her tax home was in a foreign country and (ii) he or she maintained a closer connection (within the meaning of Reg. 301.7701(b)-2(d)) to that foreign country than to the United States, the individual's residency termination date is the last day during the calendar year that the individual is physically present in the United States.

The residency termination date for an individual who meets the "green card" test and the two requirements of the closer connection exception discussed above, is the first day the individual is no longer a lawful permanent resident. The residency termination date for an individual who meets both the substantial presence test and the "green card" test (as well as the two requirements of the closer connection exemption discussed above) will be the later of the first day the individual is no longer a lawful permanent resident or the last day the individual was present in the United States.[26]

C. *De minimis presence*

An individual may be present in the United States for up to ten days without triggering the residency starting date or extending the residency termination date for purposes of the substantial presence test, provided that the individual is able to meet the three requirements of the closer connection exception discussed above. Note that these days are included as days of US presence for purposes of the substantial presence test.[27]

D. *First year election*

An individual who does not meet either the "green card" test or the substantial presence test may nevertheless elect to be treated as a full year US resident if he or she satisfies the following:

- the individual must meet the substantial presence test for the immediately following year;
- the individual must be physically present in the United States for at least 31 consecutive days in the current year; and
- the individual must be present in the United States for at least 75 percent of the number of days beginning with the first day of the 31-day consecutive period and ending with the last day of the year of arrival. For purposes of this 75 percent requirement, up to five days of absence from the United States may be treated as presence within the United States.[28]

The election is made by attaching a statement to the individual's income tax return (Form 1040) for the taxable year for which the election is to be in effect. Since the election cannot be made until the individual has satisfied the substantial presence test for the year following the election year, the individual may have to request an extension of time for filing the return. The penalty for failing to file a timely return is that the individual must file his or her income tax return for the current year as a non-resident alien.[29]

VI. COORDINATION WITH IRC SECTION 877

An individual will be taxed as a US citizen who expatriated to avoid tax under IRC Section 877 if: (i) the individual is a US resident during at least three consecutive calendar years (the initial residency period); (ii) the period of residence for each of the three years includes at least 183 days; (iii) the alien is again taxed as a non-resident; and (iv) the alien then becomes a US resident within three calendar years after the residency termination date of the individual's initial residency period.

This special tax applies only if it is greater than the tax normally applicable to a non-resident alien.[30]

VII. TAX YEAR

The regulations generally require an alien individual to adopt a calendar year unless a fiscal year has been established prior to residency. An individual is considered to have established a fiscal year if the annual period during which the individual computes his or her income is a fiscal year. Accordingly, a citizen of the United Kingdom would appear to be able to continue using the UK tax year as his or her US tax year, provided appropriate fiscal year books and records are maintained for US tax purposes. The regulations also provide that an individual who has previously established a fiscal year in a foreign country may adopt the calendar year as his or her taxable year for US income tax purposes without requesting a change in accounting period.[31]

VIII. COORDINATION WITH INCOME TAX TREATIES

A. *Dual resident taxpayers*

A "dual resident taxpayer" that is, an individual who is considered a resident of both the United States and the country with which the United States has an income tax treaty – may determine that he or she is a resident of the foreign country for treaty purposes and therefore claim treaty benefits so as to reduce the individual's US income tax liability.[32]

B. *Filing requirements*

A dual resident taxpayer who determines that he or she is a non-resident alien under an income tax treaty must file his or her US income tax return as a non-resident alien on Form 1040NR on or before the date prescribed by law. As part of the return, the alien individual must attach a statement ("Treaty-Based Return Position Disclosure Under §301.7701(b)-7(b) and Section 6114") to the Form 1040NR which indicates that the taxpayer is claiming a treaty benefit as a non-resident of the United States, the facts relied upon to support the position taken, and the nature and approximate amount of income and the specific treaty provision for which the taxpayer is claiming a treaty benefit. The Form 1040NR and the attached statement must be filed with the IRS Center in Philadelphia, Pennsylvania.[33]

The filing of a Form 1040NR by a dual resident taxpayer may affect the determination by the INS as to whether the individual qualifies to maintain his or her residency permit.[34] Moreover, individuals who are considered non-residents under a treaty for purposes of computing their US tax liability may nonetheless be considered residents for other purposes under the IRC. For example, an alien may be deemed a resident for purposes of Subpart F of the IRC which could cause a foreign corporation in which the individual is a shareholder to be classified as a "controlled foreign corporation".[35]

C. *Proposed regulations*

Simultaneously with the issuance of the final regulations under IRC Section 7701(b), the IRS issued proposed regulations that provide special rules for S corporations that have as a shareholder a dual resident taxpayer. The proposed regulations provide that a dual resident taxpayer who claims any treaty benefits as a non-resident of the United States so as to reduce his or her US income tax liability shall be treated as a non-resident alien of the United States for purposes of IRC Section 1361(b)(1)(C). Because an S corporation cannot have a non-resident alien as a shareholder, in the absence of a special exception, the proposed rules would cause a termination of the corporation's S election pursuant to IRC Section 1362(d)(2).[36]

The proposed regulations provide that a dual resident taxpayer who claims a treaty benefit will be treated as a US resident for purposes of IRC Section 1361(b)(1)(C) if certain conditions are met. First, the dual resident taxpayer must treated as carrying on a US business through a permanent establishment, if the S corporation carries on such a business. Second, the S corporation must withhold tax on dual resident taxpayer's distributive share of the S corporation's income under the principles of IRC Section 1446 (relating to partnership withholding on foreign partners). Third, the dual resident taxpayer must be taxed on the gain on the disposition of his or her shares in the S corporation as if the S corporation were a partnership and the individual was a foreign partner of the partnership. Finally, the dual resident taxpayer and the S corporation must enter into an agreement to ensure proper withholding of the individual's tax liability.[37]

As discussed above, a dual-resident taxpayer who claims a treaty benefit as a non-resident alien must attach a statement to his or her Form 1040NR. If the taxpayer is a shareholder in an S corporation, the proposed regulations require that the statement indicate that the taxpayer understands that claiming a treaty benefit as a non-resident may terminate the corporation's S election unless the taxpayer and the S corporation enter into the withholding agreement described above.[38]

IX. PROCEDURAL RULES

The regulations contain stringent documentation requirements for individuals claiming to be exempt individuals, claiming to have a medical condition, claiming the closer connection exception or claiming the ten-day exception for residency starting and ending dates. Generally, an individual qualifying for any of these exemptions must file a detailed statement with the IRS in Philadelphia. The regulations require that these statements be filed regardless of whether the individual files a tax return.[39]

The penalty for failure to file the prescribed statement is loss of the claimed exemption. Days that would not be counted as days of US presence under an exemption are considered days of US presence. Exempt teachers, trainees and students, however, are not subject to penalties.[40]

X. EFFECTIVE DATES

The final regulations to IRC Section 7701(b) contain important revisions to the proposed regulations issued in 1987. Tax advisors should review the final regulations, especially the reporting requirements, before advising individuals with respect to their US residency status for federal income tax purposes.

APPENDIX
US RESIDENT OR NON-RESIDENT
(IRC Sec. 7701(b))

I. Were you citizen of the United States or did you have a "green card" at any time during the current year?

YES You are considered a resident of the United States for the entire year. The tests below do not apply.

NO You will be treated as resident only if you satisfy one of the tests below.

II. Were you physically present in the United States for 31 days or more during the current year and does the sum of 100% of days of physical presence in the United States in the current year plus 1/3 of the days in the preceding year plus 1/6 of the days in the second preceding year equal or exceed 183 days?

YES You are a resident, unless you are a:
- student
- teacher
- scholar
- diplomat

or you are present in the United States because you are:
- ill
- in transit
- commuting to a job in Mexico or Canada
- a professional athlete participating in a charitable event or you claim a closer connection to a foreign country.

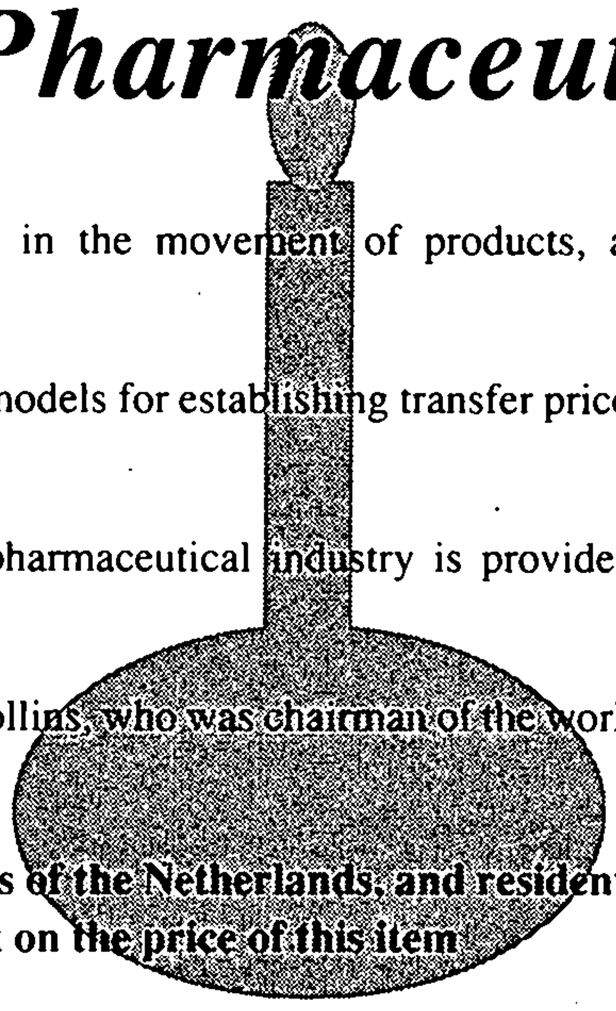
NO You are not a resident.

III. Can you establish a tax home in and a closer connection to a country other than the United States and were you in the United States for less than 183 days in the current year?

YES You are a non-resident.

NO You may be a resident if you satisfy one of the above tests.

IV. Does your country of citizenship or residency have a tax treaty with the United States?



YES Consult the treaty for additional exemptions from US residency.

NO The above rules apply.

V. Were you present in the United States for at least 31 days in the current year and do you satisfy the test in II. above for the following year or were you married and were you or your spouse residents at the end of the current year?

YES You may be able to elect US residency for the entire current year (see Sec. 6013(g) and (h)).

International Transfer Pricing in the Ethical Pharmaceutical Industry

Explores the role of transfer pricing in the movement of products, active ingredients and intangibles within international groups.

Description and critical assessment of models for establishing transfer prices. Practical suggestions on how to identify the most appropriate methods.

Full background information on the pharmaceutical industry is provided, and the text is supported by relevant statistics.

Compiled and written by Maurice H. Collins, who was chairman of the working group which produced the 1979 OECD Transfer Pricing Report.

PEOPLE'S REPUBLIC OF CHINA:

A BRIEF INTRODUCTION TO TIANJIN PORT BONDED ZONE

Li Zhi Hui
NanKai University, Tianjin, China

A bonded zone was established in Tianjin Harbour on 12 May 1991 with the approval of the State Council of the People's Republic of China (PRC). As a new showcase for China's reform and open policy, the bonded zone has adopted special policies that are more flexible and preferential than those in force in Special Economic Zones and Economic Development Zones. By providing an ideal investment and operational environment for Chinese and foreign trading organizations and export-oriented enterprises engaged in storage, transport, packaging and processing, the zone will put itself at the service of foreign trade, entrepot trade, transit trade and export-oriented processing industries. In the course of this process it will gradually become a typical Chinese free trade zone which maintains close ties with world markets and follows all internationally established business practices.

I. SUPERB GEOGRAPHICAL POSITION

Sandwiched between the Container Wharf and the newly built Dongtudi Pier in Tanggu Xingang Harbour, the bonded zone has the harbour's trunk road Highway No. 4 and a railway in the south, the newly built Beijing-Tianjin-Tanggu Expressway in the north and the north-south East Ring Road in the west. The entire zone covers 1.2 square km, with ample room available for future expansion.

The bonded zone derives much of its strength from Tianjin Harbour, a major foreign trade centre which enjoys high international prestige, it operates a host of international shipping lines and has the economic backing of the vast north and northwest of China. The harbour has seen continuous enlargement over the last few years, and the number of its berths is steadily growing. As an international hub for containerized shipping, Tianjin Harbour leads China in the number of containerized berths and in the capacity to handle containerized shipping.

A seaside door for the Chinese capital of Beijing, Tianjin is one of the nation's three municipalities directly under the central government. It is an important economic and trade centre in north China and, with a complete array of urban facilities, a harbour city of international calibre. Thanks to its ideal geographical position, including its close proximity to Beijing in particular, the bonded zone will display great economic vitality in the near future.

II. PERFECT EXTERNAL CONDITIONS

The Tianjin Harbour is intricately linked with the rest of China by waterways, highway, railways and airlines. It also has shipping ties with more than 300 harbours in the 160-odd countries and regions and operates some 30 regular shipping lines. A host of trunk railways and highways meet in the harbour area, such as the Beijing-Shanhaiguan, Beijing-Tianjin, Beijing-Pokou and Liqizhuang-Beidagang railways, the Beijing-Tianjin-Tanggu Expressway, and the Tianjin-Tanggu, Tianjin-Dagu and Yangzhuang-Beitang trunk highways. Tianjin and Beijing airports are close by. More importantly, the city has all facilities a world-class harbour can offer commerce, finances, customs service, commodities inspection and living facilities.

The comprehensive system of auxiliary installations of the harbour has provided the bonded zone with ideal external conditions. The harbour's power supply centre (a 110 kv transmission station) and water plant are situated next to the zone. A newly built modern network will meet the zone's telecommunications needs, and the highways have made it easy to reach the docks and beyond of the zone.

III. PREFERENTIAL INVESTMENT POLICY AND TAX PRIVILEGES

Bound by international conventions, the bonded zone follows a series of preferential policies to attract foreign capital and develop an export-oriented economy. Foreign-invested enterprises in the bonded zone enjoy more preferential treatment than their counterparts in China's special economic zones and economic and technological development zones. The additional treatment includes the following:

1. All goods, when shipped from abroad to the bonded zone or vice versa are exempt from import or export licensing and customs duties. Foreign-invested firms may engage in international trade, as may Chinese enterprises which have been delegated such power. Enterprises in the bonded zone may obtain approval to operate entrepot and transit trade.

2. Commodities and goods, when shipped out of or sold within the bonded zone, are exempt from production-related industrial and commercial consolidated tax or product tax (or VAT): goods entering the bonded zone from the non-bonded zones in China, which are eligible for export, are exempt from production-related industrial and commercial consolidated tax or may have the product tax already levied reimbursed. Bonded goods entering the non-bonded zones from the bonded zone pay industrial and commercial consolidated tax or product tax (or VAT).

© 1993 International Bureau of Fiscal Documentation

3. Exemption from customs duties and industrial and commercial consolidated tax is granted for building materials imported for the use of enterprises in the bonded zone, equipment and spare parts for production and management purposes, means of transport, office supplies and raw and auxiliary materials for production purposes.

4. The income tax on enterprises with foreign investment of a production nature in the bonded zone is levied at a reduced rate of 15 percent.

5. Upon the expiration of the tax exemption and reduction period as provided for in the tax law, export-oriented enterprises with foreign investment pay enterprise income tax at ten percent, if the value of the export products of the year exceeds 70 percent of the total value of products of the year.

6. Technologically advanced enterprises with foreign investment may, upon the expiration of the enterprise income tax exemption and reduction period as stipulated by the tax law, further enjoy a 50 percent reduction in enterprise income tax for three years based on the rate set forth in the tax law, if such enterprises remain technologically advanced enterprises.

7. Foreign-invested enterprises engaged in port and dock construction and which have an operation period exceeding 15 years may, upon approval of their applications by the tax authorities at level of municipality directly under the administration of the central government in which the enterprises are located, enjoy exemption from the first profit-making year to the fifth year, and a reduction in enterprise income tax by 50 percent from the sixth to the tenth year.

8. Foreign-invested enterprises in the bonded zone are temporarily exempt from local income tax.

9. Houses built or purchased by foreign-invested enterprises in the bonded zone are exempt from house property tax for five years beginning from the month construction is completed or when the purchase is made.

10. The enterprises may accelerate the depreciation of fixed assets.

11. A foreign exchange control system is followed in the bonded zone. Enterprises in the zone are allowed to keep their foreign exchange revenue from business operations as turnover funds.

IV. PRAGMATISM AND HIGH EFFICIENCY

The Administrative Committee of the bonded zone constitutes a new administrative system and, as authorized by the Municipal People's Government, handles administrative affairs in the bonded zone in unified way.

The Administrative Committee works to simplify administrative and work procedures and does its best to adopt international procedures to create an ideal environment under which conditions are made convenient, straightforward, simplified and highly efficient for investors.

The Administrative Committee has the authority to examine, approve and process applications for the establishment of enterprises in the bonded zone. With the certificate of approval issued by the committee, prospective investors may complete all official formalities such as registration with the industrial, taxation and customs authorities and setting up of bank accounts under the same roof. The bonded zone will ensure water and power supplies, telecommunications, public health facilities, landscaping, legal consultancy services accounting, labour and other services.

Before the bonded zone was established in May 1991, China's mainland had its first Chinese and foreign joint-venture Commercial Bonded Warehouse (CBW) established there. Over the last two years CBW has yielded remarkable economic returns and accumulated experience for the bonded work of the zone.

A general zoning plan has been mapped out, and various rules and regulations have been promulgated. Construction of infrastructure facilities is in full swing and conditions have ripened for the arrival of foreign investors.

The Tianjin Port Bonded Zone welcomes domestic and foreign business people wishing to conduct inspections and business talks and invest in the zone. It can help them succeed in the business world.

ASSOCHAM/IFA CONFERENCE

Peter Hann

The Associated Chambers of Commerce and Industry of India (ASSOCHAM) and the International Fiscal Association (IFA) India Branch hosted an interesting, informative, and well attended conference on 6 and 7 November 1992 in New Delhi. The more than 300 participants included representatives from several neighbouring countries, including Pakistan and Bangladesh. The speakers and panellists included many of India's leading tax experts, including Dr. R.J. Chelliah, Chairman of India's Tax Reform Committee, as well as international experts such as Dr. A. Fantozzi, Chairman of the Permanent Scientific Committee of IFA. In addition, the Deputy Minister of State for Finance and the Finance Secretary gave valuable comments during the opening and closing sessions of the conference.

The conference concerned itself with four related issues which are facing India in the area of direct taxation. Firstly, the international trends in corporate taxation which India is following especially in reduction of tax rates and simplification of the system. Secondly, presumptive taxation, where India is following the lead given by other developing countries in attempting to simplify business taxation and widen the tax net. Thirdly, the reform of the tax administration, without which any legislative changes cannot take effect and be enforced; and fourthly, the interpretation of double taxation agreements, of which India has a wide and growing network.

The conference enabled participants to hear of international developments in each of these areas, and in the light of this the discussion led to a more detailed examination of the position in India.

The background to the discussion is that in India direct taxes account for only 14.6 percent of government revenue, while indirect taxes account for 64.8 percent (the rest comes from interest on government loans, profits of public sector concerns and foreign aid or grants). It is known that, in India, a large number of individuals and businesses are avoiding direct taxes, and a combination of new legislation and reformed administration could result in a great increase in the total number of direct taxpayers.

The Chelliah Committee on taxation reform has recently presented its final report, which also examines the above issues. Much discussion at the conference was conducted with reference to the findings of the Chelliah Committee, and it was noted by the conference that the measures recommended by the Chelliah Committee were in line with the international trends.

Another factor which makes reform of India's direct taxation relevant at the present time is the relaxation of the position regarding the ability of foreign companies to invest in India. Foreign companies are able to hold 51 percent equity in an Indian subsidiary, while certain selected multinationals are allowed to trade in India through 100 percent subsidiaries. There is now concern that the potential inflow of foreign investment could be deterred by high taxation rates or unsatisfactory treaty arrangements.

OPENING ADDRESSES

A welcome address was given by Dr. N.M. Dhuldhoya, President of ASSOCHAM, followed by a discussion of the conference theme by Mr. O.P. Vaish, Conference Convenor and Chairman of IFA, India Branch.

Mr. Vaish emphasized the fact that the success of any tax legislation which is introduced depends on the effectiveness of the tax administration which has to implement it. In addition to the tax itself, the taxpayer has to pay some indirect costs in complying with his tax obligations, and the extent of these indirect costs depends on the efficiency of the tax administration. If the implementation of tax legislation leads to uncertainty, undue demands for information, and arbitrary decisions, this is also a cost for the taxpayer.

In the inaugural address, the Deputy Minister of State for Finance emphasized the need for India's domestic thinking to be in line with the rest of the world. He pointed out the speed with which the government had implemented reforms suggested by the Chelliah Committee and confirmed the government's commitment to reform. He also pointed to India's success in expanding the network of bilateral tax treaties. Domestically, the government is committed to promoting fairness and eliminating delays.

In the key note address, Dr. Chelliah expressed his confidence that the reforms recommended by his committee are in line with international trends, which is an important consideration as India attempts to globalize its economy. A tax system must be created which does not change significantly from one year to the next, and this system must be supported by taxpayers who in the past have been accustomed to request changes in the tax system to benefit their particular interests. The lower tax rates should encourage greater compliance among taxpayers. Changes in tax legislation at the Federal level will not be sufficient on their own, and must be accompanied by reforms in the tax administration and also by reform of the tax systems of State governments.

Dr. Fantozzi, in a brief summary of international trends, discussed some issues resulting from the increase in cross-border transactions. He referred to the return to territoriality as a basis for establishing the tax liability of an entity. Attempts to tax entities on a worldwide basis were now being re-thought. There was an increasing concern with transfer-pricing provisions, resulting from the increased globalization. The creation of common markets in some places showed a willingness to cooperate and even to surrender some sovereignty.

TRENDS IN CORPORATE TAXATION

In her presentation on international trends in corporate tax reform, Ms N. Payne of the International Bureau of Fiscal Documentation indicated that over the last decade there has been a trend toward lower corporate tax rates, broader tax bases and simplification of taxation systems. The tax reform movement arose due to a perception in many countries that high tax rates and special tax incentives had created tax systems which were overly complex and lacking in neutrality. The tax reforms which were implemented in developed countries to remedy this situation have also been implemented in many developing countries. The recommendations made by the Chelliah Committee are consistent with these international developments.

Ms Payne also noted the growing trend towards anti-avoidance measures, such as transfer pricing, controlled foreign corporation, thin capitalization and treaty shopping provisions. These measures are generally aimed at corporations whose transactions cross national boundaries, and are therefore gaining in importance as the number of international transactions increases. While such anti-avoidance measures are aimed at broadening the tax base and increasing tax revenues, they inevitably involve greater complexity in their implementation and therefore lead to increased costs of administration. Ms Payne's presentation was followed by a panel discussion on Indian tax reforms with participation from the floor.

The conference noted that a general feature of taxation systems throughout the world is that they have tended to be frequently amended in response to the demands of various pressure groups within a country. The result of this situation is that it is difficult for businesses to plan ahead as they do not know to what extent the tax system will change in the future. It would therefore be preferable for future tax policy to be announced a few years in advance where possible – for instance, where the tax rates are to be lowered over a period of years the government should publicize the rates of tax for some years ahead, and should then not alter this.

In line with international trends, the Chelliah Committee suggested a domestic tax rate of 40 percent, with a tax rate on branches of foreign companies around 7.5 percent higher to compensate for tax which would normally be collected on distributed profits by way of withholding tax on dividends.

More controversial was the Committee's view that the present classical system of taxing dividends, whereby no tax credit is given to the shareholder and he is in effect taxed twice, should be retained for the time being. The reason for the Committee's view is that simplicity should be retained, and also that the lowering of both the individual and corporate tax rates will reduce the disadvantage to the shareholder of double taxation.

Earlier experience in India of a 'partial integration' system aimed at relieving the double taxation of the shareholder was that it was unworkable in practice, owing to problems for the tax administration and problems of compliance. This whole issue therefore has to be seen in the light of efforts to reform the administration, and the need to change the attitude of taxpayers, which was also a concern of the conference. As in other areas, a method of taxation is being recommended on the grounds of simplicity, rather than because it is fair, because the legislation has to work in practice. More complex methods, which will lead to more fairness, must await further reform of the tax administration to enable it to cope with the additional burden caused by more complex methods.

There was discussion at the conference of the appropriate depreciation rates for plant and machinery. The international trend on this issue has been to equate the allowable depreciation rate for taxation purposes with the accounting treatment, rather than to give higher rates or even 100 percent write-offs in the year of purchase. The international tax trend is for neutrality of treatment, rather than to try to influence the behaviour of businesses by means of tax incentives. It is now recognized that the taxation system is not the appropriate place to introduce incentives for investment in plant, especially as business decision-makers often do not allow tax considerations to play a major role in such decision-making. The Chelliah Committee recommended retention of the present 25 percent depreciation rate.

A feature of the situation in India is that it has a Federal system and the individual states have the right to levy their own taxes. This leads to a difference of treatment between businesses operating in different states, especially because of the different levels of indirect taxes levied in different states. The goal of neutrality cannot therefore be achieved by reform at the federal level alone, but will require tax reform at the state level.

PRESUMPTIVE TAXATION

The second technical session comprised a panel discussion on the subject of presumptive taxation, with participation from the floor. A presumptive tax is a tax which is imposed on the basis of an estimated taxable income. A review of the international position on presumptive taxation was given by Mr P. Hann (IBFD). Developed and developing countries have often used final withholding taxes, based on gross income, when taxing non-residents. In some countries, a minimum tax is imposed, based on a percentage of turnover or of net wealth. Flat-rate taxes are increasingly being used where it is difficult to establish the taxable income of businesses, for instance because the books and records are inadequate. Presumptive taxation has the advantage of simplicity, both for the tax administration and for the taxpayer, and it consequently saves administrative time and costs. The simplicity of a tax may also encourage compliance by the taxpayer.

India has for some time had certain types of presumptive taxation in its legislation, for instance in respect of the liquor and timber trades, where inadequate books of account were maintained. Also various types of income of non-residents have been subject to a presumptive tax, as it is otherwise too easy for them to escape paying taxation in India altogether.

The background to the discussion of presumptive tax in India was that the Chelliah Committee recommended two new presumptive taxes on small businesses. Firstly, a fixed tax on businesses whose turnover was less than 500,000 Rs., and secondly the Estimated Income Scheme on small businesses with turnover above 500,000 Rs., but less than 2.5 million Rs., which would estimate profit to be a certain percentage of their turnover depending on the type of activity from which it was earned.

© 1993 International Bureau of Fiscal Documentation

Of these, the government introduced in the Finance Act 1992 a fixed tax on the lines suggested by the Committee, but did not introduce the estimated income scheme. It is, however, understood that the government are in agreement with the Committee on the necessity of such a scheme but wish to first examine the effectiveness of the fixed tax before going ahead with further schemes.

Another development which was the subject of concern at the conference was that the presumptive tax on the liquor and other trades introduced in 1988 has encountered objections on the grounds that it is unconstitutional. The objection is that the section offends against Article 14 of the Constitution which concerns equality before the law. Where the presumptive tax leads to a higher tax burden than would apply from assessment on the basis of book profit, there is a constitutional problem. From the Court decisions, it would appear that under the Constitution the taxpayer has the right to object to the imposition of the presumptive tax and to ask for the laws to be read as offering the presumptive tax as an alternative to assessment on book profit, with the taxpayer in the last analysis being able to insist on assessment based on book profit.

The Chelliah Committee recommended that to avoid legal challenges, the presumptions would have to be made rebuttable. This of course leads to the disadvantage that the taxpayer can choose the presumptive tax when it is to his advantage and reject it when it is not, so that the system always works to the taxpayer's advantage.

The possibility of opting to submit a tax return rather than paying the presumptive tax does not, however, make it less useful in attaining its principle objectives of simplification and of widening the tax net. It is important to determine the level of presumptive taxation with great care and to revise it frequently so that it does not lead to abuse by being set too low or lead to evasion because it is too high.

The conference was in agreement that a presumptive tax such as the fixed tax on small businesses has the great advantage of simplicity, and this means that it saves administrative time and also encourages compliance by the taxpayer as it avoids the necessity to submit a return of income and satisfy the tax authorities that it is correct. Small businesses have in particular suffered from over-assessment, with the resulting time and effort necessary to revise an assessment, and the presumptive tax will solve these problems. Simplification will be an incentive to taxpayers to comply with their obligations, provided that the presumptive tax is set at a reasonable level.

The discussion surrounding the presumptive tax is related to the other aspects of the Indian tax system discussed by the conference. Simplification is a trend in the whole world, and in the particular circumstances of India it is especially necessary in order to solve the problems of tax evasion and an over-burdened tax administration.

TAX ADMINISTRATION

The third technical session featured a lively panel discussion with floor participation.

The Chelliah Committee recommended reforms such as improvement of information-gathering by further computerization, education of tax officers, reform of methods of assessing tax officers, and simplification of tax laws.

The conference identified a major problem to be that too many people who are earning enough to pay tax are escaping the tax net, and that the over-burdened tax administration does not have the resources to identify these tax evaders. Therefore, more resources must be devoted to improving information-gathering and storing of data.

Linked with this is the necessity for a change in the attitudes of both taxpayers and tax administrators. Administrators should be aware that they are collecting tax on behalf of the community, and that collection involves cooperation with the taxpayer rather than confrontation. Taxpayers must see the payment of their tax as part of their duties as citizens.

It was commented that there is a tendency for too much unnecessary contact between the tax administrators and the taxpayers, with frequent requests for the taxpayer to report to the tax office during an enquiry into his affairs. Ideally, a taxpayer should pay his tax at a counter or by post in the same way that he pays an electricity bill, without lengthy procedures. The elimination of lengthy enquiries would be an incentive for taxpayers to comply with the law. The costs of compliance for the taxpayer are at present too high, and to reduce these costs would be another incentive to businesses to comply with the law, in addition to saving administrative time and costs for the tax administration.

The frequent use of search and seizure provisions was also commented on. Hundreds of such searches are carried out each year in India and they rarely result in prosecutions of offenders. Also, the issue of an assessment after a search has taken place takes too much time. During this time, the books which have been seized by the tax authorities are held by them, to the detriment of the taxpayer's business. The situation can amount to unnecessary harassment of the taxpayer. There are other measures that can be taken to combat the non-production of books and records by a taxpayer, and greater use should perhaps be made of these.

The Chelliah Committee had pointed out that the methods of assessment of the work of officers in the tax administration led to the tendency to over-assess taxpayers. Reform of assessment procedures could therefore lead to fairer treatment of taxpayers.

Also, training of administrators should aim at instilling in them a respect for the taxpayer and a realization that this respect should be maintained during the course of an enquiry into a taxpayer's affairs. Internal courses within the tax administration could perhaps be improved by inviting the participation of outside professionals.

INTERPRETATION OF DOUBLE TAX TREATIES

India is in the process of opening itself up to foreign investment by allowing foreign companies to operate through 51 percent subsidiaries and in some cases 100 percent subsidiaries. As mentioned above, it is important that the taxa-

© 1993 International Bureau of Fiscal Documentation

tion system should not counteract this policy by providing a disincentive to investment from outside India. India has a large network of double taxation treaties, and it is therefore necessary that there should be clarity and consistency in the interpretation of the treaties so that foreign companies are able to rely on treaty provisions.

Equally important is the interaction between the treaties and the domestic tax law. In India, the situation is regulated by Section 90 which authorizes the government to enter into taxation treaties and to make the appropriate decrees to put them into effect in India. The Finance Act 1991 introduced an amendment to the effect that where the domestic law gives more favourable treatment than a treaty, the domestic law shall apply.

In his keynote address for the final technical session, Dr. Fantozzi emphasized that, even though a double taxation treaty is implemented in the domestic law of a country, it remains an international agreement and should be subject to an interpretation which is acceptable to both contracting states. An attempt by a state to interpret a treaty according to definitions contained in its own domestic law may be contested by the other party to the treaty.

Subsequent discussion of the issues by the conference revealed that the problems addressed by Dr. Fantozzi are of relevance in India. As more foreign companies begin to invest in India, they will require security as to the meaning of the double tax treaties, and the most reliable course of action for them will be to obtain advance rulings on interpretations which may be contentious. For advance rulings to be reliable, the tax administration must be able to train some staff to enable them to give such rulings, and this should now be a priority.

Double tax treaties provide for a mutual agreement procedure, and another priority for India should be to ensure that such a procedure will be conducted within a reasonable time span.

CONCLUSION

The topics discussed at the conference are related, and have arisen as a result of two important developments in India. Firstly, the need to widen the direct tax net within India, and secondly the need to attract more foreign investment.

The reform of the direct tax system will not be effective unless it is accompanied by a reform of the tax administration, to enable it to cope with the additional work and new challenges. This reform must include a change in attitudes and also more efficient information-gathering systems. The widening of the tax net cannot come about without a greater effort to inform taxpayers of changes in the system and a change in the tax culture which will improve the citizens' attitudes to the payment of tax.

As a result of changes in foreign exchange regulations, an increase in foreign investment in India is expected and, indeed, has already begun. Reform of the taxation system must keep pace with this development, otherwise foreign investors will be deterred. Direct tax rates must therefore be realistic and in line with international levels, and foreign investors must also be able to rely on the network of double tax treaties without fear of legal problems over interpretation.

The concluding remarks for the conference, given by India's Finance Secretary, were well received and provided a satisfying conclusion to an informative and well organized international tax conference.

Resolutions 46th IFA Congress, Cancún, 1992

SUBJECT I: Transfer pricing in the absence of comparable market prices

Resolution (original version)

The 46th IFA CONGRESS

TAKING NOTE OF the 26 National Reports and the General Report as published in the *Cahiers de Droit Fiscal International*, Vol. LXXVIIa, and

TAKING FURTHER NOTE of the discussions held during the Congress on 12 October 1992,

RECOGNIZING THAT

1. The OECD reports *Transfer Pricing and Multinationals* (1979) and *Transfer Pricing and Multinationals, Three Taxation Issues* (1984) and virtually all the countries covered by the National Reports affirm that the "comparable uncontrolled price" is the most appropriate criterion to establish correct transfer prices;
2. the OECD reports acknowledge that if application of this criterion is impossible, other methods such as the "resale price method", the "cost plus method" or so-called "fourth methods" may be used;
3. the OECD reports, however, do not explore in detail the "fourth methods", and do not examine their consistency with the arm's length standard;

RECOMMENDS:

1. While the so-called "fourth methods" do not generally comply with the arm's length principle, there may be specific circumstances under which they do comply, e.g. because they can be applied on a transactional basis. The OECD should study the circumstances under which this may occur. Those methods that do not comply with the arm's length principle (including the comparable profit method as prescribed in the proposed US Section 482 Regulations) should not be used to determine transfer prices. They may be used only to verify whether prices established by one of the basic methods lead to generally acceptable results or to highlight potential problem areas without being used to establish replacement prices for the relevant transaction. Furthermore, use of any of these methods is acceptable if the taxpayer and the tax authorities (in two countries if need be) agree, either in an advance agreement or in a settlement, on the use of a particular method.
2. In determining an arm's length price, the law should not prescribe a specific order as to what method should be applied but it should allow the use of any method or combination of methods – provided it is a method complying with the arm's length principle – that provides the best access to and use of comparable data and appears to be the most appropriate given the facts and circumstances of the case. However, if a taxpayer has consistently used a particular method and can demonstrate that it is in accordance with the arm's length principle and appropriate in the light of the structure of its business and transactions, the authorities should also follow that method.
3. In determining the amount of a tax adjustment in a transfer pricing case, the tax authorities should not be permitted to use information that could not reasonably have been at the taxpayer's disposal at the time the transfer prices were established, unless the taxpayer makes use of such information in justifying the relevant prices.
4. In applying transfer pricing methods that comply with the arm's length principle, taxpayers and tax authorities should not take a narrow, rigid approach in defining standards of compatibility, but be prepared to refer to substantially comparable market situations to which adjustments can be made reflecting the circumstances of a particular taxpayer.
5. The OECD Model Convention should include a provision giving the taxpayer the right to approach the tax authorities of the two countries involved to obtain advance clearance, on the basis of mutual agreement, on basic elements of the transfer pricing system to be followed such as the method to be applied, the selection of the data to be used and, if required, adjustments thereto.
6. Article 9 of the OECD Model Convention should be amended to reflect more accurately the mandatory use in profit adjustments of methods based on the arm's length principle. The Commentary to this article should include a reference to the OECD Report(s) on transfer pricing to ensure that courts, when applying that article, will follow the recommendations of those OECD Report(s).
7. Paragraphs 2 and 38 of the OECD Report recognize that within affiliated groups, conditions for arm's length bargaining may be fulfilled. This could be the case if the persons having a decisive influence on the transfer price have diverging economic interests, where civil law rules prescribe certain behaviour, where group entities have their own profit responsibility and are free to contract with third parties, or where there are significant minority or even majority interests.

   The OECD Report should provide criteria to identify such situations and provide that, if they are found to be present, the price that has been established should be accepted as an arm's length price.

Notes of the Chairman of the Résumé Committee

1. At an early stage in the proceedings it was decided that the subject lent itself better to Resolutions than to a Précis or Résumé. The elements of the discussion and the arguments for the various positions are well covered in the General Report and the National Reports, as well as in numerous other publications on the subject of international transfer pricing problems. A Résumé would merely add another summary of arguments to the already voluminous material. At the same time, IFA members

© 1993 International Bureau of Fiscal Documentation

unanimously expressed the desire to eliminate double taxation resulting from transfer pricing disputes, and IFA should use the opportunity to express recommendations that support that objective.

2. It was noted that in discussions on transfer pricing, two subjects can be distinguished: the first is procedural, viz. what procedures can be developed to minimize the time and cost involved in resolving transfer pricing disputes, and the second is substantial, viz. what methods and criteria should be adopted in establishing arm's length prices. The Reports and the Congress dealt with both subjects, as can be seen from the Resolution. Another subject that was discussed extensively during the plenary sessions but which did not result in sufficient convergence for a Resolution was the distinction between methods used to *establish* transfer prices and methods used to *audit* them.

3. As regards procedure, strong support was noted for the EC arbitration convention and the US advance pricing agreements. Also, the Recommendations express the feeling that taxpayers are entitled to more protection against arbitrary and revenue-seeking actions of the authorities, and that the taxpayer's choice of method, if made with proper diligence, should be given considerable procedural weight.

4. On the issue of criteria and methods, the main concern expressed by the reporters and other participants of the Congress was the lack of definition and criteria in the application of the "fourth methods" (i.e. the methods that are sometimes used beside the "basic" methods of comparable uncontrolled price, resale price and cost plus). The trend toward the use by the revenue authorities of methods based on profitability standards rather than arm's length standards (as expressed, inter alia, in the proposed US Section 482 Regulations) was discussed at length and rejected by most participants. Another area of considerable concern was the use of information not available at the time of the transactions.

5. On some of the Resolution's recommendations, certain qualifications were noted that are listed below.

6. On Recommendation 1, there was a prolonged discussion on whether only "transactional methods" (i.e. methods that look for comparability at the level of the transaction) can be regarded as meeting the arm's length standard, or whether methods looking for comparability at the profit level may also meet that standard. If profit-based methods are applied on a transactional basis, can they then meet the arm's length standard? Generally it was felt that while there is a strong relationship between "transactionality" and "arm's length", it cannot be said to be exclusive. Specifically, a minority of the Resolution Committee members felt that no broad statements could be made branding the fourth methods and/or the US proposals as being not at arm's length.

7. On Recommendation 3, some of the Resolution Committee members felt that the use of later data should be permitted, as this could well result in a fair price and could work to the advantage of the taxpayer as well as to his disadvantage. However, the majority of the members expressed a strong feeling that such data should not be used unless introduced by the taxpayer.

8. On Recommendation 5, some Congress participants expressed the view that it is superfluous since article 25 of the OECD Model Convention already implies this right, and in fact several countries have entered into "advance mutual agreement" negotiations in specific cases based on the authority of article 25. However, the Committee members and the majority of the Congress participants favour the inclusion of a specific provision in tax conventions.

9. On Recommendation 6, a similar issue arose. The OECD reports have the same status as the Commentaries to the OECD Model Conventions, and the second sentence of the Recommendation therefore appears redundant. However, the inclusion in the Commentaries of the reference will be useful as it highlights the commitment of the OECD to the principles outlined in the reports.

10. Recommendation 7 contains a "safe haven" for transfer pricing within affiliated groups. Several Committee members felt that this was not a very realistic proposition and cases would be too few to justify the inclusion in a Resolution. However, the majority of the Committee members and of the Congress participants see considerable merit in this "prudent businessman" approach.

M.J. Ellis (Netherlands)

SUBJECT II: Tax Consequences of International Acquisitions and Business Combinations

Resolution (original version)

The tax consequences of international acquisitions and business combinations (mergers and acquisitions, M&A) were discussed at the Congress on the basis of 27 National Reports synthesized in a General Report as published in *Cahiers* Vol. 77b.

The following resolutions were adopted:

1. *The taxation of international acquisitions and business combinations*

1.1. Considering on the one hand the growing inter-dependencies of world markets and the increasingly multinational character of economic activities,

Considering the increased necessity for enterprises to optimize their worldwide efficiency and activities so as to cope with keener competition on world markets,

Considering the growing importance of international acquisitions and business combinations to adjust to such harsher free-market conditions,

Considering that domestic acquisitions and business combinations are in an increasing number of countries feasible in a tax-neutral way whilst identical international transactions and similar international re-organizations are in some cases impeded by tax hurdles,

Considering on the other hand that international acquisitions and business combinations often result in a transfer of shares, assets or other tax substrata from one tax jurisdiction to another,

© 1993 International Bureau of Fiscal Documentation

Considering that such tax hurdles are already being eliminated by 12 countries in Europe on the basis of the EC merger directive,

The Congress recommends:

A. That Governments should have due regard to the trend towards international acquisitions and business combinations and national legislation, including transaction taxes, should not impede that development.

B. In general that ways and means be devised by which any higher tax burden on international acquisitions as compared to the tax burden of similar domestic transactions are eliminated or mitigated, including the possibility of tax deferral or deferral of tax payment, taking into account the fiscal interests of the countries concerned.

C. That shareholders involved in an international acquisition or business combination should be no less favourably treated by reason only of their residence outside the country of incorporation of the companies concerned or by reason of the fact that one or several of the companies concerned are incorporated abroad.

2. *Tax inefficiencies*

2.1. Considering that mergers and business combinations often result in the flow of income through various tax jurisdictions,

Considering that such flows lead to tax inefficiencies and a higher tax burden due to the imperfect elimination of double taxation, insufficient imputation of withholding or foreign taxes, insufficient tax credits and accumulation of anti-abuse provisions,

Considering further that the structures by which such inefficiencies can be mitigated often lead to operational inefficiencies,

The Congress recommends:

that internal legislation and double taxation agreements ought to give more weight to the elimination of such higher tax burden.

2.2. Considering further that even more cumbersome structural or operational inefficiencies are caused by tax hurdles impeding after an acquisition or business combination an optimal integration and reorganization of the two formally separate economic entities.

The Congress recommends:

That ways and means should be studied and implemented to foster optimization of efficiency by facilitating international reorganizations after acquisitions in a tax neutral manner by tax deferral, deferral of tax payments or in any other way, and that this problem be adopted as the subject of a later Congress.

Notes of the President of the Résumé Committee

At the Congress session on 14 October the participants' contributions were streamlined, by being grouped into six categories:

1. Tax considerations affecting the form of acquisition.
2. Tax inefficiencies resulting from acquisitions.
3. Deductibility of interest and other financing cost incurred in the context of an acquisition.
4. Possibility and limits of tax deductibility of the purchase price or part thereof.
5. Preservations of carry-forward of pre-acquisition losses.
6. Case studies, stapled shares, etc.

Consideration of all the six topics resulted in a discussion on the necessity of careful acquisition tax planning and various methods available for such planning.

1. *Tax considerations affecting the form of acquisition*

In addition to the advantages and disadvantages of share purchase, purchase of assets and merger respectively set out in the reports it clearly emerged that the bargaining on the conditions of an acquisition will be influenced by any tax money payable or potentially payable by either party to the revenues involved. In addition, the acquirer would take into account any tax or operational advantages or inefficiencies resulting from the structures of the deal.

2. *Tax inefficiency resulting from the acquisition or business combination*

Tax inefficiencies occurring during and more especially after an acquisition mainly result from the flow of income from its source to the eventual shareholder through several tax jurisdictions. They are due to imperfect elimination of double taxation, insufficient imputation of withholding or foreign taxes, and insufficient tax credit. In addition the problem of the even more cumbersome structural and operational inefficiencies caused by tax hurdles impeding the optimal integration of two formerly separate economic entities and the tax hurdle to implement the required reorganizations was broached. Such tax impediments to international reorganizations are referred to in the Resolution.

In the discussion the importance of careful tax planning to minimize the foregoing tax inefficiencies were stressed. Four tax planning features were more specifically discussed under points 3 to 6.

3. *Deductibility of interest and other financing cost*

From the deliberations it emerged that no sterner rules in respect of debt financing of the acquisition of share or in respect of thin financing are warranted in cases where these problems arise in the context of acquisition or a business combination. On the contrary, such transactions often provide additional economic and business justification for debt financing of either or both, the acquirer or the target.

4. *Deductibility of purchase price*

There was a consensus that any tax-free revaluation of assets available in domestic transactions should also apply internationally. As regards the possibility of allocating a larger part of the purchase price to depreciable assets like covenants not to compete, the acceptability of such methods would seem to be controversial except where warranted by special circumstances.

© 1993 International Bureau of Fiscal Documentation

5. *Preservation of losses carried forward*

Whilst recognizing the necessity of preventing abuses, it was felt in general that acquisitions or business combinations should not affect the carry-forward of losses to the extent that business activity of the acquired company continued.

6. *Case studies, stapled shares*

As an example of a method for coping with situations of extreme tax inefficiencies, stapled shares and similar vehicles were explained and discussed. Attention was, however, drawn to the tax and operational inefficiencies and to the transfer price problem which must be solved to achieve integration of the operations of the two stapled companies.

Dr. A. Burckhardt (Switzerland)

LIST OF TICKET AND AIRPORT TAXES AND FEES

AN INVALUABLE AID

✔ A comprehensive list and quick reference tool with respect to the requirements for collection, filing, ticketing, remitting, etc. of various airline ticket and airport taxes, charges and fees.

✔ More than 750 information records for over 550 different airline ticket and airport taxes, charges and fees imposed in some 187 countries.

✔ The list is in loose-leaf format and comes in two volumes.

AVAILABLE NOW

✔ Available in English at the annual subscription rate of CHF 640 (USD 400) including revisions and mailings. Renewal rate will be CHF 400 (USD 250).

MINTZ, Jack M.
Is there a future for capital income taxation?

© 1993 International Bureau of Fiscal Documentation

Paris, OECD - Organisation for Economic Co-operation and Development. 1992. Economics Department Working Papers, No. 108. pp. 42.
This paper examines the future of capital income taxation in a world of capital mobility. It first explores the motivation for personal and corporate income taxation in an open economy and argues that policymakers should view these taxes as having quite different impacts on the economy. The paper then suggests that some forces (e.g. capital flight) will encourage governments to shift away from capital income taxation while others (e.g. tax exportation) will have an opposite effect.

THE FIRST CARIBBEAN TAX CONFERENCE — 107 — *Dr Willem G.Kuiper*

The first Caribbean tax conference was held in October 1992 in Aruba. This landmark event brought together tax experts from the Caribbean, the United States and Europe to discuss recent tax and foreign investment developments in the Caribbean, tax consequences of doing business in the region and financial services. This issue features a number of the papers presented during the very successful conference

EXCERPTS FROM THE ADDRESS OF THE MINISTER OF FINANCE OF ARUBA — 108 — *H.E. Mr Roland H. Laclé*

The Minister of Finance opened the conference with a call to the United States and the governments of other industrialized governments to conclude double taxation treaties with the Caribbean countries.

RECENT TAX AND FOREIGN INVESTMENT DEVELOPMENTS IN THE CARIBBEAN — 109 — *Annette T. Johnson*

Contrary to widely held perceptions only five of the 27 territories in the Caribbean levy no taxes at all – the majority have relatively developed tax systems which are as diverse in their approach to taxation as are countries of Western Europe. Ms Johnson overviews the tax systems of the Caribbean region, including the overseas features which have influenced the development of these systems.

TAXATION OF FOREIGN INVESTMENT IN JAMAICA — 116 — *Christine A. Gore*

Ms Gore looks at a number of incentives available to investors in Jamaica. Her conclusion – the Jamaican taxation of foreign investment needs to be re-examined with a view to ensuring that such legislation fulfils its objective, i.e. creating incentives, and not impediments to the investor.

TAX REGIME AND INVESTMENT INCENTIVES IN THE FRENCH CARIBBEAN ISLANDS (MARTINIQUE, GUADELOUPE AND GUYANE) — 122 — *Pierre-Jean Douvier*

French law is fully applicable in the Overseas Departments although it may be adapted for the specific circumstances of the island. This article takes a look at how the tax laws work in Martinique, Guadeloupe and Guyane.

DOUBLE TAXATION AGREEMENTS OF CARICOM: A REVIEW OF EXISTING PRACTICE AND PROSPECTIVE POLICY OPTIONS — 129 — *Bruce Zagaris*

This article discusses the Commonwealth Caribbean double taxation agreements and their effect on trade, commerce and investment. The article in particular considers the principal double taxation agreements to which the Caribbean countries are parties, and explains the legal effects of these agreements.

THE FIRST CARIBBEAN TAX CONFERENCE

Dr Willem G. Kuiper
Technical Director, IBFD International Tax Academy

INTRODUCTION

In 1992 the IBFD International Tax Academy (ITA) organized the first Caribbean Tax Conference in cooperation with the Foundation First Caribbean Tax Conference. The conference, held in Aruba from 7-9 October, was intended to be the first major tax event to bring together tax experts from the region, as well as from the United States and Europe. Ninety-eight delegates from 21 countries (including ten countries in the region) attended the conference. The conference programme was divided in three parts:

- recent tax and foreign investment developments in the Caribbean;
- tax consequences of doing business in the Caribbean from a US and European perspective (with special focus on tax information exchange agreements);
- financial services in the Caribbean, including the domestic and international tax consequences thereof.

After a welcome speech by the conference chairman, Mr Maarten J. Ellis and the official opening of the conference by H.E. the Minister of Finance of Aruba, Mr Roland H. Laclé, the first speaker was Ms Annette T. Johnson who gave an overview of the tax systems in the region and different overseas (Dutch, French, English) features which have influenced the development of these systems. Ms Johnson also discussed the highlights of recent tax reforms in some of the countries concerned, including Barbados and the Dominican Republic, the activities of CARICOM in the area of taxation, some trade and investment issues under the Lomé Agreement and the Caribbean Basin Initiative, the various tax incentives under the CARICOM Harmonization Fiscal Agreement and the influence of the UN model treaty on tax treaty negotiations by Caribbean countries. Many of the issues raised by Ms Johnson were discussed in more detail during the subsequent presentations, workshops and panel discussions.

The next speakers were Ms Christine Isaacs and Mr Colin Brewer who discussed domestic and international tax aspects of the tax systems of their respective countries, i.e. Jamaica and Barbados. These presentations were followed by a number of workshops, each dealing with the tax consequences of a foreign multinational company investing in the region, i.e. the Bahamas, Barbados, the British Virgin Islands, Jamaica and the French Caribbean islands.

The second day commenced with a presentation by Mr Alan W. Granwell who discussed the US tax consequences of doing business in the Caribbean in light of recent international tax developments in the United States and US international tax policy objectives, including the US policy as to whether or not tax treaties should be concluded with Caribbean countries. The focus then moved across the Atlantic to the European tax consequences of doing business in the Caribbean (with particular reference to the special tax relationship between the Netherlands and the Netherlands Antilles). During the panel discussion, Mr Hubert M. Bierlaagh and some of the other speakers deliberated on the potential impact of the EC tax directives and other EC tax regulations on doing business in the Caribbean.

Ms Grace Perez-Navarro of the IRS highlighted the contents and practical use of tax information exchange agreements, primarily between the United States and countries in the region, but also in a wider context. One of the issues discussed during the subsequent panel discussion was the US position as regards its demand to enter into tax information exchange agreements versus its reluctance to conclude comprehensive double taxation agreements with countries in the Caribbean. Other issues discussed by the panel included:

- the consequences and application of the US Caribbean Basin Initiative; and
- the impact of regional tax harmonization, including the tax treaty policy of Caribbean countries, on foreign investment from the United States, Latin America and Europe.

The central topic of the third day was financial services in the region. A number of tax, investment and banking experts from the region (including Aruba, the Netherlands Antilles, the Bahamas, the British Virgin Islands and Barbados) overviewed the relevant aspects of financial services from the perspective of their respective countries. A number of workshops followed, which focused on the same countries and during which case studies and other practical aspects of financial services were discussed.

During the wrap-up session, the importance of this type of seminar, particularly for Caribbean countries, was emphasized by several speakers and delegates. Taking into account the increased efforts of Caribbean countries to achieve a higher degree of harmonization of their fiscal systems and ongoing discussions on the use and abuse of the Caribbean in relation to other parts of the world, either in general or for specific types of transactions, there was a general consensus that a second conference of this type should be held in the not too distant future. ITA expressed its willingness to contribute to such a conference, which will probably take place in early 1994.

The ITA and the editor of the *Bulletin* are pleased to publish this special issue which contains a number of the papers presented during the First Caribbean Tax Conference.

EXCERPTS FROM THE ADDRESS OF THE MINISTER OF FINANCE OF ARUBA

H.E. Mr Roland H. Laclé

I am very pleased to have the opportunity to address you at the opening of the First Caribbean Tax Conference. You have come from 17 different countries to attend this conference, which precedes the annual meeting of the International Fiscal Association. The number of participants clearly indicates that the initiative of the First Caribbean Tax Conference meets a need. I am pleased that my country's private sector has offered this opportunity to provide you with information on the possibilities for investments and financial services in this region.

It appears to me that the Caribbean region has become very appealing to the world of financial investors. This is also the case for Aruba. The world of financial services imposes special demands. Political and economic stability, good infrastructure, including telecommunication and adequate accessibility, are among those demands. I am pleased that my country scores very high in this respect, which contributes to increasing confidence. This confidence not only results in an increase in financial services, but is a prerequisite for foreign investors and for economic activities.

In respect of economic activities, delegates attending this conference will address the question of the fiscal relations of our region with the industrialized world. Fiscal relations with Europe and the United States will also be brought into focus.

Kindly allow me to make an observation, which relates to the question of fiscal relations between the United States and our region. My remarks are not intended to pre-empt tomorrow's speakers. On the contrary, please regard this part of my speech as an attempt to contribute to the discussions.

Double taxation treaties are usually concluded when the economic activities between countries justify them. As I was told the United States follows this policy. If I understand it correctly, it is the US view that the economic links with most countries of this region are far too small for the conclusion of double taxation treaties.

One of the provisions in a double taxation treaty is the exchange of information provision. Unless there is a treaty base no information is exchanged. This is understandable: information supplied by a citizen of a country to the tax authorities of that country in fulfilment of statutory obligations should not be passed on to the tax authorities of another country in the absence of very compelling reasons. These reasons can be explained in light of the importance of a correct observance of treaty provisions. The exchange of information provision constitutes only one part of a double taxation treaty. As the economic ties between the countries concluding the treaty become closer, the exchange of information becomes more important. You might say that mutual administrative assistance crowns the cooperation between countries as laid down in double taxation treaties.

The last decade evidences an increasing need for mutual administrative cooperation, not only on a bilateral, but also on a multilateral level. As a result the OECD and the Council of Europe jointly designed a treaty aimed to meet this need. This multilateral treaty may be considered a supplement to what countries already agreed on bilaterally in double taxation treaties. Thus, in historic perspective, there were first the bilateral treaties, followed by the multilateral treaty as a further elaboration on administrative cooperation.

But there is more. The United States also uses the Tax Information Exchange Agreement (TIEA) which is intended for countries that, based on the criterion of economic activity, are not eligible for a double taxation treaty.

Earlier I explained that the provisions for the exchange of information form a part of a double taxation treaty. There can only be question if there is a sufficient economic activity between the states concluding the treaty. As regards the TIEA it is precisely the crucial criterion of economic activity that appears to play a minor role.

I am under the impression that there is some inconsistency here. If I understood well, there is either sufficient economic activity justifying a tax treaty, of which the exchange of information may form a part, or so little economic activity that there can be no reason for a tax treaty of any nature.

When I mention here that our Government does not embrace the idea of concluding a TIEA, this is merely caused by the objection in principle to this phenomenon. I would like to call on the US policy makers to give shape in another way to the solidarity between their country and countries in our region as regards fiscal relations. In order to promote economic activity in Aruba, the government sees the conclusion of double taxation treaties as a viable instrument. Underlining the special relation of neighbourhood between the United States and our region, I would request that the United States seriously take into consideration the alternative of a policy of complete and full-fledged double taxation treaties with the Caribbean countries. Let there be no mistake that in these treaties the exchange of information should receive the attention it deserves in view of international developments.

It goes without saying that when I make this call on the United States, it should be seen within the context in which I made my observation. Of course, I would also call on other industrialized countries to pursue this policy.

Finally, I would like to express the wish that this first Caribbean tax conference will offer you everything you expect from it, and even more.

I. INTRODUCTION

Contrary to widely held perceptions, only five of the 27 territories in the Caribbean region levy no taxes at all.[1] The remainder have relatively developed tax systems and taxes account for a large portion of government revenue. Moreover, Caribbean jurisdictions are as diverse in their approach to taxation as are Western European countries.

The 12 countries which make up the Caribbean Community (hereinafter "CARICOM") – Antigua and Barbuda, Barbados, Belize, Dominica, Grenada, Guyana, Jamaica, Montserrat, St. Kitts-Nevis, St. Lucia, St. Vincent and Trinidad and Tobago – have similar tax systems, evolved from pre-independence British colonial tax legislation. Most of these countries' tax systems share common features such as a partial imputation system for corporate and individual taxation, the remittance basis of taxation for certain foreign income and the credit method for the relief of double taxation. Guyana is the only country within this group which levies a capital gains tax.

French income tax law extends to its Caribbean Overseas Departments of Martinique and Guadeloupe, Guyane and St. Martin. With a few differences such as the exclusion of one-third of locally-derived income from the tax base, the tax system in these territories is identical to that of France.

The income tax systems of Aruba, Surinam and the Netherlands Antilles are based on Dutch tax legislation without some of its recent refinements. Common features of these income tax systems include the participation exemption, the taxation of capital gains as normal business profits, the non-integration of personal and corporate taxation and the exemption method for the avoidance of double taxation.

The income tax law of the United States forms the basis of the tax systems of Puerto Rico and the US Virgin Islands. Puerto Rico's 1954 Tax Code is based on the US Internal Revenue Code of 1939, as amended by the 1987 Tax Reform Act. The tax code of the US Virgin Islands is a virtual replica of the US Internal Revenue Code.[2]

Taxation matters aside, the overriding factor common to all these territories is their status of lesser developed countries (LDCs) characterized by scarcity of capital, a large agricultural sector, with the export of commodities and primary materials far exceeding that of manufactured goods. Fiscal incentives have therefore been widely utilized to encourage direct investment in underdeveloped sectors such as manufacturing as well as in the more advanced tourism sector. The dependencies of the United Kingdom and the Netherlands, which are associated with the EC,[3] have also utilized special fiscal measures to encourage their development as specialized non-tax jurisdictions given the limitations imposed on traditional industrial activity by their size and insularity.

II. RECENT TAX DEVELOPMENTS

Following the trend in OECD countries and other LDCs, major tax reforms have been undertaken in four of the larger tax jurisdictions within the past six years. Significant changes were introduced in Barbados and the Dominican Republic during 1992 and in Jamaica and Trinidad and Tobago in 1986 and 1989, respectively.[4]

In all four cases, tax reform was part of a package of measures implemented within the broader framework of economic adjustment programmes agreed with the multilateral lending agencies. These countries had shown a substantial fiscal deficit

1. See Appendix I.
2. Under the provisions of the Naval Service Appropriations Act of 1922 48 U.S.C. 1397, the Virgin Islands apply the income tax laws in force in the United States as the tax laws of the Virgin Islands. See IRS Revenue Ruling 83-10, also released as News Release IR-82-158 dated 29 December 1982.
3. Art. 227(3) of the Treaty of Rome established the association of Aruba, Anguilla, British Virgin Islands, Bermuda, Cayman Islands and Netherlands Antilles with the European Community as set out in Part IV thereof. The main elements of Part IV of the Treaty of Rome and implementing provisions established in Council Decision 91/482/EEC include the progressive abolition of customs duties on trade between the 12 member states of the EC and the associated territories and the provision of economic development assistance of EC states to the associated territories.
4. A comprehensive tax reform was also undertaken in Grenada between 1986 and 1987. The most significant features of the reform were the reduction in the number of taxes from 20 to 7, the abolition of income taxes on corporations and individuals and the introduction of a value added tax. For an account of the reforms, see W.A. Samuel, "Tax Reform in Grenada", 42 *Bulletin for International Fiscal Documentation* (March 1988), at 123.

© 1993 International Bureau of Fiscal Documentation

(excess of government expenditure over revenue intake) during the 1980s.[5] Increasing government revenue through a reform of the tax system and expenditure restraint were therefore important elements in the type of adjustment necessary to move towards fiscal balance in the 1990s.

Unlike many LDCs, income taxation has been an important source of tax revenue in these four countries for many years even in the absence of a broad industrial base. The development of the income tax base has been attributed to the early presence of foreign enterprises in the agricultural and mineral sectors. These provided an accessible tax base for corporate taxation and offered an easier foothold for the administration of individual income taxes.[6] It was not surprising therefore, that the reforms in these countries included significant changes to individual income tax and some changes to corporate taxation.

Domestic retail taxes remain important revenue sources and the reforms in Jamaica and Trinidad included replacing the numerous indirect retail taxes by a single value added tax.[7]

As in any tax reform, the aims of the reforms in the Caribbean included the public finance goals of efficiency, simplicity and equity. As efficiency implies increased revenue yield, the reform measures sought to broaden the tax base for personal taxation. In addition, exempt items of income were brought within the tax net.

The decisive step towards broadening the tax base for personal income tax was the abolition of the large number of personal deductions previously accorded to individual taxpayers. In addition, steeply progressive rate structures with high (in excess of 50 percent) marginal rates were replaced by lower marginal rates and fewer brackets.

The abolition of personal deductions was intended to simplify administration to the extent that it removed the disproportionate burden placed on the tax administrations' resources in processing the small number of claims for the available deductions. The administrative resources employed in multiple calculations occasioned by the numerous tax brackets could be devoted to enforcing compliance, thereby increasing revenue yield. Abolishing the deductions also addressed equity considerations, to the extent that taxpayers with like income were to be treated equally whether or not they chose to dispose of that income in a tax advantageous manner.

In Barbados, the pre-reform rate structure of five marginal rates of between 20 and 50 percent was replaced by a dual rate system. Tax is levied at 25 percent on the first BDS$ 24,200 of taxable income, and 40 percent on taxable income over that amount.

In Jamaica the pre-reform rate structure of five marginal rates of between 30 and 57.5 percent were replaced by a single flat rate of 33.33 percent.[8]

Under the pre-reform schedular tax system[9] in the Dominican Republic, the total net income of individuals was taxed under a progressive rate structure with no fewer than 16 marginal rates of between three percent and 70 percent. These were replaced by a progressive triple-rate structure, under which the first RD$ 60,000 is exempt. Fifteen percent tax is payable on income between RD$ 60,000 to 100,000; 25 percent on income between RD$ 100,000 and RD$ 150,000 and 30 percent on the excess over RD$ 150,000. The top marginal rate is to be decreased by one percent over the next three years so that in the year 1996 the top marginal rate will be 25 percent.[10]

In Trinidad, the pre-reform rate structure consisting of 11 marginal rates ranging from five to 50 percent was replaced by four brackets of between five and 45 percent.[11]

The second common feature of the reforms was the replacement of personal deductions by a standard fixed deduction. In Jamaica and Barbados, individuals were accorded a plethora of tax deductions ranging from life insurance, medical and dental expenses, household helpers, mortgage interest and alimony. These were replaced by a standard deduction of J$ 14,352 and BDS$ 13,000, respectively.[12] In the Dominican Republic, pre-reform deductions which were available in the form of personal and family allowances/credits have been replaced by a standard deduction of RD$ 60,000. In Trinidad the approach was slightly different: personal deductions for, *inter alia*, medical expenses, mortgage interest, housekeepers and dependent relatives were replaced by a non-refundable tax credit of TT$ 600 per year for each taxpayer, rather than a standard deduction.

The reforms in three countries also introduced the taxation of interest on bank deposits by withholding at source. Interest on bank deposits had been previously excluded from the tax base. In Barbados the withholding tax rate for interest is 12.5 percent (with no refund of tax if total income is less than the basic deduction). In Trinidad the rate is 15 percent, with a refund of excess withholding for taxpayers in the five percent tax bracket. In Jamaica the withholding tax rate is 33.3 percent, with an exemption for taxpayers whose income is below the basic deduction.

There was no overall consistency in the treatment of corporate income tax. In Jamaica the rate was reduced from 35 per-

5. Between 1981 and 1988 the fiscal deficit as a proportion of GDP averaged 6% in Barbados, 2% in the Dominican Republic and 7% in Jamaica and Trinidad and Tobago, respectively. See Inter-American Development Bank, *Economic and Social Progress in Latin America 1990 Report* (Baltimore: Johns Hopkins University Press, 1990) and Caribbean Development Bank, *Annual Report 1990*.

For an overview of the relationship between economic development, tax administration and the revenue importance of different taxes, see C.Y. Mansfield, "Tax Reform in Developing Countries - the Administrative Dimension", 44 *Bulletin for International Fiscal Documentation* (March 1990), at 137.
7. Jamaica's value added tax, the General Consumption Tax was introduced in October 1991, some five years after the reform of direct taxation.
8. Sec. 7, Income Tax (Amendment) Act 16/1980. The rates for tax years before December 1980 contained 8 marginal rates of between 30 and 80%.
9. Under schedular tax systems which were exported to the Western hemisphere from continental Europe, income from different sources is taxed separately. Thus separate assessments are made on business profits, income from movable capital, etc. A complementary tax is usually imposed on the total amount of an individual's income.
10. Art. 296 Ley 11-92, approving El Codigo Tributario de la Republica Dominicana (Official Gazette, No. 9835, 16 May 1992).
11. The highest marginal rate was subsequently reduced to 35% in 1990.
12. Under the pre-reform system in Barbados, individuals whose total personal deductions were less than BDS$ 15,000, could claim that sum as a lump sum deduction. Individuals whose actual personal deductions exceeded the amount were able to claim the full amount thereof.

© 1993 International Bureau of Fiscal Documentation

cent to 33.33 percent. In Barbados, the rate was increased to 40 percent from 35 percent. In Trinidad the 49.5 percent maximum combined rate of the four taxes on corporations was reduced to a single 45 percent rate.

The reforms in the Dominican Republic included the abolition of tax incentives with the exception of those granted to assembly and manufacturing enterprises operating in the Free Zones. The incentives were, like those currently granted in the other three countries, in the form of exemption from corporate taxes and import duties. The export assembly sector in the Dominican Republic saw significant growth in the 1980s though the tax preferential treatment meant that the sector provided only a limited contribution to government revenue.[13] The tax incentive laws of the other three countries have not be reviewed since the reforms.

III. CARICOM

CARICOM was established by the Treaty of Chaguaramas in 1973, replacing the Caribbean Free Trade Association (CARIFTA) in order to establish a single market.[14] In addition to the 12 full members, Anguilla, Bermuda, Cayman Islands, Colombia, the Dominican Republic, Haiti, Mexico, the Netherlands Antilles, Puerto Rico, Surinam and Venezuela have observer status in several CARICOM institutions.[15] Cuba's recent request for observer status is being considered.

Though the integration process has been to some extent restricted by the predominance of nationalist interests among member states, increasing economic regionalism in the global economy and in neighbouring regions has increased pressure on CARICOM to establish a single market by 1994. In addition, several initiatives have been taken towards that goal.

By Article 40 of the Annex to the Treaty, member states agreed to harmonize fiscal incentive laws under which tax concessions are granted to encourage investment. To this end, the Agreement on Fiscal Incentives to Industry was concluded in 1974. It provides guidelines to member states offering tax incentives to investment and in fact forms the basis of the legislation providing tax incentives to industry in several member states including Barbados, Antigua, Jamaica and Trinidad and Tobago. Although the Harmonization Agreement provided more generous incentives for investment in the LDCs, its existence has ensured some uniformity in the development of fiscal incentive policy in the region, minimizing distortive intra-CARICOM competition in this area. A revised draft of the Harmonization Agreement was prepared in 1991, with new emphasis on exports and other foreign exchange earning activities.

By Article 41 of the Annex to the Treaty, member states agreed to adopt common principles in negotiating double taxation treaties with third countries. In addition, a CARICOM double taxation treaty was drafted to regulate double taxation between the more developed members (Barbados, Jamaica, Guyana and Trinidad and Tobago) and the lesser developed members. However, the treaty was never ratified by member states and is not in force.

An important step towards the free movement of capital was the commencement of cross border trading on the stock exchanges of Barbados, Jamaica and Trinidad and Tobago in April 1991. About 90 companies are listed on the three exchanges with an estimated value of US$ 1.5 billion.

To date, the most important achievement in progress towards a single market is the introduction of a common external tariff ranging from five to 35 percent on all imports from outside CARICOM.

IV. FOREIGN TRADE AND INVESTMENT

Trade between countries in the Caribbean region with OECD countries has been facilitated over the years by preferences accorded under the Lomé Convention IV and the Caribbean Basin Initiative.[16]

The Lomé accord is a multilateral economic aid agreement concluded between the 12 EC member states and the African, Caribbean and Pacific (ACP) states of which the independent Caribbean territories form part.[17] Trade preferences granted under Lomé which are of special interest to Caribbean states include duty-free access to the EC for certain agricultural commodities and minerals. Economic assistance takes the form of grants and low interest financing for large capital projects and improvements to existing infrastructure.[18]

The Caribbean Basin Initiative (CBI) is, on the other hand, more in the nature of a unilateral economic aid package developed by the United States in the mid-1980s for the benefit of designated Caribbean territories. Initially temporary, CBI was made permanent and extended in 1990.

The primary thrust of the CBI is the provision of duty-free access to the US market for products assembled or manufactured in a CBI country, to the extent that at least 35 percent of the customs value of the final product is attributable to direct processing costs in one or more CBI countries. Agricultural products also qualify for duty-free access. Duty-free access is not permitted for textiles and apparel, canned tuna, leather footwear, watches and watch parts. Investors may obtain an advance ruling from the US Customs Service on the eligibility of proposed products for duty-free treatment.

Access to financing on favourable terms for CBI projects is facilitated by the provision of what are commonly known as "Section 936 funds" from qualified financial institutions based in Puerto Rico. Under Section 936 of the US Internal Revenue Code, as amended by the Tax Reform Act 1986, US corporations are granted exemption from federal income tax

on passive investment income derived from the reinvestment of exempted business profits in Puerto Rico or any CBI beneficiary country with which the United States has a Tax Information Exchange Agreement.[19] The funds are administered by the Economic Development Administration of Puerto Rico. Estimates indicate that in February 1991, up to US$ 500 million of qualifying Section 936 funds had been invested in CBI projects.[20]

There is currently evidence of concern in CBI beneficiary countries that duty-free access under CBI may be curtailed now that the North American Free Trade Agreement (NAFTA) has been signed, especially in view of projected increased US imports from Mexico. A US/CARICOM Trade and Investment Council has been established as the framework within which CARICOM beneficiary countries are to have discussions with the United States on the likely impact of NAFTA on CBI.

V. TAX INCENTIVES

Although there are other specific tax incentive regimes in each, CARICOM members share a tax incentive scheme based on the Agreement on the Harmonization of Fiscal Incentives to Industry (hereinafter the "Agreement") established by CARICOM in 1974. The following summary is based on the revised draft of the Agreement prepared in 1991.

The Agreement establishes five to 20-year periods of exemption from corporation tax for approved enterprises and their CARICOM-resident shareholders as well as import duty relief for imports of capital equipment and inputs from outside CARICOM. A company incorporated under the laws of a member state and a branch of a foreign company may qualify for the benefits of the scheme.

Approved enterprises fall into one of three categories: (i) an enclave enterprise is one which manufactures exclusively for export outside CARICOM or for the benefit of another enclave enterprise; (ii) highly capital intensive enterprises are those with capital investment of EC$ 40 million in any LDC or EC$ 80 million in an MDC; and (iii) Group I, II or III enterprises which are manufacturing enterprises whose classification depends on the local value added to product manufactured.

Group I enterprises are those whose final product has local value added of 50 percent or more; Group II enterprises are those with local value added of between 25 and 50 percent; and Group III are those with local value added of between 10 and 25 percent of the sale price of the product manufactured.

Local value added (expressed as a percentage of the total cost of the product) is the amount by which the cost of the product in a continuous 12-month period exceeds the aggregate value of (i) imported raw materials, components, fuels and services; (ii) wages and salaries paid to non-nationals of member states; (iii) interest and management charges paid to non-residents other than to a branch of a non-resident bank; and (iv) depreciation of imported capital equipment. The percentage of local value added is weighted according to a formula whose factors include net extra-regional foreign exchange earnings, remuneration paid to CARICOM nationals, the cost of regional raw material input and net intra-regional foreign exchange earnings. In effect, this means that the greater the foreign exchange earnings or remuneration paid to locals, the higher the local value added percentage will be.

The incentives consist of exemptions from indirect taxes (customs duties and other taxes on imports) on factory equipment, plant and machinery, spare parts and raw materials imported for use in the enterprise in constructing, altering or extending the factory or manufacturing process. Direct (corporate) tax exemptions vary in the countries from between five to 20 years, with Group I and enclave enterprises enjoying tax holidays of up to nine or ten years.

Dividends distributed out of profits derived during the tax holiday period to resident shareholders are exempt from income tax. Dividends paid to shareholders resident outside CARICOM are only exempt to the amount by which local tax exceeds the liability of the recipient in his country of residence. If the dividends are exempt from tax in the residence country of the recipient, they are exempt from tax at source. However, if they are taxable in the residence country, they will be taxed at a rate represented by the difference between the source country rate and the residence country rate. By contrast, all payments of interest on loan capital, overdraft or debenture to non-residents are subject to withholding tax.

VI. TAX TREATIES

The countries in the Caribbean region have a well-developed tax treaty network as shown in Appendix II. The majority of these treaties were negotiated after independence, although a few UK treaties with OECD states which had been extended to its Caribbean territories remain effective. The CARICOM treaty between less developed member states and more developed member states is not included in the table shown in Appendix II because it was never ratified by member states and is not in force.

Caribbean treaties, including those concluded before the official release of the UN model for tax treaties between developed and developing countries, show a consistent departure from two basic assumptions underlying the OECD model towards a broadening of source jurisdiction. Those two assumptions are (i) that the country of source will limit the scope of its jurisdiction to tax source income and reduce its tax on that income; and (ii) that the country of residence will prevent or eliminate double taxation by the credit or exemption method.[21] An examination of some of the articles in the Caribbean treaties which have traditionally entailed a limitation on the scope of source country jurisdiction illustrates the extent of that departure from the OECD model.

A. *Permanent establishment*

As there is much literature exposing the inappropriate nature of the PE concept in tax treaties between developed and developing countries, it is sufficient to summarize the basic problem.[22] The use of the PE concept to allocate taxing jurisdiction between developed and developing countries demands substantial revenue sacrifice which is absent when the concept is used in tax treaties between countries which are at a similar stage of development, with reciprocal investment flows.

Developing countries like those in the Caribbean have addressed the problem by broadening the PE definition which is used to determine the nature and scope of activities justifying source country taxation as well as the provisions for allocating income to the PE. Hence most Caribbean treaties with the notable exception of the Dominican Republic/Canada, Germany/Trinidad and Tobago, Surinam/Netherlands and the Netherlands Antilles/Norway treaties include a store or sales outlet in the PE definition.

Most Caribbean treaties follow the UN model with respect to building sites, treating a site which exists for six months or more as a PE. However, there are a few exceptions at both extremes: the Trinidad/Sweden treaty which goes further than the UN model in that all building sites are considered PEs with no time limitation while the Dominican Republic/Canada treaty has a 12 month period as in the OECD model. With the recognition in the Commentary to Article 5 of 1992 OECD model that the 12-month test is often abused (by enterprises which divide contracts into several parts of less than 12 months, attributing each part to a different company within the same group), one wonders whether a test of six months or even three months as in the Jamaica/Canada treaty may become the standard negotiating position of Caribbean countries in treaties with OECD countries.

Many Caribbean treaties follow the UN model paragraphs regarding dependent and independent agents. The UN model broadens the scope of the OECD model paragraph on dependent agents by including an agent who lacks authority to bind the enterprise which he represents but nevertheless habitually maintains a stock of goods from which he regularly makes deliveries on behalf of he enterprise. The Barbados/Sweden, Barbados/Canada, Jamaica/Denmark, Trinidad/Germany and Trinidad/Sweden treaties all follow the UN model. An interesting deviation from both the UN and OECD models, which appears to have been included as a result of bilateral negotiations, is the Dominican Republic/Canada accord which treats an agent who purchases agricultural or mineral produce or livestock on behalf of an enterprise as a PE thereof.

Most Caribbean treaties with OECD countries, with the notable exception of the Barbados/Norway and Jamaica/Germany treaties, follow the UN model's restricted the definition of independent agent and exclude commission and other independent agents whose activities are almost "wholly devoted on behalf of an enterprise". Such agents are not treated as independent agents and may be regarded as a PE of the enterprise to which most of their activities are devoted.

Several Caribbean treaties, including the Surinam/Netherlands, Jamaica/Canada, Barbados/Canada, Jamaica/Germany and Jamaica/UK treaties, include the collection of insurance premiums (except for re-insurance) or the insurance of risks through employees or dependent agents in the definition of PE.

B. *Business profits*

Although many Caribbean treaties follow the business profits article of the OECD model incorporating an arm's length allocation of profits to the PE, several extend the scope of source country taxation by incorporating the force of attraction principle as in the UN model. The business profits articles in the Barbados/Finland, Barbados/Norway, Barbados/Sweden, Trinidad/Sweden as well as the Jamaica/Denmark and Surinam/Netherlands treaties provide for attribution to the PE of profits earned from activities similar to the PE's activities which are carried out without any connection to the PE. All of these treaties go further than the UN model in that they place the onus on the enterprise to prove that the activities generating income attributed to the PE under the force of attraction principle could not have reasonably been undertaken by the PE.

C. *Independent professionals*

Most Caribbean treaties deviate from the OECD model in respect of the taxation of the income derived by independent professionals. The United Kingdom's treaties with Jamaica and Trinidad do not incorporate the fixed base concept. The Trinidad/UK treaty, like that with Italy, accords taxing jurisdiction to the source country where the professional is present for a period of 30 days or more in a tax year while the Jamaica/UK treaty allows source country taxation, regardless of the time present therein or the amount of remuneration received. However, the analogous article in the Barbados/UK treaty adopts the OECD model article thereby retaining the fixed base concept.

Other treaties, such as the Barbados/Canada and Jamaica/Denmark treaties, follow the UN model's expansion of source country jurisdiction by adding to the fixed base concept (of the OECD model) the criteria of duration of stay in the source country and the amount of remuneration derived there.

D. *Tax sparing*

Most Caribbean treaties with the exception of those concluded with the United States adopt tax sparing provisions the object of which is to minimize the nullification of the benefits accorded to enterprises under tax incentive schemes by the imposition of full taxation in the country of residence.

22. For a brief analysis and historical overview of the PE concept, see P. Moore, "The Permanent Establishment Concept in Tax Treaties: Old Bottles for New Wine?" 6 *Queens Law Journal* (1981), at 482. For a detailed account of the development of the concept, see *The Permanent Establishment Concept in Tax Treaties between Developed and Developing Countries* (Osgoode Hall Law School: 1987 thesis submitted by author).

© 1993 International Bureau of Fiscal Documentation

Many treaties limit the tax sparing credit for ten years, subject to review after agreement between the competent authorities.

VII. NON-TAX JURISDICTIONS

Only five of the territories traditionally referred to in the literature – Anguilla, Cayman Islands, Bahamas, Bermuda, Turks and Caicos Islands – are full tax havens, i.e. no income tax is levied on individuals or corporations. Nevertheless to the extent that the Cayman Islands and the Bahamas issue guarantees (mandatory for exempt companies and trusts) against the future imposition of direct taxes for 20 years, these jurisdictions do not apparently rule out imposition of taxes in the future.

The other territories which have developed a financial services sector do in fact levy income and corporation taxes but they exclude certain types of entities from the scope of taxation or apply reduced rates of corporation tax to those entities. Among the territories in this group are the British Virgin Islands (BVI), Aruba, the Netherlands Antilles and Belize on the Central American mainland.

The BVI, the Netherlands Antilles and Aruba best illustrate this duality approach. The BVI levies corporation tax on the worldwide income of "ordinary" companies at 15 percent; investment income which is tax exempt in the jurisdiction in which it arises is taxed at a reduced rate of one percent. By contrast, international business companies which, inter alia, must be owned entirely by non-residents and are prohibited from carrying on business in the BVI are completely exempt from tax in the BVI. However, individuals resident in the BVI are taxed on their worldwide income at progressive rates of between three and 20 percent; non-domiciled residents are taxed on a remittance basis in respect of certain foreign-source income such as pensions.

The Netherlands Antilles levy a profit tax on *onshore* corporations at relatively high rates of between 32 and 38 percent. Reduced rates of tax of between 2.4 and three percent apply to *offshore* corporations. Although both onshore and offshore corporations are regulated by the Commercial Code of the Netherlands Antilles, offshore corporations are, like BVI IBCs, distinguished by the fact that they may only engage in commercial activities outside of the Netherlands Antilles exclusively for the benefit of non-residents.

The distinction drawn above is important and it is recognized by very few of the OECD countries which include "watch lists" of countries with a privileged tax regime in their controlled foreign corporation (anti-tax haven) legislation.[23]

The list produced by the tax authorities of Spain includes most Caribbean territories but omits Belize and St. Kitts-Nevis both of which have offshore sectors; Cuba, Haiti, the Dominican Republic, Puerto Rico and the French Overseas Departments are not mentioned.[24]

The list produced by the Italian authorities does recognize the distinction and divides Caribbean territories into one of two groupings.[25] The first grouping lists territories which are deemed to have a privileged tax regime, i.e less than 23.9 percent and it includes all full tax havens plus St. Kitts-Nevis and Grenada. The second grouping lists countries which have a privileged regime for specific activities such as tax incentive schemes or international business companies legislation. Although Belize introduced IBC legislation in 1990, it is not listed among countries in the second grouping.

23. In some countries such as France these lists are issued by the tax administration and do not have the force of law. In others such as Spain, the list forms part and parcel of the legislation.
24. The Spanish list is contained in Royal Decree 1080/1991 of 5 July 1991, supplementing Law 17/1991 of 27 May and Law 31/1990 of 27 December 1990.
25. The list is contained in Ministerial Decree of 24 April 1992, supplementing the anti-tax haven provisions of Law 413 of December 1991.

I. INTRODUCTION

In 1987 Jamaica's income tax system was radically reformed. We changed from an imputation system to a classical system of taxation and abandoned a graduated scale of income tax in favour of a flat rate of 33.33 percent for both bodies corporate and individuals. The income tax rate payable by individuals in Jamaica has since been reduced from 33.33 percent to 25 percent by a recent amendment to the Income Tax Act. This new rate of income tax for individuals became effective on 28 December 1992.

With the 1987 reform the definition of "company distributions" was extended to include "the transfer of any profit of a body corporate to any person outside the Island".[1] The intention here was probably to impose a branch profits tax, but a much wider net was cast than was necessary. What, however, did not happen as a result of the reform is that the definition of dividends in the incentive legislation was not extended to include the transfer of the profits of the branch, so that although the branch's operations were in fact exempt from tax, since 1987 they are liable to branch profits tax from which, technically anyway, they are not exempt, even though they are supposedly enjoying the incentive.

Neither the incentive legislation nor the double taxation agreements have been reviewed since the 1987 reform. This has created a number of problems, some of which I will mention below.

Tax incentives are available for investors in the following sectors:

(1) manufacturing – both for local consumption (including CARICOM) and for export,
(2) tourism – both hotels and resort villas,
(3) agricultural,
(5) bauxite and alumina,
(6) petroleum refinery,
(7) cement industry,
(8) shipping,
(9) motion picture industry,
(10) free zone operations.

I will focus on the incentives available to the first three sectors, i.e. manufacturing, tourism and agricultural, and the last one, i.e. free zone operations.

II. MANUFACTURING SECTOR

Persons wishing to obtain incentives for manufacturing products in Jamaica for consumption by Jamaica and other CARICOM countries may apply to the Minister responsible for industry pursuant to the provisions of the Industrial Incentives Act (IIA). The incentive may be enjoyed by either a Jamaican registered company or a branch of an overseas company.[2] The Act provides for a ten-year period of relief from income tax on the company's profits arising from the manufacture of the approved product[3] and for the payment of tax-free dividends to Jamaican resident shareholders.[4] Shareholders resident in other territories are relieved from so much of the tax as exceeds the shareholder's liability to tax in his country of residence.[5]

The IIA itself makes reference to the Harmonization of Fiscal Incentives Agreement (HFIA) which is an agreement entered into between CARICOM countries in 1973.[6] The HFIA seeks to limit incentives granted by member countries (other than the less developed countries) and to tie the period of relief granted by any member country to the amount of local value added in the manufacturing process.

1. *Id.* Sec. 34(1).
2. Industrial Incentives Act Sec. 2.
3. *Id.* Secs. 11 and 12.
4. *Id.* Sec. 13(4).
5. *Id.* Sec. 13(5).
6. Harmonization of Fiscal Incentives to Industry Agreement of 1 June 1973.

© 1993 International Bureau of Fiscal Documentation

Local value added is defined in the HFIA as the percentage of total sales of an approved product which exceeds the aggregate amount of the following:

- value of imported raw materials and services;
- salaries paid to persons who are not nationals of member states;
- profits distributed to persons not resident in a CARICOM country;
- interest, management charges and other income payments accruing directly or indirectly to persons not resident in a CARICOM country other than a bank; and
- depreciation on imported plant, machinery and equipment.[7]

The HFIA provides that where the local value added exceeds 50 percent of the selling price of the unit the maximum tax holiday which a member state should grant is nine years.[8] Where the local value added is 25-50 percent, the tax holiday is a maximum of seven years[9] and where the local value added is between 10-25 percent the tax holiday must not exceed five years.[10]

Highly capital-intensive industries (i.e. those with capital investment of not less than $ 50 million EC currency)[11] are entitled to a ten-year tax holiday.[12]

In addition to the company's profits being relieved from income tax,[13] the HFIA provides for relief from tax on the dividends declared by the company to persons resident in CARICOM,[14] and relief from so much of the income tax due on dividends paid to persons resident outside of CARICOM as exceeds the shareholder's liability to tax in his country of residence.[15]

Whilst the IIA does not contain any provisions authorizing the granting of approvals for any periods other than ten years nor for the conferral of incentives other than the tax holidays described above, there have been approvals purportedly granted pursuant to the IIA which contain the reliefs referred to in the HIFA. Since the IIA does not confer the power to grant that type of approval, it seems that these approvals are ultra vires. However, as far as I am aware, even where the terms of the approval contain the much narrower HFIA incentives, the approved company is allowed to enjoy the IIA benefits.

As far as I am aware the Orders are not enforced and indeed it is the ten-year incentive that is enjoyed by an approved company.

In terms of the practical aspects of applying for approval, there are no prescribed forms or required information set out in the IIA. The IIA does, however, provide that in determining whether or not to grant approval the Minister must have regard to the following considerations:

- the effect that approval will have on existing industries;
- whether manufacture of the product would utilize raw materials and skills available in Jamaica;
- whether the existing capacity for the manufacture of the product is sufficient to meet the demand for the product; and
- the element of risk involved in establishing a successful manufacture of the product.[16]

The application is usually made by letter from an attorney. It is always helpful, although not essential, for the investor to have made contact with and to have the support of JAMPRO Limited (the Government's agency for investment promotion). The letter should contain a description of the proposed operation, with particular emphasis placed on the number of local persons being employed and the capital which will be invested. Whilst local borrowing by an overseas investor is no longer restricted, it is not encouraged. Of course, information about the intended market should be included. Where the intended market is Jamaica as opposed to other CARICOM countries, great emphasis will have to be placed on the import replacement possibilities of the enterprise and the consequent net foreign exchange savings to Jamaica.

Where the intended market is outside the CARICOM region, the application should be made under the Export Industry (Encouragement) Act (EIEA). The incentives are identical to those available under the IIA and, of course, the application is made to the same Minister. The applicant may be either a locally registered company or a branch of an overseas company.[17]

Again, Orders purportedly made under the EIEA appear to conform to the provisions of the HIFA and may be ultra vires, see discussion above).

There is no prescribed form of application for approval under the EIEA and application is by way of letter to the Minister. However, the EIEA is somewhat more helpful in that it provides that the Minister must be satisfied that the applicant will manufacture for export exclusively to countries outside CARICOM, is adequately financed, has employed adequate trained personnel, has access to the necessary technical information, is able to obtain adequate raw materials and possesses or will possess the necessary factory space.[18] Also, the element of risk involved will be taken into account as to the effect approval, if granted, would have on existing industries.[19]

III. TOURISM SECTOR

Turning to the tourism sector, tax incentives are available for both hotel enterprises and villa enterprises.

A hotel can be as small as ten bedrooms with facilities for preparing and serving meals.[20] The incentive period is in most cases ten years.[21] Convention-type hotels (i.e. hotels with 350 rooms and convention facilities) are entitled to con-

cession periods of 15 years[22] and hotels operated in special development areas so designated by the Minister of Tourism may enjoy incentives of 11 to 15 years.[23]

Applicants may be either Jamaican incorporated companies or subsidiaries or branches of overseas companies or "any other body approved as such by the Minister".[24] It should be noted that the incentive is available to either the owner or the tenant of the hotel *and* the operator but not to all three entities.[25]

The incentive is relief from income tax for the concession period on profits arising from the approved hotel enterprise.[26] Dividends paid out of such profits are also not liable to tax if paid to a Jamaican resident or to a person resident in a country in which they are relieved from income tax on the dividend.[27] Where the shareholder is liable to tax in his country of residence, he is relieved from so much of the Jamaican income tax as exceeds his liability to tax in his country of residence.[28]

Whilst there are no statutory requirements in relation to the form of application, there is in fact an application form which the Ministry of Tourism requires each applicant to fill out. This includes five-year cash flows and profit and loss accounts and must include detailed architectural drawings.

Persons interested in the resort cottage industry may also enjoy the incentives available under the Resort Cottages (Incentives) Act. Individuals as well as bodies corporate, wherever resident, may apply provided they are either the owner or the tenant or the operator[29] of a building comprising not less than two furnished bedrooms, a furnished living room, bathroom facilities and facilities for the preparation and consumption of meals and used or intended to be used by transient guests for reward.[30] The concession period is seven years,[31] and where the applicant is a company, relief from income tax on dividend income is identical to the relief discussed above.[32] Application is made to the Minister of Tourism and there is an application form which must be accompanied by architectural drawings.

All of the other pieces of incentive legislation follow basically the same framework. In all cases, except under the Motion Picture Industry (Encouragement) Act, the approved enterprise is not permitted to make initial or annual allowances during the concession period in respect of its plant, equipment or machinery.[33] That Act allows the investor an investment allowance of 70 percent of capital expenditure incurred in the acquisition of motion picture facilities.[34]

Each piece of legislation permits the approved enterprise to carry forward losses created during the concession period for six years after expiration of the tax holiday.[35] General law, however, now allows an enterprise to carry forward losses indefinitely consequent upon the 1986 reform. It is therefore anticipated that these provisions will be amended to bring them in line with the general income tax law.

Turning to the Income Tax Act (ITA) itself, we see some real incentives tucked away in remote subsections of the Act. Section 12(s) gives the Minister of Finance power to exempt from income tax income derived as interest on moneys from investments in a hotel enterprise approved under the Hotel Incentives Act or in a recognized resort cottage approved under the Resort Cottages (Incentives) Act. Note that the relief is only available to an investor resident in a country in which he is not liable to pay tax on the interest and that the relief is indefinite. The relief is not available to a Jamaican resident but is available to any investor in the project – whether or not that person has an interest in the ownership of the hotel.

Another interesting provision is found in Section 12(w) of the ITA. The Minister of Finance has the power to exempt from income tax dividend income arising from an investment in a hotel enterprise approved under the Hotel Incentives Act or from an investment in a resort cottage approved under the Resort Cottages (Incentives) Act. The investor must, however, be resident in a territory in which he is not liable to pay tax on the dividend. Again, it seems that the relief may be indefinite and is not available to a Jamaican resident.

IV. AGRICULTURAL SECTOR

The incentives available to an agricultural enterprise are also contained in the ITA, and accordingly application for relief is to the Minister of Finance and not to the Minister of Agriculture. The period for which relief is granted is entirely at the Minister's discretion and is available to anyone – an individual, body corporate or partnership. The longest incentive period granted that I am aware of is 12 years. Shareholders of approved companies are not liable to pay income tax on dividends received by them from the company if they are Jamaican residents.[36] If the shareholder is resident in a country with which Jamaica has a double taxation agreement, then the shareholder will be relieved from so much of the Jamaican income tax as exceeds his liability to tax on the dividend in his country of residence.[37] Shareholders resident in other countries are not entitled to relief from income tax on the dividend.[38]

There is also another interesting incentive available to an agricultural investor contained in the same section of the ITA. Where the approved farmer carries on any other business, he may set off losses incurred in the approved agricultural activity against the income arising from that other business.[39]

V. EXPORT FREE ZONE

Indefinite relief from income tax is available to an approved enterprise operating in an export free zone pursuant to the provisions of the Jamaica Export Free Zone Act. Activities for which approval is available under the Act are:

- warehousing and storing,
- manufacturing,
- transshipment,
- loading and unloading operations,
- exporting and importing,
- service operations,
- packing and shipping,
- assembling,
- processing, refining, purifying and mixing,
- merchandising.[40]

VI. MISCELLANEOUS TAXES

I want to turn now to a topic that no one talks about much – the taxes that an investor who enjoys incentives must pay.

A. *Transfer tax and stamp duty*

Transfer tax and stamp duty are levied on most land transactions and on the issue or sale of shares in private companies incorporated in Jamaica.

On the sale of land, transfer tax at the rate of 7.5 percent[41] is imposed on the market value of the land, regardless of the sale price paid by the purchaser to the vendor.[42] Transfer tax is by law borne by the vendor only[43] and stamp duty at the rate of 5.5 percent[44] is borne by either party, but usually it is shared equally.

Stamp duty at the rate of one percent of the annual rental is also paid on leases[45] and may be borne by either party or both parties in such proportion as they shall agree.

On the sale of shares, transfer tax at the rate of 7.5 percent is payable, again on the market value of the shares regardless of the sale price and is borne by law by the vendor.[46] Stamp duty at the rate of one percent of the value of the shares is usually borne equally by the vendor and the purchaser.[47]

Stamp duty at the rate of one percent is also due and payable to the government on the creation of shares and the issue of mortgages, debentures and most security documents.

B. *Customs duties*

Customs duties were levied on the importation of plant, machinery and equipment, which most incentive investors were exempt from and which has now for the most part been replaced by the General Consumption Tax (GCT). Whilst these investors are still exempt from GCT and customs duties on the importation of goods into Jamaica, they are not exempt from GCT on goods and services provided to them or supplied by them in Jamaica.

C. *Payroll taxes*

As an employer, an approved investor will have to contribute to:

National Insurance Scheme	–	2.5% of emoluments not exceeding J$ 377 per annum per contributor employee.[48]
National Housing Trust	–	3% of emoluments of each contributor employee[49]
Education Tax	–	2% of all emoluments paid by the employer.[50]
Human Employment and Resource Training Trust	–	3% of total emoluments.[51]

VII. FOREIGN EXCHANGE INVESTMENT

At around the same time that the Jamaican government started its liberalization of the foreign exchange controls it created two forms of foreign exchange investment in Jamaica which are both tax free. When the incentives available to these investments are compared to the incentives available to persons interested in investing in manufacturing, agriculture, construction, tourism or other substantial and economically beneficial enterprises, it is indeed remarkable.

The Government created two accounts which financial institutions, mostly only commercial banks and other authorized dealers, were allowed to offer to overseas investors (i.e. non-residents) from April to September 1992.[52] The first is an "A" account. To open an "A" account the investor had to be an individual and needed to prove that he was not a Jamaican resident. Any amount could be deposited to this account and the interest rates range from three to four percent. The interest is paid tax free.[53] There is no foreign exchange risk in that the investor is guaranteed to get back foreign exchange at the rate at which he put it in and the account is maintained in foreign exchange.

With a "B" account the depositor accepts the foreign exchange risk, but the risk is compensated or reduced in many cases by the interest rate that is payable on the deposit. The interest is paid tax free to non-residents.

In Jamaica, the interest rates on deposits of J$ 1 million for periods of over six months normally range from 23 to 27 per-

53. It is now possible for Jamaicans to open foreign exchange accounts but only non-residents enjoy tax-free interest.

© 1993 International Bureau of Fiscal Documentation

cent per annum, but there is presently a downward decline in these rates.

Note that these investments create no jobs and provide no spin off support to the rest of economy. There is full repatriation of capital in very short periods of time and there is very little, if any, medium or long-term benefit to the development of the country.

Another little known provision in the ITA allows an investor to make a foreign exchange investment with a building society and enjoy the investment completely free of Jamaican income tax where that investor is resident in a country in which the Commissioner of Income Tax is satisfied that he is not liable to pay tax on that income.[54]

VIII. DOUBLE TAXATION AGREEMENTS

Jamaica has concluded eight double taxation agreements other than the Caribbean tax treaty which was concluded in 1973. They are:

United States	–	1980
United Kingdom	–	1973
Sweden	–	1985
Canada	–	1978
Denmark	–	1955
Germany	–	1974
Israel	–	1984
Norway	–	1956

I want to look briefly at provisions of four of the treaties and highlight three aspects of these agreements.

A. *US treaty*

Under the US treaty, a company is a Jamaican resident company if it is managed and controlled in Jamaica[55] and, of course, a company is resident in the United States if it is incorporated in the United States. If a company is resident in both territories by virtue of these rules, it is deemed to fall outside the treaty, except for the provisions of the articles relating to dividends, non-discrimination, mutual agreement procedure, exchange of information and entry into force.[56] Of course, companies incorporated but managed and controlled in the United States, which occurs frequently, fall completely outside the treaty.

Dividends paid by a company resident in Jamaica to a company resident in the United States enjoy a treaty dividend rate of ten percent of the gross dividend if the beneficial owner is a company owning ten percent or more of the voting stock of the company paying the dividend.[57] In all other cases, the treaty rate is 15 percent of the gross dividend.[58]

As is standard in all US treaties, there are no tax sparing provisions, and accordingly the granting of incentives to Jamaican resident companies beneficially owned by US companies really only operates as a gift of the Jamaican tax to the US government since the US government taxes the income anyway. The US treaty does, however, exempt from accumulated earnings tax the income of a "Jamaican company" derived from the manufacture of approved products under Jamaica's incentive legislation.[59] Note the term "Jamaican company" is not defined in the treaty. A Jamaican resident company is also exempt from accumulated earnings tax if individuals who are residents of Jamaica own more than 75 percent of the voting power of the company throughout the last half of the tax year.[60]

B. *UK treaty*

Under the treaty with the United Kingdom, the residence of the company is determined by the management and control test. If the company is resident in both countries by virtue of that test then it is deemed to be resident in the territory in which effective management is situated.[61] The treaty withholding rates on dividends paid by a Jamaican resident company to a UK resident is 22.5 percent of the gross dividend if the company beneficially owns more than ten percent of the voting power of the company paying the dividend.[62] In all other cases, the treaty rate is 15 percent. The tax sparing provisions of the treaty grant tax credits for the tax that would have been payable not only on the dividend that is paid but also in respect of the tax that would have been paid by the company paying the dividend.

C. *Swedish treaty*

The Swedish treaty is virtually identical in these respects to the UK treaty except that the treaty withholding rate on dividends is ten percent if at least 25 percent of the voting power of the company is owned by the Swedish company, and 22.5 percent in all other cases.[63]

D. *Canadian treaty*

In the case of the Canadian treaty, a company's residence is determined on the basis of its place of management, and if by virtue of that test the company is resident in both territories, then the matter must be settled by mutual agreement.[64] The treaty rate on dividends is generally 15 percent[65] but is increased to 22.5 percent if:

(a) the beneficial owner of the dividend is a company resident in Canada which holds at least ten percent of the voting power of the company paying the dividend; or

64. The Double Taxation Relief (Taxes on Income) (Canadian) Order, 1979 Art. IV.
65. *Id.* Art. X(2).

© 1993 International Bureau of Fiscal Documentation

(b) the beneficial owner of the dividend is a company resident in Canada regardless of the voting power which it holds in the Jamaican resident company provided the Jamaican resident company qualifies under the tax laws of Canada as a foreign affiliate.[66]

Again, the Canadian treaty includes tax sparing provisions similar to the UK treaty.

IX. CONCLUSION

Jamaica's taxation of foreign investment is desperately in need of rationalization insofar as there remain several inconsistencies and inequities which have negative and disincentive implications for the investor. As indicated above, certain legislation has been amended without reference to other relevant legislation, thereby creating uncertainty in many instances as to the exempted status of the investor. This problem needs to be addressed at length by the Jamaican government to ensure that the legislation relating to investments and taxation in fact creates incentives and not impediments to the investor.

66. *Id.* Art. X(3).

TAXATION AND INVESTMENT IN THE CARIBBEAN

Key information for a successful investment or operational strategy in the Caribbean — the first independent (and only comprehensive) survey of the many and varied Caribbean tax systems. Individual country chapters include:

- investment climate and regulatory conditions; tax systems and tax incentives to investment ;
- succinct country surveys, summarizing each country's economic situation and principal business activities;
- relevant company law, exchange control regulations, business licence fees and other essential information;
- in-depth explanations of the main forms of doing business, organization and taxing powers;
- details of income, indirect, transaction and property taxes,and the latest statistics from official sources; and
- coverage of all aspects of offshore business regimes.

TAX REGIME AND INVESTMENT INCENTIVES IN THE FRENCH CARIBBEAN ISLANDS (MARTINIQUE, GUADELOUPE AND GUYANE)

Pierre-Jean Douvier*

* Bureau Francis Lefebvre. The author wishes to express his gratitude to Vincent Agulhon, Associate, Bureau Francis Lefebvre for his assistance.

I. INTRODUCTION

The French Overseas Department (DOM) of Guadeloupe consists of two main islands, Grande-Terre and Basse-Terre, a smaller island Marie-Galante to the south east, and another island La Désirade to the east. Guadeloupe also has a number of small dependencies, mainly Saint-Barthélémy and the northern half of Saint-Martin.

The DOM of Martinique consists of a single island.

The DOM of Guyane lies north of the South American coast, with Surinam to the west and Brazil both to the south and to the east.

French law is fully applicable in the DOMs although the legislation and administrative organization of these DOMs may, if necessary, be adapted to their specific circumstances. Consequently, French company law fully applies to DOMs. Income tax, corporation tax and TVA (VAT) are categorized as state taxes (*impôts d'Etat*) under the French central government's full and exclusive responsibility; responsibility for direct local taxes is shared by the central government and the local authorities. The *octroi de mer*, a tax on imports levied only in the DOMs (and recently amended), is in large part under the control of the local authorities.[1]

II. TAXATION OF INDIVIDUALS

Individuals resident in France are taxable on their worldwide income, unless a treaty provides otherwise. If the right to tax certain income is granted to a state other than France by virtue of an income tax treaty, France retains the right to apply the so-called effective tax rule. Under this rule, although France cannot tax the relevant income, French income is subject to tax at the worldwide rate. This rule does not apply to non-residents who are generally taxed at a minimum rate of 25 percent on their French-source income (18 percent in the DOMs).

A. *Domestic definition of domicile and residence*

An individual is domiciled in France if he fulfils any one of the following tests:

(1) the individual has his home in France. In general, an individual's home is the place where his family lives, i.e his usual place of abode. This definition allows France to tax an individual working abroad if his family (spouse and children) lives in France;

(2) the individual has his principal place of abode in France. This criterion focuses on where the individual spends most of his time, even if it is in a hotel while his family lives abroad. In general, if an individual spends more than 183 days in France during a calendar year, he will be deemed to have his principal place of abode in France. However, jurisprudence has specified that the 183 days test is not definitive; an individual may be regarded as resident of France if he stays a longer time in France as compared to other jurisdictions, even if the time spent in France is less than 183 days;

(3) the individual engages in a business activity in France. This criterion attracts an individual into the French income tax net if he engages in a remunerative activity in France (whether or not salaried), unless he provides evidence that the business activity is merely ancillary;

(4) the individual has the centre of his economic interests in France. This criterion is rather broad, and thus subject to discussion. An individual has the centre of

1. In 1978, the EC Court of Justice held that the Treaty of Rome and secondary EC law apply integrally to French DOMs (see text below).

© 1993 International Bureau of Fiscal Documentation

his economic interests where he manages his investment activity or where he has the headquarters for his personal business activities. This could be the place from which he earns the majority of his income.

B. *Fiscal regime for resident individuals*

Unlike corporations, individuals resident in France (regardless of nationality) are subject to income tax on their worldwide income, whether or not remitted to France. Generally, taxable income is the net aggregate of the taxpayer's income categories: real property, commercial and industrial business, agriculture, non-commercial activities (e.g. liberal professions), employment compensation, movable capital and certain capital gains.

The net taxable income is taxed at graduated rates up to 56.8 percent. The tax so computed is adjusted by allowable tax credits and reductions, notably a 40 percent tax relief available for Guyane residents (limited to Ffrs. 44,070), and a 30 percent tax relief available for residents of Guadeloupe and Martinique (limited to Ffrs. 33,310). Certain capital gains and income from (mostly) non-negotiable debt instruments may be subject to a final payment, which satisfies the tax liability in full.

In most cases income tax is imposed on the household rather than on the spouses separately. The computation of income tax is as follows: first, the net result of the various income categories (with the exception of capital gains taxed at a flat rate and certain types of interest subject to a final levy) are aggregated to arrive at taxable income. Taxable income is then divided by a coefficient reflecting the taxpayer's marital status and number of dependents. The standard tax table is thereafter applied to the result and the income tax thus computed is multiplied by the same coefficient to arrive at the gross tax burden. The gain achieved by application of the family coefficient is limited to an amount fixed annually. The tax burden is then reduced by 30 or 40 percent depending on the DOM where the taxpayer is a resident.

C. *Fiscal regime for non-resident individuals*

Depending on treaty provisions, non-resident individuals are subject to tax on their French-source income (whether continental France or DOM) including:

- income from employment or professional activity performed in France;
- income from an industrial, commercial, agricultural or "handicraft" business or real property situated therein;
- capital gains, pensions and annuities, income from French securities, copyrights, patents, licences, etc., and generally any profit-making activities exercised in continental France or in a DOM.

As for residents, the tax burden of non-resident individuals is computed under the family coefficient system and the standard tax table. Nevertheless, the tax rate resulting from that computation may not be lower than the legal rate fixed at 18 percent for the DOMs, unless the individual can prove that this rate is higher than the rate which would have resulted from application of the French tax table to the individual's worldwide income. Most reductions are not granted to non-residents in determining their tax base.

Special rules apply to French-source salaries and wages paid to non-residents. A withholding tax is levied on the annual wages paid to a non-resident individual by a debtor domiciled in the DOMS: zero percent up to Ffrs. 57,060, ten percent between Ffrs. 57,060 and 165,580 and 18 percent over Ffr. 165,580. The schedules vary each year and differ depending on the period of payment and the time spent in France for the relevant activity. This withholding tax is final as to wages taxed at zero or ten percent. The portion taxed at 18 percent is taken into account for computation of income tax, but the corresponding amount of withholding tax is creditable against the income tax liability. In this case (or if other French-source income is generated), the non-resident must file a tax return with the French revenue authorities.

Non-residents who have the use and enjoyment of one or more residences in France (DOMs inclusive) may be charged to income tax on a notional income equal to three times the annual fair market rental value of the residences.[2] This rule does not apply if the non-resident is a resident of a country which has entered into a tax treaty with France.

III. TAXATION OF COMPANIES

A. *General*

Under French law, enterprises are commonly classified into two groups: *sociétés de personnes* (companies of persons) and *sociétés de capitaux* (capital companies). Other undertakings may be carried out as economic interest groups or joint ventures. "Sociétés de personnes" are generally treated as partnerships although they are not always completely transparent for tax purposes. "Sociétés de capitaux" are limited companies subject to corporation tax.

B. *Sociétés de personnes*

As a rule (unless they have elected to be liable to corporation tax) general partnerships and similar entities are not subject to income tax, although they generally enjoy legal capacity. However, such entities must file a return for information purposes. The partners are subject according to their status to income tax or corporation tax, as the case may be, on their respective shares, whether or not income is distributed.

C. *Sociétés de capitaux*

Stock companies (*société anonyme, société en commandite par actions*) and limited liability companies (known as SARLs or EURLs) are subject to corporation tax.

1. Principles

Corporation tax is levied on income generated by "enterprises operating in France" or on income the taxation of which is attributed to France by virtue of a tax treaty. Consequently,

2. Under certain circumstances, this taxation is waived, notably for the benefit of residents of treaty countries.

© 1993 International Bureau of Fiscal Documentation

French corporations are not taxable on a worldwide basis but rather according to the results they generate in France, meaning that no credit system generally exists in France (except where a treaty so provides or for Section 209 B purposes, see below). The crucial term, "enterprise operating in France", is not specifically defined in the French tax code (CGI), and in the absence of a tax treaty, the case law of the Conseil d'Etat provides the only valid guidance. This court has generally defined the term as meaning the habitual exercise of a commercial activity in France, i.e.:

- when a business activity is conducted through an "establishment", i.e. a fixed place of business, a fixed installation operating with some degree of autonomy (e.g. a branch, sales bureau, etc.). Tax practitioners generally believe that the scope of this definition is broader than that of a permanent establishment (PE) as used in the OECD model;
- when, in the absence of an establishment as defined above, business is conducted in France by a "dependent agent". This definition may be co-extensive with the OECD model treaty definition of this example of a PE;
- when, in the absence of an establishment or a dependent agent, the potential taxpayer performs a complete commercial cycle in France. Thus, a one-time business transaction involving both the purchase and sale of a product in France may fall within the French taxing jurisdiction.

These rules apply only in the absence of a tax treaty. When a tax treaty applies the foreign corporation usually will not have to pay tax in France unless it has a PE there (or it derives French-source income). The French tax treaties all use the notion of PE (as set forth in the OECD model) to determine when a taxpayer falls within the French taxing jurisdiction.

The territorial scope of France for tax purposes includes French, European and Overseas Departments, but excludes the *Territoires d'Outre-Mer*, i.e. New Caledonia, French Polynesia and other territories. The three French departments of the Caribbean region are considered France for tax purposes.

For corporation tax purposes, taxable income is broadly defined as the net profits arising from all operations. Net profit is equal to the difference between the net worth at the end of the accounting period and the net worth at the beginning of the period as reduced by capital contributions made during the period and increased by distributions to shareholders.

Losses may be carried forward for five years. Companies may also carry back losses three years. Losses corresponding to the annual capital allowance (so-called ART) may be carried forward for an unlimited period of time. In the case of a reorganization such losses may be converted into ordinary losses retroactively to the time they were generated. In addition, operating losses or annual capital allowances (ART) may be disregarded in the event of a change of activity.

Upon request, the headquarters of foreign companies may be subject to corporate income tax at the normal rate but on a reduced base, generally equal to between eight and ten percent of expenses.[3]

2. Special rules concerning the computation of taxable income

Capital allowances are permitted on depreciable tangible assets. The straight-line method may be applied without any limitation. Conversely, the use of the declining balance method is subject to limitations.[4]

Reserves may be booked against potential subsequent losses or expenses provided the loss or expense is deductible and clearly defined.

Capital gains are part of taxable income. Short-term capital gains are taxable at the standard rate (33.33 percent). This regime applies to gains realized on assets held for less than two years and depreciable assets held for at least two years, to the extent of the capital allowance. Long-term capital gains are taxable at a reduced rate of 18 percent, provided the balance, i.e. the capital gain less the tax paid, is posted and maintained in a specific reserve of long-term capital gains.[5]

Long-term capital gains generally are gains realized on the transfer of assets owned for more than two years (but such gains are taxed as ordinary business income in respect of any recouped depreciation). Long-term capital gains may be offset by any long-term capital losses realized during the fiscal year. In the event the balance generates capital losses, the latter may be carried forward for ten years.[6]

3. Computation of corporation tax

The corporation tax rate is fixed at 33.33 percent. Nevertheless, until 31 December 2001, companies established in a DOM or in continental France are subject to tax on only two-thirds of the income accruing from their DOM-situated establishments in the following economic sectors: industry, tourism, hotel industry, agriculture, fisheries, new energies, construction and public works, transport and handicrafts, and from 1 January 1993 on maintenance activities for the industry as well as television and film activities and broadcasting. This reduction of the tax base also applies to long-term capital gains taxed at the reduced rate of 18 percent (resulting in a rate of 12 percent). As a result long-term capital losses may be carried forward for only two-thirds of their amount. Losses derived from a DOM-sourced activity may be set off against the profits of a continental French company only within the two-thirds limit.

Branches of non-resident companies are subject to corporation tax under the same conditions. In addition, branch profits are deemed to be distributed to non-resident persons and

3. The special tax regime for headquarters of foreign groups is granted if:
- the legal entity (French subsidiary or more frequently branch of a foreign company) is owned by an international group;
- it provides exclusively passive services to the members of the group (e.g. coordination, control, audit, etc.);
- its activity is limited to a certain area (e.g. Western Europe, the EC, etc.).

4. This method is applicable only for new equipment depreciable at least over three years.

5. This rule does not apply, however, in the case of a winding up of the company.

6. Capital gains on certain portfolio securities – mainly investment securities – may not benefit from the special capital gains regime and are therefore includable in taxable income.

© 1993 International Bureau of Fiscal Documentation

are therefore subject to a 25 percent branch tax. However, this rate may be reduced by tax treaties, or the tax may be refunded under certain circumstances (mainly if the shareholders are residents of France or if the foreign company has not distributed dividends and provides evidence of this); the application for refund is subject to a time limit.

An annual minimum lump sum tax based on the company's turnover is also payable.

4. Tax treatment of distributions

Distributions from companies resident of France are not subject to withholding tax if paid to residents. A tax credit (*avoir fiscal*) equal to 50 percent of the dividend received is attached to any distribution by French limited companies. Distributions to non-residents are generally subject to a 25 percent withholding tax and are not entitled to the benefits of the avoir fiscal, although tax treaties may reduce the rate to five, ten or 15 percent, or may extend the benefit of the avoir fiscal to non-residents.

If the avoir fiscal is granted to non-residents, it is also subject to the relevant withholding tax. As far as distributions between qualifying EC companies are concerned, the domestic withholding tax may be eliminated if certain tests are met (see "6" below).

Unless exempt under the affiliation privilege (see "5" below), French parent companies which receive dividends from a French or foreign source are charged to corporation tax on the aggregate of the dividend, and as the case may be, the avoir fiscal or any tax credit. They may credit the avoir fiscal against their own tax liability but any credit in excess over the tax burden is definitively lost.

Dividends distributed out of income which has not been subject to corporation tax at the standard rate (e.g. received under the affiliation privilege or derived from an activity carried on outside the territorial scope of France for tax purposes) or paid out of income realized more than five years before distribution are subject to an equalization tax (*précompte mobilier*)[7] equal to 50 percent of the net dividend.[8] Consequently, where dividends are paid out of income derived from a DOM and only partially subject to corporation tax because of the two-thirds rule (see above), the "précompte" is due on the distribution of the exempt one-third.

5. Affiliation privilege

Under the affiliation privilege, dividends received by a resident parent company from a subsidiary, whether or not resident, in which it has at least a ten percent share or a participation of at least Ffrs. 150 million, are 100 percent exempt (Finance Bill for 1993). French PEs of non-resident companies may generally qualify for the affiliation privilege.

The affiliation privilege regime is optional; in other words, the recipient company may elect whether or not to take advantage of it. As from 1993, there is no particular advantage in electing the regime, particularly as far as domestic-source dividends are concerned, because the corporation tax has been reduced to 33.33 percent. For example:

If a French corporation receives a dividend of 100 from a domestic corporate subsidiary, the taxation is as follows:

Dividends received	100	
Avoir fiscal (AF) attached	50	(50% of dividends distributed)
Taxable income	150	
Theoretical corporation tax 33.33%	50	
Offset of the AF	(50)	
French corporation tax due	0	

This regime is still available for dividends derived from non-resident companies.

A special regime also applies to holding companies whose income received in the form of dividends from foreign subsidiaries qualifying for the normal participation exemption regime represents at least two-thirds by value of their total income, and whose participation in such foreign subsidiaries represents at least two-thirds by value of the total assets' value. Then, dividends received from qualifying subsidiaries are exempt under the affiliation privilege outlined above. Redistribution by the holding company does not entitle the recipient to the avoir fiscal and does not result in the levying of the précompte. The 25 percent withholding tax on dividends paid to non-residents is increased to 50 percent, this rate being reduced by most tax treaties, and to nil for EC countries under certain circumstances (see below).

6. Parent-subsidiary directive

The withholding tax on dividends paid by French companies to qualifying EC parents is reduced to nil as from 1 January 1992. To qualify, the parent company, as a beneficial owner, must provide evidence that the following conditions are satisfied:

- it is organized in one of the forms listed in the schedule to the directive (mainly limited liability companies);
- it has its effective place of management within the EC and may not be regarded as having its residence outside the EC under a double tax treaty with a non-EC member state;
- at least 25 percent of its shares have been held continuously for two years before the date of the distribution;
- it must be subject to and not eligible for exemption from corporation tax in the state of its effective place of management;
- it must not be entitled to a payment of avoir fiscal;
- it must be the actual beneficiary of the dividend.

This provision does not apply if the dividends are enjoyed by a person controlled directly or indirectly by non-EC members unless evidence is provided that the chain or participation does not have as it main goal (or one of its main goals) the avoidance of withholding tax. The provision, derived from an EC directive, applies to companies set up in the DOMs.

7. This does not apply under certain circumstances if the domestic tax unity system (*intégration fiscale*) is applicable.
8. That is, it is equal to the avoir fiscal.

© 1993 International Bureau of Fiscal Documentation

7. Other

If a non-resident company does not have a PE, a 33.33 percent withholding tax is levied on the market value of certain French- source income such as property transfers, professional income (if the activity is realized in France) and royalties.

IV. SPECIAL REGULATIONS ISSUED TO PREVENT INTERNATIONAL TAX EVASION

A. *CGI Article 209 B*

Resident companies may be subject to additional assessment for a proportional share of income deemed received from a subsidiary organized in any form and established in a low-tax jurisdiction in which they, directly or indirectly, hold at least a ten percent interest. This also applies to foreign PEs owned by French corporations. This provision does not apply where the foreign entity has an effective industrial or commercial activity primarily carried out in its home market. Generally, a low tax jurisdiction is defined as a jurisdiction in which the subsidiary is subject to a tax burden lower by at least one-third than the tax burden it would have borne in France.[9]

In any event, the question of Section 209 B compatibility with tax treaties applies, as well as the scope of the privileged tax regime.

B. *CGI Article 238 A*

Payments made by a debtor (corporate or individual) established in France to foreign entities or individuals established in a low-tax jurisdiction are not deductible from French taxable income unless the taxpayer provides evidence that the payments are being made in consideration of actual and fair activities and the amount of the payments are neither exaggerated nor abnormal. This provision applies to interest, royalties and services. It also applies if payments are made into a bank account situated in a low-tax jurisdiction.

C. *CGI Article 57*

Profits indirectly transferred by way of transfer pricing from a company resident in France to another related entity which is not resident in France may be recaptured into the profits taxable in France. For purposes of this article, the term "related entity" means a company that controls the French company or is controlled by it. Both companies may also be deemed related if they are controlled by a same third company.

This test of related parties is not compulsory if payments are made to a non-treaty country.

D. *CGI Article 990 D*

A three percent tax is levied on the market value of real estate situated in France owned by French or foreign legal entities. However, the CGI provides for exemptions concerning namely:

- French legal entities or foreign legal entities situated in a country which has concluded with France a treaty containing a non-discrimination or administrative assistance clause, provided they file, or commit themselves to file, an annual tax return, including a description of the real estate and the identity of their shareholders or partners;
- entities in which the value of the French real estate, excluding real estate used for their business activity, represents less than 50 percent by value of their French assets;
- companies, the shares of which are listed on an official stock exchange;
- non-profit-making entities and foreign states and international organizations.

According to recent case law, entities resident in countries that have concluded a tax treaty with France, including a clause for non-discrimination based on nationality, are not subject to the tax.

V. TAX TREATY NETWORK

France has concluded tax treaties with more than 80 countries.[10] Those treaties generally apply to residents of DOMs. However, the treaty concluded between the Netherlands and France excludes the Netherlands Antilles. In the same way, the treaties entered into with the United States and the United Kingdom do not apply to the US and UK territories situated therein.

VI. OTHER TAXES

A. *Value added tax (VAT)*

The scope of VAT was extended to the DOMs in 1946. The introduction of VAT into Guyane, however, was deferred and VAT remains, until further notice, not applicable in that DOM. Conversely, VAT applies – with certain mitigations – to Martinique and Guadeloupe.[11]

---

9. A recent report of the French Senate lists the following Caribbean jurisdictions as offering privileged tax treatment, particularly to offshore companies:

Antigua and Barbuda	Montserrat
Barbados	Netherlands Antilles
Belize	Saint Lucia
British Virgin Islands	Saint Vincent and the Grenadines
Saint Kitts and Nevis	Turks and Caicos Islands
Grenada	

The Tax Administration has also issued a list of countries in which companies benefit from a low-tax liability. The list includes:

Cayman Islands	Netherlands Antilles
Bahamas	Barbados
Bermuda	Grenada
Turks and Caicos	British Virgin Islands
Panama	Jamaica
Venezuela	Montserrat
Antigua	Saint Vincent

These lists are not exhaustive and the Tax Administration may determine whether or not the foreign company benefits from a low-tax liability on a case-by-case basis.

10. Tax treaties have been concluded with Ecuador (in force) and Mexico (not yet in force). Negotiations have been finalized with Venezuela and are to start with Cuba.
A treaty with Trinidad and Tobago entered into force on 1 January 1990. This is the only treaty concluded with another Caribbean State applicable thus far.

11. EC rules substantially apply to VAT but not all rules apply to Guadeloupe and Martinique.

© 1993 International Bureau of Fiscal Documentation

For purposes of VAT, Guadeloupe and Martinique are regarded as import and export territories distinct from continental France and from the other DOMs. Consequently, imports from continental France into Guadeloupe and Martinique are exempt in France (with the possibility for the exporter to deduct his input tax) but taxable in the relevant DOM at the lower rate applicable therein.

The generally applicable rates are as follows:
- lower rate (staple commodities, etc.): 2.1 percent (5.5 percent in continental France);
- standard rate: 7.5 percent (18.6 percent in continental France);
- higher (luxury) rate: 14 percent (22 percent in continental France) (the "luxury" rate was abolished on 1 January 1993).

Substantial VAT exemptions are available in connection with the importation into the DOMs of equipment and materials for tourism and the hotel industry, as well as products, construction materials, fertilizers and industrial and agricultural tools listed in the tax code.

B. *Octroi de mer*

The "octroi de mer" is a tax on imports (CIF value) from all destinations (including EC countries, continental France and other DOMs) levied in the DOMs (Guadeloupe, Martinique and Guyane).[12] The rates are set by the local authorities and the proceeds are used to finance the budget of local administrations. Prevailing rates are as follows: 12 percent in Martinique and Guyane, and 13 percent in Guadeloupe.

In 1992 the European Court of Justice held that this tax represents a customs duty or a tax of equivalent effect and is therefore forbidden under the Treaty of Rome. In 1989 the European Commission issued guidelines for a reform of the octroi de mer, and a French law issued in July 1992 provides for a large-scale reform of the tax. At this time it is impossible to ascertain whether or not the new tax regime will comply with EC law. Nevertheless, the main features of the new octroi de mer are described below.

Taxable operations include import of goods into a DOM; production of goods in a DOM (except for real estate and services); and sale and purchase activities (upon election).

Exemptions from the tax are available for export of local products out of the DOM, and a special regime applies to exchanges between DOMS.

Certain products are exempt because of their nature (tourism equipment, materials for agriculture and construction business, raw materials for local production activities, equipment for local authorities and State administration, sanitary and medical equipment, etc.).

The determination of the rates remains in the discretion of the local authorities (maximum 30 percent).

C. *Custom duties*

Customs duties are levied in accordance with the common external tariffs of the EC with preferential treatment for certain associated countries.

D. *Import/export duties*

A 1986 law provided for the creation of free zones in the DOMs in which enterprises would benefit from a suspension of customs duties, VAT and indirect taxes, but this provision has not yet entered into force. However, enterprises may benefit from an EC regulation which provides for a suspension of VAT where the product to be obtained is destined for re-export.

VII. INCENTIVES AND TAX PLANNING IN THE FRENCH WEST INDIES

A. *Residents of France*

French DOMs benefit from special incentives regimes to favour their economic development.

1. Companies

Companies subject to French corporation or income tax may deduct from their taxable income the total amount of investments made in the DOMs until 31 December 2001.[13] Investment which exceeds Ffrs. 30 million requires a prior administrative agreement. The deduction only applies to investments in the following activities:
- industry
- hotel industry (including camping facilities)
- fisheries
- tourism (holiday resorts/leisure activities, lodging and tourist services (local tour operators, car and boat renting, etc.)
- new energies
- agriculture
- construction and public works
- transportation
- handicraft
- TV and film activities, equipment maintenance and production and broadcasting (under conditions unknown at this time).

A prior administrative agreement is compulsory for investments in the hotel industry, tourism, transportation and TV/film production, unless they are under Ffrs. 30 million.

To qualify the investment must be in the form of the purchase or production of new assets which normally benefit from capital allowances according to their nature. In certain limited cases, land and second-hand materials may also benefit from the deduction regime. Investments made after 1 January 1992 must be in qualifying activities for five years (movable property) or nine years (immovable property), failing which the deduction may be recaptured into taxable income.

12. The octroi de mer does not apply to the Islands of Saint-Martin and Saint-Barthélémy.
13. Note that for both direct or indirect investments, the deduction from taxable income is limited to 75% in respect of the following activities: hotel industry, tourism, transportation and audio-visual and cinematographic production. The deduction is also limited to 75% when the qualifying company is not liable to corporation tax (sociétés de personnes - partnerships, etc.).

© 1993 International Bureau of Fiscal Documentation

It is also possible to deduct cash contributions made to the following companies from taxable income:
- *Sociétés de Développement Régional* (SDR): companies involved in the DOM's regional development;
- companies whose activities are conducted exclusively overseas (i.e. not in continental France) and fall under one of the above-listed activities. These companies must be subject to corporation tax and 90 percent of their assets must be assigned to qualifying activities.

The investing company must hold its participation for at least five years. Where the investment deduction is set off against personal income tax (the investor is an individual or he invests through a partnership, this deduction is limited to 75 percent of the investment amount.

2. Individuals

Until 2001, individuals resident in France (DOMs included) may benefit from a tax credit provided they:
- purchase or build on real estate to be used as their home or their tenant's home;
- make contributions to the capital of companies which:
  - have the building of houses as their exclusive purpose, or
  - are investing in various listed activities, or
  - are Regional Development Companies.

Prior administrative authorization is required for investments over Ffrs. 30 million. The list of qualifying activities is the same as for companies making indirect investments. The shareholding period, or the period during which the house is being used as a home, must be at least five years. The tax credit is equal to 25 percent of the investment. One-fifth of the tax credit may be set off against the individual's tax liability each year for five years.

Since the incentives provided for corporations are more favourable than those provided for individuals (the amount of the investment may be deducted from the first year's income), many taxpayers invest in the DOMS through a partnership which qualifies for the corporation tax incentives. A specialized entity is therefore appointed as *gérant* (non-member manager) so that the investors can remain passive investors.

B. *Non-residents of France*

Provided certain conditions are met, newly created enterprises having an industrial, commercial or handicraft activity may benefit from a total and then partial tax exemption (exemption from corporation tax or income tax depending on the form of entity). This regime applies all over the French tax territory and not only the DOMs. The law provides for a 100 percent exemption on gains realized during the first 23 months after the creation of the enterprise, and after that for 75 percent, 50 percent and 25 percent exemptions on gains realized during the following three periods of 12 months. The exemption also applies to the annual minimum lump sum tax.

If the enterprise is in the legal form of a corporation or a partnership, its equity capital should not be more than 50 percent controlled, directly or indirectly, by other legal entities.

In case of distribution of exempted gains to the shareholders, the equalization tax (précompte mobilier) is due.

This exemption regime is compatible with the one-third reduction of the tax base applicable in the DOMs.

1. Special middle-term tax regime (Article 208 quater)

A middle-term tax regime applies to approved new corporation tax entities established in the DOMs before 31 December 1996, and to approved existing corporation tax entities which undertake new activities. Income accruing to enterprises under this regime may be totally or partially exempt from corporation tax and minimum tax for a period of ten years.[14]

Prior approval must be given by a local commission and the revenue authorities (in many cases the Central Administration in Paris). In deciding whether to grant approval the authorities look at the nature of the proposed activity, the potential benefits to the local economy and the number of jobs created.

The authorities may impose certain requirements on the qualifying company. Failure to fulfil these requirements or if the activity varies from the proposed activity, the authorities may claim the payment of taxes corresponding to the period during which the company did not qualify.

2. Special long-term tax regimes (Article 1655 bis)

A "long-term" tax regime applies to corporate tax entities whose purpose is the exploration and exploitation of mines in the DOMs. This regime also applies:
- in Martinique and Guadeloupe to corporate tax entities whose industrial activity is regarded as essential to the economic development of these DOMs and which invest more than Ffrs. 20 million in the region;
- in Guyane to corporate tax entities and simple general partnerships conducting agricultural, forestry or industrial activities provided prior approval is granted.

Applications for prior approval must be submitted to the central tax authorities in Paris before 31 December 1996.

For a maximum period of 25 years, approved enterprises are subject to corporation tax in accordance with the rules and rates applicable as at 1 January of the year in which approval was granted, but may benefit from any favourable modification introduced subsequently. Income accruing to such enterprises is exempt from corporation tax for the term agreed if reinvested in the enterprise or in enterprises carrying out similar activities in the DOMs.

14. However, the regime does not apply to the tax due on capital gains on fixed assets and portfolio investments.

DOUBLE TAXATION AGREEMENTS OF CARICOM: A REVIEW OF EXISTING PRACTICE AND PROSPECTIVE POLICY OPTIONS*

Bruce Zagaris**

I. INTRODUCTION

This article discusses the Commonwealth Caribbean double tax agreements and their effect on trade, commerce and investment. In particular the article considers the principal double taxation agreements to which the countries of the region are parties and explains the legal effects of these agreements or the absence of these agreements. The advantages and disadvantages of such agreements are discussed, with particular reference to access to commercial opportunities in the United States. The article also discusses and considers the adequacy, for serving the usual objectives of such agreements, of the Commonwealth double taxation arrangements in local tax legislation.

The article examines the substantive aspects of the tax treaties and related mechanisms, and provides proposed policy recommendations.

Part II discusses the principal models utilized by CARICOM members. Part III looks at tax information exchange agreements (TIEAs). Part IV then considers the adequacy of local tax legislation for serving the usual objectives of tax treaties. Although tax administration is not an essential part of the model tax conventions of the OECD or the UN model conventions, tax administration is discussed since the issue is considered an essential element of development in CARICOM, and CARICOM itself has committed substantial resources towards tax administration. Fortunately, in recent years tax conventions have begun to embrace tax administration. Hence, the provisions of these conventions are discussed. The tax impacts of non-tax treaties (i.e. investment and trade agreements) are next considered in Part VI, especially since the explosion of free trade agreements has resulted in increased investment and trade agreements that have tax implications and have stimulated the conclusion of double tax agreements. Part VII examines taxation within CARICOM in the context of accelerated integration. It considers the two agreements relating to tax within CARICOM, namely the 1973 Tax Convention between the more and less developed countries of CARICOM, and the 1973 Agreement on the Harmonization of Fiscal Incentives. This section also looks at the developments within the EC on tax harmonization and the potential of these models being emulated by CARICOM (or at least the potential emulation by CARICOM) in a process of tax harmonization. Part VIII focuses on the principal effects of different treaty approaches. Taxation within CARICOM in the context of accelerated integration, especially within the Hemisphere, is then discussed. The final part offers some options for tax treaty policy.

II. PRINCIPAL DOUBLE TAXATION AGREEMENTS TO WHICH CARICOM MEMBERS BELONG

The most important general observation about the tax treaty policy of CARICOM and its members is that the majority of CARICOM member countries are not signatories to any double tax agreements. A few countries, namely Jamaica, Trinidad & Tobago, Barbados, and to a lesser extent Guyana, have each concluded a few treaties. Most of the treaties tend to be with the United States, Canada, the United Kingdom, and to a lesser extent Germany, the Nordic countries and Switzerland.

An interesting trend is that until the last two years Latin American governments with the exception of countries such as Brazil have not had serious tax treaty programmes. However, a major departure has been made in the last two years. Mexico and Venezuela have begun concluding a series of income tax treaties. Mexico has also concluded two TIEAs.

* Prepared for the Caribbean Law Institute on 5 December 1991.

** Partner, Cameron and Hornbostel, Washington, D.C.

© 1993 International Bureau of Fiscal Documentation

Chile has scheduled tax treaty negotiations with the United States in January 1993. Brazil and the United States have had a round of negotiations. Other Latin American countries, such as Argentina and Bolivia, have commenced discussions with the United States about starting formal negotiations.

One difficulty that CARICOM members face is that within CARICOM there are no academic or continuing education programmes that discuss methodically and comprehensively the technical aspects of international taxation or tax treaty policy. A new development has been the initiation of continuing education programmes by the local branches of the International Fiscal Association (IFA), particularly the Barbados branch, in conjunction with Caribbean Law Institute (CLI). An additional difficulty is that the CARICOM governments do not have a ready body of human or technical resources with which to develop an international tax policy and particularly a tax treaty policy. Even in the larger CARICOM member countries it is difficult to find more than two or three professionals in public service who spend the bulk of their time concentrating on tax treaty policy. Many of the CARICOM governments do not invest in sending their officials to obtain regular training on international taxation and tax treaty policy. Since international tax and treaty policies change rapidly, governments must spend enough resources to provide for a basic level of training on tax and then international tax policy, and additionally on tax treaty policy. An additional commitment of resources is then necessary to enable the professionals with enough training to understand tax treaty policy to maintain the level of training required to be effective in designing and implementing tax treaty policy. Some training programmes are available externally although these are costly and it sometimes may be difficult to sufficiently match the CARICOM professional to the proper external programme so that the expenditure of resources is worthwhile.

The countries that have no tax treaties are likely to face the following economic and investment impacts: investors have less certainty about the tax impact of their investments compared to the opportunities to invest in countries with tax treaties; investors tend to incur substantially higher withholding taxes than they would in an investment in a treaty jurisdiction since a treaty will provide for reduced withholding rates; investors have no treaty competent authority procedure by which to resolve any disputes over taxation that may arise between the investor and the host and/or home countries; and investors cannot take advantage of the tax sparing provisions that most developed countries other than the United States offer.

The CARICOM countries that have tax treaties follow four principal models. The first model is the old UK extension treaty that results from the colonial relationship between CARICOM members and the United Kingdom. These treaties were concluded either between the United Kingdom and another developed country or between the United Kingdom and one of the CARICOM countries as they were becoming independent. They follow some of the principles contained in an older OECD classical model treaty for the developed countries. They do not cover as many subjects as the newer treaties. For instance, there are extensions of the tax treaties between the United Kingdom on the one hand and Switzerland and Denmark on the other hand. Some of these treaties have been extended to Antigua,[1] Dominica,[2] Grenada,[3] Jamaica,[4] Montserrat,[5] St. Lucia[6] and St. Vincent.[7] These treaties follow to some extent the 1963 OECD model convention although several of them even precede by almost a decade the 1963 OECD model.[8]

Although they do not reflect in many cases the economic, political and juridical circumstances between the CARICOM contracting parties on the one hand and Switzerland and Denmark on the other hand, they do provide some utility to private investors and the signatory parties. In most cases it would be preferable for CARICOM members to maintain these treaty relationships until they can establish a new treaty policy and revise them.

The second and perhaps most-often used model is the UN model treaty between developed and developing countries.[9] The model emphasizes, *inter alia*: source-based principles to expand whenever possible the jurisdiction of the source (i.e. developing) country; higher withholding tax rates to attempt to increase source country revenue; and lower thresholds for imposing a permanent establishment (PE) whereby the source country has jurisdiction to tax. The treaties have variations on the UN model treaty. Examples of these treaties are the treaties of Trinidad and Tobago,[10] Jamaica,[11] Guyana[12] and the earlier treaties of Barbados.[13]

1. See, e.g. the Antigua/UK treaty signed in 1947, as amended in 1968, or the Antigua/Switzerland treaty, signed on 26 August 1973, Switzerland/UK treaty and extended on 30 September 1954 to Antigua.
2. See e.g. the Dominica/UK treaty, signed 7 March 1968, amending the 1949 treaty; the Dominica/Denmark treaty of 22 December 1954, extending the UK/Denmark treaty, signed 27 March 1950.
3. See, e.g. the Grenada/UK treaty, signed 3 and 25 April 1968, amending the 1949 tax treaty; the Grenada/Swiss treaty of 26 August 19653, extending the 30 September 1954 treaty.
4. See, e.g. the Jamaica/Denmark treaty. An extension was signed on 22 December 1954 of the earlier Jamaica/Denmark treaty.
5. See, e.g. the Montserrat/UK treaty, signed 8 April 1968 amending the treaty of 1947; the Montserrat/Denmark treaty of 22 December 1954, extending the UK/Denmark treaty of 27 March 1950; the Montserrat/Japan treaty, signed 25 September 1970, extending the treaty signed 4 September 1962; and the Montserrat/Switzerland treaty, signed 265 August 1963, extending the UK/Switzerland, signed 30 September 1954.
6. See, e.g. the St. Lucia/UK treaty, signed 5 April 1968, amending the treaty of 1949; the St. Lucia/Denmark treaty, signed 22 December 1954, extending the UK/Switzerland treaty, signed 26 August 1963, extending the UK/Switzerland treaty, signed 30 September 1954.
7. See, e.g. the St. Vincent/UK treaty, signed 1 April 1969, amending the treaty of 1949; the St. Vincent/Denmark treaty, signed 22 December 1954, extending the UK/Denmark treaty, signed 27 March 1950; the St. Vincent/Switzerland treaty, signed 26 August 1964, extending the UK/Switzerland treaty, signed 30 September 1954.

These treaties have a PE provision based in part on the UN model tax convention. For instance, they provide that a building site or construction assembly, installation or dredging project, or a drilling rig or ship used for exploration of natural resources within a Contracting State for one or more periods totalling 183 days in a 12-month period will constitute a PE.[14] The treaties contain many provisions that are designed to broaden the host country's jurisdiction to tax. This is a means to enable the host country jurisdiction, typically the Caribbean country, to be able to raise revenue through the employment of its ability to tax.

A common feature of these models is higher withholding taxes than is common in tax treaties between OECD countries. For instance, withholding rates on dividends range typically from ten to 25 percent rather than five to 15 percent as in the case of treaties between OECD countries. Withholding rates on interest are typically around from ten to 25 percent rather than ten percent as in the case of treaties between OECD countries (in many cases five percent is the rate). Withholding rates on royalties and management fees are typically ten to 20 percent rather than five percent as in the case of treaties between OECD countries.

A third model is the one previously used by Barbados. Its model has evolved more from a strict application of the UN model in the 1970s to a hybrid model that blended some aspects of the UN and OECD models. For instance, in its 1983 income tax treaty with the United States, Barbados emulated the OECD treaty in the sense that it agreed to relatively low withholding rates of five and 15 percent on dividends and 12.5 percent on royalties and interest.[15] The treaty also contained a liberal limitation on benefits article that allows some offshore activities to benefit from the treaty.[16] The treaty also has a broad non-discrimination provision that enabled Barbados offshore companies to obtain tax benefits in the United States on an equal basis with US persons. This provision enabled Barbados to attract, for instance, international business companies (IBC) when the United States partially terminated its income tax treaty with the Netherlands Antilles. Barbados also succeeded in obtaining exemptions on US insurance premium excise taxes.[17] As a result Barbados has become the second largest jurisdiction for hosting captive insurance companies (after Bermuda). However, the United States terminated the treaty, resulting in some small dislocation and slow-down in the growth of this new industry. A unique feature of the Barbados/US treaty is that slightly before the conclusion of an income tax treaty in December 1983, the two governments concluded a TIEA, thereby making Barbados eligible for hosting foreign sales corporations (FSCs).[18] Barbados has become the second largest host of FSCs after the British Virgin Islands.

A fourth model is the current Barbados model. Starting a few years ago when Barbados began to diversify its tax treaty network and negotiated with three Nordic countries and then Germany, its model evolved to provisions more similar to those of a 1977 OECD-type model. It eliminated the expansion of the source country's ability to tax by using PE and provisions analogous to those in the 1977 OECD model convention. It lowered the withholding rates for interest and royalties to as low as five percent.

The reason that Barbados has done this is twofold. On the one hand, its offshore sector has begun to grow and, in order to prosper, it is preferable to have low withholding rates and the ability to use tax treaties. Barbados has also decided to revert to the OECD model treaty for purposes of the jurisdiction of the source country. In order for the Barbados offshore sector, say IBCs, to be able to invest in and trade into the other country at a minimal tax rate, such Barbados entities need to be able to take advantage of a high threshold before the source country can impose tax on such investment/trade so that they can avoid the possibility of being taxed in countries such as the United States. With a UN model PE provision, it becomes more difficult for a Barbados IBC to provide services ancillary to trading into the United States and yet avoid US tax on such activities. For instance, in the proposed protocol between Barbados and the United States, the combination of the PE article (which is analogous to the 1977 OECD model convention) and the limitation of benefits article, enables a Barbados IBC to assist a foreign company that wants to begin exporting or consolidate existing exports to the Western Hemisphere, especially the United States. By establishing a Barbadian IBC and by having an active trade or business in Barbados relative to its US activities, the Barbadian company can conduct activities ancillary to marketing and selling goods into the United States without any imposition of tax. There are other examples, but the key point is that Barbados can attract investment to its offshore sector through emulating the OECD model convention. Barbados also believes that, in the competitive market in which it must try to attract investment, a very low threshold by which the source country can impose tax and then high withholding rates does not necessarily increase revenue. In fact, since Barbados is a high-cost jurisdiction, the combination of high taxes and high operating costs (i.e. comparatively higher wages) may preclude attracting new investment.

III. TAX INFORMATION EXCHANGE AGREEMENTS

Another variant of a double tax treaty has been the TIEA, which is a part of the Caribbean Basin Economic Recovery

(as concluded with the United Kingdom and extended to Barbados), subsequently modified and no longer in force; Denmark, signed 27 March 1950 (as concluded with the United Kingdom and extended to Barbados and no longer in force); Norway, signed 2 May 1951 (as concluded with the United Kingdom and extended to Barbados and no longer in force); Switzerland, signed 30 September 1954 (as concluded with the United Kingdom and extended to Barbados); United Kingdom, signed 26 March 1970; Canada, 22 January 1980; and United States, signed 31 December 1984.

14. This contrasts with the periods of 12 months in the OECD model and 24 months in the US model.

15. See, e.g. Barbados treaties with Finland signed, 15 June 1989, Norway, signed 15 November 1989, and Sweden.

16. A limitation on benefits or anti-treaty shopping article is an article directed at limiting the benefits arising from the treaty to those persons that are intended beneficiaries. Such provisions define the intended beneficiaries normally as nationals, residents, holders of minimum amounts of equity, publicly held companies and so forth.

17. Another aspect of the 1983 Barbados/US income tax treaty is that it emulated the UN model in that it has low thresholds to impose a PE.

18. For background on foreign sales corporations, see Bruce and Lieberman, *Foreign Sales Corporations* (Tax Mgmt. Portfolio 264-4th BNA 1988).

Act of 1983.[19] There are approximately 11 TIEAs, including the one with Mexico[20] and excluding three TIEAs with US possessions. Others are awaiting ratification (i.e. Canada/Mexico and Peru/US).

These agreements expand on the obligations of signatory countries to exchange information pursuant to Article 26 of the OECD model treaty. Specifically, TIEAs override bank secrecy and bearer share provisions. They provide more specificity as to the methods by which the requesting state may request information.

From an economic policy perspective the result of TIEAs seems clear. Some investors, particularly those interested in anonymity and confidentiality or concerned about an eventual audit by the Internal Revenue Service, will invest in other countries in which their preference for anonymity can be satisfied.

The TIEA makes CARICOM signatory parties eligible for three benefits: Americans attending conventions in CBI countries with TIEAs can more easily deduct their expenses, thereby facilitating convention business in those CBI countries; eligibility to host FSCs;[21] and Section 936 financing. Each benefit is quite marginal. Even together, all the benefits are marginal. Convention deductions are important only if the Caribbean country has a substantial convention infrastructure, and most countries do not have the ability to attract large conventions. The few that have the facility, such as the Bahamas, have concluded that the benefits of the convention business would be outweighed by the loss of offshore business, especially because most investors using the Bahamas depend in part on confidentiality, many for legitimate reasons. The second benefit, eligibility to host FSCs, is no longer viable. For instance, only the United States, Virgin Islands, Barbados, and to a small degree Jamaica, have any FSCs. The bulk of opportunities were in the first year. The market for hosting such entities is now full and there is no room for newcomers to host FSCs. In any event, the fees and business derived from FSCs are not in themselves significant. Rather the business of hosting FSCs is only valuable as part of a broader portfolio of offshore business. The third benefit, the Section 936 financing, has been the most attractive. However, the projects for Section 936 have been rather narrow. The prospective life of Section 936 is indeed quite limited, regardless of the outcome of the evolution of Puerto Rico's status.[22]

Clearly one of the goals of the CARICOM member states should be to only conclude TIEAs as an ancillary mechanism and complementary to an income tax treaty. Although TIEAs are useful, tax treaties are clearly more important, compared to TIEAs, in attracting and facilitating transnational investment. TIEAs assist CARICOM governments in their own tax compliance efforts as well as their efforts to prosecute crimes that may include tax and related crimes (currency exchange violations that may be tax crimes).

The most usual answer of the United States to the reason why it does not negotiate income tax treaties with most CARICOM governments is that it does not have time to negotiate with so many small countries. This can be solved either by increasing the staffing of the officials in the US Government, concluding some multilateral treaties, and/or assisting the small countries in their knowledge of international taxation and especially the negotiation of tax treaties.[23]

A regional trend has been that some developing countries, led by Mexico, have begun negotiating TIEAs in order to raise revenue, especially from flight capital (residents and nationals with investments outside the country) and from investments by multinational companies.[24] There is also a regional TIEA model that has been concluded with the Inter-American Center of Tax Administrators (CIAT).[25]

IV. ADEQUACY OF LOCAL TAX LEGISLATION FOR SERVING THE USUAL OBJECTIVES OF TAX TREATIES

One element of a tax treaty which local legislation cannot accomplish is the revision or elimination of barriers to investment and trade in other countries. For instance, US investment in Barbados captive insurance companies was primarily desirable after 1984 due to the elimination under the Barbados/US treaty of the insurance premium excise tax. Similarly, the US Virgin Islands, Barbados and Jamaica only received FSCs because of the TIEA they concluded with the United States. As noted above convention deduction and Section 936 tax benefits are only available in the context of a TIEA. Reciprocal recognition of deductions made to foreign charitable organizations may sometimes only be available in the form of a treaty.

In connection with inbound investment tax treaties are required to either obtain a lower threshold for the host country's assertion of jurisdiction and lowering or eliminating the rate of withholding tax.

In most CARICOM countries, where there is no tax treaty and the foreign income is subject to income tax in a British Com-

19. For background on TIEAs, see Zagaris, *Selected Developments of New Tax Information Exchange Agreements and Their Relatives*, 19th Annual International Tax Conference (1 January 1991); for the text of the TIEAs, see R. Rhoades and M. Langer, 3-4 *Income Taxation of Foreign Related Transactions* (1985). For additional discussion of the TIEA programme at its inception, see Foster & Penick, "Barbados Signs the First Exchange of Information Agreement under the Caribbean Basin Initiative", 114 *Tax Management International Journal* (1985), at 100; Sharp and Steel, "The Caribbean Basin Exchange of Information Draft Agreement - A technical Analysis", 19 *International Lawyer* (1985), at 949; Zagaris, "The Caribbean Basin Initiative", 28 *Tax Notes*, at 102.

20. For a discussion of the Mexico/US TIEA, see Karlin & Breger, "Exchange of Tax Information Between the United States and Mexico", 6 *International Enforcement Law Rptr.* (February 1990), at 69; Zagaris, "US and Mexico Conclude Tax Information Exchange Agreement", 5 *International Enforcement Law Rptr.* (November 1989), at 413.

21. See *supra* note 18.

22. For a critical look at the TIEAs, see Zagaris, "The Caribbean Basin Tax Information Exchange Agreements Program of the United States: Eat Softly and Carry a Big Stick", 43 *Bulletin for International Fiscal Documentation* (March 1989), at 115.

23. However, lobbying is needed to persuade the United States to invest some resources in negotiating tax treaties.

24. For a discussion of the tax compliance emphasis in the region, see Zagaris, "International and Comparative Tax Trends in a Caribbean Integration Perspective" (9th Caribbean Conference of Accountants 20-22 June 1991 unpublished).

© 1993 International Bureau of Fiscal Documentation

monwealth country that provides similar relief, a partial credit for such foreign country taxes paid can be claimed in the CARICOM country. For instance, in Barbados relief is limited to 50 percent of the lower of the Barbados or foreign country income tax paid on the same income. In the event the foreign taxes paid surpass the credit granted by Barbados, the excess foreign taxes are deductible for Barbados tax purposes.

The operation of unilateral relief of double taxation in the CARICOM can be illustrated by reviewing the Antigua legislation. Unilateral relief of double taxation is primarily given for British Commonwealth taxes. Relief within limits may be provided to residents of Antigua against Antiguan income tax for the income taxes of British Commonwealth countries as listed in the Income Tax Act, assessed on or deducted at source from income taxed both in the Commonwealth country and in Antigua. However, Antigua does not give unilateral relief for the income taxes of a country with which Antigua has a double tax agreement, which is limited to the United Kingdom at present, unless the agreement allows such unilateral relief. In the case of the United Kingdom it does not. Antigua only gives unilateral relief if the country of source of the relevant income grants similar relief to its residents for Antiguan income tax.

For an eligible Commonwealth income tax unilateral relief is effectively half the Antigua rate, and hence 20 percent since only resident companies would normally be eligible for the relief. Unilateral relief is given on a per country basis. Claims for unilateral relief should be made within two years of the end of the relevant year of assessment, as for relief under double taxation agreements, but the legislation does not expressly so state.

Unilateral relief can be given to a non-resident of Antigua. Such relief is conditional on similar relief being available in the other Commonwealth country, a rare occurrence since other countries normally do not provide relief for foreign taxes to non-residents.

Foreign taxes on income derived from non-Commonwealth countries or Commonwealth countries that do not provide a similar credit for Antigua tax may not be credited against the Antiguan income tax or business tax. One issue is, whether such taxes may be deducted in computing taxable income. Concerning UK taxes, the tax act precludes the deduction of UK income taxes completely as an outgoing or expense wholly and exclusively incurred in producing the chargeable income. The prohibition seems to also extend to UK corporate tax.

For taxes of other countries, the question is difficult to answer. If foreign taxes that are not Commonwealth taxes could be regarded as outgoings or expenses which are wholly and exclusively incurred in producing the chargeable income according to the tax authorities, then they should be deductible.

V. TAX ADMINISTRATION

One element of tax cooperation that can be incorporated in a double tax treaty and/or a TIEA is to provide for technical and financial assistance in tax administration. Before reviewing some provisions of tax administration within treaties, it is useful to review tax administration in the Caribbean.[26]

The regionalization of tax administration is in its infant stage. One of the principal organizations for regional tax administration is the CIAT, which is based in Panama. Three CARICOM countries (Barbados, Trinidad & Tobago and Jamaica) as well as Bermuda are members. Several developed countries, such as the United States, Germany, Spain and Canada also participate in CIAT. CIAT holds courses on tax administration; for instance, in 1985, it held a comprehensive course on planning and control in tax administration.[27] CIAT also has a bimonthly newsletter that provides an update on CIAT activities, developments in tax administration in the member countries (i.e. new laws, administrative regulations, policy initiatives and changes in personnel), and other information, such as developments and publications of interest to its members. CIAT has been trying to assist CARICOM to develop more programmes on a sub-regional level.

The principal sub-regional organization in the Caribbean is the Caribbean Organization of Tax Administrators (COTA), which is composed of the tax administrators within CARICOM. At its annual meetings tax administrators present papers which are published.

Some of the improvements in tax administration are obtained through bilateral technical assistance with the United States. The US Agency for International Development (AID) funds projects that the Office for Tax Administration Advisory Services (TAAS) assists. The assistance may be training, or may be furnished by automated data processing. The Inter-American Development Bank (IDB) serves as a major source of financing tax administration.

A. *The international component of tax compliance and tax administration in the Caribbean*

In February 1990, the adoption by the CIAT of a draft TIEA cements the legitimacy of TIEAs throughout the region.[28]

With the increasing conclusion of TIEAs agreements that include implementation programmes, the role of technical assistance in the implementation of such programmes and technical assistance in tax matters, generally to developing countries, is becoming increasingly important. In the United States this role is performed by the Office of TAAS.

26. For further information on tax administration in the region within the context of overall tax policy, see Zagaris, "The Potential Role of Barbados in Strengthening Tax Policy and Tax Administration in the Caribbean", 4-9 (Paper prepared for programme on CARICOM Tax Treaties sponsored by the Barbados Branch of the IFA and the CLI 2-3 November 1990), from which this section is taken almost verbatim; for additional background on the conference, see Zagaris, "IFA Barbados Branch Considers CARICOM Tax Treaty and Tax Issues", 43 *Bulletin for International Fiscal Documentation* (April 1991), at 186.

27. For the papers on the programme, see *Planning and Control in Tax Administration* (Amsterdam: International Bureau of Fiscal Documentation No. 39, 1987).

28. This discussion is taken largely from "Tax Information Exchange Agreement Point to Increasing Importance of Technical Assistance", 6 *International Enforcement Law Rptr.* (April 1990), at 146.

The TAAS of the IRS provides technical assistance in tax administration to foreign, state, local, commonwealth and territorial governments, US possessions and institutions of higher education. Generally, its goal is to give advice and assistance to governments which ask for help in modernizing and strengthening the administration of their internal tax programmes. Its overall goal is to motivate and assist governments in developing an independent capability to carry out continuing improvements in their tax administration management, organizations and technical programmes. TAAS provides assistance on a short or long-term basis extending up to several years and covers all major functions of tax administration. TAAS services cover the functional areas of tax administration, including activities such as training and management, but do not include assistance in tax policy or customs matters.

IRS/TAAS started its overseas advisory assistance programme in 1963. This programme has included a broad range of activities to more than 54 countries throughout the world. TAAS provides two types of technical assistance: general comprehensive assistance, and a more limited specialized assistance. For both types, the donee country completes a pre-survey request (questionnaire), after which TAAS provides a report of findings and submits a work plan based on the request from the donee country and the pre-survey.[29]

TAAS also sponsors two categories of tax administration for managers. The first category is a six-week Middle Management INTAX Seminar for tax administrators. The second category of training concerns various types of short courses, including the following: basic instructor training; executive development seminar; financial investigative techniques; middle management INTAX seminar; training for trainers; analyst training; and technical training. TAAS also has a course on international issues, which covers basic areas of international taxation including foreign corporations, foreign tax credits and transfer pricing. Its special agent investigative techniques course covers basic income tax investigative techniques, proving income, and computer applications.

The TAAS financial investigative course has especially been in demand, including from European countries. The one-week course is an orientation to financial investigative techniques, and is particularly useful to persons working in criminal investigation and examination. Through discussions, participants learn of sources and means for obtaining financial evidence and examine techniques that can be applied in their country. Among the topics covered are: financial interviewing, indirect methods of tracing funds and effective communications.

IRS/TAAS has made the formation and activities of intergovernmental association of tax administrators a priority. It is a charter member of CIAT, and has attended all of CIAT's general assemblies and most of its technical seminars. For instance, TAAS actively participated in the preparation and adoption of the CIAT model TIEA.[30] It has provided technical and logistical advice to CIAT when needed. Albeit not a member, the IRS has played an active role in the COTA, participated in annual assemblies and supported its training projects.

The INTAX course has been held in Brazil in conjunction with the CIAT. It is possible to hold the INTAX course in other regional areas, such as the Commonwealth Caribbean where COTA operates and where discussion has already focused for many years on having a common regional tax scheme for the Eastern Caribbean in the context of the Organization of East Caribbean States (OECS). In fact, one possibility for regional tax approaches on training, management and systems is in the context of the Administration of Justice Project (AOJ) for the Commonwealth Caribbean and the CLI. The AOJ Project is a project whereby the US AID is providing $ 10 million to the University of the West Indies Law Faculty for on-lending to the East Caribbean national legal committees for, *inter alia*: strengthening law libraries, training judges and practitioners and developing textbooks.[31] The CLI is a joint venture between Florida State University and the University of the West Indies, funded by the US Congress.[32] Its purpose is to unify and harmonize the commercial and other laws of the Commonwealth Caribbean, especially to assist in attracting investment.[33] More uniformity in tax administration and management would help all investors, especially foreign investors, since the region's tax system would become more predictable. However, newly independent countries jealously guard their tax and customs regimes and are initially reluctant to surrender power over them.

In the discussions on the establishment of new legal systems and mechanisms in Central Europe, technical assistance and a common regional tax approach may well be useful. With the United States leading most of the rest of the world in its aggressive posture towards international tax compliance, the technical assistance, in conjunction with similar compliance trends in the rest of the world, will produce transfer of technology and more uniformity of approaches in international tax compliance.[34]

As money laundering becomes increasingly criminalized and laws to identify, trace, freeze, seize and confiscate illegally gained assets become prevalent, you will see developing

29. Normally, this phase costs $ 20,000, which includes the cost of a two-person, two-week survey, the report, the round-trip transportation and per diem. However, if the request is very specific, such as the potential interest by a country in improving automated data processing and/or improving compliance by small mobile merchants, the cost can be cut in half, based on one person and one-half the work.

30. For a discussion of the CIAT model TIEA, see Zagaris, "CIAT Adopts Model Tax Information Exchange Agreement", 6 *International Enforcement Law Rptr.* (March 1990), at 105.

31. For a discussion of the Caribbean AOJ Project, see Zagaris, "Law and Development or Comparative Law and Social Change - The Application of Old Concepts in the Commonwealth Caribbean", 19 *University of Miami Inter-American L.R.* (No.2, June 1988), at 543.

32. For background to the CLI project, see *Id.*, at 590.

33. For a status report on the work of the CLI, see a report prepared by Professor Ralph Carnegie, Commercial Law Survey Seminar (15 January 1990 (unpublished) 57 pp.).

34. In May 1990, the Sub-committee on Compliance, Enforcement and International Tax Law, Committee on International Tax Law, Section of International Law & Practice, American Bar Association chaired by James P. Springer, Special International Tax Counsel, US Dept. of Justice, hosted a programme on technical assistance in tax matters, especially financial investigations, featuring Socorro Velasquez, the director of TAAS, and Leif Muten, a senior attorney at the International Monetary Fund. The author also participated and addressed more general tax policy and tax administration. These types of programmes could and should be held in the Caribbean.

© 1993 International Bureau of Fiscal Documentation

countries' tax and law enforcement authorities increasingly line up to take courses on financial investigation, and request assistance from the United States in locating records, taxpayers and witnesses.

The beginning of an era of cooperation in tax and money movement has begun. This also is imposing new standards on bankers, accountants, lawyers and all kinds of professionals. Those who do fail to ask enough questions and follow the "know your customer" approach and make criminal referrals when they encounter "suspicious transactions" will encounter civil and even criminal problems.

B. *Prospects for improving tax administration in the Caribbean*

A major initiative to improve tax administration is to provide a regional training center. For instance, the Inter-American Development Bank (IDB) funded a training programme for Latin American tax administrators which is located in Venezuela. There has been a proposal to start such a programme in CARICOM. CIAT would provide much of the technical assistance while the IDB would provide the financing.

For many years discussion of common tax administration and customs (and other, e.g. legal) services have been discussed with the OECS. For many years US AID has offered to fund these common services. Clearly throughout CARICOM and especially in the least developed countries in the OECS, better training is essential to ensure proper tax collection and to bring some equity to the tax system. Repeatedly studies show that the only real and practicable means of improving tax administration in the OECS countries is through regionalization.[35] Unfortunately, the OECS countries and CARICOM have not been able to regionalize tax administration. Instead the more developed CARICOM members obtain assistance from participating in CIAT, occasionally sending tax officials to courses in developed countries (such as the Harvard Tax Program). These courses, while beneficial, are not designed just for the Caribbean and without proper follow-up the training cannot realize its potential.

If the region and if CARICOM members are going to achieve the degree of professionalism required to raise revenue, give the tax system integrity and credibility, the system must have an ongoing programme to train lower and mid-level officials as well as specialized courses for mid and senior-level persons. They also need to set a standard of performance and recognize officials who have achieved high standards. Such an investment would be worthwhile both economically and politically.

In the near future the establishment of the Caribbean Center for Tax Administrators, with technical assistance from CIAT, interested donor governments and private foundations should be started. One potential source of funding could be debt-for-equity swaps. If the Enterprise for the Americas Initiative were expanded slightly, the cancellation of official debt could be used not just for environmental needs, but for fiscal ones as well.[36] In fact, professionalization of tax administration is just one of the structural reforms called for by the Enterprise for the Americas Initiative. Hopefully, the Administration and other developed countries will realize and contribute to such an initiative. However, CARICOM and its member governments and institutions must have the political maturity and foresight to propose the establishment of such a Center. The CARICOM private sector should encourage the development of regional tax administration.[37]

C. *Agreements with assistance to tax administration provisions*

With this background on tax administration in the Caribbean, one mechanism to provide for technical assistance for tax administration is through tax treaties and TIEAs.

The United States and American Samoa have concluded a tax implementation agreement (TIA) (Samoan TIA) that will facilitate information exchanges and mutual assistance in tax matters.[38] The Tax Reform Act of 1986 necessitated the new agreement because the Act allows American Samoa, Guam and the Northern Marinara Islands to enact their own tax laws in place of the Internal Revenue Code.[39] The Samoan TIA is very similar to the TIA concluded by the United States and the Virgin Islands[40] in February 1987. The Samoan TIA provides specifically that the United States will "routinely supply" tax information to American Samoa, including copies of the following: income subject to withholding, partnership return of income, information returns, W-2 combined wage reporting tapes and elections to be treated as an FSC or as a small FSC.[41] American Samoa will routinely supply to the United States audit reports of individual, partnership, corporate and employment changes (with associated reports of experts) that "disclose information relevant to the United States".[42] The specification of the precise documents that will be exchanged is unique to the TIAs and can be explained in part by the identity of the tax systems and even forms of the contracting par-

35. See e.g. Francis and Supersad, "Tax Policy and Tax Administration in the Less Developed Countries of the Caribbean Community", (also contained in Zagaris (ed.), II *International Tax Law Materials* 318 (UWI Extramural course materials, Cave Hill Campus, 1978).

36. For a discussion of broadening the purposes for which debt-for-equity swaps can be used, see Zagaris, "Swap Debts for Education", *The Journal of Commerce* (31 August 1990).

37. A recent example of this was the hosting by the Barbados IFA branch and the CLI of a programme on international tax and tax administration.

38. See "Tax Implementation Agreement Between the United States of America and American Samoa", 7 January 1988, (Hereinafter Samoan TIA) reprinted in *Tax Notes International*, 7 June 1989, at 54; *BNA Daily Tax Reporter* No. 10 (5 January 1988), at L-9. According to the Treasury Department, the Samoan TIA replaces and expands upon prior tax agreements between the two jurisdictions. See Treasury News Release B-1257 (14 January 1988).

39. Tax reform Act of 1986, Pub. L. 99-514, §§ 1271, 1277, 100 Stat. 2593 (codified at 26 USC §§ 931 (Supp. V 1987).

40. See *Tax Notes International*, supra note 312; Treasury News Release B 889 (2 March 1987) (explaining that the Virgin Islands TIA will be used as a model for other tax agreements); Zagaris, "US/USVI Tax Exchange Agreement Analyzed", 3 *International Enforcement Law Reporter* (1987), at 301.

41. Samoan TIA, *supra* note 38, Art. 4(2)(a)(i)-(vii).

42. *Id.* Art. 4(2)(b)(i). The information supplied will also include the following reports about: any taxpayer who is a citizen of the United States or has been a resident alien of the United States; files an income tax return with American Samoa that discloses non-American Samoa source of income; and claims for the first time to be an American Samoa resident; all corporate information about ownership interests in any FSC established in American Samoa; and such information about corporations electing application of Sec. 936 of the Internal Revenue Code as agreed upon by the competent authorities. *Id.* Art 4(2)(b)(ii)-(iv).

© 1993 International Bureau of Fiscal Documentation

ties. Under the agreement, the parties will develop a simultaneous examination programme for both civil and criminal investigations.[43] In addition, the United States will assist in collecting taxes, interest and additions to tax owed by American Samoa taxpayers present in the United States.[44]

The Samoan TIA indicates a new type of momentum behind the tax information exchange programme. This TIA is more significant than a TIEA since it provides for technical assistance by the United States in addition to joint tax collection.[45] Technical assistance gives developing country governments, many of which are in dire need of revenue, an incentive to acquire the technical know-how to close the revenue gap and apply their tax laws in a more equitable fashion.[46] Practically speaking, the inclusion of such incentives also makes conclusion of such agreements much more likely even though the emphasis is still on enforcement. However, the confidentiality desired by foreign investors is adversely affected by TIAs that contain provisions enabling exchange of tax- related information. Accordingly, the TIAs between the United States and its possessions and protectorates may have a significant impact on amounts and types of inbound investment.

CARICOM members would benefit by incorporating the tax administration assistance provisions and programmes in TIAs into their own TIEAs and tax treaties with the United States, provided of course that they can persuade the United States of their efficacy. To persuade the United States would require lobbying because Treasury does not have statutory authorization and funds to undertake this effort at present.

VI. TAX IMPACT OF NON-TAX TREATIES

CARICOM countries will want to be aware of and sometimes take advantage of investment and trade agreements that impact on tax treaties. Increasingly, as the services round of the GATT progresses, the services sector and even taxes may be affected. For instance, already three Caribbean jurisdictions have profited from the decision of the GATT panel that the US Domestic International Sales Corporation (DISC) provisions were illegal and contrary to the GATT. As a result, the United States had to enact new legislation, known as the Foreign Sales Corporation Act, which required US corporations wanting to take advantage of the tax preference to establish a subsidiary overseas. Among the leading FSC jurisdictions have been the US Virgin Islands, Barbados, and to a lesser extent Jamaica.

Increasingly, successful foreign direct investment and international trade require taking advantage of provisions for national or most-favoured-nation treatment on a range of related matters, only one of which involves taxation. Important aspects of investment and trade decisions involve bringing employees of the investor's choice, from whichever country the employer chooses, the right of establishment, the right to freely repatriate profits and a host of other rights that may or may not involve taxation.[47]

Bilateral investment treaties (BITs) have been successfully used to gain tax benefits. In particular, the national treatment provisions that require a host signatory country to accord investors from the home signatory country the same treatment as nationals that are similarly situated has been utilized for tax purposes. For instance, after the US Government partially terminated its double tax treaty with the Netherlands Antilles, many entities moved the entities holding their US real estate operations to Barbados in order to take advantage of the election under the tax code that only a US tax resident or a person to whom the national treatment provisions of a tax treaty or BIT applied. Although the Barbados provisions were part of its income tax treaty with the United States, it could also have utilized a BIT. For instance, after the partial cancellation of the income tax treaty, Antillean companies for a while were able to use the national treatment provisions of its Friendship Commerce and Navigation Treaty for tax benefits.

The other area in which trade provisions are impacting on international tax and must be taken into consideration are the dynamic area of regional integration treaties, such as the European Economic Community. This area is discussed below.

VII. TAXATION WITHIN CARICOM IN THE CONTEXT OF ACCELERATED INTEGRATION

Increasingly, regional integration and free trade initiatives are propelling tax changes. Some of the changes are effected by legislation and regulations promulgated by a regional body. The treaty giving the regional bodies authority must be scrutinized for its provisions with respect to taxation. Sometimes, treaties are made to implement policies of regional bodies, such as the Council of Europe/OECD convention on mutual administrative assistance in tax matters.

A. *Tax treaty arrangements within CARICOM*

1. 1973 regional double tax convention

In 1973, the members of CARICOM concluded a unique tax agreement. Similar to the OECD and the UN model treaties the CARICOM treaty has the purposes of encouraging international trade and investment and preventing fiscal evasion

43. *Id.* Art. 7(6). The object of the examination programme is to avoid redundancy in examination coverage. *Id.*
44. *Id.* Art. 7(8). Such tax collection efforts by the United States are subject to the availability of enforcement resources and allowed only to the extent permitted by law. *Id.*, Art. 7(8), 1. The Agreement provides that the competent authorities will discuss appropriate procedures for facilitating such collections. *Id.*, Art. 7(8). Any taxes collected are to be remitted to American Samoa, after deducting the reasonable costs of collection. *Id.*
45. *Id.* Art. 7(9).
46. See Zagaris, "Inter-American Center of Tax Administrators Holds Session on Ways to Discourage Tax Evasion and Avoidance", 4 *International Enforcement Law Reporter* (1988), at 264 (discussing technical assistance issue). For example, developing countries often rely on the inequitable device of indirect taxes in their adminstration of tax laws. See Wallschutzsky, "Achieving Compliance in Developing Countries", 43 *Bulletin for International Fiscal Documentation* (May 1989), at 234.
47. For a useful discussion of how BITs are useful mechanisms to attract investment, offering both tax and non-tax incentives to nationals of the treaty country, and in many cases to third country nationals willing to establish joint ventures in one of the treaty countries with a view to further activities in the other treaty country, see Gantz "The Use of Non-Tax Treaties for Encouraging Investment and Economic Development", 45 *Bulletin for International Fiscal Documentation* (April 1991) at 190.

© 1993 International Bureau of Fiscal Documentation

with respect to taxes on income and profits.[48] Unfortunately, the agreement seems to have for many years fallen into disuse and is virtually ignored by all tax professionals.

Commentators also express doubt as to whether the treaty or at least various parts of the treaty are used or have succeeded in accomplishing any of its principal purposes.[49]

One unique feature of the treaty is that it is between the more developed countries within CARICOM, which are designated in Schedule 1 as Barbados, Guyana, Jamaica and Trinidad & Tobago, and the less developed countries within CARICOM, which are listed as Antigua, Belize, Dominica, Grenada, Montserrat, St. Lucia, St. Vincent and St. Kitts, Nevis & Anguilla.

The reduced withholding rates of ten percent in the case of interest and five percent in the case of royalties only apply to the more developed countries within CARICOM. The less developed countries may tax these amounts according to their laws. For dividends, varying reduced withholding rates apply to three of the more developed countries. Barbados and the less developed countries can apply the rate of tax chargeable in respect of the profits or income of the company paying the dividend. The lack of reduced withholding rates when capital flows from the more developed countries to the less developed countries is unique and does not, compared with other tax treaties around the world, assist in providing tax incentives to stimulate investment flows. Perhaps most importantly, the classification of Guyana as a less developed country is deemed anachronistic.

Unless the treaty is actually being used and unless it is succeeding in the purposes of encouraging the flows of investment and reducing tax evasion, it would be better to either conclude a protocol to modernize the treaty or terminate it.

On 7 July 1992, the CARICOM Secretariat circulated for comments a proposed CARICOM double taxation agreement for investment and trade among CARICOM members to replace the 1973 double tax convention. Unfortunately, it is based closely on the source taxation conventions of the Andean group conventions for the avoidance of double taxation.[50] The latter conventions apply both internally among Andean members and externally in tax treaties between Andean and non-Andean members. However, because the global trend is towards the OECD model, even among many developing countries, Andean countries such as Venezuela have abandoned the Andean tax convention in their negotiations with countries such as the United States. The adoption of the source taxation convention would be quite harmful to the stimulation or even facilitation of trade and investment among CARICOM members and even *vis à vis* extra-regional trade and investment. The purposes of the source taxation model, revenue raising and the prevention of tax evasion, can be solved in part by consumption taxes and in part by strengthened enforcement arrangements (discussed below).

An alternative to having the current or the proposed treaty would be to revise the Treaty of Chaguaramas and give the CARICOM institutions more authority to promulgate tax laws to facilitate and encourage investment flows. Such an approach would emulate the tax legislative capability of the EC. This may be unrealistic at present unless CARICOM is restructured and allowed taxing powers. It may be premature at the historical development of integration within CARICOM for the members to cede such power.

Another alternative for facilitating and encouraging investment within CARICOM would be for CARICOM to prepare model double tax convention(s) for use by the CARICOM members that want to use such models for encouraging investment and/or reducing tax evasion. It is important for the new model to be based on current global tax treaty policy, i.e. the OECD model or at least a model emulating a mix of the OECD and UN models. This arrangement would be normal. For instance, in the context of European integration, its members have maintained standard income tax treaties that reflect the OECD models. EC tax policy is gradually interacting with and superseding treaties, to the extent that the treaties may conflict with the Treaty of Rome and its amendments.

To prevent tax evasion and to raise revenue (one of the obvious purposes of the proposed CARICOM double taxation convention), CARICOM members should conclude an expanded and modern version of a multilateral convention on mutual assistance in tax matters. The Council of Europe/OECD Convention is the best model that can be adopted to CARICOM purposes. Alternatively, the model TIEA of the CIAT could be adopted for CARICOM purposes. Such a treaty could be a multilateral one to which all member states should participate or could be used as a prototype for bilateral TIEAs between interested CARICOM members. Clearly, a multilateral mutual assistance treaty that embraces, inter alia, assistance in administration and information, service of documents and assistance in collection are preferable. Because of the relative newness of the achievement of independence by each of the CARICOM members, the relative newness and frangibility of CARICOM's institutions, and the political importance to the countries and the principal taxpayers of revenue, such a treaty may be controversial. A potentially critical component in the CARICOM convention could and should be assistance for tax administration. Each of the CARICOM members has important elements of tax administration in which it needs assistance. The ability to earn revenue, the fairness and integrity of the tax system, and of course the nexus between the tax system and investment depends on the ability to administer the tax laws. One of CARICOM's goals is to provide some of these services to the region. Lack of resources has impeded achievement of some of its goals.

The linkage between budget and trade deficits, political and economic stability and overall development has interested some developed countries and international financial organizations. In particular, the IDB has discussed with CARICOM

48. For a useful discussion of the CARICOM tax treaty, see the paper given by Mr. Panniah Karalasingham, "An Examination of the Permanent Establishment and Residence in the CARICOM and other Treaties", prepared for the seminar on the CARICOM Tax Treaty and Tax Issues within CARICOM sponsored by the IFA, Barbados Chapter in association with the CLI (2-3 November 1990) (unpublished).

regional resources for tax administration and training. Other key players are the CIAT, the IMF and major donor countries, such as the United States, Canada, Germany and Spain. Until now the European countries have been the most far-sighted and innovative in providing tax assistance to regional bodies. At times when donors such as the US Government have offered assistance in tax administration on a regional basis, donees, such as the OECS countries, have not deemed the offer appropriate for consideration.

One trend within the international financial organizations, such as the World Bank Group, has been to emphasize tax compliance and maximizing potential for local revenue as a condition to structural adjustment programmes. Recent examples of these programmes are Mexico and Argentina. The technical assistance given to Mexico for tax administration has been a major success. The Argentine programme is still in a design phase and its implementation has not proceeded far enough yet to make any appraisals. More than likely, a conditionality of structural adjustments programmes in the future within CARICOM may be programmes to improve tax administration.

Assuming CARICOM members want to undertake a regional programme of tax administration in the context of a regional convention, the best models seem to be in the tax information exchange and implementation conventions between the United States and its territories. Some provisions of those conventions would serve as appropriate models for use.

2. Agreement on the Harmonization of Fiscal Incentives to Industry

Another convention on taxes *vis-à-vis* countries outside of CARICOM is the Agreement on the Harmonization of Fiscal Incentives to Industry. This Agreement was concluded in 1973 at the formation of CARICOM due to the need for promoting the balanced and harmonious development of CARICOM by conferring incentives to industry. It covers several important types of tax: relief from tonnage tax and customs duties on plant, equipment, machinery, spare parts and raw materials; relief from tax liability on export profits; depreciation allowances; carry-forward of losses; dividends and other distributions; and interest. Although the purpose is laudable – to coordinate fiscal incentives so that CARICOM members do not have highly divergent regimes *vis-à-vis* foreign investment – this Agreement has fallen into disuse and is not observed.[51]

It appears that the provisions of the Agreement already may conflict in some cases with national legislation, actual investment concessions to individual projects, double tax treaties and BITs. Pressure exists from multilateral development banks and governments outside CARICOM for CARICOM members to revise their treatment of foreign investment (e.g. Enterprise for Americas Initiative). The pressure is on the individual members rather than on the Agreement even though liberalization of national regimes would be in breach of the Agreement. The overlap of tax and investment regimes is becoming more common in the evolution of economic integration and free trade organizations. It creates both opportunities and problems. The problems spring from lack of agreement and coordination of the substantive and procedural provisions.

Any tax treaty models adopted should be coordinated with the Agreement or it should be cancelled. Otherwise there will be conflicting obligations among the double tax treaties, BITs and the Agreement. The conflicts will create confusion and lead to a lack of respect for the rule of law.[52]

B. *European Community*

1. Tax harmonization

The tax developments for the completion of a single European market exemplify this phenomenon.[53]

Until 1990, most of the progress concerning harmonization or approximation of tax rules within the EC occurred in the area of indirect taxation. Several value added tax (VAT) measures were taken. The Sixth VAT Directive produced a substantial body of VAT law. An extensive jurisprudence on VAT has emerged, both at the level of the European Court of Justice and in many of the EC member state tribunals in interpreting various aspects of VAT legislation. However, an impasse has occurred concerning further steps towards VAT harmonization.[54] A fundamental issue is how to combat fraudulent transactions designed to avoid VAT liability. Business is arguing against imposing too great a burden on taxpayers. However, the EC recognizes the need to promote a system which does not overly distort purchases (i.e. trade) between EC member states.

Substantial progress has been achieved in the area of excise duties on tobacco products, alcoholic beverages and mineral oils and fats.

The EC has harmonized capital duties within narrow bands, which have been consistently moved downwards. Currently, the rates are between zero and one percent. The EC Commission wants to abolish capital duties completely in the near future.

In 1990, the most important progress occurred in the area of direct corporate taxation. Three corporate tax directives were finally passed by the ECOFIN Council of 23 July 1990. The parent-subsidiary directive will, inter alia, exempt dividends (1) from EC-based subsidiaries owned 25 percent or more by an EC member state company from withholding tax, as well as (2) from 95 or 100 percent of the corporate tax otherwise due in the hands of that corporate shareholder (unless the

51. Some senior practitioners in the Caribbean and government officials have told the author that they had not even heard of it.
52. There is a project within CARICOM to revise and modernize the Agreement. It was to become operative in January 1991, but amendments were still being proposed in October 1990 and the new Agreement may not yet be in force.
53. For a discussion of the tax developments in the context of EC 92, see Liebman, "Summary of Tax Developments for the Completion of a Single European Market", *Materials of the Annual Spring Meeting American Bar Association Section of International Law and Practice* (1991), at 667, from which the discussion in this section relies heavily.
54. Proposals to approximate rates within two bands and to establish a clearing-house mechanism have been opposed. The EC Commission has proposed a transitional plan that would temporarily table the proposal to eliminate the VAT exemption for exports (i.e. retaining the destination principle) until 1996.

© 1993 International Bureau of Fiscal Documentation

recipient is instead accorded a tax credit in its home country for underlying mainstream taxes). The merger directive will permit a deferral of taxation on the cross-border transfer of assets occurring as a part of a qualified merger, division (split-up) or contribution of a branch of activities. The arbitration directive provides the basic tenets of a convention to provide for the mandatory resolution of transfer pricing disputes between EC member states. A number of items remain to be clarified, particularly concerning the details of such a tax arbitration procedure.

The EC Commission has stated that it wants to make a number of other proposals, such as the elimination of intra-group withholding taxes on interest and royalties and group consolidation of tax losses.

Other initiatives are the existing information exchange provisions and the proposals to strengthen them, and a 1984 proposal to establish and harmonize the corporate tax base.[55]

These tax and other directives and changes derived from the establishment of a single internal market in Europe are expected to reduce the operational need for establishing redundant sales subsidiaries and distribution operations in each EC member state. As a result, group reorganization and restructuring will be required for many multinationals.

2. Conflicts between tax treaties and European integration in the context of the Single European Market

A problem that has arisen in the context of the realization of the Single European Market is the challenge made to the tax treaty policy of member states, namely Germany. The possible effects of such a potential conflict, in the realization of Caribbean accelerated integration, bears consideration here.

(a) *Article 28 of the German/US tax treaty*

In particular the new income tax convention between Germany and the United States, which was signed on 29 August 1989, and which has now been ratified by both countries, contains a "treaty shopping" clause that is consistent with US treaty shopping policy.[56] The purpose of Article 28 is to prevent taking advantage of the treaty's privileges by interposing only a person that is resident in one of the contracting states. A person that is a resident of a contracting state and derives income from the other contracting state is entitled to the benefits of the treaty only if such person is: (a) an individual; (b) a contracting state or one of its public bodies; (c) an active "company" as defined in the treaty; (d) a company quoted and traded on a stock exchange; (e) a person beneficially owned more than 50 percent by persons which for their part are entitled to the benefits of the treaty or are US citizens, and using not more than 50 percent of its gross income to meet liabilities to persons not entitled to the benefits of the treaty; or (f) a not-for-profit organization.

Article 28(2) of the treaty entitles the competent authorities of the source state to concede the benefits of the treaty in individual cases even to a person that does not comply with the above-mentioned conditions.

(b) *EC treaty requirements*

Article 52 of the EC Treaty provides that each resident of an EC member state has the unconditional right to establish and manage undertakings in another member state of the EC, including the incorporation of subsidiaries. This is referred to as the "right of establishment". Companies that are established pursuant to the laws of an EC member state and that have their registered office, place of management or principal office within the EC can also benefit from this right under Article 58 of the EC Treaty. The European Court of Justice has held that discrimination of residents from another EC member state can occur through disadvantageous taxation.[57]

(c) *Compatibility of Article 28 and EC law*

The issue of the compatibility of Article 28 with EC law arises in the context of Article 28(1)(e) in the case of a German resident company when the majority of shares is held by persons qualified under the treaty or by citizens of the United States. By this restriction, German companies with a majority of shareholders that are residents from other EC member states are excluded from the benefits of the treaty.

The argument of discrimination of EC residents cannot be solved by referring to the "activity clause" in Article 28(1)(c), especially since the US tax treaties with Italy and France do not have such "activity clauses", or the competent authority discretion according to Article 28(2).

Pure holding companies are of course excluded from the treaty benefits by the activity provisions. Article 52 of the EC Treaty safeguards the unconditional right of establishment and freedom of capital movements to all companies of the EC without any discriminating restrictions. The subjection of companies to conditions regarding the persons participating in the company violates Article 52 in connection with Articles 58 and 67 of the EC Treaty.

Many commenters believe that Article 28 of the US/German income tax treaty injures European integration and tends to separate the national markets rather than facilitate their amalgamation into an internal market. Some commenters believe that the introduction of "treaty shopping clauses" contributes to the isolation of national markets. If the EC Commission also concludes that Article 28 of the US/German treaty infringes basic EC law, it would introduce a formal infringement procedure under Article 169 of the EC Treaty. A company affected by Article 28 could also bring the case before a national tax court for submission to the European Court of Justice pursuant to Article 177 of the EC Treaty.

Several potential solutions can be foreseen if the EC Commission rules that Article 28 infringes EC law. The United

55. The 1975 proposal to harmonize corporate tax rates and establish a common imputation tax credit system was temporarily withdrawn in 1990 and this initiative awaits the result of a study to be conducted by a "committee of experts".

56. For a useful discussion of the application of the treaty shopping problem to the US/German treaty and the EC challenge, see Becker and Thömmes, "Treaty Shopping and EC Law Critical Notes to Article 28 of the New German–U.S. Double Taxation Convention", *European Taxation* (June 1991), at 173.

57. Case 270/84 *Commission vs. France* of 28 January 1986, ECR (1986) at 273, 302.

© 1993 International Bureau of Fiscal Documentation

States and Germany can try to renegotiate the treaty. This would be extremely difficult and cumbersome. To assist, they could try to refer to secondary Community law, such as the 1990 parent-subsidiary Directive. Another approach would be to bring the member states' tax treaties in line with EC law by negotiating a common EC model treaty. The EC Commission would prepare it and the EC Council would then have binding effects for further treaty negotiations between an EC member state and any third country.

C. *The Western Hemisphere*

The free trade developments in the Western Hemisphere are having a catalytic impact on international tax developments.

As a result of the free trade agreement between the United States and Canada, withholding rates are being lowered significantly with several business groups demanding their complete abolition, so that capital may flow more freely. In the context of free trade, cooperation between the United States and Canada in tax enforcement is extremely close. Canada is the only government with which the United States automatically and regularly provides information on bank accounts. Simultaneous audits between the two countries are up.

A few years ago Mexico had no income tax treaties. Now it has an income tax treaty with Canada and TIEAs with both Canada and the United States. Soon Mexico and the United States will have a fourth round of negotiations and are about to conclude an income tax treaty. Again US business groups are requesting that, concomitant with the pledge to conclude a North American Free Trade Agreement, the tax treaty should not be the standard treaty with moderate rates of withholding taxes, but rather that the rates should be extremely low, so that the flow of goods is facilitated.

Propelling the tax aspects of free trade arrangements is competition. As long as corporations and other entities in Europe can make tax-free reorganizations and as long as dividends between parents and subsidiaries must be tax-free, other free trade arrangements will need to have tax provisions that are as conducive to international trade and business.

In the context of free trade arrangements, CARICOM governments would be wise to have a treaty programme. There are several components to such a programme. In the context of the Enterprise for Americas Initiative, framework agreements on trade have been concluded. Unfortunately, the Bush Administration did not make the conclusion of tax treaties a part of the Enterprise for Americas Initiative. A similar oversight occurred in the Reagan Administration when income tax treaties were omitted from the CBI. To compound the omission, Congress overruled the Reagan Administration's proposal for a tax credit (as the alternative to tax sparing) and then imposed the TIEA.[58] While TIEAs have the laudable objective of strengthening tax enforcement, they do not provide tax incentives and probably discourage some potential foreign investors. In practice, countries such as Mexico, Venezuela and Chile are beginning to start negotiating income tax treaties because of a reevaluation of their trade and investment infrastructure due to the explosion of free trade and economic integration in the Hemisphere.

Why should CARICOM or other governments of free trade agreements have a tax treaty programme? A tax treaty programme would eliminate double taxation, provide a more stable environment governing the rules for transnational investment and reduce withholding rates on items such as dividends, interest and royalties, thereby encouraging investment. A tax treaty programme would encourage foreign investors to the Caribbean and it would increase the use of those Caribbean countries for operations for investment and trade into their treaty partners.

VIII. PRINCIPAL EFFECTS OF DIFFERENT TREATY APPROACHES

Most importantly, CARICOM countries without tax treaties are disadvantaged when they compete for foreign investment with CARICOM and non-CARICOM countries with tax treaties. In addition, they have less ability to export goods and services than countries with tax treaties because when natural and artificial persons from their country trade and invest abroad, they will not be able to compete as well economically with persons from other countries. To the extent a CARICOM country has an international financial or services sector, a tax treaty programme may be able to attract foreign investment into that sector partly due to an advantageous treaty. One example has been the use of Barbados IBCs and the non-discrimination provisions in the 1983 tax treaty with the United States. It has resulted in substantial foreign investors in US real estate using Barbados in order to take advantage of the election under Section 897(i) of the US Internal Revenue Code.

The principal effect of having a treaty is that foreign investment will increase in CARICOM countries. A potential impact of a treaty is that the reduced withholding taxes may deprive the host (e.g. CARICOM) country of revenue that it would otherwise have received. To try to increase its revenue, developing countries have decided not to conclude tax treaties, whereby the withholding rates and perhaps even jurisdiction to tax would be reduced. When they decided to conclude tax treaties, they also utilized the UN model. Recently, developing countries, led by Mexico, have revised their policy. Mexico and Venezuela have decided to start negotiating tax treaties. Mexico has decided to utilize an OECD model. The past belief that a country would lose revenue if it concluded tax treaties or used the OECD model probably requires reexamination.

From the perspective of a private investor, a treaty provides assurance about the tax treatment that will apply. Many investors have difficulty finding or understanding the law of a foreign country. This problem is exacerbated in some Caribbean countries because codification has not occurred for many years and the laws and tax regulations are not easily located outside the Caribbean. An additional problem is that foreign investors do not know or understand the formulation and application of regulations. A treaty thus offers

58. For background on the development and other policy aspects of the TIEAs, see Zagaris, *supra* note 22 ; Zagaris, "The Caribbean Basin Initiative", 28 *Tax Notes* (1985), at 1021.

© 1993 International Bureau of Fiscal Documentation

more certainty for investors. Investors also can resort to the competent authority procedures in the treaty if a problem or dispute arises. Hence, there is a known procedure that can be utilized.

There is widespread agreement that treaties will increase flows of investment internationally.[59]

The use of the UN model approach will expand the opportunities for the host CARICOM government to raise revenue, provided the level of foreign investment is maintained or increases. If the tax regime, either because of another treaty or because of national laws within CARICOM, in combination with other economic factors, is more favourable in another CARICOM or non-CARICOM country, then foreign investment may not increase in the country trying to raise revenue and the policy may prove unsuccessful.

Use of the OECD model has the advantage of providing a more favourable tax regime to a foreign investor and also to the extent CARICOM countries can attract investors to use a tax treaty to export services (e.g. through an international financial sector). If an OECD model treaty is used in conjunction with BITs and other investment mechanisms, the increase in foreign investment, especially if they have a multiplier effect, may produce more revenue and development than the UN model.

Many different experts have argued for both the OECD and UN approaches. CARICOM and non-CARICOM countries have even combined these approaches in one treaty.

IX. OPTIONS

The recommended option is for the region to prepare a model tax treaty or perhaps two models, along the lines discussed above. The models would have an explanation of their purposes and variations, so that CARICOM countries could refer to it in negotiating. The model(s) should be periodically reviewed and revised.

Some issues and recommendations may be acceptable regardless of which model is followed. For instance, each CARICOM country wants to attract funds abroad for charitable organizations. Since the laws and policies of some governments, such as the United States, do not favour contributions to foreign charitable organizations, one of the ways to overcome these laws and policies is through the negotiation of tax treaties. Such provisions would provide a reciprocal deduction when citizens and residents of one treaty country make contributions to charitable organizations recognized in the other treaty country. Since the flow of contributions will normally and predominantly be from the developed to CARICOM countries, such a provision would be favourable to all CARICOM countries, notwithstanding their choice of a model.

Many CARICOM members may want more comprehensive provisions to prevent tax evasion and/or avoidance (i.e. tax information exchange and mutual assistance in tax matters and anti-treaty shopping provisions).

CARICOM members should consider the model(s) and tax treaty goals. Wherever possible, they should consider having multilateral negotiations. This would solve the problem of countries having to spend an inordinate amount of time concluding treaties with tiny countries with very limited markets. Unless the CARICOM members find a way to minimize the time and resources that a treaty negotiation consumes, most countries will continue to take the position that they do not have time and resources to negotiate with so many small countries.

One requirement for an effective tax treaty programme is for CARICOM as an organization, CARICOM members and the interested private sectors (i.e. within CARICOM and in external donor countries)[60] to invest sufficient resources to have the material and human resources to design and implement policies. One of the most economical ways this can be achieved is for one of the regional institutions to undertake the investment.[61]

With respect to TIEAs, CARICOM as a whole and CARICOM members should try to obtain more benefits from the United States in exchange for concluding TIEAs. The provisions to stimulate investment by US persons in the Caribbean, the investment tax credits, were removed from the initial proposal of the Reagan Administration. Without substantial mechanisms to motivate US persons to invest in the CBI countries that have signed the TIEA, the TIEAs benefit the United States much more than the CBI countries with TIEAs. Unless the United States clearly distinguishes in the US persons eligible for benefits, such as tax credits and deferral and makes eligibility contingent on the existence of a TIEA, the CARICOM members will not be realizing the potential benefits that could flow from assisting the United States in enforcement cooperation. Among CARICOM members, a convention on international assistance in tax matters modeled on the Council of Europe/OECD Convention, would be useful to tax enforcement cooperation.

As accelerated integration proceeds, CARICOM institutions may well have to consider whether treaty shopping and other provisions of such treaties comply with CARICOM law, and take steps accordingly.

CLI and/or CARICOM may want to make recommendations on a model CARICOM TIEA or a type of convention for administration assistance in tax matters. The tax exchange of information and implementation agreements between the United States and its territories provide examples of the types of agreements that have tax administration provisions.

59. A comprehensive macroeconomic review of the principal effects of different treaty approaches is beyond the scope of the paper.

60. In Europe, Germany and Spain are among the major donors to tax administration through their contributions to the CIAT.

61. For instance, the University of the West Indies, in cooperation with the Caribbean Association of Industry and Commerce, the Caribbean Development Bank and initially one or two external institutions, could provide the instruction. Courses and practical research and development could occur as part of the regular curriculum and as part of an associated organization, such as a Caribbean Institute of Services. Technical and financial assistance is available through the European Development Fund and the provisions of the Lomé IV Convention, provided it is a regional project. For additional background on this idea and for the precise proposal, see Zagaris, "Application of the Lomé IV Convention to Services and the Potential Opportunities for the Barbados International Financial Sector", 45 *Bulletin for International Fiscal Documentation* (June 1991), at 289.

© 1993 International Bureau of Fiscal Documentation

CLI and/or CARICOM may want to make suggestions on non-tax treaties that are useful, and model provisions for such treaties. In particular BITs would serve this purpose. CARICOM or CLI may want to assist in providing a model or alternative model BITs.

To remain competitive, CARICOM must reconsider and revise its internal tax treaties. For instance, there is both a fiscal harmonization agreement entered into by the CARICOM members in the mid-1970s and the 1973 CARICOM double taxation treaty between the most developed and the less developed countries. The CARICOM double taxation treaty is based for the most part on the old (1964) OECD model treaty. Tax incentive legislation in individual member country chapters follows this harmonization agreement. The double tax treaty is in need of revision. Alternatively, if the 1973 CARICOM double taxation treaty is not revised in the near future, it may be preferable to some countries, after receiving CARICOM's approval, to negotiate their own arrangements. Eventually, CARICOM itself may want to follow the EC model of making legislation that controls tax relations among member countries within the Community and eventually, at least to some extent, outside the Community.

Similarly, the Agreement to Harmonize Investment Incentives has fallen into disuse and may well conflict with national laws and agreements of CARICOM members. Hence, if not already done, it needs to be revised or scrapped.

As CARICOM starts achieving substantial progress towards realizing the free and unrestricted movement of people, goods and capital, it will need to consider harmonizing its tax systems. In that regard, it may want to consider providing more authority to the ministers in charge of finance to study and propose means of achieving tax cooperation and harmonization in the context of accelerated economic integration. In the short-term it may want to facilitate or commission some studies and try to strengthen CARICOM institutions, such as the COTA and the tax policy resources within CARICOM, and initiate tax policy research capability within CARICOM (i.e. University of the West Indies, CAIC, and the proposed Caribbean Institute on Services).

FINANCIAL SERVICES IN THE BRITISH VIRGIN ISLANDS

Michael Riegels

Michael Riegels *was born in Tanzania and educated in Kenya and at Oxford University. He is a member of Grays Inn and was called to the Bar in England in 1961. He was admitted as an Advocate in Tanzania in 1962. After practising for ten years in Dar-es-Salaam he settled in the BVI in 1973 where he joined the law firm which is now known as Harney, Westwood & Riegels, of which he is the Senior Partner.*

Until I read the conference papers I thought that the British Virgin Islands (BVI) was unusual although probably not unique in that it offers investors a choice of low tax or no tax, but from the table of tax rates in the Caribbean[1] it is clear that several Caribbean countries offer such a dual tax regime. However, when you look at the actual rates of tax offered by other jurisdictions it would probably be more correct to say that they offer the choice of "no tax" or "not very high tax". Our nearest competitor appears to be Montserrat which offers no tax or a 20 percent tax, followed by Jamaica with no tax or a 33.3 percent tax, but the Netherlands Antilles is in there fighting with an alternative tax rate of between 27-34 percent. And again if I have read my papers correctly Aruba should also be included amongst those countries offering a zero rate in certain circumstances, and a rate of between 27-34 percent in other circumstances.

Traditionally, the BVI has always been a low tax jurisdiction. For many years the top rate of income tax was 12 percent but it has crept up over the years so that the top rate for individuals is now 20 percent whilst the rate for companies is a flat 15 percent (with some lower rates for special circumstances).

BVI tax is very simple – there are no personal allowances – and except for certain categories of income which are exempted (such as domestic servants), tax is payable from the first dollar earned. For the individual taxpayer the rates are as follows:

$	0	– $ 2,500	3%
	2,501	– 7,500	6%
	7,501	– 15,000	10%
	15,001	– 25,000	15%
over	25,000		20%

One somewhat unusual feature of BVI tax is that the top rate – and for most purposes the only rate – of tax for companies is lower than the top rate for individuals but there is no tax on dividends. Thus for an individual earning in excess of about $ 28,000 it is sensible to form a company which will then employ the individual and pay only 15 percent tax on net income over and above the individual's salary which can be distributed to the individual tax free.

The international investor, however, is unlikely to reside in the BVI and thus his interest in BVI tax would normally be with a view to minimizing his tax elsewhere, and to achieve this objective he would invariably want to use a BVI company. For many years, like our friends in the Netherlands Antilles, the BVI prospered from the extension of tax treaties negotiated between the United Kingdom and other high tax areas.

At the height of the golden era of double tax treaties the BVI had double tax treaties with the United States, Canada, New Zealand, Denmark, Norway, Sweden, Switzerland and Japan. Most of these treaties allowed for reduced withholding taxes on dividends and interest and in most cases allowed royalties and commercial profits where there was no permanent establishment (PE), to leave the high tax areas without suffering any tax at all.

Slowly but surely these treaties were curtailed and cancelled, but two treaties remain in force, i.e. the treaties with Japan and Switzerland.[2] In my experience the Swiss treaty, which was extended to the BVI on 1 January 1961, is very little used and is somewhat limited in that its principal benefits are that it exempts from tax, royalties (which includes rent for films and for the use of commercial, industrial or scientific equipment) and, subject to the PE test also exempts from Swiss tax, capital gains and industrial and commercial profits. There are also exemptions arising from the operation of ships and aircraft. The operation of aircraft I can understand but I cannot believe that there is much scope for shipping activities in Switzerland.

1. See A. Johnson, "Recent Tax and Foreign Investment Developments in the Caribbean" in this issue, at 109.

2. Again I am indebted to the very interesting analysis of treaties prepared by Annette Johnson, which shows that several Caribbean jurisdictions enjoy the benefit of the extension of UK treaty with Switzerland.

© 1993 International Bureau of Fiscal Documentation

The interesting treaty is of course the one with Japan with which country I see no other Caribbean jurisdiction has a treaty. The treaty is quite a good one. It is an extension of a UK treaty and was extended to the BVI with effect from 1 January 1963. It features the following:

- the usual commercial and industrial profits exemption otherwise than from a PE, and the ships and aircraft exemption;
- in the case of dividends paid by a Japanese company the withholding tax is reduced to 15 percent, and where more than 50 percent of the Japanese company is owned by a BVI company, to ten percent;
- dividends paid by a BVI company out of income derived from Japanese sources are free of Japanese tax if paid to non-residents of Japan;
- withholding tax on interest payments to a BVI company is ten percent;
- withholding tax for use of copyrights, patents, film rentals and for use of industrial, commercial or scientific equipment is limited to ten percent as is tax on capital sums derived from the sale of patents and royalty rights to a BVI company.

As mentioned earlier, BVI corporate tax is levied at the rate of 15 percent. Taxable income is computed after taking all the normal deductions properly incurred in earning the income, and management fees are an acceptable form of deduction. Thus if BVI tax is not offset by tax credits it can be reduced by management fees paid to a suitable advisor situated in a zero tax area, but in such cases it is advisable to discuss the effect and scope of the management fee beforehand with the BVI tax authorities because although it is not possible to negotiate tax rates in the BVI, the tax authorities will usually advise whether or not a management fee is acceptable in given circumstances.

There are also generous tax credits available in the BVI. Any foreign tax paid on the same income is available by way of tax credit and where appropriate provisions are obtained in double tax treaties, in the case of dividend income, tax on the underlying profits from which the dividend was paid is also available by way of tax credit. Thus where a BVI company owns more than 50 percent of a Japanese company the reduced withholding tax of ten percent in Japan is a direct credit against BVI tax, and in most cases the Japanese taxes levied on the income from which the dividend is paid may also be claimed as a credit leaving no BVI tax to be paid.

There are no capital gains taxes in the BVI and no inheritance taxes or estate duties. In order to take advantage of tax treaties, however, the company must be incorporated under the Companies Act and must be a resident company, i.e. it must be controlled and managed in the BVI. It will be deemed for tax purposes to be so controlled and managed if a majority of its directors are resident in the BVI.

The BVI/US treaty was certainly the most widely used treaty and with its cancellation in the early 1980s, the BVI decided in 1984 that in addition to being a low tax jurisdiction, it would join the ranks of the no tax jurisdictions, and for this purpose the International Business Companies Ordinance was enacted which created the International Business Company (IBC), a company which is prohibited by law from carrying on business with residents and therefore can only do business with non-residents. The name IBC is not very original and our friends from Barbados will assert that they were using this name and concept long before it dropped anchor in the BVI. It has now become so popular, however, that it has been taken on board by the Bahamas and other jurisdictions as well. What we did in the BVI was to combine no tax with a very modern and streamlined company law and the result has been very successful. There are now more than 60,000 IBCs in the BVI – that is more than four companies for every man, woman and child in the Territory and the rate of new incorporations runs at about 1,000 a month.

It is difficult to say too much about companies which are exempt from tax at a tax conference. It is a bit like comparing different brands of whisky at a convention of teetotallers, but suffice it to say that zero tax entities have a place in any tax planning structure, besides which IBCs are very useful tax planning tools in that:

- they can redeem shares and reduce capital with a minimum of formalities;
- they have the utmost flexibility in the distribution of assets by way of dividend. Before making any distribution directors are required, bona fide, to satisfy themselves as to the solvency of the company and that the company can meet its liabilities in the ordinary course of its business. For such purpose the directors may take into account unrealized gains, but having made such a determination the company may distribute all assets in excess of the company's liabilities as established by its accounts and its capital;
- dividends can be distributed to certain classes of shares and not others;
- there is no minimum capital requirement;
- there are no requirements for specific debt-to-equity ratios;
- assets can be allocated to different classes of shares;
- IBCs can exist without any shareholders although in such circumstances the directors will be personally liable for the company's debts.

Most of the features upon which I have dwelt so far are features that could well be attractive to the international tax planner, but there are other attractive features which make an IBC popular to those who have exchange control problems.

A selection of such features would be the following:

(1) Registered and bearer shares can be issued and holders of either can convert such shares into the other type.
(2) Shares may be issued with or without par value and need not be numbered.
(3) An IBC may purchase and own its shares.
(4) A company incorporated under the Companies Act may be converted into ("continue as") an IBC.
(5) A foreign company may continue as an IBC without any reciprocal arrangement in the jurisdiction of incorporation.

© 1993 International Bureau of Fiscal Documentation

(6) A foreign company may provisionally continue as an IBC subject to instructions for the continuation being given to the Registry by a nominated third party.
(7) An IBC may continue itself in another jurisdiction.
(8) An IBC may fully indemnify officers and agents from corporate funds.
(9) An IBC may merge, consolidate or enter into arrangements with other IBCs, with companies incorporated under the Companies Act or with foreign companies.
(10) The directors may protect the assets of the IBC for the benefit of the IBC, its creditors and its members and for any person having a direct or indirect interest in the IBC by transferring the assets of the IBC to another company or legal entity in trust for the IBC, its members, creditors and persons having other direct or indirect interests in the IBC.[3]
(11) Where a foreign government expropriates or imposes confiscatory taxes upon the shares or other interests in an IBC, the IBC or any person holding shares or other interest may apply to the court for an order that the IBC disregard the action of the foreign government and continue to treat as members or interest holders those persons whose shares or interests were subject to action by the foreign government.
(12) Minority shareholders have the power to dissent from certain transactions and to obtain fair value for their shares.
(13) The power to amend the Memorandum and Articles may be given to the directors.
(14) An expeditious and simple form of voluntary winding up is available for solvent companies.
(15) An IBC may rescind voluntary winding up proceedings after the commencement thereof.
(16) An IBC may apply to a judge in chambers, without the necessity of joining any other party, for a declaration on any question of interpretation of the IBC Act or the Memorandum or Articles of an IBC.

These companies can be formed cheaply and quickly. The Companies Registry is extremely efficient which is important if certified copies of documents or certificates of good standing are required, or if mergers need to be accomplished within tight deadlines. Annual Government fees for most companies are $ 300, and for companies with large capital, $ 1,000 per annum.

The IBC is popular because it is many things to many people. It can do things which other more conventional companies cannot do and can thereby step around the tax laws in other jurisdictions which cannot imagine the existence of such a creature.

Before concluding I would like to dwell very briefly on two other points: the exchange of information and recent developments in BVI laws to broaden the scope of the financial services which we offer.

As regards the exchange of information the BVI always has and I believe always will adhere robustly to the principle that except where we have tax treaties in force we will not act as tax collectors or assistant tax collectors for any other jurisdiction. The United States chose to cancel its treaty with the BVI and quite frankly neither the carrots nor the stick are such as to cause us to change our mind. That does not mean, however, that in the BVI anything goes and I feel it would be remiss of me if I did not make the point that the steady growth of international crime and fraud is a matter of great concern.[4]

It is my belief that concerns over international fraud and international crime will soon eclipse the problem of mere tax evasion and the financial centres will have to make a choice as to how they wish to conduct their affairs. Will they be a haven for criminals or will they recognize the fact that offering financial services also means offering responsibility? As far as the BVI is concerned there is no question but that we want no truck with those bent on crime or fraud and we have reached this conclusion without any carrots or sticks from the United States.

The BVI recently embarked on a new and far-reaching regulatory regime where we seek not so much to regulate the people doing business with the BVI but more to regulate those who handle their business in the BVI. Any form of regulation is an inconvenience but "no regulation" is as great a peril as "over-regulation". There is no foolproof method of detecting criminals or potential criminals and not even the most sophisticated regulatory mechanism will achieve this. However, the dangers of the criminals moving in can be minimized by demanding high standards of those who operate in the offshore business, and trying to eliminate negligence, laziness and the "couldn't-care-less" attitude.

That is one way to tackle the problem, but that in itself is insufficient. Any jurisdiction which wishes to enjoy a good reputation must decide how and where to differentiate between a legitimate desire for confidentiality and an illegitimate desire to conceal the proceeds of fraud and crime from the innocent victims thereof. We in the BVI are trying to tackle this problem because we are determined to keep our jurisdiction as clean as possible.

So if anything, I think you can expect from the BVI a tightening up on such things as bearer shares, the total anonymity of directors, and the absence of any statutory framework requiring disclosure of information in the event of established fraud or crime. For the legitimate businessman the BVI will continue to be a helpful and useful jurisdiction, but for the international criminal the welcome mat is definitely not on the floor.

Finally, I would like to dwell on two recent developments in our law which are intended to keep the BVI in the forefront of the financial services business. There is presently passing through our legislative assembly, some amendments to our trust law which are long overdue. These amendments in brief:

3. This may appear to be a very esoteric benefit but advantage was taken of this provision during the Gulf War.
4. The subject is very much in the news at the moment, first with Barlow Clowes involving tens of millions of dollars, then with Robert Maxwell involving hundreds of millions, and finally to the largest international fraud ever – so far – the BCCI, involving thousands of millions of dollars.

© 1993 International Bureau of Fiscal Documentation

- introduce a fixed perpetuity period of 100 years;
- introduce the so-called "wait and see" rules;
- clarify the tax-exempt status of trusts for non-residents;
- eliminate registration requirements for trust deeds;
- introduce the concept of the purpose trust, i.e. a trust with a business purpose would be possible.

The second piece of legislation which will shortly be enacted will regulate partnerships and introduce the concept of limited partnerships into BVI law. This is a definite lacuna in our law since limited partnerships are a very effective tax planning tool in the United States and elsewhere, and there is a definite perceived need to have limited partnerships as part of BVI law. BVI law will follow very closely the law in Delaware.

TAX TREATIES

Data Base on CD-ROM

THE WORLD'S MOST UP-TO-DATE AND COMPREHENSIVE COLLECTION OF DOUBLE TAXATION TREATIES

FULL ENGLISH TEXT OF VIRTUALLY EVERY TAX TREATY THROUGHOUT THE WORLD (APPROX 1200).

INCLUDES **CURRENT TREATIES** AND ALSO TREATIES SIGNED AND PUBLISHED BUT NOT YET IN FORCE,
MANY TREATIES WHICH ARE NO LONGER IN FORCE BUT REMAIN IMPORTANT;
PLUS **PROTOCOLS**, SUPPLEMENTARY CONVENTIONS, LETTERS AND RATIFICATION DOCUMENTS.

ALSO WITH THE FULL TEXTS OF THE 1963 OECD DRAFT CONVENTION
AND THE 1977 OECD MODEL DOUBLE TAXATION CONVENTION ON INCOME AND CAPITAL;
PLUS THE UN MODEL DOUBLE TAXATION CONVENTION BETWEEN DEVELOPED AND DEVELOPING COUNTRIES.

USER FRIENDLY SYSTEM ALLOWS IMMEDIATE RETRIEVAL OF THE FULL TEXT OF ANY TREATY,
WITH VERIFICATION OF WHETHER OR NOT IT IS IN FORCE AND WHETHER IT CONTAINS ANY SPECIAL PROVISIONS.
SPLIT SCREEN FACILITY ALLOWS DIRECT COMPARISONS BETWEEN TWO DIFFERENT DOCUMENTS.

UPDATED AT LEAST TWICE A YEAR BY A COMPLETELY NEW CD-ROM.

2,400 DUTCH FLORINS ANNUAL LICENCE FEE 1,500 DUTCH FLORINS ONCE ONLY PAYMENT FOR SOFTWARE
1,500 DUTCH FLORINS REFUNDABLE DEPOSIT PER CD-ROM
RESIDENTS OF THE NETHERLANDS, AND RESIDENTS OF THE EC WITHOUT A VAT NUMBER, ARE LIABLE

FINANCIAL SERVICES IN THE NETHERLANDS ANTILLES

Michael Ellis

Mr. Ellis *works at Pierson, Heldring & Pierson (Curaçao) NV, where he is Vice President of the Trust Division. He is also a member of the board of the Curaçao Chamber of Commerce and Industry.*

INTRODUCTION

Like Aruba, the Netherlands Antilles (NA) is an autonomous part of the Kingdom of the Netherlands. It is an associate member of the EC. The head of state is Queen Beatrix, who is represented in the NA by a Governor General. The NA has its own legislation and monetary system. The currency is the NA guilder which is maintained at a fixed rate versus the US dollar.[1]

The NA consists of five islands: Curaçao, Bonaire, Sint Maarten, Sint Eustatius and Saba.[2] Curaçao is the largest with approximately 150,000 inhabitants. The central government of the NA and Parliament reside in Curaçao. The NA is governed by a Cabinet of Ministers headed by the Prime Minister. The Parliament is democratically elected every four years. Each island has its own government and parliament, and certain responsibilities are delegated by the central government to the respective island governments, but most taxes are imposed by NA law (Central Government).

The main pillars of the economy are trading and distribution (Free Zone and container terminal), oil refining, tourism, transshipment, ship repair and the financial offshore industry. For the financial offshore industry Curaçao is the most important island which houses some 35 trust companies and about 50 offshore banks. In addition, there are some 20 trust companies which have been established to serve selected interests. The offshore industry in its present form dates from the early 1950s, and directly employs over 1,200 individuals. According to the commercial register there are nearly 20,000 offshore companies.

COMPANIES

The NA limited liability company (NV) is the most common type of legal entity in the NA. An NV may be formed by one or more persons, either individual or legal entites, and may be either a public or a closely held company.

Once an NV is incorporated it must be registered with the Commercial Registry of the Chamber of Commerce and Industry.

The minimum authorized capital of an NV is US$ 30,000 (or the equivalent in another currency). At least 20 percent (or US$ 6,000) must be paid up and must be outstanding at all times. An NA company may repurchase its own shares so long as they are fully paid up and provided that 20 percent of the authorized share capital remains outstanding.

If provided by the Articles of Incorporation shares may be common shares, preference shares, non-voting shares or shares with limited voting rights. Shares may be registered or bearer, they must have a par value, and if registered, may be partly paid to a minimum of ten percent of par value. The names of the shareholders are not registered in any public record.

An NV is managed by a board of managing directors, consisting of at least one individual or corporate managing director, and at least one managing director must be resident in the NA. An NV may have a supervisory board to advise and supervise the board of managing directors but this is not mandatory.

The annual general meeting of the shareholders must be held within nine months of the company's financial year end. The managing directors must present the financial statements[3] and a report of the managing directors at the annual meeting. An audit of the financial reports is not mandatory unless so mandated by the articles of incorporation or the shareholders.

1. The last time the Netherlands Antilles changed the parity of its guilder was 20 years ago.
2. Aruba was part of the NA until 1 January 1986 when it obtained *status aparte*, as a separate part of the Kingdom of the Netherlands.
3. The financial statements are comprised of a balance sheet and a profit and loss account and notes.

© 1993 International Bureau of Fiscal Documentation

To protect the rights of creditors, NA legislation contains rather extensive provisions regarding the dissolution of limited liability companies. The liquidation process must be initiated by the shareholders by a resolution at the general meeting. Once in liquidation the company's affairs are managed only by the liquidator. The company continues in existence but only to the extent that this is necessary to wind up its affairs.

Notice of the liquidation must be published in the Official Gazette and the plan for liquidation must be filed at the Commercial Registry for public inspection. Creditors may object to the plan within two months after filing. After expiration of the two-month moratorium and after the creditors have been paid the liquidator can make the final distribution of assets to the shareholders. A final account is then filed with the Chamber of Commerce; if no objections are filed within three months the liquidation procedure is completed and the company stricken from the Commercial Registry. After liquidation, the company books must be kept in custody for 30 years.

TAX SYSTEM

Broadly, resident companies and other taxable entities are subject to profit tax on their worldwide income.[4] The tax rates vary depending on whether the company is an onshore or an offshore company. An onshore company mainly carries on business activities in the NA. The purpose of an offshore company is to derive income from investment or trading activities outside the NA and its shares are held only by non-residents; such companies, which include trading companies, finance companies, investment/holding companies, intellectual property and patent-holding companies and shipping companies, are deemed resident companies for NA tax purposes. Certain of the individual types of offshore companies are discussed below.

The tax rate for onshore companies, which is progressive, ranges from 37-40 percent, including the 15 percent island surcharge. Investment, holding, finance and intellectual property and patent-holding companies, however, qualify for concessionary tax treatment under Articles 14 and 14A of the Profit Tax Ordinance, i.e. they are subject to tax at the rate of 2.4% on net income of US$ 56,000 and three percent on the balance.[5] For companies engaged in other activities a special advance ruling must be obtained in order to be treated under the advantageous tax regime.

Non-resident companies (both on and offshore) are taxed to the extent that they engage in business in the NA through a permanent establishment, on profits derived from real estate in the NA and on profits derived from claims whose principal amount is secured by a mortgage on real estate situated in the NA.

Capital gains derived by onshore companies are included in the taxable income and taxed at the usual rates. Capital gains derived by companies which qualify under Article 14 or 14A (i.e. offshore companies) are exempt from tax, and capital losses are not deductible. There are no withholding taxes on interest, royalties or any profit distributions. No capital tax, sales tax or inheritance or gift tax is imposed on non-NA resident private individuals in the NA.

A tax return must be filed annually with the Inspectorate of Taxes, together with the company's financial statements. The return must generally be filed within six months of the financial year end.

Investment/holding companies and finance companies

Portfolio investment/holding companies are companies established to invest in securities such as shares, bonds, etc. Finance companies engage exclusively in borrowing and lending activities, i.e. to borrow sums from third parties which are then used to furnish loans to affiliated companies. All of the above companies are eligible for the reduced rate of profit tax (i.e. 2.4/3 percent) upon application to the tax inspector.

Patent-holding companies

Patent-holding companies are offshore companies whose principal object is the receipt of royalties and technical service payments from sources outside the NA. These companies are subject to the reduced rate of profit tax on the net amount of royalty income received.

OTHER TYPES OF COMPANIES

Offshore banks

As mentioned above the NA hosts about 50 offshore banks which are licensed to conduct international banking transactions with offshore companies and with non-resident individuals.[6] Investment and interest income qualifying under Article 14 of the Profit Tax Ordinance is subject to the reduced rate of tax. Other types of foreign-source income will be taxed at the rates of 24-30 percent unless reduced by a ruling of the tax inspector.

Captive insurance companies

Special rules apply to captive insurance companies, i.e. companies whose activities only consist of insuring the risks of other companies. The profits of qualified companies which do not receive any treaty related income will be set at NAFl. 100,000 and taxed at the rate of 2.4 percent, thus limiting the amount of tax payable to NAFl. 2,400.

Real estate companies

Resident companies and NA offshore companies carrying on business in the NA through a permanent establishment are

4. A company is deemed resident in the NA if it is established under the laws of the NA or if its effective management and control is located in the NA.
5. According to the Guaranty Ordinance of 1976, the reduced taxation regime will apply to the offshore sector through to the financial year commencing 1 July 1999.
6. Many offshore banks have been established by Dutch banks, but countries such as Canada, France, Germany, Italy, Saudi Arabia, Switzerland and the United States are also represented.

© 1993 International Bureau of Fiscal Documentation

exempt from tax in respect of profits derived from real estate situated outside the NA.[7]

Mutual funds

Certain countries allow foreign mutual funds to operate directly in their domestic markets, or as the case may be, allow them to be marketed locally if supervised or regulated by a recognized foreign authority. There is no supervision of mutual funds in the NA, although they may be regulated by the Central Bank in the Netherlands; therefore mutual funds may be marketed in foreign countries and may operate in foreign financial markets.

As from 1 January 1988, mutual funds incorporated in the NA are exempt from profit tax on non-treaty related income provided they meet certain criteria, i.e. the fund should have either at least US$ 50,000,000 in net assets, a participation of at least 50 shareholders and four local employees or minimum net assets of US$ 300,000,000 and two local employees. Mutual funds that do not meet this criterion will be taxed on non-treaty related income at the rates of 2.4 to 3 percent with a minimum charge of US$ 1,000 and a maximum of US$ 10,000.

TAX TREATIES

The NA currently has a tax treaty with Norway.[8] The 1955 treaty with the United States was terminated as of 31 December 1987, except for Article VIII, which provides for an exemption of US withholding tax on interest paid by US sources to a resident of the NA if the NA recipient waives the right to be taxed under the low rates, i.e. the exemption only applies if the NA company is subject to the tax rates of 24-30 percent on its net taxable income.

TAX REGULATION OF THE KINGDOM OF THE NETHERLANDS

The 1964 (as amended) Tax Regulation of the Kingdom of the Netherlands governs double taxation issues between the NA, Aruba and the Netherlands. The principal benefit offered by the Regulation relates to the tax treatment of dividends received from the Netherlands by NA companies. Withholding tax on dividends paid by a Netherlands source to a NA party is 15 percent; however, if the NA company has a participation of at least 25 percent of the capital of the Dutch company, the withholding tax is further reduced to 7.5 percent. The rate is reduced to five percent if the NA company elects to be taxed in the NA at a rate of at least 5.5 percent.[9]

7. The exemption extends to real estate profits distributed to the NA by a subsidiary which carries on business through a permanent establishment in the Netherlands or Aruba.
8. The NA formerly had treaties with the United Kingdom and the United States. The Norway and UK treaties have been terminated in full, and the US treaty has been terminated except for Art. 8 dealing with the treatment of withholding tax on interest. Negotiations are taking currently place with Austria, Belgium, Italy and Sweden.
9. Tax Regulation for the Kingdom of the Netherlands, Art. 11(3).

CONFERENCE DIARY

For further details of the events listed below please write to the organizers at the addresses indicated.

MARCH 1993

The New U.S. Transfer Pricing Regulations, Amsterdam, 22 March 1993 (English):
IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, The Netherlands, Tel.: 020-6267726, Fax: 020-6209397.

The New U.S., the Netherlands and Mexico Tax Treaties, Amsterdam, 24 March 1993 (English):
IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, The Netherlands, Tel.: 020-6267726, Fax: 020-6209397.

U.S. International Taxation, Amsterdam, 25-26 March 1993 (English):
IBFD, International Tax Academy, PO Box 20237, 1000 HE Amsterdam, The Netherlands, Tel.: 020-6267726, Fax: 020-6209397.

VAT 1993: Intra-Community Transactions, Practice in Belgium, France, Great Britian, Luxembourg, Germany and the Netherlands, Brussels, 26 March 1993 (French):
Ecole Supérieure des Sciences Fiscales, Blvd. Brand Whitlock, 2, B-1150 Brussels, Belgium, Tel.: 32-2-7393796, Fax: 32-2-7393897.

APRIL 1993

Dutch–U.S. Income Tax Treaty, Amsterdam, 7 April 1993 (English):
Kluwer Seminars, Postbus 23, 7400 GA Deventer, the Netherlands, Tel.: 31-5700-47190, Fax: 31-5700-13630.

International aspects of American tax law for Dutch businesses and their advisors, Velp, 27-28 April (English):
Euroforum, Antwoordnummer 27, 5600 VB Eindhoven, the Netherlands, Tel.: 040-608811, Fax: 040-449895.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

AFRICA

Nigeria

TAX LAW AND TAX ADMINISTRATION in Nigeria.
Edited by M.A. Ajomo and Oluwole Akanle.
Lagos, Nigerian Institute of Advanced Legal Studies. 1991, pp. 387.
This volume is the first of the Institute Conference Series and contains papers delivered at a National Conference on Tax Law and Tax Administration held at the Institute in November, 1984. The papers provide a comprehensive review of all aspects of the nation's tax system with suggestions for reform. Of particular importance are suggestions concerning improvements in the administration of the system.

Cyprus

VALUE ADDED TAX.
Nicosia, Ernst & Young Russell Lakoufis & Co., Nicosia Tower Centre, 36 Byron Avenue, P.O. Box 1656, Nicosia, Cyprus. 1992.
Loose-leaf publication divided into four sections: VAT law, VAT rules, summary of main provisions of the VAT law and rules and explanatory notes. The first two sections have been completed as of the date of publication. The first section is divided into ten parts and covers, inter alia: imposition and extent of the tax; registration; rates and determination of value; settlement of tax and credits; reliefs, exemptions and refunds of tax; administration and powers of commissioners; special arrangements; general provisions and schedules. The second part reproduces the Value Added Tax (Treatment of Certain Transactions) Rules 1991 made by the Council of Ministers. The original law and regulations were enacted in Greek. This is an unofficial English translation.

HARRISON, Debbie.
Pension provision in the EC. Opportunities for the private sector in the Single Market. A Financial Times Management Report.
London, Financial Times Business Information; 7th Fl., Broadway Buildings, 50-64 Broadway, London SW1H 0DB. 1992, pp. 160, £ 253.
The report describes the most important pension systems operating in the EC. It looks at how governments are tackling the problem of funding a rapidly increasing number of pensioners and how this, along with the move towards a single market, is leading to a much broader diversification of pension options and pension fund investment. Full text of the First Pension Funds Directive is given along with a thorough analysis of its impact on each Member State. The topics covered include: pension systems in the EC, the demographic time bomb, towards a single market, the First Pension Funds Directive, the impact of the Directive on fund management and investment services, the role of occupational schemes for the social protection of workers and labour mobility, mobile workers–the current options, state provision, equalization, and the US experience.

INTERNATIONAL

SONNEVELDT, Frans; MENS, Harrie L. van.
The Trust. Bridge or abyss between common and civil law jurisdictions?
Deventer, Kluwer Law and Taxation Publishers. 1992, pp. 98.
The book deals with the trust and its tax consequences in some common law countries, viz. the UK and the USA, and in a number of civil law countries such as Switzerland, the Netherlands and France. An introductory chapter discusses the trust phenomenon as such, touching on its historical background, the uses to which the trust is put, the modern trust and also the Hague Convention on Trusts. The closing chapter is devoted to the treatment of trusts under the OECD Model Convention. In dealing with these subjects the authors discuss the similarities and differences in the various tax law approaches, including observations and conclusions on the significance of these comparisons. Price: 60.- Dfl. or US$ 40.- (excl. VAT).

International Transfer Pricing in the Ethical Pharmaceutical Industry

Explores the role of transfer pricing in the movement of products, active ingredients and intangibles within international groups.

Description and critical assessment of models for establishing transfer prices. Practical suggestions on how to identify the most appropriate methods.

Full background information on the pharmaceutical industry is provided, and the text is supported by relevant statistics.

Compiled and written by Maurice H. Collins, who was chairman of the working group which produced the 1979 OECD Transfer Pricing Report.

LIMITATIONS ON BENEFITS UNDER THE NEW US–NETHERLANDS INCOME TAX TREATY — 159 — *Philip H. Spector*

The limitations on benefits provision in the new US–Netherlands income tax treaty is the most detailed and probably the most heavily negotiated limitations on benefits article in the history of bilateral tax agreements. Mr Spector first looks at the reasons why the Netherlands is an attractive location for holding companies and finance subsidiaries for international groups. He then overviews the US response to treaty shopping since 1981. The remainder of the article describes in detail the requirements of the various categories of treaty entitlement.

TREATY SHOPPING UNDER THE NEW US–NETHERLANDS TREATY — 175 — *Philip T. Kaplan*

The new US–Netherlands tax treaty carries anti-treaty shopping provisions to new heights – some 23 pages of text under the limitation on benefits provision and a memorandum consisting of 30 numbered sections of which 15 concern the limitation on benefits article. By using diagrams and charts Mr Kaplan sets out the limitation on benefits provisions in such a way to make them comprehensible to all.

INTERNATIONAL: INDICATIONS OF FUTURE POLICY IN THE LATEST OECD TASK FORCE REPORT — 181 — *Jill C. Pagan*

The primary objective of the Committee on Fiscal Affairs Report on the proposed IRC Section 482 regulations was to reinforce the various representations to the US Treasury by governments and international commercial and trading associations. The full Report was made available by the OECD in January 1993 (the report appears in the January issue of the *Bulletin*), the month in which the United States issued its new regulations. Jill Pagan takes a critical look at the Report, concluding that it is a hastily produced response the proposed regulations which fell prey to an over-preoccupation with tax avoidance.

UNITED STATES: TRANSFER PRICING REGULATIONS ISSUED — 187 — *Stanley C. Ruchelman*

The temporary and proposed Section 482 regulations issued on 13 January 1993 revise the rules under which cross-border transactions between controlled parties are examined to determine whether they have been carried out at arm's length. The substantive regulations were accompanied by two sets of proposed regulations: one to limit the impact of foreign law on the ability of the IRS to make an adjustment, and the other set addresses the reasonable cause exception to the accuracy related penalty in transfer pricing matters.

JAPAN: TAXATION OF DIVIDENDS AND INTEREST — 202 — *Alum Bati*

This article discusses the taxation of dividends and interest paid to, or received from, non-Japanese companies. The focus is on the new thin capitalization rules as well as withholding taxes and the method of giving tax credit for foreign taxes.

DENMARK: TAX STATUS OF EXPATRIATES — 211 — *Bente Moll Pedersen*

Denmark recently adopted a new tax regime for foreign employees transferred to the country for a period of six to 36 months, i.e. under certain conditions such employees may opt to be taxed at a flat rate of 30 percent of the monetary payments under a service agreement.

FRANCE: MAJOR MEASURES CONCERNING INTERNATIONAL TAXATION: THE FINANCE ACT 1993 AND TRANSFER OF ASSETS ABROAD — 214 — *Pierre-Jean Douvier*

The Finance Act 1993 contains a number of important measures for corporations, including reduction of the corporate tax rate, abolition of the surtax due on distributions of income and abolition of the "five percent rule" so that dividends received under the affiliation privilege will be completely exempt from tax. Additionally, the CFC provisions of Section 209 B have been tightened and the three percent tax on French real estate owned by certain foreign companies has been modified. Finally, a measure has been introduced affecting French companies which transfer assets abroad to a third person or trustee for certain purposes.

EUROPEAN COMMUNITY: CORPORATE INCOME TAX HARMONIZATION IN THE NINETIES — 220 — *Dr. George Mavraganis*

The establishment of the single market, the conclusion of the Treaty on European Union, the Ruding Report and the EC Commission's reaction to that Report will influence the development of the harmonization of corporate tax law of the EC member states. This article examines the implications of these events for corporate tax harmonization.

LIMITATIONS ON BENEFITS UNDER THE NEW US–NETHERLANDS INCOME TAX TREATY

Philip H. Spector

Philip Spector is a US tax partner with the New York office of the international law firm Watson, Farley & Williams. Mr Spector specializes in cross-border transactions and has published numerous articles in US tax and financing journals. He is a graduate of Columbia University (B.A., 1978), the University of Pennsylvania Law School (J.D., 1981) and New York University School of Law (LL.M. in Taxation, 1986).

I. INTRODUCTION

The eagerly anticipated new income tax convention between the United States and the Netherlands (the "Treaty"), together with an accompanying Memorandum of Understanding (the "Memorandum") was signed on 18 December 1992. The signing concludes protracted negotiations that began a decade ago. When it becomes effective, the Treaty will replace the current convention, which was concluded in 1948 and supplemented in 1965.

The Treaty's provisions generally have precedents in the US and OECD model treaties and recent US treaties with developed countries (e.g. the US–Germany treaty concluded in 1989). However, one clear and significant departure from precedent is the Treaty's long and complex limitation on benefits provision. This is the most detailed and probably the most heavily negotiated limitation on benefits article in the history of bilateral tax agreements. The length and detail is due in large part to the United States' interest in preventing "treaty shopping" (third party use of the Treaty), and the Netherlands' competing desire to retain its status as an attractive location for holding companies and finance subsidiaries for international groups. The result of these competing interests is a provision that seeks to define with unprecedented precision who is eligible for Treaty benefits and who is not.

A. *The attraction of the Netherlands*

The Netherlands generally imposes a corporate income tax at rates up to 40 percent, but the "substantial holding privilege" or "participation exemption" can completely exempt from tax dividends received from domestic and foreign corporate affiliates and capital gains from the sale of affiliate stock. Thus, a Netherlands corporation may be completely free from Netherlands tax if its sole activity is to act as a vehicle for receiving and distributing subsidiary earnings and for the acquiring and disposing of subsidiary stock. The Netherlands is also an attractive home for holding companies because the comprehensive Dutch tax treaty network can substantially reduce (often to zero) withholding taxes levied at source on dividends received from subsidiaries and Dutch withholding taxes on dividends paid to the Dutch holding company's parent or shareholders.

Netherlands companies have also been used as finance companies for multinational corporate groups. Such a company borrows from within or outside the group and onlends the funds to affiliates. Under Dutch tax practice, the Dutch company is required to earn a marginal "spread" on its borrowing and lending activities, and this spread is subject to the corporate income tax. However, the Netherlands imposes no withholding taxes on interest payments made by a Dutch company and most tax treaties with the Netherlands substantially reduce (often to zero) any withholding taxes levied by the countries where the funds are used.

The Netherlands has tax treaties with many countries that either do not have an income tax treaty with the United States, or whose treaty with the United States is less favourable than the US–Netherlands treaty. Residents of such countries, and residents of countries that do not have a tax treaty with either the United States or the Netherlands, have utilized Netherlands holding companies and financing companies in order to take advantage of the existing US–Netherlands tax treaty. For example, a large amount of Canadian investment in the United States is structured through Netherlands holding companies in order to reduce the US withholding taxes on interest and dividends from 15 and 10 percent (under the US–Canada

treaty) to zero and five percent (under the US–Netherlands treaty). As another example, foreign persons from countries that do not have a tax treaty with either the United States or the Netherlands have used the so-called "Dutch sandwich" structure to make investments in US real property and other US investments.[1]

Use of a tax treaty by persons not resident of either of the treaty countries, sometimes called "treaty shopping", is not an uncommon practice in structuring international operations and transactions. Typically, the multinational corporation that uses a Netherlands holding or finance company is merely trying to avoid double taxation by reducing its foreign withholding tax burden and avoiding excess foreign tax credits in its home country. At one time, the Internal Revenue Service (IRS) did not consider treaty shopping under the existing US–Netherlands tax treaty (and other US treaties) an abusive practice.[2] However, the IRS' position on treaty shopping has changed.

B. *Responses to treaty shopping*

Since 1981 there has been a concerted effort on the part of the IRS, the Treasury Department and Congress to reduce or eliminate treaty shopping, including treaty shopping using the existing US–Netherlands tax treaty.[3] These efforts have been, in part, unilateral. That is, in US legislation, regulations, official rulings and litigating positions, the US lawmaking and taxing authorities have prescribed conditions that must be met before a treaty can operate to reduce or eliminate a US tax. These conditions have been imposed without prior negotiation with treaty partners.[4] To date, unilateral limitations on treaty benefits have been imposed on a selective rather than broad-based approach, and do not apply, for example, to limit treaty relief from US withholding taxes. However, legislation proposed in 1992, and which is expected to be proposed again in 1993, would unilaterally import limitation on benefits provisions into every US tax treaty, and these treaty limitations would apply with respect to all US taxes.[5]

Certainly a more diplomatic way of imposing limitations on treaty benefits is by bilateral negotiation with treaty partners. The United States began this process in 1981 with the inclusion of a limitation on benefits provision in the 1981 draft US model income tax treaty. Its limitation on benefits provision lay the groundwork for subsequent treaty negotiations, including the negotiations with the Netherlands.[6] The principle underlying these provisions is that, in order for an entity to qualify for treaty benefits, it is not sufficient that the entity be organized under the laws of, or treated as a resident of, the treaty partner country. The entity and/or its owners must establish additional substantial nexus with that country. Under the 1981 US model treaty provision, a treaty country resident other than an individual or a publicly-held company is not entitled to any treaty benefits unless it satisfies a beneficial interests/base erosion test: more than 75 percent of its beneficial interest must be directly or indirectly owned by individual residents of the treaty country, and its income cannot be used in substantial part to meet liabilities to residents of third countries ("base erosion"). Alternatively, benefits are available if the treaty resident establishes the lack of a principal purpose of obtaining treaty benefits.

Since 1981, limitation on benefits provisions have entered into force in treaties with several US treaty partners (either in new treaties or in protocols to existing treaties).[7] These provisions reflect, in various modified forms, the basic thrust of the 1981 US model and include, in most cases, a beneficial interests/base erosion requirement, a publicly-traded exception and a principal purpose exception.

Several post-1980 US treaties also contain limited exceptions to loss of benefits for treaty country residents conducting active business operations in the treaty country.[8] The "active trade or business" principle extends treaty benefits in situations where the entity is owned by non-treaty country residents, but has a sufficient active business nexus with the treaty country to justify the availability of benefits.

The "derivative benefit" concept extends treaty benefits to a treaty country resident if its beneficial owners reside in a third country that also has a tax treaty with the United States that provides similar treaty benefits. The concept of derivative benefits is not present in the 1981 US model but appears in the Jamaica treaty and more predominantly in the treaty with Mexico. The US–Mexico treaty's limitation on benefits article has derivative benefits provisions that are keyed in part to the North America Free Trade Agreement ("NAFTA"). Under these provisions, for example, a Mexican company is eligible for benefits if its stock is owned in a prescribed quantities and combinations by certain residents of the United States, Canada and Mexico.[9]

---

1. The foreign person would establish and own a Netherlands Antilles company which would organize a wholly-owned Netherlands company which would make an investment in the United States (typically through a US subsidiary). This has remained a viable structure despite the substantial termination of the income tax treaty between the United States and the Netherlands Antilles.
2. See e.g. Private Letter Rulings 7723035, 7739080, 7746046 and 7751023.
3. See generally, R. Rhoades & M. Langer, "Limitations on Treaty Shopping", in *Income Taxation of Foreign Related Transactions* (Matthew Bender, 1992), ch. 12A.
4. The branch profits tax is a good example of unilateral treaty limitation by legislation. Sec. 884(e) and (f)(3) of the Internal Revenue Code (the "Code") and the regulations thereunder precondition treaty relief from the branch profits tax and branch-level interest taxes on satisfaction by the treaty partner resident of one of a number of alternative tests, based in large part on the 1981 US model income tax treaty limitation on benefits provisions.
5. See Sec. 302 of H.R. 5270, 102nd Cong., 2d Sess. (1992).
6. See Kramer, "Attempts to Curb Treaty Shopping in US–Dutch Treaty Negotiations", 37 *Bulletin for International Fiscal Documentation* (March 1983), at 107. The United States is not the only country that has negotiated anti-treaty shopping provisions with the Netherlands. For example, both the UK–Netherlands tax treaty (Art. 9(3)(d)) and the Switzerland–Netherlands tax treaty (Art. 9(2)(a)) have provisions of this nature, but they are more limited in scope than either the 1981 US model's or the Treaty's provisions.
7. See, e.g. Jamaica (Art. 17); Australia (Art. 16); New Zealand (Art. 16); Canada (Art. XXIX(6)); Italy (1984 Protocol, Art. 2); Cyprus (Arts. 4 and 26); Barbados (Art. 22); China (1984 Protocol ¶7; 1986 Protocol ¶¶1-4); Bermuda (Art. 4); Belgium (Art. 12A); Indonesia (Art 28); Finland (Art 16); France (Art. 24A); Germany (Art. 28); India (Art. 24); Tunisia (Art. 24); Spain (Art. 17; Protocol ¶13); Mexico (Art. 17).
8. These include the treaties with Barbados, Jamaica, Belgium, Germany and Mexico.
9. See US–Mexico tax treaty (Art. 17(1)(d)(iii) and (g)). These provisions of the treaty take effect only when (and if) NAFTA enters into force. See US–Mexico tax treaty (Protocol, Art. 15(d)).

II. DESCRIPTION OF ARTICLE 26

The new Treaty's limitation on benefits provisions are contained in Article 26, and are elaborated in the Memorandum that accompanies the Treaty. Article 26 incorporates elements of the 1981 US model provisions and limitation on benefits provisions from other treaties in force. Depending on how one attempts to arrange them, Article 26 describes approximately 13 different categories into which a resident of the United States or the Netherlands may fall and thereby become entitled to Treaty benefits. Several of these categories have precedents in prior treaties (the treaties with Germany and Mexico in particular), but in Article 26 the categories are described with greater precision and detail than in any other US treaty.

The volume of alternative categories and the descriptive detail is likely due to the desire of the Netherlands negotiators to provide as many options for third-party benefits as would be acceptable to the United States, and to ensure that these options were described with sufficient clarity to allow third country residents to structure new investments and restructure existing holdings with relative certainty.

In summary, Article 26 describes six broad categories of persons entitled to Treaty benefits, as follows:

• *Qualified person* is a term of art that itself includes eight categories of persons who are eligible for benefits generally as a result of their status as residents of, or ownership by residents of the United States and/or the Netherlands. These include corporations and other entities that satisfy one of several publicly-traded or beneficial interests/base erosion tests. Special rules apply to "conduit companies" that receive and pay out interest and royalties (e.g. finance subsidiaries). Derivative benefits for Netherlands corporations with EC ownership are available in some circumstances.

• The *active trade or business test* affords Treaty benefits to residents of one country that earn income from the other country if the resident carries on an active trade or business in its home country that is related to and substantial in relation to income-producing activity in the other country, or if the income is incidental to the home country business. A formulary non-exclusive safe harbour is available to establish "substantiality". In certain cases, business activities can be attributed to a Netherlands resident from related parties, and certain activities performed in other EC countries by affiliates of a Netherlands resident can be treated as conducted by the Netherlands resident in the Netherlands.

• *Headquarter companies*, i.e. Netherlands or US residents that perform supervisory and administrative functions for a multinational corporate group, and that satisfy various requirements, are entitled to Treaty benefits.

• *Limited Treaty benefits* (relief from US withholding and branch profits taxes) are available to Netherlands companies that satisfy certain stock ownership and base reduction tests.

• *Income from international transportation operations* is eligible for benefits if certain ownership tests are met.

• Finally, Treaty benefits may be granted to a treaty country resident in the *discretion of the competent authority* of the source country if obtaining Treaty benefits was not a principal purpose of the resident's establishment and operations.

Eligibility for benefits is determined on an annual basis, and each of the categories of persons eligible for Treaty benefits is an alternative category. Thus, a person may qualify for Treaty benefits under one category in one year, and then qualify for benefits under a different category in the following year, and so on.

The remainder of this article describes in detail the requirements of the various categories of Treaty entitlement. As with all complex tax provisions, a number of technical questions are unanswered by Article 26 and the Memorandum, and hopefully will be resolved in the Treasury Department's official explanation of the Treaty.

For purposes of consistency and clarity, the discussion below generally assumes that the person seeking Treaty benefits is a resident of the Netherlands that derives income in the United States. However, except as noted otherwise, the limitation on benefits provisions of Article 26 apply equally in the reciprocal case of a US resident seeking Treaty benefits.

A. *Qualified persons*

A person that is a resident[10] of the Netherlands and derives income from the United States is entitled to all the benefits of the Treaty if the person is a "qualified person".[11] As described more fully below, there are eight categories of qualified persons.

1. Individuals

An individual who is a resident of the Netherlands is a qualified person entitled to all the benefits of the Treaty.[12]

2. Governments

The Government of the Netherlands, and any political subdivision or local authority thereof, is a qualified person, entitled to all benefits under the Treaty.[13]

3. Not-for-profit organizations

Generally, a not-for-profit organization that, by virtue of that status, is generally exempt from taxation in its country of residence, is a "qualified person", entitled to all benefits under

10. The term "resident" is defined in the Treaty. Generally, for purposes of the Treaty, and as used in this article, a "resident of the Netherlands" means any person who, under the laws of the Netherlands, is liable to tax in the Netherlands by reason of the person's domicile, residence, place of management or place of incorporation (but not persons liable to tax only on income from Netherlands sources). Partnerships, trusts and estates are treated as Netherlands (or US) residents only to the extent that the income derived by the entity is subject to tax in the Netherlands (or United States) in the hands of the entity or in the hands of the partner or beneficiary. "Tie-breaker" rules apply for individuals who would be treated as residents of both the United States and the Netherlands under the general rules.
11. Treaty Art. 26(1) and 26(8)(g).
12. Treaty Art. 26(1)(a).
13. Treaty Art. 26(1)(b).

© 1993 International Bureau of Fiscal Documentation

the Treaty, provided that more than 50 percent of the beneficiaries, members or participants (if any) in such organization are qualified persons.[14]

However, a pension fund, pension trust or similar entity organized for the purpose of providing retirement, disability or other employee benefits is entitled to Treaty benefits if (1) it is organized under the laws of the United States or the Netherlands, and (2) the organization sponsoring the fund, trust or entity is entitled to Treaty benefits.[15] Thus, for example, a pension plan sponsored by a Netherlands or US corporation that meets the publicly-traded test would qualify for Treaty benefits.

4. Publicly-traded companies

A corporation that is a resident of the Netherlands is a qualified person, entitled to all Treaty benefits, if it satisfies the following test (the "publicly-traded test"): the principal class of its shares is (1) listed on a recognized stock exchange located in either the Netherlands or the United States, and (2) substantially and regularly traded on one or more recognized stock exchanges.

(a) *Principal class of shares*

The "principal class" of a company's shares is the company's common shares if those shares represent the majority of the company's voting power and value. If no single class represents the majority of vote and value, the "principal class" includes each of those classes of shares that in the aggregate represent more than 50 percent of the vote and value.[16] In addition, the "principal class of shares" also includes any class (a so-called "disproportionate class") that entitles the holder to disproportionately higher participation in the earnings generated in the United States as a result of particular assets or activities of the Netherlands company in the United States.[17]

> *Example 1*: NL, a Netherlands corporation, has three classes of stock outstanding: common stock, non-voting preferred stock and a "tracking" stock that entitles the holder to disproportionately higher participation in earnings from the operations of NL's subsidiaries doing business in the United States. The common stock possesses 100 percent of the voting power and 45 percent of the value of NL. The preferred stock represents none of the voting power and 50 percent of the value of NL. The "principal class" of NL's shares includes all three classes. Accordingly, NL will meet the publicly-traded test only if each class is listed on a recognized stock exchange in either the Netherlands or the United States and is substantially and regularly traded on a recognized stock exchange.

(b) *Recognized stock exchange*

A "recognized stock exchange" includes the Amsterdam Stock Exchange, and exchanges registered with the US Securities and Exchange Commission as a national securities exchange.[18] The competent authorities have agreed to include the stock exchanges of Frankfurt, London and Paris, and may agree to include others.[19] The US NASDAQ ("over-the counter") system and the parallel over-the-counter market in Amsterdam are also recognized stock exchanges, except with respect to shares of a "closely-held company", i.e. any company 50 percent or more of whose principal class of shares is owned by persons other than "qualified persons" or "residents of a member state of the European Communities", each of whom beneficially owns, directly or indirectly, alone or together with related persons, more than 50 percent of such shares for more than 30 days during a taxable year.[20]

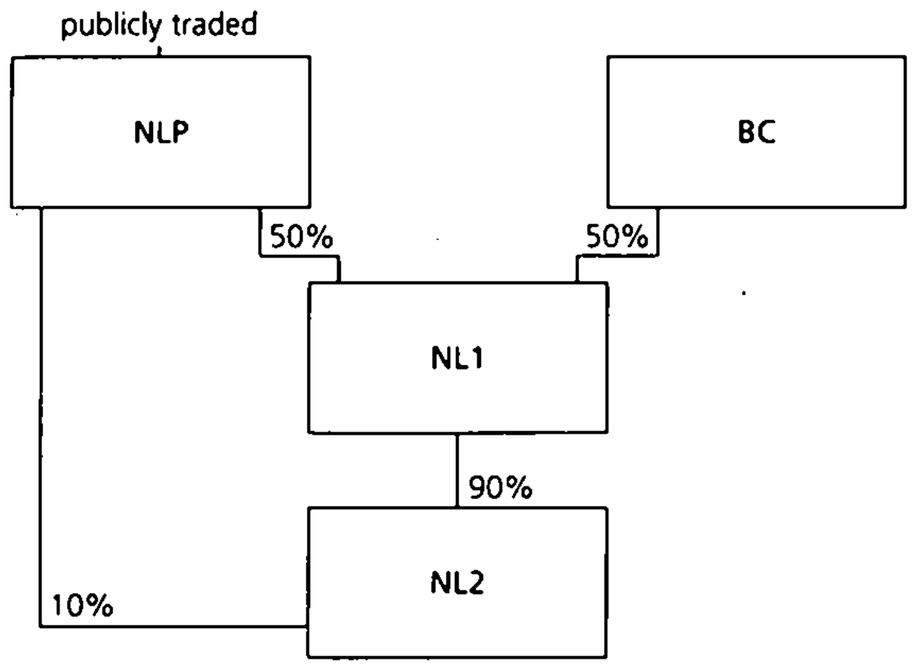
(c) *Substantial and regular trading*

The shares in a class of shares are "substantially and regularly traded" on one or more recognized stock exchanges in a taxable year if (1) more than a de minimis quantity of shares of that class are traded on such recognized stock exchanges during every month, and (2) the aggregate number of shares of that class traded on such exchanges during the previous taxable year is at least six percent of the average number of shares outstanding in that class during that year.[21] Any pattern of trades conducted for the purpose of meeting the "substantial and regular trading" test are disregarded. A person can be required to rebut evidence that it has engaged in such trading.[22]

5. Subsidiaries of publicly-traded companies

A company is a qualified person eligible for all benefits under the Treaty if (1) more than 50 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies ("parents") which are residents of either the United States or the Netherlands, (2) each parent satisfies the "publicly-traded" test, and (3) the company is not a "conduit company".[23]

For purposes of this test, to establish "indirect" ownership through a chain of companies, each company in the chain must itself qualify as a subsidiary of a publicly-traded company.[24]



> *Example 2*: NLP is a Netherlands corporation that meets the publicly-traded test. NL1 is a Netherlands corporation whose stock is owned 50 percent by NLP and 50 percent by BC, a Bermuda corporation. NL2 is a Netherlands corporation ten percent of whose stock is owned by NLP and 90 percent of whose stock is owned by NL1. In determining whether NL2 qualifies for Treaty benefits as a subsidiary of NLP, NLP is not treated as owning any stock of NL2 indirectly through NL1 because NLP does not own more than

14. Treaty Art. 26(1)(e). Not-for-profit organizations include charitable, educational and scientific organizations, and also include pension funds, pension trusts, private foundations, trade unions, trade associations and similar organizations.
15. Treaty Art. 26(8)(j).
16. Treaty Art. 26(8)(a). In determining voting power, authorized but unissued shares are taken into account. The competent authorities may mutually agree upon the impact of restrictions or limitations on voting rights of issued shares. *Id.*
17. Treaty Art. 26(1)(c)(i).
18. These include the New York Stock Exchange and the American Stock Exchange, among others.
19. Treaty Art. 26(8)(d)(iv) and Memorandum Art. XXII.
20. Treaty Art. 26(8)(d) and (e). The competent authorities can agree to disqualify other exchanges as "recognized stock exchanges" with respect to the stock of such companies. The term "resident of a member state of European Communities" is defined in the text at II.A.6.(a).
21. Treaty Art. 26(8)(f).
22. *Id.*; Memorandum Art. XXIV.
23. Treaty Art. 26(1)(c)(ii).
24. Treaty Art. 26(8)(k).

© 1993 International Bureau of Fiscal Documentation

50 percent of NL1's stock. Therefore, NL2 is not a qualified person under the subsidiary test. If NLP owned 51 percent of NL1's stock, then NLP would be treated as owning 51 percent of NL1's 90 percent interest in NL2, or 45.9 percent. Assuming that it is not a "conduit company," NL2 would be a qualified resident because NLP's combined direct and indirect ownership of NL2 would be 55.9 percent.

Example 2

"Conduit companies", and the circumstances under which they may qualify for benefits, are described below at II.A.8.

6. Netherlands/EC controlled company

A corporation that is resident in the Netherlands is a qualified person, entitled to all Treaty benefits, if its stock is owned principally by prescribed combinations of publicly-traded companies that are residents of the United States, the Netherlands and member states of the EC (US corporations are not eligible to qualify as qualified persons under this test.) Specifically, this test is satisfied if (1) the corporation is resident in the Netherlands, (2) the corporation is not a conduit company, (3) at least 30 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer corporations that are residents of the Netherlands, each of which meets the publicly-traded test, and (4) at least 70 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies that are residents of the United States or residents of an EC member state, each of which companies satisfies the publicly-traded test (other than the listing requirement of that test).[25]

For purposes of this test, "indirect" ownership through a chain of companies can be utilized to meet either the 30 percent or the 70 percent part of the test only if each company in the chain itself satisfies ownership requirements of the 30 percent test or the 70 percent test, as the case may be.[26]

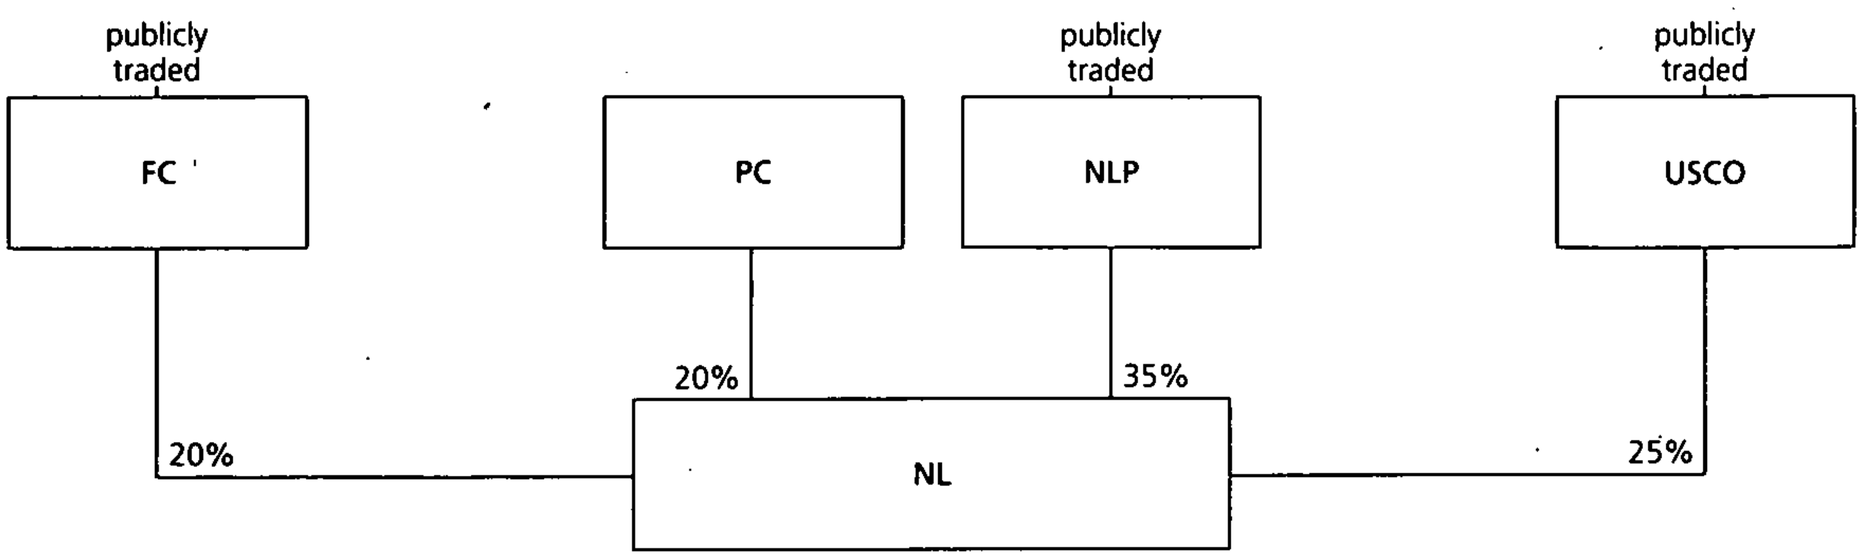
(a) *Resident of an EC member state*

A company (or any other person) qualifies as a resident of an EC member state[27] if (1) the company would be considered a resident of an EC member state under the principles of the definition of "resident" in the Treaty, (2) the company is entitled to the benefits of the particular income tax convention between the company's EC state of residence and the United States, and (3) the company would be a "qualified person" under the provisions described in II.A., applied as though the parties to the Treaty were the United States and the relevant EC member state.[28]

Example 3: NL, a Netherlands corporation, has one class of stock outstanding, which is owned as follows: 20 percent by FC, a French corporation; 20 percent by PC, a corporation that is a resident of Portugal; 35 percent by NLP, a Netherlands corporation; and 25 percent by USCO, a US corporation. Assume that NLP and USCO each meets the publicly-traded test.

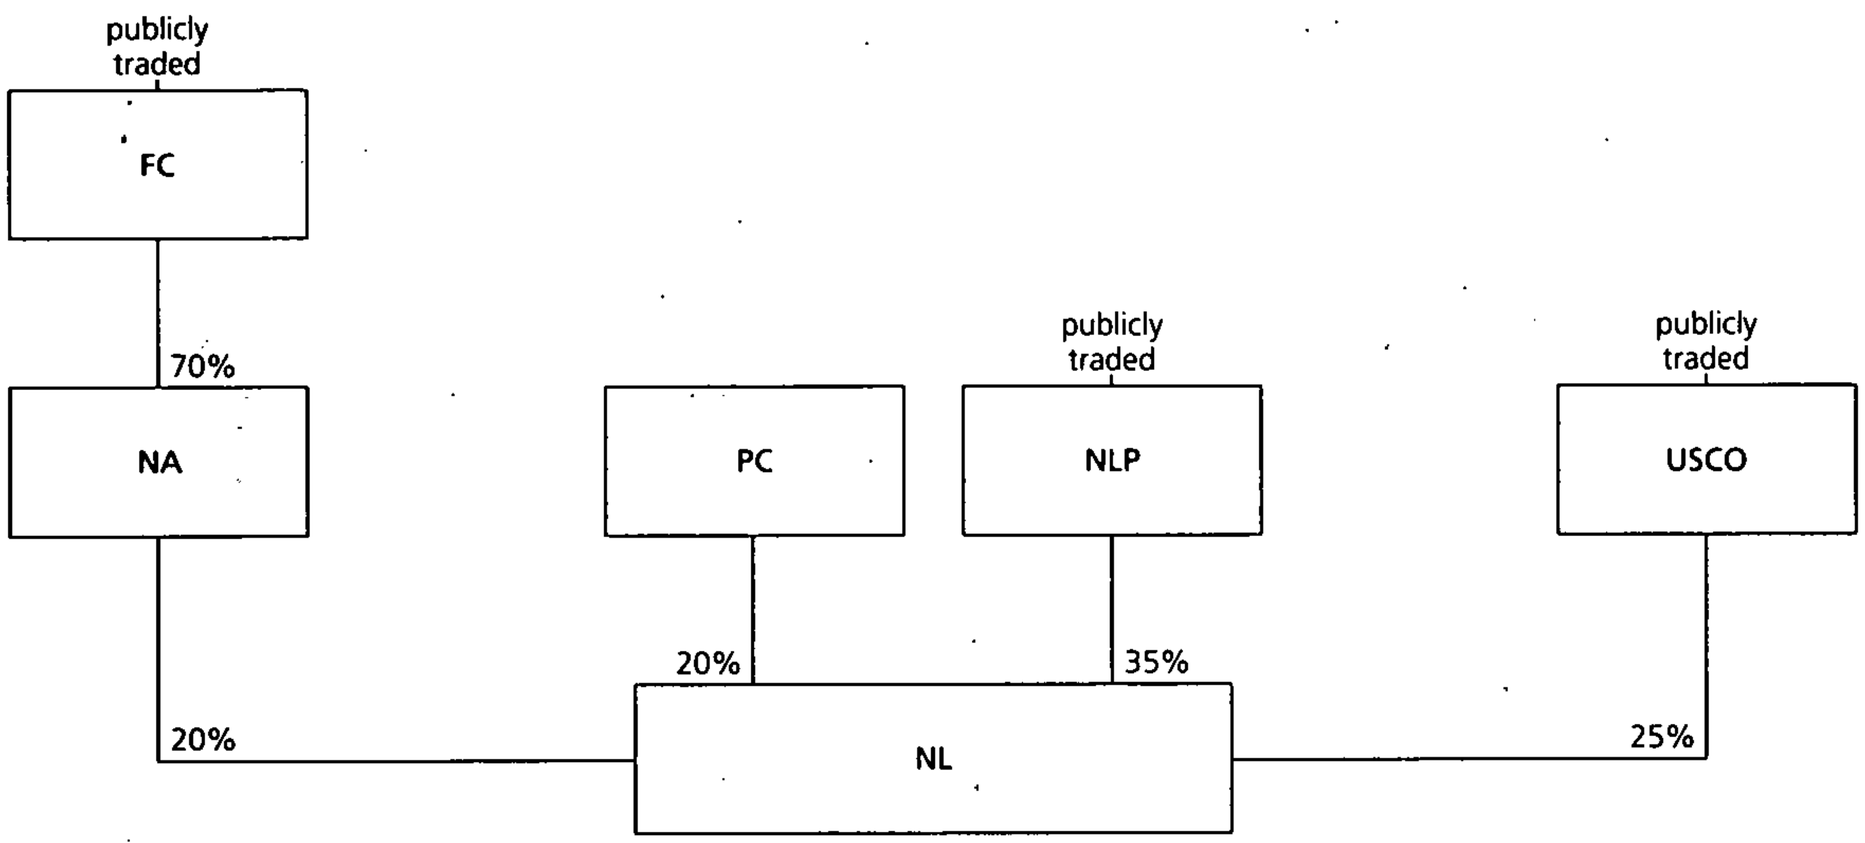
(a) Assume that the principal class of FC's stock is substantially and regularly traded on the Paris stock exchange. FC qualifies as a "resident of an EC member state" for Treaty purposes because (i) FC would be considered a "resident" of France under the Treaty's residence principles, (ii) FC would be a "qualified person" under the principles of the Treaty (applied as though the Treaty were between France and the United States) because FC would meet the publicly-traded test, and (iii) FC is entitled to benefits under the US-France income tax treaty.[29]

(b) In determining whether NL is a qualified person under the 30/70 percent test, the 30 percent test is met because NLP, a Netherlands resident corporation that meets the publicly-traded test, owns directly 35 percent of NL's stock. The 70 percent test is met because 80 percent of NL's stock is owned by residents of EC member states or the United States (NLP, FC and USCO), each of which meets the publicly-traded test. Assuming that NL is not a conduit company, NL is a qualified person. Note that Portugal is not an "EC member state" for purposes of the Treaty because Portugal does not have comprehensive income tax conventions with the United States and the Netherlands. Accordingly, PC's 20 percent interest in NL is not counted for the 70 percent test.



Example 3A: Assume the same facts as in Example 3, except that FC does not own its 20 percent interest in NL directly. Instead, FC owns 70 percent of the stock of NA, a Netherlands Antilles corporation, which in turn owns 20 percent of NL's stock. In this case, the 70 percent test will be met only if FC's 14 percent indirect interest in NL (70 percent of NA's 20 percent interest) can be combined with the 60 percent held by NLP and USCO. Indirect ownership through NA can be taken into account only if NA itself is at least 70 percent owned by a resident of an EC member state. Here, NA is 70 percent owned by FC, which is a resident of an EC member state for Treaty purposes. Accordingly, FC's indirect 14 percent interest may be counted for the 70 percent test. Assuming that NL is not a conduit, NL is a qualified person entitled to Treaty benefits because the 30/70 percent test is met.

Note that, in Example 3A, in determining whether FC's indirect ownership through NA may be taken into account for



25. Treaty Art. 26(1)(c)(iii).
26. Treaty Art. 26(8)(k).
27. For purposes of the Convention, "EC member states" include the Netherlands and the other member states of the EC with which both the United States and the Netherlands have in effect a comprehensive income tax convention. These other EC member states are Belgium, Denmark, France, Germany, Greece, Ireland, Italy, Luxembourg, Spain and the United Kingdom. Portugal is a member state of the EC but is not an "EC member state" for Treaty purposes because it does not have tax treaties with the United States and the Netherlands.
28. In the remainder of this article, references to a person that qualifies as a resident of an EC member state denote a person that satisfies these three requirements.
29. FC would qualify for benefits under the US–France tax treaty because it would satisfy the publicly traded test in that treaty's limitation on benefits provisions. See US–France tax treaty (Art. 24A(3)).

© 1993 International Bureau of Fiscal Documentation

Example 3

Example 3A

purposes of the 70 percent test, the determinative factor is whether the intermediary (NA) itself meets the 70 percent ownership requirement. The intermediary's country of residence is not controlling, nor is the fact that the intermediary does not satisfy the 30 percent test.[30] Thus, for example, the result in Example 3A is not changed if the other 30 percent of NA's stock is owned by non-EC, non-US persons.

7. Beneficial interests/base reduction test

A person is a "qualified person" eligible for all benefits under the Treaty if (1) more than 50 percent of the beneficial interests in the person is owned, directly or indirectly, by qualified persons, and (2) the person meets the "base reduction test" described below. For corporations, the beneficial interest part of the test is met if more than 50 percent of the aggregate vote and value of all shares, and more than 50 percent of the shares of any disproportionate class, is owned directly or indirectly by qualified persons.[31]

This two-part ownership and base erosion test has precedents in other US treaties, although the EC element in the base reduction test is new.

(a) *Base reduction test*

The base reduction test is designed to prevent a person from qualifying for Treaty benefits (under this category of "qualified person") when a substantial part of its earnings are paid out in satisfaction of obligations to non-treaty country residents, who would thereby indirectly enjoy the benefits of the Treaty.[32] Thus, even if qualified persons own more than 50 percent of the beneficial interest in a Netherlands company, the company will fail to come within this category of "qualified person" if a substantial portion of its earnings are devoted to certain payments (such as interest expense on indebtedness) to non-qualified persons.

Specifically, a Netherlands resident will satisfy the base reduction test if either:[33]

30. Conversely, in determining whether indirect ownership through an intermediary may be taken into account for purposes of the 30% test, the intermediary's country of residence, and whether the intermediary satisfied the 70% test, would not be determinative. See Treaty Art. 26(8)(k).
31. Treaty Art. 26(1)(d).
32. For example, a third-country resident could lend funds to a Netherlands-owned Netherlands corporation to be reloaned to the United States. The US-source interest income ordinarily would be exempt from US withholding tax under Article 12 (Interest) of the Treaty. Interest payments made by the Netherlands corporation to the third-country resident would not be subject to any Netherlands withholding tax under Netherlands law. Thus, the US Treaty benefit will have flowed to the third-country resident. In addition, the interest payment made by the Netherlands corporation could be deductible and offset the Netherlands corporate income tax on the Netherlands corporation's interest income (thereby "reducing" or "eroding" the Netherlands corporate tax base).
33. Treaty Art. 26(5)(a). A Netherlands resident can satisfy the test by meeting the requirements of clause (1) or (2). A US resident can satisfy the test only by meeting the requirements of clause (1).

© 1993 International Bureau of Fiscal Documentation

(1) during the current year, the amount of "deductible payments" made, directly or indirectly, to non-qualified persons is less than 50 percent of the greater of (i) the company's gross income for the preceding year, or (ii) the average gross income for the four preceding years;[34] or

(2) both (i) the amount of "deductible payments" made to non-qualified persons is less than 70 percent of such gross income, and (ii) the amount of deductible payments made to persons that are neither qualified persons nor residents of EC member states is less than 30 percent of such gross income. Thus, both prongs of this second alternative test can be satisfied even if as much as 30 percent of a Netherlands company's gross income is used to make deductible payments to qualified persons, and as much as 40 percent is used to make such payments to non-qualified persons that are residents of EC member states.

"Deductible payments" include interest and royalties, but not rent paid for the use of tangible property in the ordinary course of business or payments for services performed in the payor's country of residence.[35] Payments are treated as deductible payments whether or not they generate a deduction or other tax benefit for the payor.

Note that the base reduction test compares the current year's deductible payments to the gross income from the prior year or years. Thus, a company should be able to calculate, in advance, the amount of deductible payments to "bad" recipients it will be able to make during the current year and still satisfy the base reduction test.

8. Conduit companies

"Conduit companies" are not eligible to be qualified persons as either a subsidiary of a publicly-traded company (see II.A.5) or a Netherlands/EC controlled company (see II.A.6). However, as described below, such a company may be entitled to Treaty benefits if it does not pay out substantial amounts of interest or royalties to related parties located in tax havens.

Generally, a company is a "conduit company" if its aggregate "deductible payments" (e.g. interest and royalties) paid by it for the year are 90 percent or more than the aggregate deductible payments it receives during the year.[36]

The "conduit company" concept was probably intended to cover Netherlands financing intermediaries the bulk of whose income and expense is interest or royalties.[37] However, many operating companies may find that they fall within the definition of "conduit". The test does not compare a company's total income and expense with its interest and royalty income and expense. Rather, the test compares interest and royalty income with interest and royalty expense, however small these items may be in relation to the company's overall income and expense. So long as the company pays out an amount of interest and royalties that is 90 percent or more than the amount of interest and royalties it receives, the company is a conduit. Thus, technically, a company with $ 1,000 of interest income and $ 1,000 of interest expense for the year (and no other deductible payments made or received) is a conduit, even if it has $ 1 million of operating income for the year. Such a company may qualify for Treaty benefits as a "qualified conduit" (see discussion below), or may qualify for benefits under other provisions of Article 26.[38]

Almost every bank would be treated as a conduit under the Treaty because most of a bank's income and expense consists of interest. The Treaty addresses this issue with a special exception for active banks and insurance companies. A bank or insurance company is not a conduit if it (i) is engaged in the active conduct of a banking or insurance business, and (ii) is managed and controlled by one or more "associated enterprises" that are qualified persons.[39] For this purpose, a bank will be considered to be engaged in the active conduct of a banking business if it regularly accepts deposits from the public, or makes loans to the public. An insurance company will be considered to be engaged in the active conduct of an insurance business only if its gross income consists primarily of insurance or reinsurance premiums, and investment income attributable to such premiums.[40]

(a) *Qualifying conduit companies*

A "conduit company" that meets the stock ownership and residence tests applicable to a subsidiary of a publicly-traded company (described at II.A.5) or the Netherlands/EC controlled company (described at II.A.6) can be a qualified person if it satisfies a special base reduction test.[41]

The conduit company first must satisfy one of the stock ownership tests described above at II.A.5 and II.A.6. This requirement is met if either (i) more than 50 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies ("parents") which are residents of either the United States or the Netherlands, and each parent satisfies the publicly-traded test, or (ii) at least 30 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer corporations that are residents of the Netherlands, each of which meets the publicly-traded test, and at least 70 percent of the aggregate vote and value of all of its shares is owned, directly or indirectly, by five or fewer companies that are residents of the United States or an EC member state, each of which companies satisfies the publicly-traded test (other than the listing requirement of the publicly-traded test).

34. Treaty Art. 26(5)(b).
35. Treaty Art. 26(5)(c). The competent authorities can agree to add or delete other types of payments from the scope of deductible payments.
36. Treaty Art. 26(8)(m).
37. See discussion of the Netherlands as a base for financing companies in the text at I.A.
38. In addition, an operating company that inadvertently falls into the "conduit" definition may be eligible for Treaty relief granted in the discretion of the competent authority. See II.F.
39. Treaty Art. 26(8)(m). "Associated enterprises" are generally defined as two entities where one participates in the management, control or capital of the other, or entities in which the same persons participate in the management, control or capital. Treaty Art. 9 generally allows for the reallocation of income and deductions among associated enterprises of the United States and the Netherlands respecting transactions between them that are not conducted at arm's length. For the purposes of the bank/insurance company exception to the "conduit" definition, the controlling entity can be resident of either the United States or the Netherlands, so long as it is a qualified person.
40. Memorandum Art. XIII.
41. Treaty Art. 26(1)(c)(iv).

© 1993 International Bureau of Fiscal Documentation

The special conduit base reduction test is similar to the base reduction test described above at II.A.7.(a), except that the test is liberalized in that only deductible payments (i.e. interest and royalties) that are made to related parties and that are subject to a low rate of tax on the payments received are treated as "bad" deductible payments. The current year's "bad" deductible payments are compared with the gross income for the prior year (or years).[42]

Specifically, a conduit company that is a resident of the Netherlands will satisfy this test if either:[43]

(1) an amount equal to less than 50 percent of the conduit's gross income is used, directly or indirectly, to make deductible payments in the current year to related persons[44] that are not qualified persons and that are subject to an aggregate rate of tax on the payments (a "low effective tax rate") that is less than 50 percent of the rate that would be applicable had the payment been received in the conduit's country of residence and subject to the normal taxing regime in that country; or

(2) (i) an amount equal to less than 70 percent of the conduit's gross income is used, directly or indirectly, to make deductible payments in the current year to related persons that are not qualified persons and that are subject to a low effective rate on the payments received, and (ii) an amount equal to less than 30 percent of the conduit's gross income is used, directly or indirectly, to make deductible payments in the current year to related persons that are neither qualified persons nor residents of an EC member state, and that are subject to a low effective tax rate on the payments received.

Example 4: NL is a company resident in the Netherlands all of whose stock is owned by USCO, a US corporation. USCO is a multinational corporation with worldwide operations. USCO's principal class of shares is substantially and regularly traded on the New York Stock Exchange. NL's principal activity is borrowing money and relending money to its corporate affiliates. In the current year, NL makes payments of interest to its lenders in an amount that equals 90 percent of its interest income for the year. Hence, NL is a conduit for the year. NL's gross income for the current year and for each of the preceding four years is $ 1,000 and its deductible payments (interest expense) for the current year are $ 900. Assume that all of NL's interest expense is paid to unrelated lenders. In this case, NL satisfies the conduit base reduction test because none of its deductible payments are made to related persons. NL also satisfies the stock ownership test for qualified conduits because more than 50 percent of its stock is owned by a US corporation that meets the publicly-traded test.

Example 5: The facts are the same as in the previous example except that $ 500 of NL's $ 900 of interest expense is paid to NA, a resident of the Netherlands Antilles and a wholly-owned subsidiary of USCO. NA is subject to a low effective tax rate on the interest payments received from NL. In this case, NL fails the base reduction test because $ 500, the amount of interest expense paid to NA, a related person subject to a low effective rate of tax, is 50 percent or more than NL's gross income for the preceding taxable year ($ 1000), and NA is not a qualified person and is not a resident of an EC member state.

(c) *The "triangular" problem*

The "triangular" problem refers to a situation that does not involve conduit companies *per se*, but does involve a combination of tax base reduction and the tax havens. A typical case is one where a Netherlands corporation receives an interest or royalty payment from US sources, but the income is attributable to a branch or other permanent establishment maintained by the Netherlands corporation in a tax haven (e.g. the Netherlands Antilles). Under current Netherlands law, the interest or royalty payment is not subject to Netherlands tax because it is attributable to an offshore branch.

Article 24(4) of the Treaty provides that, unless the Netherlands law is amended to provide anti-abuse provisions for such situations by the time the US Senate Foreign Relations Committee hearings on the Treaty begin, the competent authorities will address the issue in a future protocol to the Treaty. It appears as though the United States is not willing to give up its source-based withholding tax in this situation unless the interest or royalties are taxed in the Netherlands.

B. *Active trade or business test*

The "qualified person" categories described above focus on objective characteristics of a person (e.g. ownership, residence, "conduit" status) to determine availability of Treaty benefits. The "active trade or business" test focuses on the location of a person's active business activities and the connection between those activities and the income for which Treaty benefits are sought.

A person that is a resident of the Netherlands[45] is entitled to Treaty benefits with respect to income derived from the United States (whether investment income or active business income) if:

(1) the Netherlands resident is engaged in the active conduct of a trade or business in the Netherlands; and

(2) either (i) the income from the United States is derived in connection with the Netherlands trade or business, and that business is substantial in relation to the income-producing activity in the United States, or (ii) the income from the United States is incidental to the trade or business carried on in the Netherlands.[46]

The business of making or managing investments is not considered an active trade or business unless these activities are banking or insurance activities carried on by a bank or insurance company.[47]

The Treaty provides rules and safe harbours for determining when US income is derived "in connection with" an active Netherlands business, when an active Netherlands business is "substantial" in relation to the US income-producing activity, and when the US income is "incidental" to an active Netherlands business. Under several of these rules and safe har-

42. "Gross income" is the greater of (1) the gross income for the preceding taxable year or (2) the average of the gross incomes for the four preceding taxable years.
43. Treaty Art. 26(5)(d).
44. The term "related persons" as used herein has the same meaning as "associated enterprises". See *supra* note 39.
45. This discussion focuses on the active trade or business test in the context of a Netherlands resident, but the test applies equally to US residents that derive income from the Netherlands.
46. Treaty Art. 26(2)(a).
47. *Id.*

© 1993 International Bureau of Fiscal Documentation

bours, the active business need not be conducted by the Netherlands resident itself; the Treaty permits attribution of active Netherlands business operations of certain affiliates and related parties to the Netherlands resident. In addition, a Netherlands resident may, under certain circumstances, elect to treat business activities conducted in other EC states as though it was conducted by the resident in the Netherlands.

1. Income derived in connection with a trade or business

US income is derived "in connection with" a Netherlands trade or business of a Netherlands resident if the income-producing activity in the United States is a line of business that forms a part of or is complementary to the Netherlands business.[48] If this requirement is satisfied, the active trade or business test is met if the Netherlands business is "substantial" in relation to the US activities.

2. Business "substantial" in relation to income-producing activity

(a) *Substantiality: general rule*

Whether the Netherlands business is "substantial" in relation to the connected US income-producing activity generally is determined by reference to the Netherlands resident's ownership interest in the US income-producing activity, and the quantity and quality of the Netherlands business relative to US activities. The nature of the activities performed and the relative contributions made to the business in both countries are considered.[49]

(b) *Substantiality: non-exclusive safe harbour*

The Treaty provides a non-exclusive safe harbour for the "substantiality" test.[50] If the requirements of the safe harbour are met, the Netherlands business will be deemed substantial in relation to the connected US activities. The requirements focus on the relative contributions of the Netherlands business and the US activities to the common line (or related lines) of business. In particular, the safe harbour involves three ratios:

(i) the ratio of the value of assets used or held for use in the trade or business in the Netherlands to the ratio of assets used or held for use in the business in the United States (the "asset factor");
(ii) the ratio of gross income from the business derived in the Netherlands to the gross income from the business derived in the United States (the "income factor"); and
(iii) the ratio of the payroll expense of the business for services performed in the Netherlands to the payroll expense of the business for services performed in the United States (the "payroll factor").[51]

The substantiality safe harbour is met for a particular year if, for the preceding taxable year, the average of the three factors exceeds ten percent, and each of the three factors exceeds 7.5 percent (or, for any factor that does not exceed 7.5 percent for the preceding year, the average for that factor for the three preceding years exceeds 7.5 percent).

As discussed more fully below, Netherlands residents may also elect to apply a modified version of the safe harbour, under which assets and activities relating to the business conducted in other EC member states by the Netherlands resident or certain related parties or affiliates can be combined with the Netherlands assets and activities (see II.B.5).

3. Income "incidental" to Netherlands business

As an alternative to the "substantiality" test, the active trade or business test can also be met if the US income is "incidental" to the Netherlands business. Income derived from the United States is "incidental" to a business conducted in the Netherlands if the production of the income facilitates the Netherlands business. For example, the investment of the Netherlands business' cash working capital in US stocks and securities facilitates the Netherlands business and the US-source dividend and interest income from those investments would be considered "incidental" to the Netherlands business.[52]

4. Attribution of business assets and activities

For purposes of the "substantiality" and "incidental" tests, the relevant business activity conducted in the Netherlands may be conducted directly by the Netherlands resident seeking Treaty benefits with respect to its US income. Alternatively, the business activity can be carried on in the Netherlands by another person, and that business can be attributed to the Netherlands resident. The Treaty specifies seven situations (described below) in which business activities of another person are attributed to the Netherlands resident. If a specified relationship exists and Netherlands business activity is attributed to the Netherlands resident from another person, (i) the Netherlands resident is deemed to be engaged in the business activity attributed to it, and (ii) the Netherlands resident is deemed to possess a proportionate share of the other person's assets, income and payroll expense for purposes of applying the "substantiality" and "incidental" tests, including the substantiality safe harbour.[53]

(a) *Attribution from a partnership*

A Netherlands resident that is a partner in a partnership is treated as being engaged in the active trade or business conducted by the partnership in the Netherlands, and the Netherlands resident partner is treated as having a proportionate share of the partnership's assets, income and payroll expense for purposes of the active trade or business tests (including the safe harbour).[54] For example, if a Netherlands resident owns a 20 percent interest in a partnership that conducts business in the Netherlands, the Netherlands resident would be treated as engaged in that business, and, for purposes of the

48. Treaty Art. 26(2)(b).
49. Treaty Art. 26(2)(c).
50. *Id.*
51. Treaty Art. 26(2)(c)(i), (ii) and (iii).
52. Treaty Art. 26(2)(d). The "incidental" test is similar in concept to the "asset use" test in Treas. Reg. §1.864-4 for determining whether interest and dividends is effectively connected to a US trade or business.
53. Memorandum Arts. XII and XV.
54. Treaty Art. 26(2)(e)(ii).

© 1993 International Bureau of Fiscal Documentation

safe harbour, the partner would be treated as owning 20 percent of the partnership's assets, income and payroll expense relating to the Netherlands business.

Example 6: NL, a corporation resident in the Netherlands, is a publishing company. NL licenses copyrighted literary works to and receives royalties from US persons. NL is not a "qualified person". NL is not actively engaged in the publishing business in the Netherlands, but owns a ten percent interest in a partnership ("Partnership") that is so engaged. The Partnership licenses literary works throughout Europe, including the Netherlands. Many of the same works licensed by the Partnership are also licensed by NL in the United States. For the previous taxable year, the asset values, gross income and payroll expenses of NL's US activities and of the Partnership's activities in the Netherlands were as follows:

	NL (US)	*Partnership (Netherlands)*
Assets	240	250
Income	40	50
Payroll	48	50

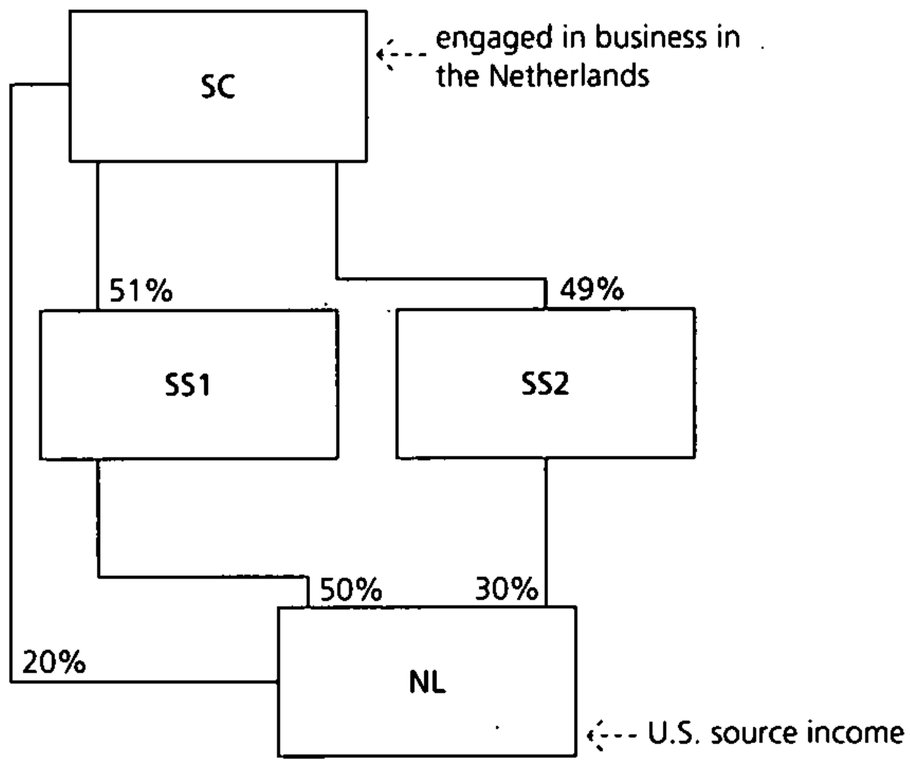
Under the partnership attribution rule, ten percent of the Partnership's assets, income and payroll are attributed to NL. Accordingly, the values of NL's US activities and attributed Netherlands activities, and the ratios of the Netherlands factors to the US factors, are as follows:

	US	*Netherlands*	*Netherlands as a % of US*
Assets	240	25	10.4% (asset factor)
Income	40	5	12.5% (income factor)
Payroll	48	5	10.4% (payroll factor)

Because each of these percentages exceeds 7.5 percent, and because the average of the three ratios exceeds ten percent, the "substantiality" safe harbour is met and NL is entitled to Treaty benefits with respect to its US-source royalty income.[55]

(b) *Attribution from a controlling shareholder*

Assets and activities of a business conducted in the Netherlands are attributed to a Netherlands resident from any single person that holds a "controlling beneficial interest" in the Netherlands resident.[56]



(i) *Controlling beneficial interest*

The concept of "controlling beneficial interest" is used throughout the active business attribution rules. A person holds a "controlling beneficial interest" in another person if it holds directly or indirectly a beneficial interest that represents more than 50 percent of the value and voting power in the other person.[57] This definition is subject to two limitations.

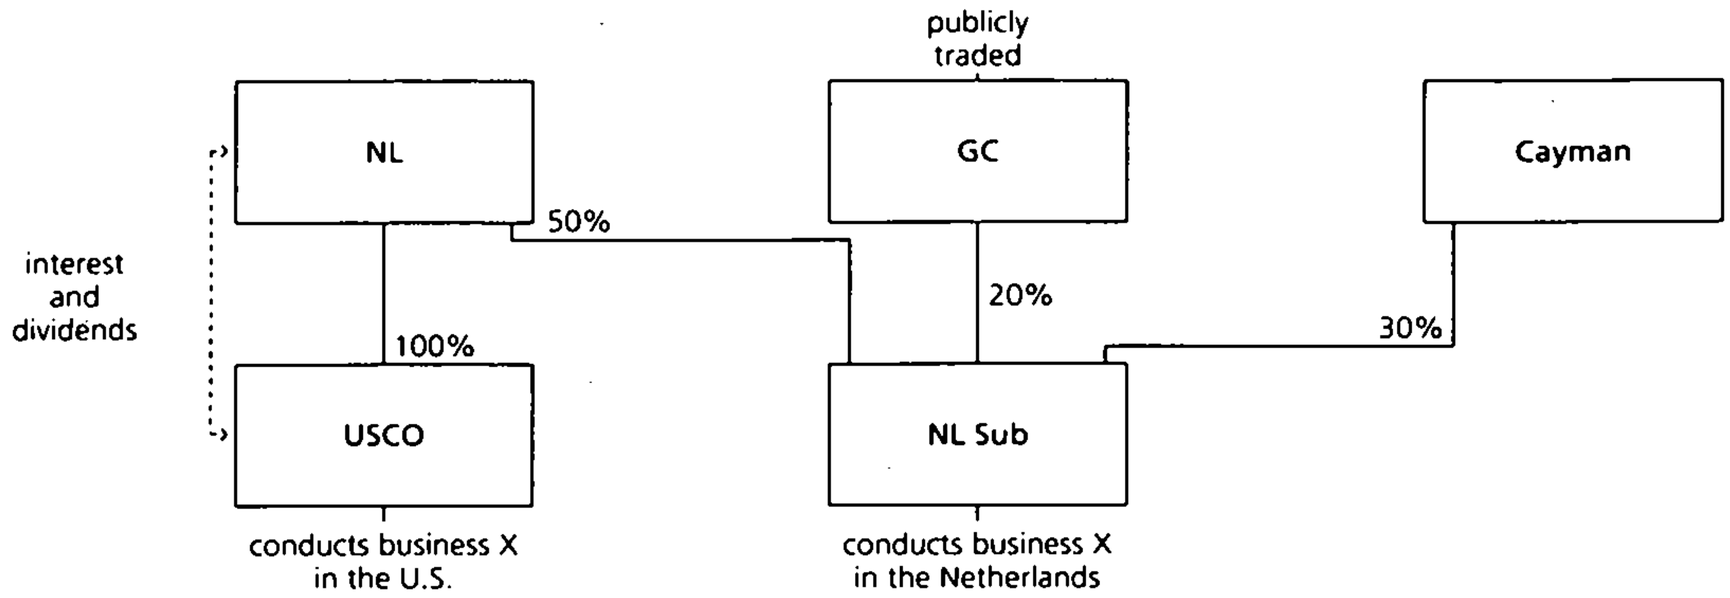
First, indirect ownership is taken into account only through intermediaries in which the controlling person (or other intermediary in the chain) owns more than 50 percent of the value and voting power.[58]

Example 7: NL is a Netherlands resident corporation that derives US-source income from business X. NL is not engaged in business X in the Netherlands. NL's stock is owned 20 percent by SC, a Sweden corporation. NL's remaining stock is owned 50 percent by SS1, a Sweden company whose stock is owned 51 percent by SC, and 30 percent by SS2, a Sweden company 49 percent of whose stock is owned by SC. SC is engaged in business X in the Netherlands. However, SC's Netherlands business activities cannot be attributed to NL because SC does not own a controlling beneficial interest in NL. SC owns, directly and indirectly, only 45.5 percent of NL's stock. SC owns 20 percent of NL directly and owns 25.5 percent indirectly through SS1 (SC owns 51 percent of SS1's 50 percent interest in NL). However, SC is not considered to indirectly own any of SS2's 30 percent interest in NL because SC does not own more than 50 percent of SS2's stock.

Example 7

Second, in determining whether a group of persons together own a controlling beneficial interest in an entity (which is relevant for the remainder of the attribution rules discussed below), a person cannot be a member of the "group" unless the person owns directly at least ten percent of the value and voting power in the entity.[59]

(c) *Attribution from a group of shareholders*



Netherlands business activities are attributed to a Netherlands resident from a group of five or fewer persons (1) that together own a controlling beneficial interest in the Netherlands resident, and (2) each of which is engaged in activity in the Netherlands that is a component part of or directly related to the business in the Netherlands.[60]

Example 8: NL is a Netherlands corporation whose stock is owned by ten shareholders, each of which is a corporation that conducts, in the Netherlands, a component part of a common business activity. One of the shareholders, XCo, owns 45 percent of NL's stock and each of the other nine shareholders owns five percent. None of the Netherlands business activities are attributed to NL because none of the minority shareholders directly owns ten percent of NL

55. It is worth noting, in the context of Example 6, that an active Netherlands business can also prevent the imposition of US withholding tax on royalties *paid by* a Netherlands resident in a "cascading royalties" scenario. For example, assume that NL in Example 6 has licensed its rights from and pays a royalty to X, a resident of the Bahamas. Under US tax principles, that royalty would be treated as US-source income subject to US withholding tax. See Rev. Rul. 80-362, 1980-2 C.B. 208. Art. 13(5)(d) of the Treaty would prevent the imposition of the US withholding tax provided that the use of the copyright by NL in the United States is a component part of or directly related to the active Netherlands business.
56. Treaty Art. 26(2)(e)(iii).
57. Treaty Art. 26(2)(f).
58. Treaty Art. 26(2)(f)(i).
59. Treaty Art. 26(2)(f)(ii).
60. Treaty Art. 26(2)(e)(iv).

© 1993 International Bureau of Fiscal Documentation

Example 9

and hence cannot be combined with XCo's 45 percent to form a controlling group.

(d) *Attribution from consolidated tax group members*

Netherlands business activities are attributed to a Netherlands resident from any member of a group of companies that form or could form a consolidated group for tax purposes under Netherlands tax law (as applied without regard to the residence of such companies), provided that at least one member of the group is engaged in the active conduct of business in the Netherlands.[61]

(e) *Attribution from subsidiaries and other controlled entities*

Netherlands business activities may be attributed to a Netherlands resident from entities (corporate or non-corporate) in which the resident owns a controlling beneficial interest. The Netherlands resident may own such interest itself. Alternatively, the controlling beneficial interest can be established if the Netherlands resident is one of a group of five or fewer persons that together own a controlling beneficial interest in the entity that has the Netherlands business. To be counted as a group member, each person owning an interest must (i) be either a qualified person, a resident of an EC member state or a resident of an "identified state"; and (ii) own directly at least ten percent of the voting power and value of the entity that has the Netherlands business.[62]

An "identified state" is any country, identified by the competent authorities, that has an exchange of information agreement in effect with the country of residence of the person whose eligibility for Treaty benefits is being tested (the Netherlands in our example).[63]

Example 9: NL, a corporation resident in the Netherlands, owns 100 percent of the stock of USCO, a US corporation, and 50 percent of the stock of NL Sub, a corporation resident in the Netherlands. GC, a German corporation, owns 20 percent of NL Sub's stock. The remaining 30 percent of NL Sub is owned by a Cayman Islands corporation. NL and GC do not directly conduct an active trade or business. However, USCO and NL Sub are engaged in the same active trade or business. USCO conducts that business in the United States and NL Sub conducts the business in the Netherlands. NL receives payments of interest and dividends from USCO. Assume that GC qualifies as a resident of an EC member state for Treaty purposes. Also, assume that NL is not a qualified person.

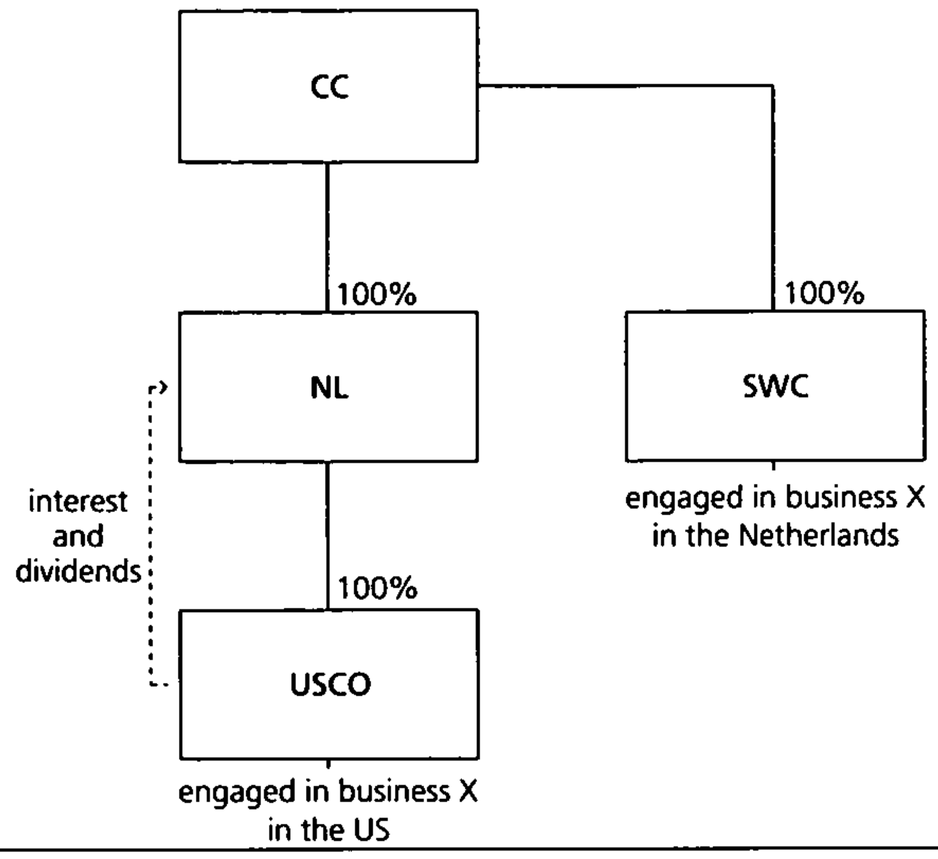
(a) NL is deemed to be engaged in the Netherlands business activities conducted by NL Sub because NL and GC as a group have a controlling beneficial interest in NL Sub, and GC is a resident of an EC member state. In addition, for purposes of applying the substantiality safe harbour, NL is deemed to own 50 percent of NL Sub's assets, income and payroll expense. (Note that the percentage of NL Sub's business items that are attributed to NL is 50 percent, the amount of NL Sub's stock owned directly or indirectly by NL. Although GC's 20 percent interest is counted in determining whether a qualified group owns a controlling beneficial interest in NL Sub, GC's 20 percent stock interest does not increase the attribution percentage to 70 percent because NL does not own that 20 percent stock interest directly or indirectly.)

(b) Assume that for each of the four most recently concluded taxable years, the asset values, gross income and payroll expenses of USCO and NL Sub attributable to the business are as set forth below. Also shown below is NL's proportionate share (50 percent) of the Netherlands assets, income and payroll attributed to NL from NL Sub, and the asset factor, income factor and payroll factor for purposes of the substantiality safe harbour:

	1 *USCO (US)*	2 *NL Sub (Neth)*	3 *Attribution from NL Sub to NL (50%)*	4 *Neth as a % of US (3÷1)*
Assets	$300	48	24	8.0% (asset factor)
Income	50	12	6	12.0% (income factor)
Payroll	60	12	6	10.0% (payroll factor)

Although each of the three factors exceeds 7.5 percent, the average of the three factors does not exceed ten percent. Therefore, the substantiality safe harbour is not satisfied.

(f) *Attribution from entities under common control*



Finally, Netherlands business activities may be attributed to a Netherlands resident from an entity that, together with the Netherlands resident, is under the "common control" of a person (or a group of five or fewer persons), provided that (i) the controlling persons (or each member of the controlling group) is either a qualified person, a resident of an EC state or a resident of an identified state, and (ii) each member of the group owns directly at least ten percent of the voting power

61. Treaty Art. 26(2)(e)(v). The Treaty is not clear as to how many of the group members must be engaged in Netherlands business activities, but it is the author's understanding that only one member must be so engaged.
62. Treaty Art. 26(2)(e)(vi).
63. Treaty Art. 26(2)(e). Memorandum Art. XVI lists all of the "identified states" with respect to the United States and the Netherlands.

© 1993 International Bureau of Fiscal Documentation

and value of the entity that has the Netherlands business.[64] A person (or group) is treated as having "common control" of two persons if it holds a controlling beneficial interest in each person.[65]

Example 10

Example 10: CC, a Canadian corporation, owns 100 percent of the stock of NL, a Netherlands corporation, and 100 percent of the stock of SWC, a Swiss corporation. NL owns 100 percent of the stock of USCO, a US corporation. NL is not engaged in an active trade or business. SWC and USCO are actively engaged in the same line of business, and SWC is actively engaged in such business in the Netherlands. NL receives dividends and interest from USCO. NL is not a qualified person. However, SWC's active Netherlands business is attributed to NL for purposes of the active trade or business test because SWC and NL are under common control of CC, CC is a resident of an identified state (because Canada has an information exchange agreement in effect with the Netherlands). For purposes of the incidental and substantiality tests (including the substantiality safe harbour), NL is treated as owning 100 percent of SWC's Netherlands business assets (and income and payroll). Note that the country of residence of the commonly controlled entity (here, SWC) is not of relevance: this entity could be resident anywhere in the world so long as it and the Netherlands resident (here, NL) are under common control of the appropriate person or group. Note also that NL's proportionate share of Netherlands business attributed from SWC is 100 percent, even though NL does not directly own any stock of SWC. NL is treated as owning the proportionate share that is equal to the controlling person's (or group's) direct and indirect ownership of the controlled entity whose Netherlands business is being attributed.

5. Election to treat related EC business activity as Netherlands business activity

The Treaty provides a special annual election for purposes of the active trade or business test. If a Netherlands resident is eligible to make and makes the election, then, for purposes of the "incidental" and "substantiality" tests, activities conducted in other EC member states that are a component part of or directly related to the Netherlands business are treated as conducted in the Netherlands by the Netherlands resident.[66] This election (referred to here as the "EC business election") applies to activities conducted in the EC directly by the Netherlands resident in other EC countries, as well as activities that are conducted by other persons which are attributed to the Netherlands resident under the attribution of business activities principles discussed above at II.B.4.[67]

To be eligible to make the EC business election, a threshold three-factor test applies to ensure that the Netherlands business activities are substantial in relation to the other EC activities. The test is satisfied if, for the preceding taxable year, each of the following ratios exceeds 15 percent: (i) the ratio of the value of assets used or held for use in the active conduct of business in the Netherlands to the value of assets (or the proportionate share of the value) so used or held within EC member states (including the Netherlands), (ii) the ratio of gross income derived from the Netherlands business to the gross income (or the proportionate share of the income) derived from the business in EC member states (including the Netherlands); and (iii) the ratio of payroll expense for services performed in the Netherlands to payroll expense (or proportionate share thereof) for services performed in all EC member states (including the Netherlands).[68]

If this test is met, the Netherlands resident is eligible to make the EC business election. If the election is made, the "incidental" and "substantiality" tests are applied by treating all (or the proportionate share) of the EC business assets and activities that are conducted by or attributed to the Netherlands resident as though they were conducted by the resident in the Netherlands.

If the EC business election is made, the regular substantiality safe harbour, described above at II.B.2.(b), does not apply, and a different safe harbour test applies (the "election safe harbour"). The election safe harbour also focuses on the ratios of the assets, gross income and payroll expense of the Netherlands business to those of the related US income-producing activities. However, the election safe harbour increases the amount of Netherlands assets, income and payroll required to come within the safe harbour because, under the election, all of the actual and attributed EC assets, income and payroll are treated as Netherlands items. Specifically, if the EC business election is made, the substantiality safe harbour is met for a particular year if, for the preceding taxable year:

(1) the average of the asset factor, income factor and payroll factor exceeds 60 percent; and
(2) each of the three factors exceeds 50 percent (or, for any factor that does not meet the 50 percent test for the preceding year, the average for that factor for the three preceding years exceeds 50 percent).[69]

64. Treaty Art. 26(2)(e)(vii).
65. Treaty Art. 26(2)(g).
66. Treaty Art. 26(2)(h).
67. Memorandum Art. XVII. EC business activities can be attributed to a Netherlands resident from any person which, if it conducted business activity in the Netherlands, would have its proportionate share of such activity attributed to the Netherlands resident under the business attribution rules.
68. Although the text of the Treaty is somewhat vague on these points, it is the author's understanding that the 15% tests are applied to the results for the year preceding the taxable year in question, and that each of the ratios are calculated by including the Netherlands income, assets or payroll in the denominator of the ratio fraction.
69. Treaty Art. 26(2)(c) and (h).

Example 11

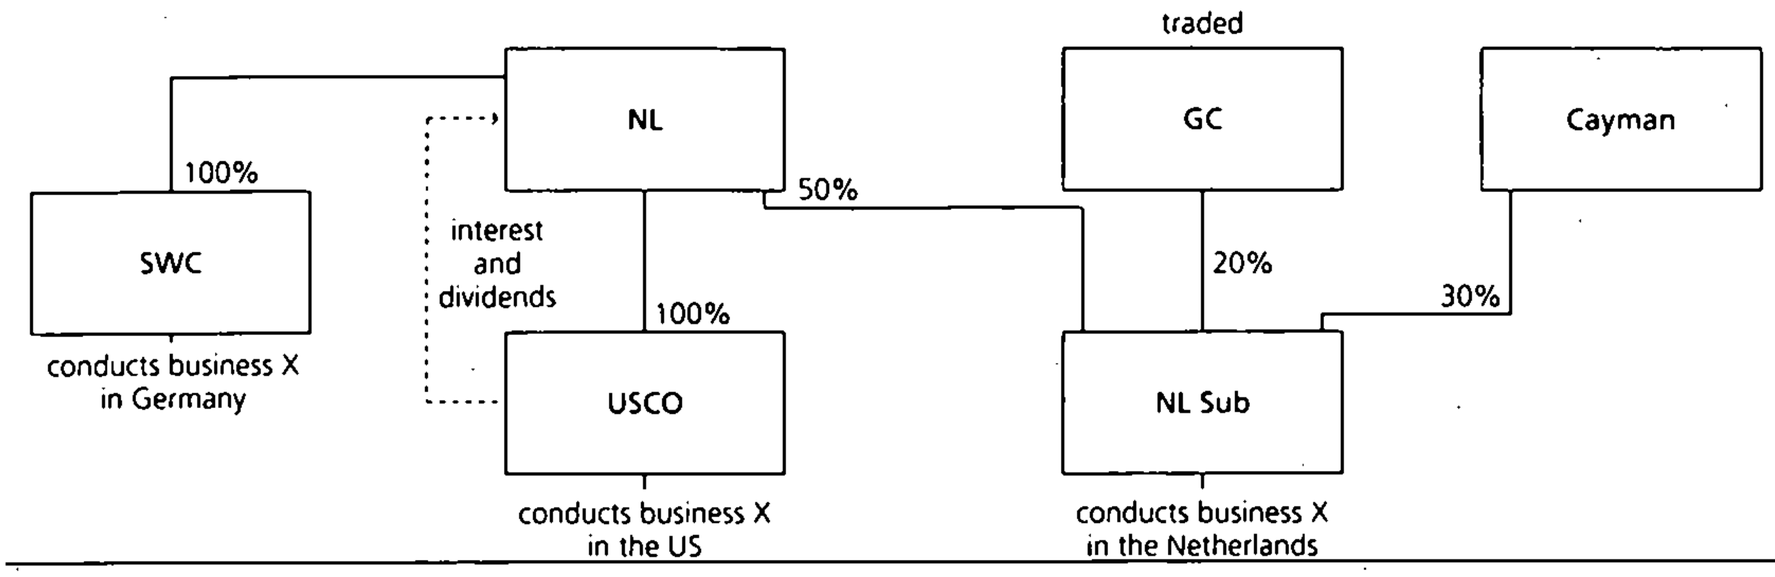

Chart I

	1	2	3	4	5	6	7	8
	USCO (US)	*NL Sub (Neth)*	*NL's share (50%) of NL Sub (Neth)*	*SWC (EC)*	*NL's share (100%) of SWC (EC)*	*Combined Neth and EC (3+5)*	*Neth as a % of Combined (3+6)*	*Combined as a % of USCO (6÷1)*
Assets	$300	48	24	131	131	155	18.3%	51.6%
Income	50	12	6	30	30	36	16.6%	72.0%
Payroll	60	12	6	30	30	36	16.6%	60.0%

Columns (1) and (2) of the chart show the asset value, income and payroll expense of USCO's US business activities and NL Sub's Netherlands activities, respectively. Column (3) shows NL's 50% proportionate share of NL Sub's assets, income and payroll. Column (4) shows the assets, income and payroll of SWC attributable to its EC business that is component part of or related to NL Sub's Netherlands business. Column (5) shows NL's 100% proportionate share of SWC items. Column (6) shows the aggregate of NL's proportionate share of income, assets and payroll of NL Sub (in the Netherlands) and SWC (in the EC). Column (7) applies the 15% test. The 15% test is satisfied because each of the ratios of NL's share of Netherlands activities to NL's share of EC activities exceeds 15%. Column (8) applies the election safe harbour (assuming that NL makes the EC business election). It shows the ratio of the combined Netherlands and EC assets, income and payroll to the assets, income and payroll of the US income-producing activity. The election safe harbour is met because each ratio exceeds 50% and because the average of the three ratios exceeds 60%.

Example 11: Assume the same facts as in Example 9, except that, in addition, NL owns 100 percent of the stock of SWC, a Swiss corporation that is actively engaged in Germany in the same line of business in which USCO and NL Sub are engaged. Assume that the Germany business activity is a component part of or directly related to the business conducted by NL Sub in the Netherlands. NL will be able to make the EC business election if the 15 percent ratio test is met. If the election is available and is made, 100 percent of SWC's Germany business activities are attributed to NL and are treated as though they were conducted by NL in the Netherlands. Attribution of SWC's activity to NL is permitted because, if SWC conducted its activities in the Netherlands, attribution would be permissible under the principles for attributing business activities from subsidiaries to parent entities described above at II.B.4.(e): NL owns a controlling beneficial interest in SWC. NL's proportionate share of SWC's activities is 100 percent because NL owns directly or indirectly 100 percent of SWC's stock.

Chart I illustrates that the election is available because the 15 percent test is satisfied, and that if the election is made, the modified substantiality safe harbour will be satisfied.

C. *Headquarter companies*

A person that is a resident of one of the Netherlands is entitled to all the benefits of the Treaty if that person functions as a headquarter company for a multinational corporate group. A Netherlands resident is considered a headquarter company for this purpose only if:[70]

(1) it provides a substantial portion of the overall supervision and administration of the group, which may include, but cannot be principally, group financing;

(2) the corporate group consists of corporations resident in, and engaged in an active business in, at least five countries, and the business activities carried on in each of the five countries (or five groupings of countries) generate at least ten percent of the gross income of the group;

(3) the business activities carried on in any one country other than the Netherlands generate less than 50 percent of the gross income of the group;

(4) no more than 25 percent of the Netherlands resident's gross income is derived from the United States;

(5) it has, and exercises, independent discretionary authority to carry out the headquarter functions referred to in (1) above;

(6) it is subject to the income taxation rules in the Netherlands that apply generally to Netherlands resident corporations (rather than some special, subsidized taxing regime); and

70. Treaty Art. 26(3).

© 1993 International Bureau of Fiscal Documentation

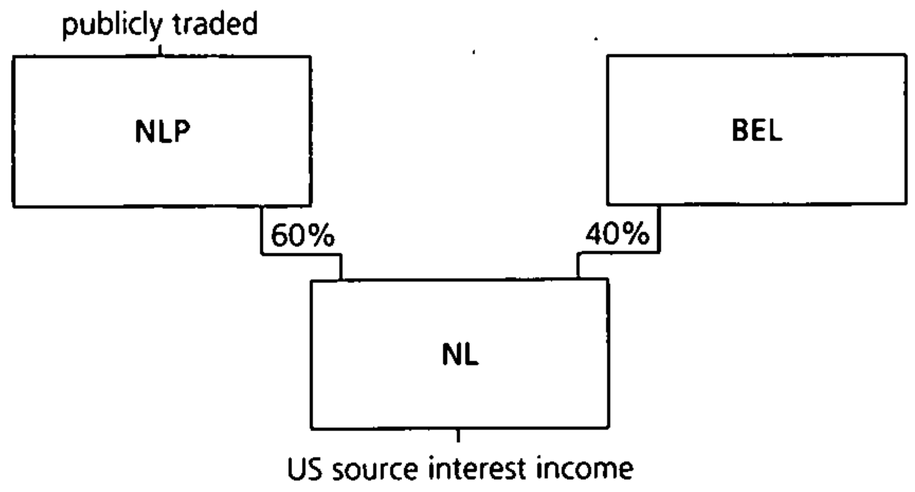
(7) the income it derives in the United States either is derived in connection with, or is incidental to, the group's active business referred to in (2) above.

If the gross income requirements of clauses (2), (3) or (4) above are not satisfied for the current year, they will be deemed to be fulfilled if the required ratios are met when averaging the gross income for the preceding four years.

A person is considered to be engaged in "supervision and administration" activities only if it engages in a number of the following types of activities: group financing (although this cannot be its principal function), pricing, marketing, internal auditing, internal communications and management. A headquarter company will be considered to provide a "substantial" portion of overall supervision and administration for the group if it performs these functions for the entire group or for a subgroup within the multinational (e.g. a geographical or product line subgroup), and the capital employed and control exercised in connection with these functions is substantial when compared with similar functions performed for the group (or the same subgroup) by other related companies.[71]

D. *Limited benefits for Netherlands companies*

A corporation resident in the Netherlands that is not a qualified person, and cannot satisfy the active business test is entitled to limited Treaty benefits if it (1) satisfies a stock ownership test (described below), and (2) satisfies the base reduction test described above at II.A.7.(a). Such a company is entitled only to the benefits under Articles 10 (Dividends), 11 (Branch Tax), 12 (Interest) and 13 (Royalties).[72]



The stock ownership test is met if:

(1) more than 30 percent of the aggregate vote and value of its shares, and more than 30 percent of any disproportionate class of shares, is owned, directly or indirectly, by qualified persons that are resident in the Netherlands; and
(2) more than 70 percent of the aggregate vote and value of its shares is owned, directly or indirectly, by qualified persons and/or residents of EC member states.

Shares owned by a resident of an EC member state are taken into account for purposes of the second part of the test only if the particular dividend, income subject to the branch tax, interest or royalty payment for which Treaty benefits are claimed would be subject to a rate of tax under the tax treaty between the United States and that EC member state that is at least as favourable as the tax rate applicable to the Netherlands company under the Treaty.

Example 12: NL, a Netherlands corporation is owned 60 percent by NLP, a Netherlands corporation that meets the publicly-traded test, and 40 percent by BEL, a Belgium corporation that qualifies as a resident of an EC member state for Treaty purposes. NL receives interest from US sources that will be subject to 30 percent US withholding tax absent treaty relief. NL satisfies the first part of the stock ownership test because 65 percent (which is more than 30 percent) of NL's stock is owned by NLP, a Netherlands resident that is a qualified person. NL does not satisfy the 70 percent because BEL's interest cannot be combined with NLP's to satisfy the test for purposes of establishing Treaty benefits for interest payments. BEL's interest cannot be taken into account because, although Belgium is an EC member state, the income tax treaty between the United States and Belgium allows the United States to impose its withholding tax on interest payments at the rate of 15 percent. Because the US–Belgium treaty's provision on interest does not provide a tax rate for interest as favourable as the Treaty's zero rate, shares of NL owned by BEL are not taken into account for purposes of the more than 70 percent test.

Example 12

E. *Income from operation of ships or aircraft in international traffic*

The Treaty provides generally that profits derived from the operation of ships or aircraft in international traffic ("international transportation income") may be taxed only by the country of residence of the person that earns the profits.[73] If a person that has international transportation income fails to qualify as a qualified person, and cannot satisfy the active business test, the person nevertheless will be entitled to Treaty benefits with respect to that income if either of the following requirements is met:[74]

(1) more than 50 percent of the beneficial interest in the person (in the case of a company, more than 50 percent of the value of the company's stock) is owned, directly or indirectly, by either or a combination of qualified persons or individuals who are residents of any third state; or
(2) in the case of a company, the company's stock is primarily or regularly traded on an established securities market in a third state.

In addition, if satisfaction of either test depends upon ownership by individual residents of a third state, or stock trading in a third state, the third state must grant an exemption under similar terms for international transportation profits to citizens and corporations of the country from which the income is derived, either under its domestic law, or in a common agreement with that country (e.g. a diplomatic exchange of notes), or under a tax treaty between the third state and that country.

Example 13: NL, a Netherlands resident corporation, is engaged in the international operation of ships, and derives income from US sources attributable to these operations. NL is not a qualified person and does not satisfy the active trade or business test. NL's stock is not traded on any stock exchange. NL's stock is indirectly owned by five individuals each of which is resident in a different country, but each of which exempts US corporations from tax on

71. Memorandum Art. XVIII.

73. Treaty Art. 8 (Shipping and Air Transport).
74. Treaty Art. 26(6).

© 1993 International Bureau of Fiscal Documentation

international transportation income (either under the country's domestic law, or under a treaty or other agreement between the county and the United States). In this case, NL is eligible for Treaty benefits with respect to its international transportation income that would otherwise be subject to US tax.

This provision of the Treaty is based in part on the "reciprocal exemption" provisions of the US tax law with respect to international transportation income.[75] Under these provisions, income derived by a foreign corporation from the international operation of ships or aircraft is exempt from US income tax if the country of incorporation grants an equivalent exemption to US corporations and certain other requirements are met.[76] The exemption is available if the corporation's stock is owned more than 50 percent (determined by value) by individuals who are residents of the same foreign country or another foreign country that grants a reciprocal exemption, or if the corporation's stock is primarily and regularly traded on an established securities market in the corporation's country of incorporation, in another foreign country that grants a reciprocal exemption, or in the United States.[77]

F. *Benefits granted in the discretion of the competent authority*

If a person does not qualify for Treaty benefits under one of the numerous rules previously described, the person can request the competent authority of the country in which the income arises to determine that Treaty benefits are available. In making such a determination, the competent authority is required to consider "as its guideline" whether obtaining Treaty benefits is or was one of the principal purposes for the establishment, acquisition or maintenance of the person or for the conduct of its business. The competent authority of the country in which the income arises is required to consult with the competent authority of the other country before denying Treaty benefits under this provision.[78]

1. Factors to be considered

In the case of a Netherlands corporation that has income from US sources, the competent authority of the United States may consider the following factors (among others) in determining whether obtaining Treaty benefits was one of the principal purposes for the maintenance or operations of the corporation:[79]

(1) the date of incorporation of the corporation in relation to the date the Treaty entered into force;
(2) the continuity of the historical business and ownership of the corporation;
(3) the business reasons for the corporation residing in the Netherlands;
(4) the extent to which the corporation is claiming special tax benefits in the Netherlands;
(5) the extent to which the corporation's business activity in the United States is dependent on the capital, assets or personnel of the corporation in the Netherlands; and
(6) the extent to which the corporation would be entitled to US treaty benefits comparable to those afforded by the Treaty if it had been incorporated in the country of residence of the majority of its shareholders.

2. Changes in circumstances

In addition, the Memorandum states that one of the common situations in which a competent authority determination will be requested is the case where a company that formerly qualified for benefits undergoes change in circumstances that technically disqualifies the company.[80] Such changed circumstances may include a change in the state of residence of a major shareholder of a company, a sale of a part of the stock of a Netherlands company to a person resident in another EC member state or an expansion of a company's activities in other member states of the EC. The competent authority may determine that a change in circumstances need not result in a denial of benefits.

In considering whether to continue a company's entitlement to benefits after such a change, the competent authority is encouraged to consider the legal requirements for facilitation of the free flow of capital and persons within the EC, and the differing internal income tax systems, tax incentive regimes and tax treaty policies among the EC member states. In addition, a change in circumstance that is not attributable to tax avoidance motives will weigh in favour of continued entitlement to Treaty benefits.

3. Post-acquisition reorganization

The Memorandum describes another circumstance in which discretionary entitlement to benefits should be granted. This is the case where a group of companies is acquired and a reorganization is needed in order to entitle one or more of the acquired companies for Treaty benefits.

> *Example 14*: NLP, a Netherlands corporation, purchases all of the stock of LUX, a Luxembourg corporation from an unrelated third party. NL Sub is a wholly-owned subsidiary of LUX. Assume that NLP meets the publicly-traded test. Although all of NL Sub's stock is indirectly owned by NLP after the acquisition, NL Sub cannot qualify for Treaty benefits under the subsidiary test (see II.A.5 above) because, for purposes of this test, indirect ownership is taken into account only if the intermediary is a resident of either the United States or the Netherlands, and LUX is not a resident of either. Assume also that NL Sub derives income from US sources and is not entitled to Treaty benefits under any other provision of Article 26.
>
> The Memorandum provides that, in the context of Example 14, if NL Sub submits a reorganization plan to the US competent authority, and if the plan would cause NL Sub's to be entitled to Treaty benefits, then the US competent authority should treat NL Sub as entitled to Treaty benefits for a transition period of reasonable duration between the time of the acquisition and the completion of the reorganization.[81] The liquidation of LUX would be one example of a reorganization that would cause NL Sub to qualify for Treaty benefits, because NL Sub would then satisfy the subsidiary

75. Sec. 883 of the Code.
76. Similar rules apply to non-resident individuals. See Sec. 872(b) of the Code.
77. See Sec. 883(c) of the Code. The Treaty provision is more restrictive than the Code's reciprocal exemption. For example, the exemption is also available under the Code if the foreign corporation is a "controlled foreign corporation" or a subsidiary of a publicly-traded company.
78. Treaty Art. 26(7).
79. Memorandum Art. XIX.
80. Memorandum Art. XXI.
81. Memorandum Art. XXV.

© 1993 International Bureau of Fiscal Documentation

test. Other reorganizations could involve transfers of the NL Sub stock to another Netherlands or US corporation in the NLP group that in turn is owned directly by NLP.

4. Companies trading in stocks and securities

The Treaty provides that certain companies engaged in stock and securities trading activities shall automatically be entitled to Treaty benefits if a request is made under the competent authority provision. In the case of a company resident in the Netherlands, it would automatically qualify if the company:

(1) holds stocks and securities the income from which is not predominantly from sources within the United States;
(2) has widely dispersed ownership; and
(3) employs in the Netherlands a substantial staff actively engaged in trades of stocks and securities owned by the company.[82]

G. *Proof of eligibility for benefits*

The Memorandum provides standards for requiring taxpayers to prove their status as "qualified persons", or otherwise prove their eligibility for Treaty benefits.[83] A taxpayer must be able to provide, upon request, "sufficient proof" to establish the taxpayer's entitlement to Treaty benefits. However, the Memorandum acknowledges that a broad and ongoing requirement to provide proof of entitlement would impose a severe administrative burden on the taxpayer. Accordingly, the competent authorities agree to develop by mutual agreement reasonable procedures for the periodic reporting of the facts necessary to support entitlement to benefits.[84] The competent authorities agree to strive to minimize the frequency of reporting. For example, once an entitlement to benefits has been documented, the taxpayer should thereafter only be required to report any relevant changes in the facts.

H. *Entry into force*

The treaty will not be effective until the US Senate and its counterpart in the Netherlands formally ratify the Treaty. Assuming that the Treaty is ratified in 1993, then, subject to a transition rule, the Treaty will be effective for taxable years beginning, and payments made after, 1 January 1994.[85]

However, if a person is entitled to greater benefits under the existing US–Netherlands treaty than under the Treaty, the person may elect to have the existing treaty (in its entirety) apply in lieu of the Treaty for a one-year period.[86] Assuming that the Treaty is ratified in 1993, then, for persons electing this one-year transition rule, the Treaty would be effective for tax years beginning after and payments made after 1 January 1995.

III. CONCLUSION

The Treaty limitation of benefits provisions are an historic culmination of 12 years of debate and action on treaty shopping. It sets two important precedents. First, it indicates that the United States may be willing to negotiate comprehensive tax treaties with countries it considers to be tax havens, provided that potential abuses are restricted, such as through the "conduit company" concept. Second, the Treaty allows derivative benefits keyed to the EC. It will be interesting to see whether the other EC member states will now seek protocols to incorporate this concept into their US treaties, and whether the United States will incorporate it into its new model treaty and/or in new and renegotiated bilateral treaties.

The new Treaty will have a major impact on residents of third countries who have utilized the existing US–Netherlands treaty in structuring their current US investments or in establishing a holding company or finance company for a corporate group. These parties will have to assess whether they will be eligible for benefits under the Treaty, and if not, they will need to consider whether and how to restructure their operations to minimize the US withholding and other taxes that would be imposed under the terms of the Treaty. A multinational corporation now using a Dutch holding company that would not qualify for benefits under the Treaty may seek to replace it with a holding company organized in another country that would be eligible for benefits under a US tax treaty. For example, the use of a Luxembourg holding company may be a viable alternative.

Another alternative, perhaps less attractive for restructuring than for new business, is a joint venture with other EC residents as participants. The derivative benefits for companies owned in part by EC residents may provide an additional justification for using a Netherlands holding company or finance company in the context of joint ventures among and between non-European firms and European firms.

TREATY SHOPPING UNDER THE NEW US–NETHERLANDS TREATY[1]

Philip T. Kaplan
Partner Weil, Gotshal & Manges, New York

I. INTRODUCTION

Almost by definition, treaty shopping is almost as old as tax treaties. The mere existence of an official mechanism to reduce taxes in international transactions is an invitation to its use by persons other than its intended beneficiaries. Governments tend to dislike the practice when it is their revenues which suffer, but to this observer the objection is one of dollars and cents, francs and centimes or marks and pfennigs, not one of principle. The tolerance level rises visibly when it is the other fellow's revenues which suffer – especially if this increases home-country revenues by cutting back on the need to give credit relief for foreign taxes paid by domestic taxpayers.

In some countries, the official reaction to treaty-shopping has gone beyond mere acceptance. Tax treaties have become national assets to be made available for a fee to third parties. This has been true of a number of smaller jurisdictions which inherited tax treaties from their days as colonies. In the second half of this century tax treaties have been an important source of revenue to the Netherlands Antilles and to the British Virgin Islands. However, most of their business by now has been eliminated by the cancellation of their most profitable treaties.

Earlier, Switzerland had earned itself a reputation as a purveyor of tax treaty benefits, but its role as such was reduced by the adoption, under pressure from its treaty partners, of the 1962 Swiss measures against abuse of tax conventions.[2] The Netherlands has had a longer run. Netherlands companies are available to all comers as vehicles for inward investment to the many countries with which the Netherlands maintains tax treaties – the usual application being a holding company or a company which makes inward loans or technology transfers. In such cases, Netherlands treaties serve to reduce source-country withholding taxes on dividends, royalties and interest.

About 11 years ago, US Treasury spokespersons began making public statements to the effect that the United States would not sign any further treaties not containing provisions designed to restrain treaty shopping. That led to the last article by this author on the subject of treaty shopping which appeared in 1982.[3] Since 1982, the use of such measures has become regular US practice. Anti-treaty-shopping provisions regularly are incorporated in US treaties[4] and the practice has spread to other countries. Even internal US law now contains such provisions which unilaterally "override" bilateral treaties not containing sufficient built-in safeguards.[5]

The Netherlands authorities made no secret of their lack of enthusiasm for a new treaty with the United States containing a "limitation on benefits" provision. An article co-authored by the person regarded as the principal US architect of the new Netherlands–US treaty states:

> [The] congressional willingness to deny treaty benefits, by legislative fiat, to persons who were 'abusing' treaties turned desultory and fitful talks with the Dutch into real negotiations.[6]

The new Netherlands–US tax treaty carries anti-treaty-shopping provisions to new heights. It contains some 23 pages of text under the heading "limitation on benefits"[7] intended to limit sharply the use of the Netherlands as a base country for investment into the United States.[8] The authors quoted above, despite their involvement in drafting the treaty, refer to those pages as full of "turgid, mind-numbing prose"[9] and, in fairness, any practicing lawyer soon learns that hard negotiations

IV. The Strange Case of the Stacked Qualified Persons Companies
V. Conclusion

1. This paper seeks to organize the complicated treaty provisions in a relatively simple manner. In so doing, it omits mention of a number of details which can be important in a particular case. Reference to the treaty itself is essential.
2. Publication No. 19 of the International Bureau of Fiscal Documentation (IBFD: Amsterdam, 1963). Despite these rules, Switzerland continues to play a role in the international treaty-shopping scene. The 1962 rules do not cover every transaction. Even where the transaction is covered, the price exacted by the 1962 rules may be worth paying to secure the treaty benefits.
3. Kaplan, "The Shoppable Treaty: Should it Become Extinct", *Tax Management International Journal* (June 1982).
4. An early example was Art. 16 of the UK–US treaty (1980). A more recent example is Art. 28 of the Germany–US treaty (1990). This despite the fact that neither the United Kingdom nor Germany had been an attractive country for treaty shoppers.
5. See, e.g., IRC 1986, Sec. 884(c)(2) limiting the US branch profits tax on "qualified residents" of countries having tax treaties with the United States.
6. Morrison and Bennett, "The New US–Netherlands Treaty: Part I – Limitation on Benefits and Related Issues", *Tax Notes International* (8 February 1993).
7. Treaty Art. 26.
8. In terms, the treaty also operates to inhibit the use of the United States as a base country for investment into the Netherlands, but that is not its main thrust.

Chart I: The Ten Categories of Treaty Qualification for a Netherlands Company

Tests Categories	Permitted Ownership	Public Ownership	Conduit Company	Base Reduction	Active Business
1. Listed & Traded Company[1]		• Listing on a recognized U.S. or NL exchange • Regular trading on a recognized exchange [NOTE A]			
2. NL/US Indirectly Traded Company[2]	More than 50% directly or indirectly owned by 5 or fewer companies resident in the US & NL	As to shares of SH companies: • Listing on a recognized US or NL exchange • Regular trading on a recognized exchange [NOTE A]	The company must not be a conduit company [NOTE B]		
3. NL/EC/US Indirectly Traded Company[3]	• 30% directly or indirectly owned by 5 or fewer NL companies, *and* • 70% directly or indirectly owned by 5 or fewer EC companies or US companies [NOTE C]	As to shares of 30% owners: • Listing on US or NL exchange As to both groups: • Regular trading on recognized exchange [NOTE A]	The company must not be a conduit company [NOTE B]		
4. Indirectly Traded Conduit Company[4]	Company must satisfy the permitted ownership test either of the NL/US or of the NL/EC/US Indirectly Traded Company category	The shareholder companies must satisfy the relevant public ownership test	This exception assumes that the company *is* a conduit company [NOTE B]	Base reduction payments to low taxed, non- qualified, associated persons limited to: • 70% of total income to EC residents • 30% of total income to others [NOTE D]	
5. Qualified Person Company[5]	Company must be more than 50% directly or indirectly owned by qualified persons [NOTE E]			Base reduction payments to non-qualified persons, whether or not associated persons limited to: • 70% of total income to EC residents • 30% of total income to others [NOTE D]	
6. Qualified Person Charity[6]	The company is a not-for-profit company and a majority of its members, beneficiaries, etc. are qualified persons [NOTE E]				
7. Active Business Company[7]					• The company is engaged in a substantial active business, other than an investment business, in the NL and the US • Income is derived from that business or is incidental to it
8. Headquarters Company[8]					The company must provide a substantial portion of the overall supervision and administration of a multinational group doing business in at least 5 countries and must be taxed as an active business company in the NL
9. Limited Treaty Use Company[9] (covering only withholding taxes on dividends, interest, royalties and branch operations)	• The company must be more than 30% directly or indirectly owned by qualified persons resident in the NL, and • More than 70% directly or indirectly owned by qualified persons and persons resident in the EC whose treaty rate of tax is as low as that claimed under this treaty [NOTE E]			Base reduction payments to non-qualified persons, whether or not associated persons limited to: • 70% of total income to EC residents • 30% of total income to others [NOTE D]	
10. Shipping & Air Transportation Company[10]	The company must be more than 50% directly or indirectly owned by qualified persons and persons resident in a third country which grants a similar exemption	Alternatively, the company's stock is primarily and actively traded on an established securities market in a third country which grants a similar exemption

NOTES AND FOOTNOTES FOR CHART I

A. "Recognized" stock exchanges are exchanges registered with the SEC as national security exchanges, the Amsterdam Stock Exchange, the NASDAQ System except as to closely-held companies and other exchanges to be added to the list by the two countries.[11] They have announced that the stock exchanges of Frankfurt, London and Paris will be added to the list.[12]

B. A conduit company is one that makes payments of interest, royalties and other types of payments defined as "deductible" at least equal to 90% of its aggregate receipts from such items. An exception is provided for certain active business banks and insurance companies.[13]

C. As examples, this test could be satisfied by 70% ownership by a single NL company – the 30% NL ownership would be subsumed in the 70% EC ownership – or by 20% ownership by an NL company and 50% ownership by four companies from other EC countries. In all cases, it requires that a 70% block be owned by five of fewer shareholders.

D. Base reduction payments are deductible payments (interest, royalties and other payments to be defined) to non-qualified persons.[14]

E. Qualified persons are US citizens and all other persons entitled to the benefits of the treaty under one of the first six categories.[15] Entities entitled to treaty benefits under one of the final four categories (Active Business Company, Headquarters Company, Limited Treaty Use Company or Shipping and Air Transport Company) are not "qualified persons". This definition is less circular than it seems at first glance because four of the six categories are not defined in terms of ownership by qualified persons. Thus a Listed and Traded Company, for example, would be entitled to the benefits of the treaty without being defined in terms of itself and could be the qualified person mentioned in the Qualified Person Company category.
EC residents, to be "good" shareholders for purposes of the Limited Treaty Use Company category, must satisfy the hypothetical requirements for benefits under the new treaty that would be applicable if the other EC country were the Netherlands. In addition, they must satisfy the real requirements of their own treaty with the United States.[16] For example, a French company would be a "good" shareholder only if it could satisfy the anti-treaty-shopping provisions of both the Netherlands–US treaty and those of the France–US treaty.

make for untidy documents. In addition to the celebrated 23 pages, the treaty is accompanied by an "[u]nderstanding regarding the convention" issued by the two governments consisting of 30 numbered sections of which 15 concern the limitation on benefits article.

This article will contain its share of commentary and even some analysis. However, its principal focus is to restate the anti-treaty-shopping provisions of the new treaty in a manner that will allow mere mortals – this author being a long-standing member of that category – to understand their basic operation.

II. OPERATION OF THE LIMITATION ON BENEFITS PROVISIONS

Article 26 of the treaty begins by stating that individuals and governmental units, resident in one of the two contracting states, shall be entitled to the benefits of the treaty. As to companies, the treaty operates by defining ten categories which qualify for treaty benefits[10] – in one case for only partial treaty benefits. All others are ineligible unless they throw themselves on the mercy of the tax authorities and are granted discretionary relief.[11]

In defining the ten categories, five tests are employed. (see chart I above and Decision Tree below). Some tests apply to some categories, some to others; sometimes in the same form, sometimes with variations. No one test is applied to all ten categories. While the overall thrust is self-evident, the intended purpose of many of the rules is unclear. Variations of the same test appear without explanation. Some percentage tests are expressed as "more than ...%", others simply as "...%". In short, the limitation on benefits rules fairly cry out to be expressed in some systematic fashion.

The five tests are:

(1) *Permitted Ownership* – treaty shopping usually takes the form of ownership of a treaty entity by third-country taxpayers. To counter this, seven of the ten tests employ some measure of required ownership. This may be a requirement that the Netherlands company be owned by a small group of Netherlands and/or US corporate shareholders, that a specified percentage of the company be owned by Netherlands and other EC shareholders or that a specified percentage be owned by "qualified persons". "Qualified persons" are defined as a citizen of the United States and as any other person entitled to the benefits of the treaty "pursuant to the provisions of paragraph 1", meaning that members of some, but not all ten, categories of persons entitled to treaty benefits will be "qualified persons" whose subsidiaries also can qualify.[12]

(2) *Public Ownership* – five tests permit defined amounts of third-country ownership if the company or, alternatively, its parent company, is publicly held and widely traded.

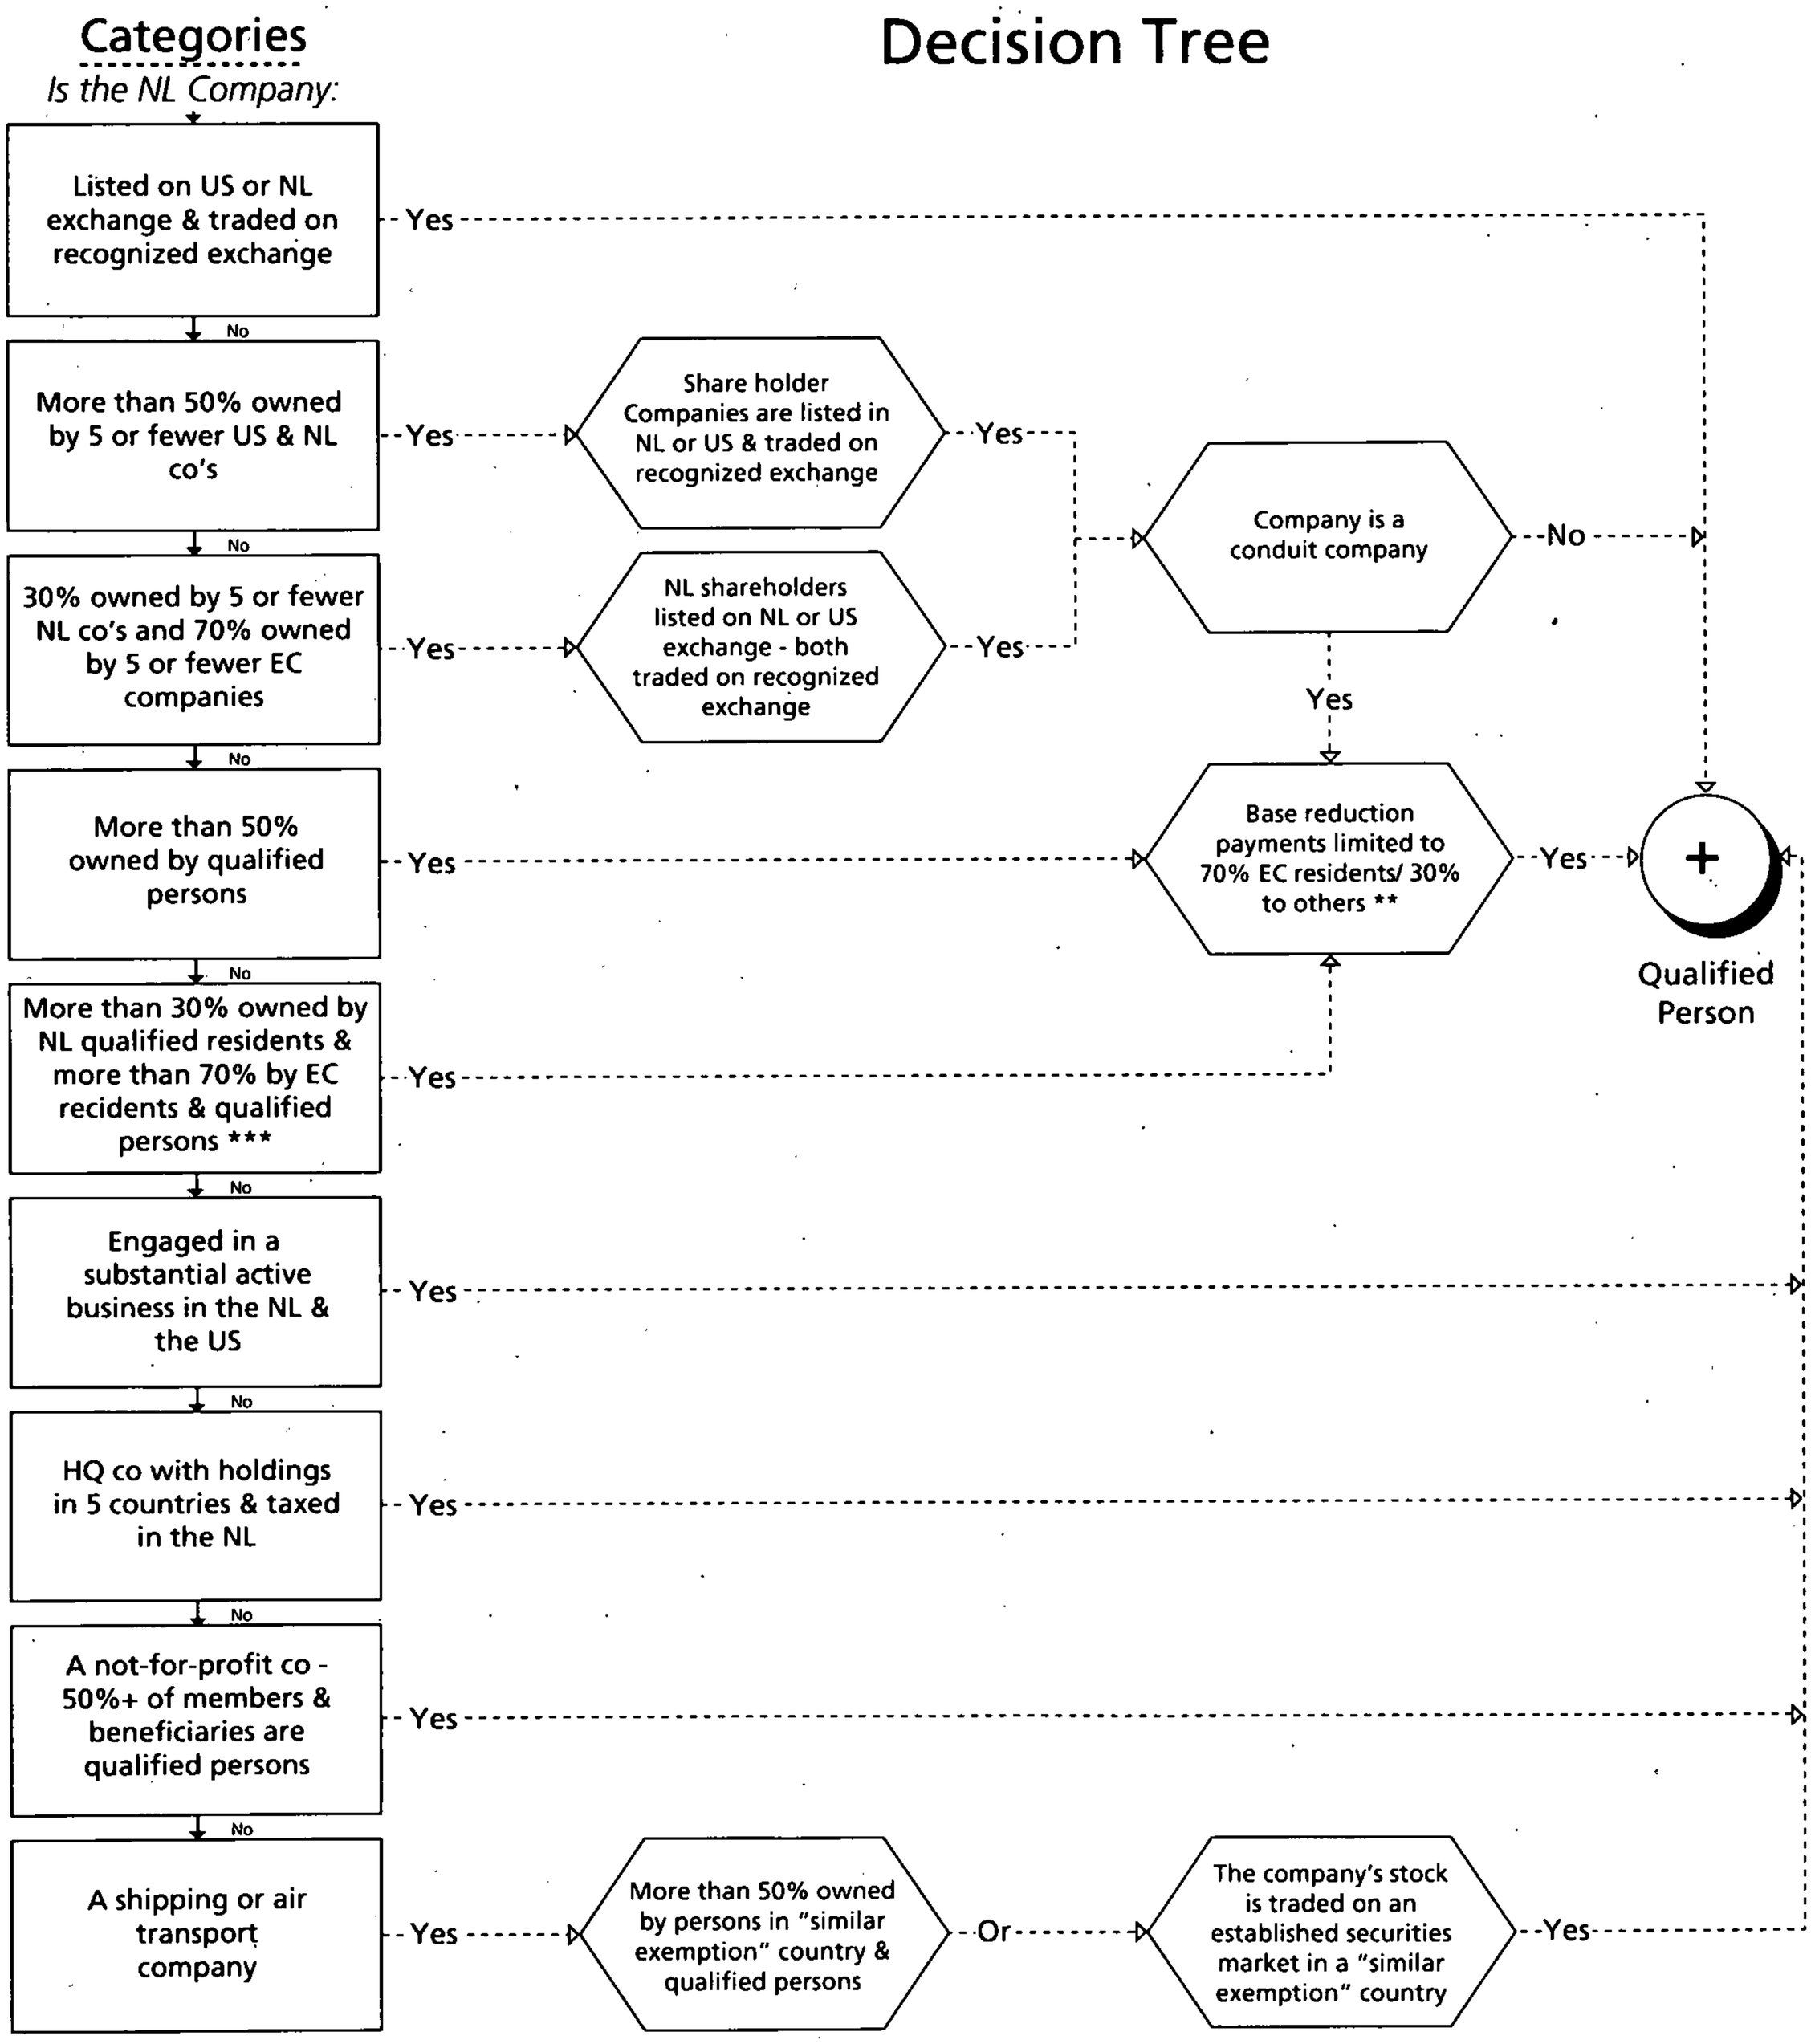
(3) *Conduit Company* – two of the tests require that the company not be a "conduit company", i.e. a company which receives interest and royalty income and pays out 90 percent or more of that income as interest, royalties or certain other forms of tax-deductible payments. Note that a company does *not* lose its taint as a conduit company simply because the payees are qualified persons.

(4) *Base Reduction* – employing a variation on the conduit company approach, two of the tests require that the company not pay out too much of its otherwise taxable Netherlands income in the form of deductible payments of interest and royalties to persons who are not qualified persons.

(5) *Active Business* – two of the tests require that the company satisfy an elaborate set of rules designed to ensure that it is

10. At times the treaty presents difficulties in deciding whether an item is a new category or merely a sub-category. Thus, the "indirectly traded conduit company" is treated as a full category for purposes of the table below but as a sub-category in the decision tree which follows the table. In both cases, the form of presentation was dictated by clarity of presentation.

11. The two governments have pre-agreed upon one set of facts that will be entitled to discretionary relief and this comes close to being an eleventh category, the principle difference being that entitlement is not automatic – advance clearance must be obtained. For a Netherlands company to qualify it must:
(1) hold stocks and securities the income from which is not predominantly from US sources,
(2) have "widely disbursed" ownership,
(3) employ a "substantial staff" in the Netherlands engaged in the securities trading, and
(4) secure the approval of the US Internal Revenue Service.
Understanding between the two governments, ¶ XX.



12. Treaty Art. 26(8)(g).

© 1993 International Bureau of Fiscal Documentation

a *bona fide* Netherlands business corporation or a *bona fide* Netherlands headquarters company.

For those readers who prefer a decision tree, the information in Chart I is presented in that form below.

Decision Tree

Notes

* At each dead-end, e.g. where the response is "no" but there is no arrow with that caption, descend to the next lower category. When all categories are exhausted, the Netherlands company is a non-qualified person.

** Two variations of the base reduction rule are involved. If the company is a conduit company, only payments to associated non-qualified persons in low-taxed jurisdictions are taken into account. In other cases, payments to all non-qualified persons are taken into account.

*** Entitlement to treaty benefits under this category carries only limited treaty entitlement with it – use of the treaty provisions reducing withholding taxes on dividends, interest, royalties and branch operations, but of not other treaty provisions.

II. COMMENTARY

In some respects, the limitation on benefits provisions operate in a predictable fashion.

It is not difficult to understand why they give emphasis to base erosion[13] since that is a favoured technique of third-country investors into the United States by way of a Netherlands company.

The exemption for listed and publicly-traded companies is a logical one. The Netherlands is the home jurisdiction of some large multinational concerns such as Phillips and Royal Dutch Shell which are mainly owned by investors of other nationalities. Most observers would agree that these companies have a legitimate claim to be regarded as Dutch for treaty purposes. Indeed, if Netherlands' treaties were not available to them, they effectively would be stateless.

The active business exception reflects a concern with real life cases of long-established, active businesses in the country owned by nationals of another country.[14] At some point, a company becomes a local entity despite being owned by non-local shareholders.

Other features are not so self-evident. Indeed, some of them are quite mystifying. For example, why were some, but not others, of the companies qualifying for treaty benefits designated as "qualified persons" – as shareholders whose ownership qualifies the company for treaty benefits? This leads to the surprising result that a Netherlands headquarters company may itself qualify for treaty benefits, but its Netherlands subsidiary will not be a qualified person company because a headquarters company is not a qualified person.

Even more mysterious, is the use of the phrase "directly or indirectly owned". Of the ten categories of Netherlands companies entitled to treaty benefits, six employ the concept of direct or indirect ownership. For purposes of three categories, and of only those three, the treaty defines the phrase to mean:

> "that all companies in the chain of ownership that are used to satisfy the ownership requirements...must meet the residence requirements...[15]

Since this definition explicitly is made applicable only to the NL/US and NL/EC/US indirectly traded categories, and thus automatically becomes applicable to the indirectly traded conduit company category,[16] it must have a different meaning as applied to the other three categories that refer to "direct or indirect" ownership – the apparent meaning being that indirect ownership can be by way of a non-qualified person. For example, a Netherlands company more than 50 percent owned by Netherlands individuals could own 100 percent of a Bermuda company which in turn owned Netherlands company #2 – which itself would be entitled to treaty benefits under the qualified person company category. Why is a qualified person company permitted to have a non-qualified person in the chain of ownership while the three categories of indirectly traded companies are not? Why indeed!

Some of these mysterious features may stem from the long and difficult treaty negotiations. It is likely that others are attributable to the seeming lack of a consistent definition of "treaty shopping" on the US side – a lack that was apparent well before the publication of the new Netherlands–US treaty. As examples:

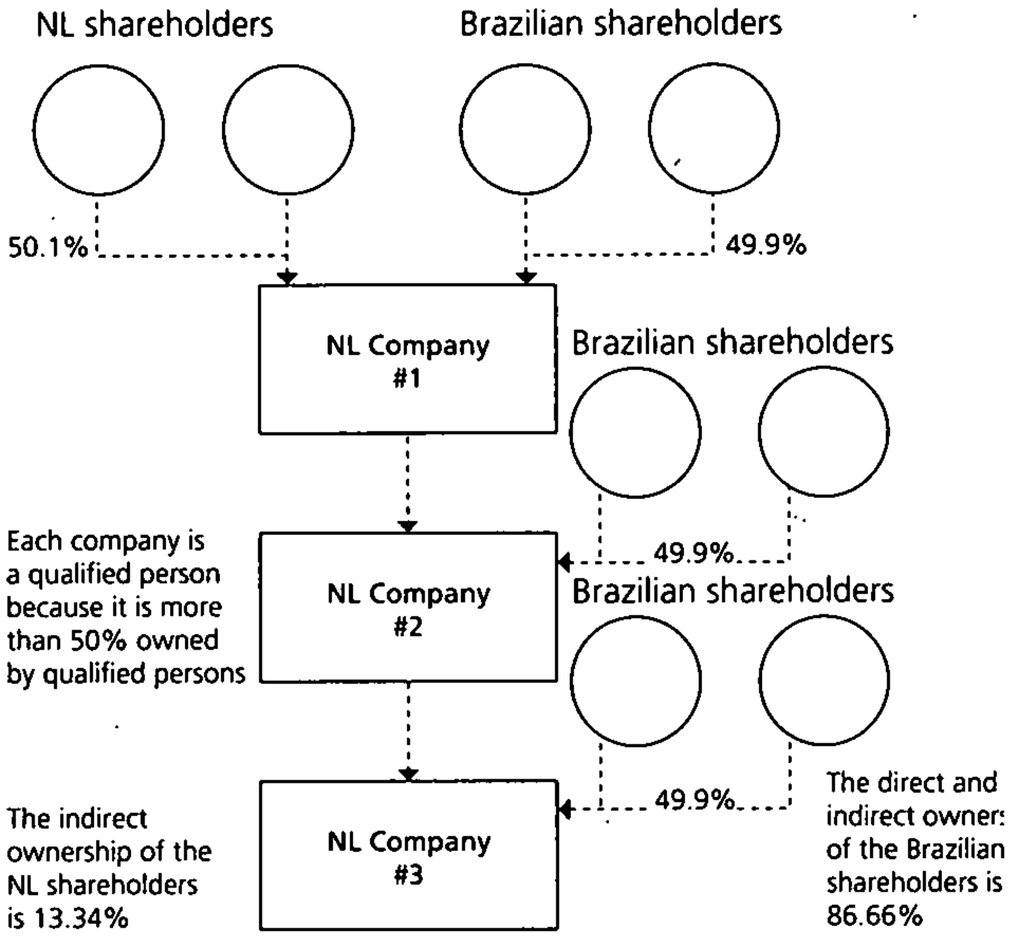
(1) As has been the case with prior versions of US anti-treaty-shopping clauses, the new treaty places US citizens automatically in the qualified person category. This means that a Netherlands company can count such citizens in the "good" category in deciding if the company is entitled to treaty benefits with respect to its income from US sources. However, US citizens investing in the United States through a Netherlands company may well be treaty shoppers. Why should they be favoured over, say, Saudi residents?

The probable explanation for the inclusion of US citizens in the "good" category is the double standard that has become regular fare in US international tax relations. For example, no attempt is made to prevent US investors from using Netherlands companies when investing in the EC and many do so. The reason for this difference is not hard to guess. When third parties use Netherlands companies to invest in the United States it is US revenues which suffer, but when US companies use Netherlands companies for investment in the EC US revenues are increased because creditable foreign taxes are reduced.[17]

2. The new treaty adopts, for the first time in US practice, the "derivative benefits" doctrine under which residents of states having comparable tax treaties with the United States are not considered to be treaty shoppers when they invest in the United States through a Netherlands company.[18] While it is logically correct to say that such persons should not be presumed to be treaty shoppers, because they had the same treaty benefits available to them at home, they often will be jurisdiction shoppers – investing through the Netherlands to escape home-country restrictions of one or another type.

Why should the United States encourage such behaviour? Once more, it is likely that the reason can be discovered by examining the question of whose ox is being gored.

---



13. Base erosion is the practice of paying out treaty-favoured income received by the base company in a deductible form, such as interest or royalties, in order to minimize taxes of the base jurisdiction – the Netherlands in this case. The practice is greatly aided by the fact that the Netherlands does not, under its internal law, levy a withholding tax on interest or royalties paid by a Netherlands company.
14. Such as the German textile company which has been French-owned for about 150 years but has conducted a substantial, active and successful business in Germany during that period. That company should not be deprived of the right to claim protection under Germany's tax treaties.
15. Treaty Art. 26(8)(k).
16. This last incorporates the ownership tests of the first two.
17. An even more striking example of the US double standard is the evolution of the US foreign tax credit which, in its present form, is designed in many cases to give less than 100% credit for foreign taxes paid unless the US parent company artificially reduces the base on which its subsidiaries pay foreign taxes by a series of charges for "management" and other services supposedly rendered in the United States. At the same time, the United States is engaged in a campaign against foreign concerns doing business in the United States which, as a group, are accused of employing artificial tactics to reduce their US taxes.
18. This doctrine is incorporated in the limited treaty use category.

© 1993 International Bureau of Fiscal Documentation

IV. THE STRANGE CASE OF THE STACKED QUALIFIED PERSONS COMPANIES

Most surprisingly, for a treaty that shows such signs of paranoia, no reference is made in the treaty or in the understanding of the two governments published with it about the possibility of abuse through the use of multiple holding company structures. For example, a Netherlands company with 50.1 percent ownership by Netherlands individuals would be a qualified person under the qualified person company test. If that company owned 50.1 percent of a second Netherlands company, under a literal reading of the treaty it too would be a qualified person even though the Netherlands individuals would indirectly own only approximately 25 percent of its equity. If the second company owned 50.1 percent of a third Netherlands company, the Netherlands individuals would indirectly own only approximately 13.5 percent of its equity. Nonetheless, on a literal reading of the treaty it would be entitled to treaty benefits. This is illustrated by the following chart which assumes a structure created by Brazilian (i.e. non-qualified persons) investors.

Chart II: Stacked Qualified Persons Companies

There is no doubt that the US tax authorities have means to combat such structures if the intervening companies are mere shells. However, in the absence of a published anti-avoidance rule, it will be necessary first to find the abusive structures – not an easy task.

V. CONCLUSION

In the 1982 article mentioned at the outset, I concluded by quoting a French author and practitioner who stated:

> "La rédaction des clauses des conventions internationales n'est pas chose aisée...La science fiscale peut encore progresser dans le domaine international".[19]

True in 1975 when written, true in 1982 when quoted, and true today.

19. "Formulating provisions for international conventions is not an easy task...Fiscal science can still make progress in the international domain". Kergall, "Les Affaires Internationales", *La Fiscalité* (Hachette, 1975), at 79.

INDICATIONS OF FUTURE POLICY IN THE LATEST OECD TASK FORCE REPORT

Jill C. Pagan

B. Advance pricing agreements
VIII. Conclusion

I. INTRODUCTION

Shortly after the United States issued its draft regulations for transfer pricing in January 1992 the OECD, in response to widely voiced concern that those regulations contravened the international standard of arm's length, set up a task force to evaluate and comment on those draft regulations. Membership of the Task Force included representatives of Canada, Finland, France, Germany, Japan, the Netherlands, Sweden, Switzerland and the United Kingdom. The United States acted as observer. Other OECD member countries were closely consulted and the Task Force obtained comments from the Business and Industry Committee of the OECD (BIAC), and the International Chamber of Commerce (ICC).

The Task Force Report was de-restricted by the Council of Ministers on 17 December 1992, but was not available until January 1993 and in some countries, including the United Kingdom, was not on sale until February or March 1993. The United States released its new regulations (under temporary classification) in January 1993 and before the Task Force report had received full circulation. This is not to say that the Task Force Report was too late to be of use, for the US Treasury had been well aware of the contents in advance and the Task Force formed the forum for the necessary coordinated international tax authority response to the US draft regulations.

In a nutshell, the Task Force Report contained no general or detailed comment or views on the US draft regulations that had not already been expressed and well publicized by professionals, businessmen and academics in the summer of 1992. Simply, the Report repeated the widely held view that the draft regulations, in aiming to provide certainty, had resorted to rigid and complex methodology which was capable of producing allocation of corporate profit from inter-company transactions which would bear little resemblance to an allocation on the international standard of arm's length pricing. The temporary regulations, issued in January 1993, have addressed a number, though not all, of the various particular concerns.

The content of the Task Force Report may therefore be argued to be of no more than academic interest at this stage. But this would be to ignore the fact that the OECD has committed its Working Party on Taxation of Multinational Enterprises to undertake as a matter of urgency a review of the major OECD 1979 Report on Transfer Pricing (see para. 1.29). This review commenced in December 1992 and will build upon the work of the Task Force. Read with this aspect in mind, the Task Force Report contains a number of indications of where this major review is starting from.

II. TRANSFER PRICING AND TAX AVOIDANCE

The disappointing aspect of the Task Force Report is that it sends strong signals that the issue of transfer pricing is still dominated in government circles by the outdated and incorrect view that it is mainly about counteracting tax avoidance by MNEs.

Given that the Preface to the 1979 OECD Report on Transfer Pricing indicated that transfer pricing should be a neutral concept relating to the system of pricing the transfer of goods, it is only to be expected that the Task Force Report takes care not to use the term transfer pricing in a sense synonymous with tax avoidance. However, the order in which issues are dealt with and the shades of emphasis throughout leave no doubt that the specter of tax avoidance looms disproportionately large. Thus, the Task Force Report provides continuing encouragement for the incorrect

© 1993 International Bureau of Fiscal Documentation

use of the term transfer pricing to mean, in a pejorative sense, a pricing decision by an MNE to deliberately shift income from one member of the group to another to reduce the tax liability in the first member country.

For example, para. 1.20 which sets out the three factors which influence the approach adopted by tax authorities places "the prevention of tax avoidance" at the top of the list. It is true that the point is made in the introduction that the other factors listed are of equal importance (prevention of international double taxation, certainty of application and administrative feasibility), but the inescapable fact is that anyone addressing what is a wider taxation issue without a preoccupation with tax avoidance would never place tax avoidance at the head of a list, for it can only be a secondary aspect.

Another example is found in para. 1.22, which discusses how existing international instruments might be put to greater or better use in maintaining consensus on the application of the international arm's length standard. Top of the list is "exchange of information", which in practice means in most circumstances exchanges of information without the prior knowledge of and cooperation of the taxpayer MNE. Bottom of the list (and accompanied by a comment of "time consuming" for which read "little enthusiasm from some members of the Task Force") are advance transfer pricing agreements which have the great advantage of encouraging taxpayer and tax authority to think about the problem in advance and work together in a spirit of cooperation. Exchanges of information are identified by tax authorities as a tool with which to combat tax avoidance as the Group of Four Report (see VIII below) clearly indicates; cooperation with taxpayers in this area is specifically discounted unless forced upon the tax authority by domestic law. Para. 1.22 may be read as equally discouraging of cooperation with taxpayers.

Even more importantly, the preoccupation with tax avoidance seems to have led the OECD to abandon basic principles of taxation (see V below).

There are a number of good thinkers at the OECD who understand that, whatever the historical reasons for its introduction in tax legislation, transfer pricing is now less about tax avoidance and more about allocation of income of an MNE between the countries in which the MNE conducts its operations. There is also an appreciation at the OECD that, as over 50 percent of world trade now takes place between intragroup entities of an MNE, the problem is an urgent and substantial one for tax authorities.

So, why has an issue which, in the reality of the global economy of the 1990s, represents a fight between national tax authorities for a fair share of tax take on internationally integrated MNE operations, emerged as predominantly a fight between tax authority and taxpayer, with a presumption that the latter has nothing in mind other than to construct international transactions to the detriment of one tax authority or another? There are two reasons.

First, the OECD needs to obtain the full agreement of the Council of Ministers of the Member Countries before its Reports may be published. There is no scope for a majority view to prevail. So, consensus is all. Those countries which regard tax avoidance as the paramount problem in transfer pricing are unlikely to signify agreement unless their views are reflected. Those who take the more modern and, it is submitted, correct approach that transfer pricing is neutral and that the real issue is apportionment on a national basis of income earned on an international basis among competing countries, must be content with a dilution of the tax avoidance content and a carefully worded text which gives some support to neutrality.

Second, it is not the OECD permanent staff which makes up the Task Force. Rather, they assist representatives from each Member Country, for the OECD in these matters is a creature of the tax authorities and represents the tax authorities' view. Given that all tax authorities suffer a scarcity of staff available to work on transfer pricing, not all countries may be able to release someone for the task force and, even if they do, pressures of domestic workload may restrict the part they are able to play. Much of the work on an OECD task force may be done by those representatives who have the greatest personal interest in the topic under review. Most often, such representatives are those who have long-standing experience in the area and almost inevitably this has, in transfer pricing, led to a concentration on the tax avoidance aspect which is where tax authorities have directed their limited staff resources. A representative may have seen transfer pricing only as a matter of (sometimes blatant) tax avoidance and not had experience of the far greater number of MNE pricing transactions in which tax avoidance is not in point. The danger of personal experience gained from dealing regularly with an abuse type of situation is that it is likely to colour an individual's reaction to any potential situation and that perspective is lost. If you see only wrong, it is difficult to constantly keep in mind that right is involved in the majority of cases which, because of your work, you will never see.

There is a third, perhaps mischievous explanation, and that is that the consequences of an integrated global economy are so complex and difficult to resolve that certain politicians and officials find it convenient to confine the discussions on transfer pricing to its tax avoidance aspects.

III. METHODOLOGY

Given that the Task Force Report is a response to the 1992 US draft transfer pricing regulations, it is only to be expected that it reiterates the methodology first set out in the 1979 OECD Report to be used by governments in applying the arm's length standard, i.e.:

(a) the comparable uncontrolled price method (CUP),
(b) the cost plus method,
(c) the resale price method,
(d) other reasonable methods which produce an acceptable figure (usually called the "fourth method").

What is amusing is the comment (para. 6 of the Executive Summary) that "these principles are strongly endorsed by the business community and tax practitioners". This is an excellent example of the proposition that you get the answer to the question you ask. Ask the business community whether they

© 1993 International Bureau of Fiscal Documentation

endorse the 1979 methodology when the alternative on offer is the rigid methodology proposed in the US draft regulations which is capable of producing a result which may bear no resemblance to commercial reality, and the response is bound to be resoundingly in favour of the OECD methodology; at least it has the merit that the results obtained by recourse to it will have some connection with commercial reality.

The really useful question to ask is the more potentially embarrassing one of whether the OECD methodology works well in practice. It is worth remembering that one of the reasons for the United States introducing new provisions and regulations was the feeling that the OECD methodology in the 1979 Report needed greater definition to work effectively. It is true that countries with a more businesslike and therefore flexible approach to taxation of corporate profits might answer that the US problem arises from its tax system which looks towards absolute certainty and therefore, lengthy and total legal definition, but these countries only cope with the OECD methodology because it is capable of being interpreted with such a degree of flexibility that it may be argued to be all things to all men.

The experience of tax practitioners known to and including the writer is that the CUP method is of little use, for there are few, if any, comparable uncontrolled transactions. Even a substantially similar but not exactly comparable CUP may require adjustments which might more accurately take the CUP into the realms of the fourth method mentioned above. As with the resale price and cost plus methods, a similar but not exactly comparable CUP is more of a point of departure from which to start evaluating a fair price rather than a complete method in itself. Transfer pricing inquiries are being resolved, and pricing strategies developed, using a facts and circumstances functional analysis. The basis of the resultant fair profit (or loss) split may properly be argued to be no more than an example of the "fourth" OECD method. As MNEs conduct operations on an increasing integration or centralization basis, no one of the three standard OECD methods is likely to be sufficient used alone. A thorough reading of the 1979 Report shows that the OECD recognized the importance of functional analysis on a facts and circumstances basis and in no way does this conflict with the arm's length principle. In effect the competing tax authorities are searching for a fair profit split where there is no comparable uncontrolled price available.

IV. PROFIT SPLIT

Although the term "profit split" has tended to be resisted by tax authorities when official discussions take place on methodology in transfer pricing, in semi-private meetings it is not unknown for officials to admit that the fair price they are seeking to establish for goods, services or intangibles is, in the usual absence of a comparable uncontrolled price, one which might be defined as a reasonable profit split.

Because the US draft regulations focused on a new methodology called the Comparable Profit Interval (CPI) the Task Force Report had to define profit split and distinguish it from profit comparison. This they did rather neatly in para. 3.12:

> the main advantage of a profit split over a profit comparison is that a profit split is based on the commercial activity of the entity under examination itself and its related parties and inevitably is related to their economic success or failure and is closely connected to the actual transactions of the group. It thus avoids one of the main criticisms made of comparable profits methods that they tend to penalise the commercially unsuccessful by seeking an adjustment to profits based on the results of their more successful commercial rivals.

Moreover, the point is made in para. 3.11 that

> "Profit comparisons are only valid if the comparable is a true one and they accord with commercial reality."

Although implicit in the discussion on CPI throughout chapter 3, the Report does not actually state in clear terms that, as CPI is designed to apply only in the absence of exact comparables, it can never be a valid comparison. Nor does it make the point that CPI would apply to virtually all transfer pricing transactions, for exact comparables very rarely, if ever, exist. Profit split is clearly no panacea for all transfer pricing transactions and para. 3.15 recognizes a number of dangers. However, the Task Force Report does accept that profit split has an important part to play, particularly in conjunction with a detailed functional analysis. Accordingly it is noted that profit split will be the subject of more exhaustive examination in the forthcoming review of the OECD 1979 Report.

V. DOUBLE STANDARDS

Clarity may well be the first casualty of consensus, but para. 18 of the Executive Summary of the Task Force Report is something far more serious. Muddled thinking, due, one can only conclude, to an unhealthy preoccupation with tax avoidance, has resulted in the OECD producing a formal report suggesting that it is quite acceptable to have an unfair, and wholly capricious, method of ascertaining profit or gain if tax avoidance is suspected.

The Report, having gone into considerable detail in chapter 3, "Difficulties Created by the Proposed [US] Regulations and Recommendations", as to why the CPI is an unreliable and unacceptable method of ascertaining profit or arm's length price, makes the statement in para. 18 that: "The proposed Regulations should be explicitly directed towards such cases [tax avoidance] and confine as far as possible the application of the CPI ... to these cases."

There is only one measurement of income acceptable as a basis for taxation and that is a fair and proper measurement. Furthermore, until income on such a fair and proper basis has been ascertained, it is impossible to consider whether tax avoidance may be in point.

It is accepted that there have been, are, and probably always will be, some cases of substantial tax avoidance through transfer pricing. There must be provisions which will both recompense the tax authority and discourage taxpayers from engaging in such abuses. However, principles of taxation dictate that anti-avoidance provisions must be of a type which follow on from the correct measurement of income which shows income or expenditure to have been under or over-

© 1993 International Bureau of Fiscal Documentation

reported. There are three main types of "penalty" provisions relating to transfer pricing:

(1) interest on tax paid late and financial penalties for underfiling of income;
(2) recategorization of the excess of non-arm's length outgoings to related parties as dividends or repatriation of capital;
(3) restriction of tax treaty relief from withholding taxes on excess interest or royalties paid to an associated party.

It is incredible that the OECD should seemingly give support to abandoning the established principles of taxation in favour of combatting what is after all, at that stage, no more than suspected tax abuse with a potentially incorrect and arbitrary measurement of income. No acceptable and therefore workable international tax system can be devised on the basis that suspected tax abuse be met with certain abuse inherent within the tax system.

VI. INTERNATIONAL ASPECTS

The Task Force Report correctly stresses that transfer pricing is an area which can only be dealt with satisfactorily if international consensus is maintained. Due consideration is given to what should be the international standard and why the US draft regulations, which may be argued to depart materially from the existing international standard of arm's length, are unlikely to be acceptable as a new international standard. However the Task Force's weakness is in the understanding of the extent of international consensus and its relationship with national sovereignty is demonstrated by the recommendations.

Section E of the Executive Summary makes 16 formal recommendations, the first of which is

> that the United States confirm[s] that it will not be bound by the proposed Regulations in the mutual agreement procedure or any arbitration process under an arbitration clause provided for in its tax conventions.

Here the OECD seems to be seriously suggesting that the United States applies the methodology in the draft regulations only to transfer pricing transactions which are not also the concern of another country with which the United States has a tax treaty. This would leave the regulations applying only to transactions between US corporations and tax havens; this is not a remotely practical possibility.

While the US transfer pricing regulations may technically be argued to be interpretative of the provisions in the US tax code, the Catch 22 is that the only way to rebut the regulations is to show that they are contrary to the very general provision in the tax code. In practice US regulations may have the force of secondary legislation. The transfer pricing regulations are a major item applying to all taxpayers alike; they could not be relegated to the status of a minor item applying only to a transaction with a related entity in a tax haven.

Furthermore, although rhetoric in the US Congress might indicate that transfer pricing is all about tax avoidance, this is something of a smoke screen. In the 1990s transfer pricing is materially about protecting the US share of tax revenue on international transactions which are growing apace with the development of the global economy. There is also an underlying realization that policing transfer pricing is one way to keep foreign inward trade within bounds.

Also, and not just in the United States, there is a natural limitation on a country's ability to "negotiate" a figure under the mutual agreement procedure (MAP) in a tax treaty. It is the reason why the OECD could not obtain agreement to a MAP provision under which both contracting states were required to reach agreement, and why the present MAP provision does no more than ask that the two states shall endeavour to reach agreement. Countries are not prepared to enter into tax treaties under which they cede jurisdiction on matters of their domestic law. Tax authorities take the view that they are not empowered to depart from the legally correct price determined by their domestic law. The US transfer pricing regulations are the US domestic law. Because the international arm's length standard is so loosely defined in tax treaties, the question of treaty override does not arise.

In a sense it is understandable that the OECD has gone for an emollient but impractical approach. International enforcement of transfer pricing is a notoriously delicate and difficult area, and it may be that the decision was taken to make an impractical recommendation rather than leave the issue out altogether or face the difficulties head-on. However, there are a number of unhappy indications that progress is not being made on resolution of disputes between tax authorities (e.g. the EC Arbitration Convention is not making progress and competent authority disputes are increasing) and it could be that the OECD will have to revisit this area next time round.

VII. RESTRICTIONS ON THE REPORT

The final chapter (4) of the Task Force Report sets out what matters the Task Force did not discuss. There is no doubt a good reason for these omissions – namely, that time did not permit. Indeed, it might well be a wonder, given the operating constraints of the OECD, that even a limited report could emerge in a matter of months rather than years.

The difficulty with the omissions is that they concern topics which are crucial to a balanced overall view of transfer pricing. Para. 4.1 indicates this by stating that the draft US regulations were only one step in the implementation of transfer pricing and that the United States had specifically asked for comments on a number of other areas, paramount among which were documentation and penalties, and advance pricing agreements. By not addressing these aspects and concentrating on a narrow selection of methodology, the report has failed to embody a sense of what transfer pricing really is about. The methodology is considered virtually out of all perspective.

A. *Documentation and penalties*

For example, documentation and penalties are dismissed in five sentences in para. 4.2, which merely notes that OECD countries recognize the need for countries to obtain information and admits to placing emphasis on the priority of the

© 1993 International Bureau of Fiscal Documentation

exchange of information articles in tax treaties as a means of obtaining information. Presumably, this cannot not mean other than that the OECD favours the exchange of information route in preference to the more draconian domestic provisions introduced by the United States in 1989 and 1990.

The positive aspects of an approach through domestic legislation are accordingly completely ignored. The disadvantage of exchanges of information between tax authorities are that they are historical, taking place sometimes years after the transaction under review and, most importantly, they take place without the knowledge and cooperation of the taxpayer. There may be no alternative where blatant tax avoidance is in point and the taxpayer is proving uncooperative. However, in the 1990s the majority (90 percent plus) of cross-border transactions on which transfer pricing issues might arise have nothing to do with tax avoidance. They arise out of normal commercial transactions in an increasingly integrated global economy and comprise a potentially substantial compliance difficulty for both taxpayer and tax authority; an MNE's operational transfer pricing policy may be based commercially upon the benefits of global integration and transcend national borders, whereas a tax system is by its nature confined to national interests. Therefore, a measured documentation (i.e. tax return) system in relation to intra-group cross-border transactions can provide a useful basis to encourage MNEs to address the issue contemporaneously with the transactions taking place, and for tax authority and MNE to communicate constructively outside the umbrella of tax abuse to resolve any queries at that stage. In the 1990s it is unlikely to be in the interests of an MNE to become embroiled in a lengthy transfer pricing dispute.

Documentation and penalties are a carrot and stick. If MNEs decline or ignore the opportunity to address the issue in a positive manner at tax return date, then penalties weigh heavily in favour of the argument that they might reconsider such an approach. Penalties are there to deal with the minority of taxpayers who either have a cavalier approach to transfer pricing or who wish to engage in deliberate tax avoidance.

Accordingly the OECD Report should have responded to the US documentation and penalty developments on the basis of seeking to define a less draconian, more practical and internationally acceptable system of documentation than the provisions introduced by the United States. Exchanges of information between tax authorities should be the fall back provision, not the main way of accessing information.

B. *Advance pricing agreements*

The Task Force Report has merely "noted with interest" the 1992 US IRS Report, which emphasized the importance that the IRS attaches to its new procedure for Advance Pricing Agreements (APAs), and has added that experience is showing them to be expensive in skilled specialist time. Three major matters of importance are ignored.

First, transfer pricing issues in a global economy cannot be resolved without skilled specialist time, and it matters not whether the dispute relates to past, present or future transactions. Administration of transfer pricing provisions requires the involvement of a highly trained inter-disciplinary team (lawyers, economists, accountants) able to understand and assess sometimes complex commercial and economic data. As experience is gained in what is a comparatively new area, time should be able to be saved. However, there is not the remotest possibility of transfer pricing issues being properly handled by clerical officers with limited training. There are no grounds whatsoever for rejecting APAs solely on the basis that they require expensive skilled specialist time. All transfer pricing disputes require such specialists, and the advantage of an APA is that less time needs to be spent in reaching an agreement for an APA than in resolving a serious dispute through the Courts. It is a misconceived argument to reject APAs simply on grounds of use of expensive skilled specialist time.

Second, the Task Force Report gives the erroneous impression that APAs are an entirely new development. The only thing that is new is that the US authorities have recently taken what for them is a quantum leap, and decided to remove the restriction that advance rulings would only be available on matters of legal interpretation and not on a view of facts and circumstances. Because transfer pricing involves taking a view of facts and circumstances, advance rulings on transfer pricing transactions had been ruled out. The reason why the United States changed position was that the present International Tax Counsel to the US Treasury, James Mogle, in his previous role as Chief Counsel to the MNE General Motors, presented the IRS with the fait accompli of an advance agreement between no less than 16 European countries to the General Motors intra-group pricing plan, and the IRS recognized that here was something it might usefully consider. APAs in a much more relaxed, and less expensive to administer form, have been available and used constructively for many years outside the United States.

Therefore, the OECD report should have commented on the wider, more informal use of APAs, and discussed whether the problems of the US style APAs arose from the particular formality and detail of the US tax system, which is in sharp contrast to the more flexible and businesslike approach found in many European tax systems. The distinction between a formal APA and a reasonable understanding between tax authority and taxpayer should also have been drawn.

The third, and probably most important, aspect of APAs is that they represent a vital potential step forward in dealing with transfer pricing issues which are increasing at a breathtaking rate in quantity and complexity. Namely, that the issues should be addressed at the time the relevant transaction is being dealt with and in a spirit of cooperation between tax authority and MNE.

Tax authorities are already complaining about the high resource cost of dealing with transfer pricing; there is one sure thing, and that is that those costs will continue to rise steeply if tax authorities persist, as the OECD Task Force Report indicates they will, in treating transfer pricing as a tax avoidance issue in which the taxpayer is never in the right and only has tax avoidance in mind.

The Report notes that the OECD Committee on Fiscal Affairs is reviewing APAs by member countries. If the same mem-

© 1993 International Bureau of Fiscal Documentation

bers of the Task Force constitute the team on the APA review, it is hoped that they will display a more constructive attitude towards APAs; otherwise it is unlikely that the review will fulfil its potential to play a useful role in the development of the administration of transfer pricing.

VIII. CONCLUSION

It can be said, of course, that the Task Force Report did fulfil its main objective which was to reinforce the various representations to the US Treasury by governments and international commercial and trading associations, namely that there were serious deficiencies in the 1992 draft transfer pricing regulations looked at from the perspective of an international standard for measurement of income for taxation purposes.

However, the Task Force Report also acted as a preparatory exercise for the other scheduled OECD Reports on transfer pricing. Here is it desperately disappointing. Unfortunately, what the Task Force Report demonstrates is that the OECD, however good its intent and however talented its permanent staff, is such a creature of the tax authorities and their consensus that it has virtually no way of upholding principles of taxation and maintaining professional standards when the members of its task force have a primary preoccupation with tax avoidance.

Before the Task Force Report was released, senior representatives of tax authorities had suggested to the writer that it would be appropriate to disregard the Group of Four Report by the tax authorities of the United States, United Kingdom, Germany and France which had, when released earlier in 1992, essentially suggested that the only way forward in transfer pricing was greater exchanges of information between tax authorities, and that it would be more appropriate to take the OECD Task Force Report as representative of current thinking. Now that the Task Force Report has emerged, it is clear that it has not moved on from the Group of Four Report at all. So here are two reports within 12 months indicating that tax authorities are having real difficulty in accepting the sea change that has taken place in transfer pricing.

In its 1979 and 1984 Reports on Transfer Pricing the OECD managed to convey a neutral and intellectually respectable approach to transfer pricing. The requirement for consensus meant those reports were somewhat generalized, but they have withstood the test of time and made an undoubted contribution in facilitating agreement on a broad international standard. It is to be hoped that the updating of the 1979 Report will revert to those earlier OECD standards, dealing with transfer pricing for what it is, i.e. the allocation and measurement of income of MNEs between competing national tax authorities. Time will tell. Meanwhile, this unhappy 1992 Task Force Report can only be judged as a hastily produced response to proposed US regulations which fell prey to an over-preoccupation with tax avoidance that it took over as though it was the only or only real issue.

CONFERENCE DIARY

For further details of the events listed below please write to the organizers at the addresses indicated.

APRIL 1993

International Aspects of American Tax Law for Dutch Businesses and Their Advisors, Velp, 27-28 April (English):
Euroforum, Antwoordnummer 27, 5600 VB Eindhoven, the Netherlands, Tel.: 040-608811, Fax: 040-449895.

Tax-Efficient Corporate Organisation, Aldermaston, Berkshire (England), 28-30 April 1993 (English):
Marion Oakley, Euromoney Publications PLC, Nestor House, Playhouse Yard, London EC4V 5EX, Tel.: 071-7798601, Fax: 071-779-8599.

MAY 1993

Tax Structuring of Cross-Border Operations and Transactions, Brussels, 6 May (English):
F.P.V. Europe, Rue de Luxembourg 45, B-1040 Bruxelles, Belgium, Tel.: 2-502 2030, Fax: 2-502 3278.

101 Offshore Tax Planning Points for Individuals, Trusts and Companies, London, 13 May 1993 (English)

TRANSFER PRICING REGULATIONS ISSUED IN THE UNITED STATES

Stanley C. Ruchelman

Mr Ruchelman is an attorney whose practice is based in New York City. He advises clients on the tax effect of cross-border transactions. Mr Ruchelman lectures on the subject of international taxation and has co-authored numerous journal articles addressed to this subject. He received a B.A. Degree from Brooklyn College (1968) and a J.D. Degree from George Washington University (1972).

Throughout the last quarter of 1992, Treasury and IRS spokesmen in the Bush Administration promised that the IRS would issue revised transfer pricing regulations prior to the change in Administration. On 13 January 1993, their promises were made good as the IRS announced the issuance of temporary and proposed Section 482 regulations.[1] These regulations revise the rules under which cross-border transactions between controlled parties are examined to determine whether they have been carried out at arm's length. The regulations are effective as of 21 April 1993, apparently to provide some opportunity for the Clinton Administration to review their content.

The substantive regulations of the Treasury Decision were accompanied by two sets of proposed regulations. One set proposes to limit the impact of foreign law on the ability of the IRS to make an adjustment.[2] This is a regulatory limitation on the scope of *Proctor & Gamble v. Commr.*[3] In that case, the Court of Appeals for the Sixth Circuit affirmed a decision of the Tax Court and held that provisions of Spanish law prohibiting payment of a royalty prevented the IRS from creating Subpart F income for a Swiss controlled foreign corporation. The same set of proposed regulations also defines when a profit split method of pricing may be elected by a taxpayer.[4] The other set of proposed regulations addresses the reasonable cause exception to the accuracy related penalty in transfer pricing matters.[5] The penalty can be as much as 40 percent of the tax increase. The proposed regulations provide guidance on how the penalty will be imposed in the transfer pricing context, and more importantly, the application of an exception to the penalty that is premised on the existence of reasonable cause.

VI. Conclusion

I. BACKGROUND

In January 1992, the IRS issued proposed regulations implementing the commensurate with income standard that was added to the arm's length transfer pricing provision of US tax law, Section 482.[6] The regulatory proposals followed a 1988 IRS White Paper addressing the subject.[7]

The regulations proposed major changes in the way Section 482 was to be applied and were controversial. The proposed regulations were premised on the standard that a transaction should be considered arm's length only if it reflects the terms that an uncontrolled taxpayer would enter after the exercise of sound business judgement. The proposed regulations departed from the primacy of the comparable uncontrolled price method and concentrated instead on a new pricing method, the comparable profit interval (CPI). In adopting this approach, the proposed regulations adopted three new methods for testing the arm's length nature of a transaction:

- the matching transaction method, which was an extremely limited application of the comparable uncontrolled price method,
- the comparable adjustable transaction method, which was similar to the comparable uncontrolled price method, but subject to override by the CPI, and
- the comparable profits method, involving an economic analysis of operating results so that a transaction would be viewed to be arm's length only if it resulted in profits within a determined band comprised of the CPI.

The CPI was determined by reference to profit level indicators which were applied to the taxpayer's financial data for a three-year period. If the actual results of operations fell within the range of the CPI, there would be no adjustment. If, however,

© 1993 International Bureau of Fiscal Documentation

the taxpayer's results were outside the CPI, an adjustment was to be made to bring the taxpayer's results to the most appropriate point within the CPI. Although no factors were provided for determining the most appropriate point, IRS spokesmen hinted that a slight miss in the transfer pricing methodology adopted by a taxpayer would allow the adjustment to fall within a favourable part of the range. The increase in taxable income would be minimized. In comparison, a significant miss would cause the adjustment to fall within a less favourable part of the range. The increase in taxable income would be severe. Once the appropriate profit was determined, the intercompany transaction would be revised for tax computation purposes so that the targeted profit amount could be generated.

The proposed regulations were controversial. Philosophically, the primacy of the CPI under the comparable profits method was viewed by many to be inconsistent with the arm's length method. When a taxpayer purchases a widget, the profit margins of an unrelated vendor are generally not of any concern to the purchaser if the market supports the price. Rather, the price charged for the widget is of paramount concern. The proposed regulations ignored that point. In addition, the proposed regulations forced taxpayers to use the CPI without providing a reasonable method for its application if an adjustment were required. This caused a significant amount of uncertainty which could not be alleviated by IRS spokesmen.

Nonetheless, the proposed regulations contained provisions that were well received. By proposing the CPI, the IRS accepted the concept that no single arm's length price exists for most goods and services. Rather a range of acceptable prices exists, all of which could be arm's length, more or less. Also, the IRS indicated a willingness to view transactions over a period of time. Thus, taxpayers could justify aberrations in transfer prices in one year by looking at performance over a number of years. The temporary regulations are intended to adopt these more acceptable provisions and to move away from the more onerous aspects of the proposed regulations, which are now withdrawn.

II. TEMPORARY REGULATIONS

A. *In general*

The regulations adopt an overall principle that is more in line with the historic view of an arm's length transaction. According to the temporary regulations, Section 482 is intended to ensure that the returns of taxpayers will clearly reflect income when a transaction is entered into with a controlled person. That transaction is sometimes referred to as a "controlled transaction". Taxpayers engaged in a controlled transaction are placed on a parity with uncontrolled parties by determining the relative economic activity undertaken in the controlled transaction.[8]

The temporary regulations acknowledge that while Section 482 grants authority only to the IRS to make adjustments, nothing in the statute or the regulations prevents a taxpayer from reporting a transaction in its tax return to reflect arm's length amounts even if those amounts differ from the contractual terms adopted.[9] In principle, a taxpayer may report a transaction in a particular arm's length way or may report a particular arm's length amount even though the commercial terms of the transaction are significantly different. This acknowledgment is, of course, limited by certain statutory and practical considerations. To illustrate, Section 1059A prevents a taxpayer from contending that the arm's length purchase price of an imported item can exceed the reported customs valuation, as adjusted. Also, a taxpayer's opportunity to ignore the commercial terms of a particular transaction may be limited by the amount of objective, contemporaneous documentation that must exist to support the arm's length transaction.

In determining true taxable income arising from a transaction between related parties, the standard to be applied is that of an uncontrolled taxpayer engaged in a comparable transaction under comparable circumstances.[10] In determining comparability, different pricing methods may be applied to related transactions where the transactions are most reasonably tested on a separate basis.[11] To illustrate, when services are provided in connection with the transfer of property, the IRS may test the arm's length nature of the pricing for the services separately from the pricing for the property. This represents a major philosophical change from the proposed regulations which tended to blend intangible property income with other income.

B. *Best method rule*

In lieu of applying listed methods in specific order, the temporary regulations provide that the best method in the circumstances should be applied.[12] This is the method that provides the most accurate determination of an arm's length result in the circumstances. The temporary regulations refer to this as "the best method rule". On the surface, this is a more flexible approach. However, in practice, this method was often followed in the course of IRS examinations. If an examiner did not agree with the data provided by a taxpayer relying on the comparable uncontrolled price method, he or she often contended that neither the resale price method nor the cost plus method was applicable and applied the fourth method. The fourth method could have comprised a profit split based on a functional analysis. Now to apply the fourth method, the examiner need not contend that the comparable uncontrolled price method was not appropriate. Rather, the examiner may contend that a particular method is more accurate, and in the circumstances, is the best available method.

In determining the method that provides the best measure of an arm's length result, factors to be considered include:

- the completeness and accuracy of the available data;
- the degree of comparability between controlled and uncontrolled transactions; and

8. §1.482-1T(a)(1) of the regulations.
9. §1.482-1T(a)(3) of the regulations.
10. §1.482-1T(b)(1) of the regulations.
11. §1.482-1T(b)(2)(ii) of the regulations.

– the extent of the adjustments that are required when applying the method.[13]

Under the best method, any available pricing method may be applied without first disproving any other method. If a taxpayer can demonstrate that a method other than the one used by the IRS produces more accurate results, that other method must be used. If the best method rule does not clearly indicate the preferred of two methods, the matter may be resolved by reference to a third method. If the application of a third method produces results that are consistent with one of the two competing methods, the third method will control the choice of the best method.[14] A similar analysis applies when two or more applications of the same method produce different results. This is illustrated in the following example:

> Foreign corporation FP sells widgets to its wholly-owned US subsidiary, DS. During the course of an IRS examination that tests the arm's length nature of the intercompany transfer price, the comparable uncontrolled price method is applied to three different uncontrolled transactions. Different results are obtained under each method. To determine whether each such method may be used to establish the arm's length range (see I.D. below), the comparable profits method is applied by the IRS. The latter method generates results that are similar to two of the three uncontrolled transactions, but deviates from the third method. As a result, data from only two of the uncontrolled transactions are considered to be comparable.[15]

C. *Comparability*

While various provisions in the temporary regulations address comparability, as a general rule, comparability with uncontrolled transactions is to be determined by reference to:

– functions performed,
– risks assumed,
– contractual terms adopted,
– economic conditions that apply, and
– property or services involved in the transaction.[16]

The relative importance of these factors depends on the method applied.[17] Some emphasize product comparability, others emphasize functional comparability, and still others emphasize broad similarity in terms of products and functions while comparing financial returns. The intent of the regulations is to focus on the factors that make sense in the circumstances.

For two transactions to be comparable, absolute identity is not required.[18] The transactions are comparable if they are sufficiently similar so that the uncontrolled transaction provides a reasonable and reliable benchmark for estimating an arm's length result. When there are differences between uncontrolled and controlled transactions, a reasonable number of adjustments may be made to account for the differences. As in the existing regulations, the adjustments are allowed if they have a definite and reasonably ascertainable effect on the result. If adjustments cannot be made because of a lack of data or because the adjustments are substantial and therefore speculative, the uncontrolled transaction will not be considered to be comparable. This may be illustrated by the following example:

> Foreign subsidiary FS is a manufacturer of widgets. It sells those widgets to its parent corporation, domestic corporation DP, in large volumes. It also sells widgets to unrelated parties, but those sales are in smaller volumes. The price to unrelated parties is $ 100 per widget, with discounts of two percent for orders of 20 units and five percent discounts for orders of 100 units. DP purchases in orders of 60 units. In these circumstances, the comparable uncontrolled price method indicates that the arm's length price for sales to DP is $ 100, and a discount of 3.5 percent should be allowed for orders of 60 units (5 percent – 2 percent = 3 percent; 100 units – 20 units = 80 units; 3 percent ÷ 80 = 0.0375 percent per unit). However, if DP's orders were for 1,000 units, the appropriate discount could not be determined on the basis of adjustments to data involving third party sales.[19]

In reviewing the functions performed, the temporary regulations adopt the concept of the functional analysis.[20] A functional analysis compares the activities performed by the parties to two transactions. For two transactions to be comparable, the parties generally must perform the same functions with respect to each transaction. Functions that are analysed in determining comparability include:

– research and development,
– product design and engineering,
– manufacturing or process engineering,
– product fabrication, extraction, and assembly, purchasing and materials management,
– marketing and distribution, including inventory management, warranty administration and advertising,
– transportation and warehousing, and
– administration, including management, legal, accounting, finance, credit, collection, training and personnel management.

In theory, the application of the functional analysis to evaluate the choice of comparables is reasonable. The arm's length price for a state-of-the-art product developed after years of research and refinement should not be controlled by the price charged in an uncontrolled transaction for a similar product based on old technology. However, recent experience in the computer industry seems to indicate that state-of-the-art products may quickly become a commodity in which price differentials between old and new products are compressed. Moreover, the analysis required in the temporary regulations may not be implemented easily by taxpayers facing real world conditions. Smaller entities may have only limited access to data, and the cost of generating anything other than a superficial report may be prohibitive. Larger entities may find that the sources of information are closed because of

intense competition within a particular industry or because concerns over anti-trust law violations. Indeed, it may turn out that the only party in a position to develop the required data is the IRS. It can develop its own set of statistics through industry programmes or can subpoena third parties to obtain information which serves as a basis for evaluating the tax return of another taxpayer.

In analysing the risks involved in two transactions, the goal is to determine whether risks borne by the various parties are similar.[21] For this purpose, risks include:

- market risks such as fluctuations in cost, demand, pricing and inventory levels,
- risks associated with the success or failure of research and development activities,
- financial risks, including fluctuations in foreign currency rates of exchange and interest rates,
- credit and collection risks,
- product liability risks, and
- general business risks related to the ownership of property, plant and equipment.

Since controlled taxpayers can manipulate risks in a controlled transaction, the risks assumed in the tested transaction must be analysed first for substance.[22] The intent is to determine which risks are real and which are only "window dressing". Thus, adequately documented risks are to be reviewed to confirm three factors. First, the review must confirm that the risks assumed by each of the parties to a controlled transaction are commensurate with the potential economic benefit that will be derived from that transaction. Second, the review must confirm that the controlled party assuming a risk has the economic capacity to absorb losses arising from the assumption of the risk. Finally, the review must confirm that the controlled party assuming the risk in its business has managerial control over the activities that influence the amount of income or loss that may be realized.

If the allocation of the risk is documented before the outcome is known, the IRS will accept the risk factor if the parties conduct is consistent with the allocation.[23] Such consistency in risk allocation must continue from year to year. Thus, parties that are allocated losses because of risks assumed during loss years are expected to be allocated profits when the transaction becomes profitable.[24] This approach is understandable because of the opportunities that exist to allocate risk to a US taxpayer in loss years – thereby shifting losses to a US taxpayer – but to move the risk to a foreign affiliate in profitable years – thereby shifting profits offshore. Nonetheless, it is an open question whether this approach is logically correct in all circumstances. Disregarding luck, only smart and timely investments should be rewarded by the market. Where a party making the earlier investment runs out of money and requires a significant cash inflow from new investors to complete a project, it cannot be said that the earlier investment is both smart and timely. In these circumstances, it is not uncommon for new investors to receive a premium because the earlier investment is worthless without the later cash infusion. The regulations ignore this aspect of business and continue to reflect an assumption that profit can be foreseen from the mere act of spending money.

The temporary regulations recognize that other factors may impact the determination of comparability. Among the other factors that must be analysed are economic conditions[25] and terms of contract.[26] Such economic conditions include:

- the existence of realistic alternatives to the actual transactions that were available to the parties,
- the size and level of the market,
- the existence of any location-specific costs, and
- the level of competition.

Contract terms that must be considered include:

- the form of payment,
- the terms of payment and financing,
- the volume involved in the transaction,
- the existence of warranty obligations,
- the rights of a party to updates,
- the duration of the rights of each party,
- the right to renewal under the contract, and
- the existence and terms of any collateral relationships and transactions.

The temporary regulations recognize that special circumstances may exist in determining comparability and these circumstances must be accounted for.[27] To illustrate, the controlled parties may have adopted a reasonable market penetration strategy for a limited period of time that does not exist in the circumstances of the third-party comparable.[28] In further illustration, there may be differences arising from the fact that the uncontrolled transaction arises in a different geographic area of the world.[29] Finally, in the controlled transaction, the parties may enjoy the benefits of location savings from operating in a low-cost jurisdiction which is not available to the parties in the uncontrolled transaction.[30] Here, however, the regulations adopt a questionable position by allocating a portion of the location savings to the customer. That allocation is premised on the assumption that a significant customer of a manufacturer will automatically demand a portion of the benefits derived from low-cost operations.[31] Taxpayers may find it prudent to test this assumption by determining whether this market condition exists in its industry.

D. *Arm's length range*

Recognizing that no single arm's length price exists, the temporary regulations provide that no adjustment will be made under Section 482 if the results of the transaction between controlled parties fall within a range of results derived from two or more applications of the same pricing method to different uncontrolled comparables.[32] This range of acceptable results is referred to in the regulations as the "arm's length

range". To form part of the range, each application of the pricing method to a specific comparable must satisfy the criteria for its application. With the exception of the comparable profit method, there is no limitation on the extent of the arm's length range. Nonetheless, a wide range may suggest that insufficient adjustments have been made for differences between the controlled and the uncontrolled transactions.

Where the controlled transaction falls outside the arm's length range, the IRS may make an adjustment to any point in the range.[33] However, the IRS need not develop an arm's length range to propose an adjustment and the IRS may propose an allocation based on a single comparable uncontrolled price.[34] If that occurs, the taxpayer may subsequently demonstrate that its results are within a range established by additional comparable transactions. If an arm's length range is demonstrated and the controlled transaction falls within that range, but is not identical to the IRS's single comparable, no adjustment will be made. If an adjustment is required, it most likely will be made to the midpoint of the range.

The application of the arm's length range concept is illustrated by the following example:

> DP is a US corporation. It manufactures widgets which are sold to DP's foreign subsidiary, FS. FS acts as exclusive distributor of DP's widgets in a particular foreign country. It reviewing the arm's length nature of the transfer prices between DP and FS, the IRS applies the resale price method using the results of three uncontrolled distributors as comparables. After making appropriate adjustments, the gross profit margins of the three comparable distributors are eight, ten and 12 percent, which the IRS determines is not an unusually wide range in the industry. The gross profit margin of FS is 9.5 percent. Because FS's gross profit margin falls within the arm's length range, no adjustment is made even though one distributor reported a lower gross profit margin.[35] If, however, FS's gross profit margin were 15 percent, it would fall outside the arm's length range and an adjustment would be required, ordinarily to the mid-point of the arm's length range which is a ten percent gross profit margin.[36]

E. *Results and aggregation*

The proposed regulations adopt a rule under which it is not necessary for the IRS to determine whether the method or procedure employed in a controlled transaction corresponds to the method or procedure that might have been used in an uncontrolled transaction.[37] Only the results are important. This is illustrated in the following example:

> DP is a US corporation that is a manufacturer of widgets. FS is its exclusive distributor in Europe. As part of DP's annual budgeting process, it establishes the price and production schedule for each model widget that is to be distributed by FS in Europe during the fiscal year. FS's gross profit margin is scheduled to be 18 percent, which is the same gross profit margin that an unrelated distributor in Europe earns from the distribution of a competing widget. Because the gross profit margins are the same, the IRS will not examine whether the administrative services performed by DP on behalf of FS must be factored into the transfer price for inventory.[38] Presumably, the cost of performing such services may have to be borne by FS as part of a separate determination.

In addition, the IRS is authorized to consider the combined effect of two or more separate transactions which are so interrelated that consideration of multiple transactions is necessary to determine the arm's length consideration for the controlled transactions.[39] Unrelated transactions are not taken into account.[40] The related transactions may occur before, during or after the taxable year under examination and may produce unexpected results. This rule is illustrated by the following examples:

> *Example 1*: DP is a domestic corporation. It enters into a licence with its foreign subsidiary, FS1, to use a proprietary manufacturing process for the manufacture and sale of widgets throughout a specified territory. FS1 licenses an affiliate, FS2, to distribute the widgets in the territory. In determining whether the licence fee received by DP is of an arm's length amount, the amounts received by FS1 from FS2 and the respective profits of FS1 and FS2 are relevant factors to be taken into account.[41]

> *Example 2*: DP is a domestic corporation that manufactures widgets. It has three subsidiaries that are formed and operating in a particular foreign country. FS1 is the exclusive distributor of widgets in that country, FS2 is the exclusive marketer of related services, and FS3 administers the warranty programme. In testing the arm's length transfer price of widgets by FS1, the IRS is authorized to consider the combined effect of the licence fee that FS2 pays for marketing intangibles and the service fees earned by FS2 and FS3 for the performance of related services.[42]

> *Example 3*: Assume the same facts as in *Example 2*, except that DP has two sets of competitors in the foreign country. The first set is comprised of uncontrolled companies, each of which independently services a segment of the widget market. The second set of competitors is comprised a group of related companies. The prices charged by each of the independent companies differ from the prices charged by its counterpart in the related group. The IRS may conclude that only the members of the group of related companies are comparable to each of DP, FS1, FS2 and FS3. In such case, the arm's length range may be computed solely by reference to the transactions of the competitor group rather than the transactions of the independent companies.

F. *Terms and structure*

The terms of a contractual arrangement between controlled parties will be respected by the IRS as long as the parties' conduct is consistent with the agreed upon terms and the contractual arrangement has economic substance.[43] If the conduct of the parties is inconsistent with a written agreement, the written document may be ignored. Similarly, if no written agreement exists between controlled parties, but a course of conduct is consistent with an agreement in substance, the IRS may conclude that an agreement exists in substance. Thus, for example, if a wholly-owned manufacturer consistently sells its entire output to a related party in the United States, the manufacturer does not have a market-related risk because a total-output arrangement exists in substance between the related party and the manufacturer. The pricing structure between the two companies must account for that factor as if a written agreement existed.

Except where a controlled transaction lacks economic substance, the IRS will evaluate controlled transactions based on the structure actually adopted by the parties.[44] It will not treat the transaction as if it were structured differently. Nonetheless, the IRS may consider alternatives that were available in determining whether the terms of the uncontrolled transaction would be acceptable to an uncontrolled taxpayer faced with alternatives similar to those faced by the controlled taxpayer faced. The IRS anticipates that the analysis of alternative transactions will result in a greater range of adjustments. Nonetheless, it appears to be an opportunity for a corporate group having different internal profit centres to contend that one profit centre negotiated with a second and caused the transaction to be at arm's length. In evaluating the existence of possible alternatives, one important factor is management's evaluation of each profit centre's performance. No alternative transaction is acceptable generally if it will result in a reduced bonus for local managers.

The anticipated analysis is thought to be central to the use of the arm's length standard and the traditional notion of comparability. The objective of the comparable uncontrolled price method is to identify an alternative price at which the taxpayer could have conducted the controlled transaction. By analysing alternative structures, the IRS believes that it is testing comparability. In essence, this provision allows the IRS to undertake a form of management analysis to determine whether the structure actually adopted by the controlled taxpayers makes economic sense. Where the IRS analysis succeeds in demonstrating the existence of alternatives that produce better results for the US taxpayer, and the results of the analysis are unanticipated and cannot be rebutted factually, a company may find that it has an internal management problem that supersedes its tax problem.

G. *Multiple years' data*

Although the IRS will ordinarily evaluate the results of a controlled transaction based on data from uncontrolled taxpayers attributable to the same period, the temporary regulations authorize the use of data obtained from different years.[45] This will occur where information on comparables is unavailable, inadequate or unreliable or where the life cycle of a product mandates the use of data from other years.[46] In addition, information from other years may be appropriate when analysing risks and market share strategy. If data from other years is used, it should be compared with the data of the controlled parties for a similar period to determine whether the same economic conditions affected the results of the controlled and the comparable transaction in equivalent ways. This may be illustrated by the following examples:

> *Example 1*: FP is a foreign corporation that designs and manufactures widgets. FP's functional currency is the FCU, the currency in circulation in its country of residence. DS is a domestic subsidiary of FP. DS is the exclusive US distributor of widgets manufactured by FP. The intercompany sales to DS are denominated in terms of FCUs. Accordingly, DS bears the currency risk with regard to its inventory of widgets. In the year under examination, the FCU appreciated against the US dollar and as a result, the profit margin of DS was eight percent. In the same year, a comparable competing distributor of widgets in the United States reported a profit margin of ten percent. However, the competitor bore no currency risk as its inventory was priced in terms of US dollars. In determining whether the gross margin of DS reflects an arm's length charge for its inventory, the gross profit margins of DS and the competitor for years before and after the year in issue may be examined.[47]
>
> *Example 2*: FS is a foreign corporation that manufactures widgets. The widgets are distributed in the United States by DS, the domestic subsidiary of FS. During each year in the five-year period under examination by the IRS, DS reports a loss. It justifies the loss in each year by reference to the results of five separate companies. Each reports a loss for a different year under examination, and in the aggregate, losses are reported among the five companies for all five years. Each of the five companies is profitable for four years and each reports an overall profit for the five-year period. The transactions are not clearly comparable over the five-year period since the economic conditions that resulted in DS's losses for each of the five years did not have a comparable effect over a comparable period of time on the five separate companies.[48]

H. *Collateral adjustments*

In making an adjustment under Section 482, the IRS is directed by the temporary regulations to take into account the effect of an arrangement between controlled parties for reimbursements or other compensating adjustments.[49] These are known as "compensating adjustments". For the compensating adjustment to be made, certain tests must be met. The arrangement must be in writing. It must call for reimburse-

©1993 International Bureau of Fiscal Documentation

ment or compensating adjustments between the controlled parties so that an arm's length adjustment is reached. Finally, the adjustments must be made before the timely filing of a US tax return.[50]

If the foregoing tests are met, the adjustment is deemed to accrue to the recipient on the date of actual payment, or if earlier, the last day of the taxable year. The adjusted results constitute taxable income of the taxpayer for all income tax purposes. The accrued compensating adjustment may be satisfied in any appropriate manner, including a cash payment or an adjustment to the books and records of the company. The adjustment may take the form of (i) offsets to other accounts receivable or payable, (ii) recharacterizations of dividends paid, or (iii) recharacterizations of capital contributions.[51] Any adjustment that is not satisfied by the due date of the tax return must bear interest thereafter.

The foregoing treatment is subject to a limitation. The compensating adjustment procedure is intended to allow taxpayers to establish a pricing mechanism in advance for budgetary purposes and to adjust the budgeted amount to an arm's length amount if required to comply with Section 482.[52] It was not intended to apply to abusive situations. As a result, the IRS need not allow the collateral adjustment if the taxpayer engages in a pattern of transactions designed to abuse the collateral adjustment procedure.[53] The temporary regulations provide no illustrations of an abusive situation. Presumably, the regulations will be amplified by published revenue rulings and technical advice memorandums.

The temporary regulations also contemplate that a primary adjustment by the IRS will be accompanied by a correlative adjustment to the results of the counter party to the transaction.[54] Thus, if income of one controlled party is increased, the income of the counter party must be decreased by a corresponding amount. The correlative adjustment must be reflected in the permanent documentation of the counter party that is maintained for US tax purposes even if the adjustment does not affect the tax liability of that other party for an open year.[55]

The correlative adjustment is not made until the primary adjustment is final.[56] Thus, one of the following must occur before the correlative adjustment is made:

- tax is assessed following the execution of a waiver of restrictions on assessment and collection of a deficiency in tax on Form 870,
- an offer of a waiver on Form 870-AD is accepted,
- a deficiency in tax is paid,
- a stipulated decision is entered in the Tax Court, or
- a final determination of tax liability is reached by an offer in compromise, closing agreement or a final resolution of judicial proceedings.

Finally, the temporary regulations acknowledge that a taxpayer may be entitled to set off the amount of a favourable non-arm's length transaction, such as an overcharge for services rendered by the taxpayer, against the amount of an unfavourable non-arm's length transaction, such as an excessive payment by the taxpayer for goods or services.[57] Thus, the proposed adjustment for the latter transaction can be reduced by the non-arm's length portion of the former transaction. In that way, an economic netting effect is achieved. However, for reporting purposes, the two transactions may have to be reported on a gross presentation basis if the source of an item of income – and the resulting US tax liability of the counter party – would otherwise be distorted. To illustrate, if a US taxpayer forgoes the payment of interest in return for an increase in the fee charged by a foreign corporation for services performed outside the United States, the interest payment will be increased, possibly resulting in the imposition of 30 percent US withholding tax, and the service fee will be reduced.

The temporary regulations impose certain limitations on the opportunity to benefit from the set-off provisions. First, in comparison to regulations that were in effect for many years, a set-off is allowed only for transactions that occur in the same year as the proposed IRS adjustment. Under the earlier regulations, a set-off was allowed for transactions in other years if a written agreement was in existence tying the two transactions together. In addition, to establish that a set-off is appropriate, the taxpayer must notify the IRS of the basis for the set-off within 30 days of the date of the letter providing formal notification of the proposed adjustments.

I. *Safe harbour*

A safe harbour is provided for taxpayers that have relatively small levels of controlled transactions.[58] To be eligible, either the US party or the foreign counter party to a cross-border controlled transaction must have less than $ 10 million in gross receipts for the year in issue.[59] In making the computations, all US affiliates must be aggregated with the US controlled taxpayer and all foreign affiliates that engage in cross-border transactions with the US affiliate must be aggregated.[60] This may pose a problem for foreign-based groups that own US businesses through different corporate ownership and reporting chains. US branches of foreign corporations generally are not eligible for the safe harbour. However, a US branch of a foreign corporation that is resident in a tax treaty jurisdiction might be eligible if an appropriate non-discrimination clause applies.

If an eligible taxpayer elects to be covered by the safe harbour, no adjustments will be made under Section 482. Provided that certain compliance rules are met, the taxpayer may compute its taxable income in accordance with measures of profitability published by the IRS.[61] Once made, the election may be revoked only with the consent of the IRS.[62]

The safe harbour does not apply for any year in which the eligibility tests are not met.[63] However, subject to an anti-abuse rule, the safe harbour will apply automatically in subsequent years when the eligibility requirements again have been met.

J. *Non-routine intangible*

Where an item of intangible property is central to the conduct of a business activity so that the business could not be conducted in its absence, the intangible property is considered to a non-routine intangible. Examples are composition-of-matter patents for a pharmaceutical company and a manufacturing intangible without which a particular product could not be produced. Neither intangible property that is a normal result of conducting a business nor intangible property for which there may be acceptable substitutes in the marketplace at a comparable price is a non-routine intangible.

The concept of the non-routine intangible implements the super-royalty aspect of the commensurate with income standard. Because its use or application is so valuable, the temporary regulations adopt the view that the owner would not make it available to unrelated parties. Accordingly, no examples of substantially similar transactions are considered to exist and the use of comparables is prohibited. The comparable profits method must be applied in determining the arm's length nature of the intercompany transfer pricing (see the discussion in III.A).[64] As a result, taxpayers must determine whether any non-routine intangibles are used by one of the parties to a transaction, and if so, whether the non-routine intangible was either (i) self-developed or acquired from an unrelated party or (ii) transferred from a related party. If it exists and if it were transferred from a related party, the use of the comparable uncontrolled transaction method is precluded; the comparable profit method must be used.

III. PRICING METHODS

A. *Transfers of tangible property*

The regulations provide five methods for determining whether the transfer of tangible property has been at arm's length.[65] These are:

1. The comparable uncontrolled price method

Transactions are comparable if the property transferred and the underlying circumstances of the two transactions are substantially the same.[66] In general, only minor differences are allowed and those differences must be capable of elimination through a limited number of adjustments. Material differences between transactions preclude the use of this method.

2. The resale price method

This method is similar to the existing regulations. For purposes of the best method rule, it is viewed to be an accurate measure if the controlled taxpayer performs a distribution function and does not add substantial value to the goods by physically altering them before resale or by the use of an intangible.[67] For this purpose, neither packaging, repackaging, labelling nor minor assembly generally will constitute physical alteration.

> Controlled and uncontrolled transactions should involve distribution of products within the same broad product categories. The appropriate gross profit is computed by multiplying the applicable resale price by the appropriate gross profit margin expressed as a percentage of sales. That margin is determined by reference to comparable uncontrolled transactions.[68] Where possible, the gross profit margins should be that of the distributor involved in the controlled sale because similar characteristics are more likely to be found among different resales of property made by the same distributor. However, that likely will occur in significant volume only in rare instances. In the absence of comparable uncontrolled transactions by the same distributor, uncontrolled transactions of other distributors may be used.

3. The cost plus method

This method is similar to the existing regulations. For purposes of the best method rule, it is viewed to be an accurate measure if the controlled taxpayer performs a manufacturing or assembly operation in which goods are sold to related parties.[69] Controlled and uncontrolled transactions should involve products within the same broad product categories. However, similarity as to the producer's investment of capital and assumption of risks is more important than close physical similarity of the property involved in the controlled and uncontrolled sales.[70]

In determining an appropriate mark-up percentage, accounting reclassification may be required when analysing financial data of other companies in order to achieve consistent treatment of the elements that enter into the computation of the production price.[71] This is particularly relevant when determining whether full costs or only direct costs are used. Also, adjustments may be required to account for differences in:

- the complexity of the manufacturing process,
- the performance of manufacturing, production and process engineering activities,
- the performance of procurement, purchasing and inventory control activities,
- the conduct of testing functions,
- the responsibility for selling, general and administration activities, and
- the existence of currency risks.[72]

The foregoing adjustments are illustrated in the following example:

63. §1.482-1T(f)(1)(iv)(C) of the regulations.
64. §1.482-5T(a) of the regulations.
65. §1.482-3T(a) of the regulations.
66. §1.482-3T(b)(2)(i) of the regulations.
67. §1.482-3T(c)(1) of the regulations.
68. §1.482-3T(c)(2)(iii) of the regulations.
69. §1.482-3T(d)(1) of the regulations.
70. §1.482-3T(d)(3)(i) of the regulations.
71. §1.482-3T(d)(2)(iii) of the regulations.
72. §1.482-3T(d)(3)(ii) of the regulations.

© 1993 International Bureau of Fiscal Documentation

DP is a domestic corporation. It manufactures widgets that are sold for distribution to a foreign subsidiary, FS. DP earns a gross profit mark-up of eight percent with regard to its manufacturing activities. Three unrelated manufacturers of widgets generate a gross profit mark-up of between six and eight percent. However, DP accounts for its supervisory, general and administrative costs as operating expenses which are not allocated to sales. In comparison, the three unrelated parties reflect supervisory, general and administrative expenses in cost of goods sold. When those expenses are subtracted from the cost of goods sold of the unrelated parties, their gross profit mark-up is increased to between ten and 12 percent. Assuming no other adjustments are applicable, the price at which DP sells widgets to FS is not within the arm's length range.[73]

Where a controlled taxpayer is comparable to a purchasing agent that does not take title to property, the commission earned expressed as a percentage of the purchase price of the goods may constitute the appropriate gross profit mark-up.[74]

4. The comparable profits method

This method relies on the general principle that similarly situated taxpayers will tend to earn similar returns over a reasonable period of time.[75] It is similar to the comparable profits method of the proposed regulations. However, this method is not a mandatory check on any of the other methods. For purposes of the best method rule, this method is an accurate measure of an arm's length result where the tested party does not use a non-routine intangible that is either (i) acquired from an uncontrolled taxpayer, in which case the party must assume significant risk and possess the right to significant economic benefits from the use of the non-routine intangible, or (ii) is self-developed. Thus, a group that consists of truly stand-alone companies will not be forced into using this method. Other groups having offshore manufacturing operations may face a different result. The comparable profit method may be a mandatory guide for arm's length pricing.

In applying this method, the party to be tested should be the party that performs the simplest operations.[76] Comparables may be most easily found for the industry segment that comprises that operation. A result is considered to be arm's length under this method if it falls within the range of constructive operating profits based on a single profit level indicator derived from comparable parties over a three-year period that ends with the taxable year in issue.[77] Profit level indicators are financial ratios that measure the relationships among profits, costs incurred and resources employed.[78] A variety of profit level indicators may be used in any given case, including the rate of return on capital employed and financial ratios such as the ratio of operating profit to sales and the ratio of gross profit to operating expenses.

The arm's length range will include all the results obtained if certain specified adjustments have been made to the data to refine their comparability to that of the controlled party.[79] For example, material items in a profit and loss statement may have to be reviewed to confirm consistency between the comparable and the tested parties. Where appropriate, accounting reclassifications may be required to relate the level of operating profit to the level of investment before computing the profit level indicators. Similarly, adjustments may be required to account for differences in functions performed and risks assumed.[80] Such adjustments are to be made only if they have and definite and reasonably ascertainable effect on operating profit. If these adjustments are not made, the arm's length range is determined by reference to the interquartile range (i.e. results between the 25th percentile and the 75th percentile) or another statistically valid method using at least four comparable parties.[81]

5. Other methods

To use another method, none of the foregoing methods can reasonably be applied[82] and the taxpayer must disclose the method on its US income tax return.[83] The taxpayer must also prepare contemporaneous documentation supporting the method adopted.[84] That documentation must explain why the method was selected and must be available for submission to the IRS within 30 days of a written request.

B. *Profit split method*

Temporary regulations issued on the same day provide for a sixth method based on profit split.[85] The profit split allocation must reflect the relative value of each controlled taxpayer's contribution to the combined profit and loss. This is to be determined in a manner that reflects the functions performed, risks assumed and resources employed by each participant in the relevant business activity. The allocation is intended to correspond to the division of profit or loss that would result from an arrangement between uncontrolled taxpayers, each performing the functions of the various members of the group that participate in the joint activity. The proposed profit split regulations caution that the profit allocated to any particular member of a controlled group is not limited to the total net profit of the group.[86] Thus, under the profit split method, it is theoretically possible for one controlled company to derive a profit while another member derives a loss.

Three profit split methods are described:

- a residual allocation method,[87] which is the basic arm's length return method ("BALRM") of the 1988 White Paper;
- a capital employed allocation method,[88] under which the parties' combined income is divided on the basis of cap-

73. §1.482-3T(d)(4) *Example 1* of the regulations.

88. Proposed §1.482-6T(c)(3) of the regulations.

© 1993 International Bureau of Fiscal Documentation

ital employed (this assumes equivalent returns on capital); and
- a comparable profit split method,[89] which is similar to the profit split method under the earlier set of proposed regulations.

A fourth method comprised of any other reasonable method may be used where capital is either difficult to measure or is not a significant determinant of operating profit.[90] The fourth method may be premised on cost ratios or other factors. However, the IRS must be satisfied that the other ratios provide an economically valid basis for an allocation.

The objective of the profit split approach is to estimate an arm's length return by comparing the relative economic contributions that two or more controlled parties make to the success of a venture. The profits from that venture are divided on the basis of the value of those contributions. These methods may be used only if both parties own items of non-routine, self-developed intangible property that contribute significantly to earning the combined income.[91] Also, significant transactions between the controlled taxpayers must take place and the parties must comply with certain administrative requirements.[92] Once elected, the profit split method cannot be revoked except with the approval of the IRS.

Under the residual allocation method, a two-step computation is made.[93] First, the operating income of each party is computed so that each generates a market return for its contributions other than valuable non-routine intangibles.[94] A functional analysis is required to identify the contributions of each party, including functions performed, resources employed and risks assumed. In this manner, profit is first allocated to the routine contributions. The residual profit that remains is divided among the controlled taxpayers based upon the relative value of the non-routine intangible property each contributes to the relevant business activity.[95] Where the relative value of actual expenditures remains more or less constant over time, the value of actual expenditures may be used to estimate the value of the contributions. Where, however, the expenditures are difficult to identify or where the facts otherwise cast doubt on the relationship between value and expenditure, other methods may be used to approximate the relative values of the contributions of each taxpayer.

The application of the residual method is illustrated in the following example:

> DP, a US corporation, developed, manufactured and marketed a line of household detergents in the United States, including a detergent that causes substantially less water pollution than competing products. The new detergent captures a substantial share of the US detergent market. FS is a European subsidiary of DP and is a well established, stand-alone company. FS alters the formula of the detergent to adapt it to European washing machines and to make the fragrance more appealing to European customers. In 1995, FS manufactures and sells the detergent in Europe.
>
> Because both DP and FS contribute valuable, non-routine intangibles to the European soap business, application of the profit split method is an appropriate method of determining the profit of each entity from the development, modification and manufacture of the low pollution detergent suitable for the European market. For 1995, DP has no direct expenses associated with the licence of the detergent formula to FS and incurs no expenses related to the marketing effort in Europe. FS's sales are $ 500 million and its expenses other than licence fees to DP are $ 300 million. Its net income exclusive of royalty expense is $ 200 million.
>
> The operating assets employed by FS are $ 200 million and data from comparable companies supports a finding that an average market return on assets is ten percent. Accordingly, the net return on $ 200 million is $ 20 million. The residual profit is $ 180 million, which is the amount that is attributable to the non-routine intangibles related to the detergent.
>
> The split of the $ 180 million profit is computed by reference to the capitalized value of expenditures as of 1995 on detergent-related research, development and marketing expressed as a percentage of the 1995 sales. Only sales related to the products covered by those expenditures are taken into account.
>
> In the case of DP, the analysis is computed on the basis of worldwide sales and in the case of FS, the analysis is computed on the basis of European sales. An analysis of the facts indicates that the R&D of DP amounts to $ 0.20 of every dollar of global sales and that the R&D performed by FS amounts to $ 0.40 of every dollar of European sales. Thus, regarding the sales in Europe, $ 0.60 of research, development and marketing expense is incurred with regard to each dollar of sales, and of that amount, DP is responsible for $ 0.20 and FS is responsible for $ 0.40. Since these amounts comprise the relative contributions of each entity, the profit split is determined on a $^1/_3 - {}^2/_3$ basis. DP is entitled to a royalty of $ 60 million ($^1/_3$ x $ 180 million) and FS retains $ 120 million ($^2/_3$ x $ 180 million). In the facts, this amounts to a royalty of 12 percent of sales.[96]

Under the capital employed allocation method, the combined profit or loss is allocated to the related parties on the basis of the relationship between the average capital employed by each related party in the relevant business activity during the taxable year and the aggregate capital employed in that activity.[97] For this method to apply, each related party must assume an approximately equal level of risk with respect to its investment in the joint activity. This is determined by reference to both the amounts at risk and the relative probability of success or failure.

© 1993 International Bureau of Fiscal Documentation

In measuring the value of intangibles employed, either fair market value or the capitalized cost of development may be used.[98] Once chosen, the valuation method must be used consistently from year to year for all intangibles in the activity. Only the developer[99] of an intangible acquired from a controlled taxpayer or a participant in a cost-sharing agreement[100] may take an intangible into account. Where an intangible is used in more than one activity, it must be apportioned when making these computations.

The capital employed method is illustrated by the following example:

> DP is a US corporation and the sole shareholder of FS, a foreign corporation. DP and FS manufacture and market widgets in the United States and Europe, respectively. Both have substantial R&D operations and both are engaged in endeavours that are subject to approximately equal risk. Their combined reported operating profit determined in accordance with generally accepted accounting principles is $ 720 million, of which DP's share is $ 400 million and FS's share is $ 320.
>
> When expenditures for marketing, sales promotion and R&D are capitalized and amortized over their respective useful lives, DP's intangibles amount to $ 440 million and FS's intangibles amount to $ 160 million. When the value of tangible assets is added, DP's total capital is $ 1,440 million (the sum of tangible and intangible assets used in its business), or 60 percent of combined capital, and FS's total capital is $ 960 million, or 40 percent of combined capital.
>
> Under the capital employed method, the $ 720 million of combined operating profit is allocated for US tax purposes between the two companies on a 60-40 basis derived from the relative amounts of combined capital employed. As a result, DP's share of combined profits is increased to $ 432 million (60 percent x $ 720 million) and FS's share is reduced to $ 288 million (40 percent x $ 720 million). The aggregate profit remains $ 720 million.[101]

C. *Intangible property*

In comparison to the proposed regulations, the temporary regulations provide separate treatment for intangible property. Intangible property includes:

- patents, inventions, formulae, processes, designs, patterns, or know-how,
- copyrights and literary, musical or artistic compositions,
- trade marks, trade names or brand names,
- franchises, licences or contracts,
- methods, programmes, systems, procedures, campaigns, surveys, studies, forecasts, estimates, customer lists or technical data, and
- other similar items.[102]

The rules for intangibles, therefore, do not cover transfers of tangible property.

Three methods are provided with respect to the transfer of intangible property.[103] These are:

1. The comparable uncontrolled transactions method

This is essentially the matching transaction method and the comparable adjustable transaction method of the proposed regulations. Taxpayers are no longer required to test the results under this method by applying the CPI. However, intangible property having a high profit potential may not be comparable with the industry norms for intangibles having much lower profit potential.

In order to be comparable, the property transferred in the two transactions must be from the same class of intangible property, must relate to the same class of products or services, and must have substantially the same profit potential.[104] In addition, the underlying circumstances of the two transactions must be sufficiently similar so that difference can be reflected by only a reasonable number of adjustments that have a definite and reasonably ascertainable effect on the amount charged.[105] Factors that must be considered when determining the comparability of the circumstances include:

- the terms of the transfer relating to exploitation rights, exclusivity, restrictions on use and limitations on covered territory,
- the stage of development of the intangible,
- the rights to updates or improvements,
- the uniqueness of the property rights and the period during which it is likely to remain both unique and protected,
- the duration of the licence and the existence of termination or renegotiation rights,
- the existence and the extent of any product liability risks for the transferee,
- the existence of collateral transactions or ongoing business relationships, and
- the functions and ancillary services that are performed by the transferor and transferee.[106]

2. The comparable profits method

This method was described above at III.A.

3. Another method

This method is similar to the other method described above at III.A.

In general, the IRS expects to see a royalty for the use of intangible property unless a different form of consideration is demonstrably more appropriate.[107] If the intangible property is transferred for a period in excess of one year, the rate is generally subject to annual adjustment to ensure that it is commensurate with the income attributable to the intangi-

107. §1.482-4T(e)(1) of the regulations.

© 1993 International Bureau of Fiscal Documentation

ble.[108] Exceptions to the periodic adjustment rule are provided in two circumstances. The first exception applies when a licence with similar terms is entered with a third party.[109] Under this exception, no periodic adjustment will be made if:

- the taxpayers enter into a written licence agreement with a comparable term to an actual licence agreement between uncontrolled taxpayers;
- the consideration charged was an arm's length amount under the comparable uncontrolled transaction method for the first year in which substantial royalties were required to be paid under the agreement;
- the comparable licence agreement generally did not permit changes to the royalty; and
- the aggregate profits earned by the controlled transferee from the exploitation of the intangible fall within a range of profits that were anticipated when the licence agreement was executed.

The second exception applies to an arm's length transaction determined from the application of another method.[110] No periodic adjustment will be made if the transaction is deemed to be at arm's length under any method other than the comparable uncontrolled transaction method in the first year in which substantial periodic consideration is required to be paid. For this exception to apply, the transfer of the intangible property must be pursuant to a written agreement that is in effect in the year in issue and upon audit, the appropriate documentation is furnished to the IRS within 30 days of a written request. Also, the total profits that were actually earned by the controlled transferee (or its total cost savings) in all open years must not be less than 80 percent or more than 120 percent of the prospective profits that were foreseeable when the controlled agreement was entered. Thus, the intangible property must have produced the level of profits or savings that were anticipated initially.

The temporary regulations reiterate that arm's length consideration for an intangible is not limited to the prevailing rates in an industry or to the rates paid in any uncontrolled transaction that do not meet the requirements of the comparable uncontrolled transaction method.[111] Thus, the arm's length consideration in a controlled transaction, particularly for non-routine intangibles that are not ordinarily transferred between uncontrolled taxpayers, may not be limited by the amount of consideration identified in uncontrolled transactions.

IV. RESTRICTIONS UNDER FOREIGN LAW

On the same day that the temporary regulations were issued, the IRS issued proposed regulations addressing the effect which a provision of foreign law has on the power of the IRS to make an adjustment involving the income of a foreign entity. The regulations attempt to reduce the impact of *Proctor & Gamble v. Commr.*, *supra*.

A. *Background*

Since 1972, a limitation has been placed on the power of the IRS to make a transfer pricing adjustment under Section 482. A taxpayer cannot be allocated income for purpose of computing tax if it would have been illegal to earn the income, and the record contains no evidence that the taxpayer disregarded the law in carrying on its activities.[112] However, the IRS contends that this limitation applies only to activities that are illegal under US law. This position is premised on the fact that *Commr. v. First Security Bank* involved a proposed transfer pricing adjustment which would have comprised an illegal act under the law of a particular state. The limited application of the case that was adopted by the IRS was successfully challenged in *Proctor & Gamble*, a case in which a multinational group of companies was faced with a legal prohibition under Spanish law.

In *Proctor and Gamble Co.*, the US-based multinational owned a Swiss entity that in turn owned a Spanish subsidiary. The Spanish subsidiary was licensed to use certain intangible property belonging to the Swiss entity. However, Spanish law as applied by the Ministry of Industry prohibited the payment of a royalty because the recipient was the shareholder of the payor. Relying on the advice of competent local counsel, no appeal was taken from the Ministry's decision.

Disregarding the prohibition, the IRS allocated royalty income to the Swiss entity. Because that entity was a controlled foreign corporation of which the US-based multinational was a US shareholder, the allocation resulted in an inclusion of income for the US shareholder under Section 951, often referred to as Subpart F.[113] The allocation was challenged and the Court upheld the taxpayer.

The Court discerned no distinction between the circumstances in *Commr. v. First Security Bank of Utah* and the facts before it. In each instance, the companies chose to follow relevant law for which violation could have resulted in the imposition of serious criminal penalties. In each instance, there was no evidence that other taxpayers were regularly carrying out activities that were purportedly illegal under the relevant law. Once the Court refused to force a taxpayer to violate an applicable statute, the holding in *Commr. v. First Security Bank of Utah* controlled the resolution of the issue.

The IRS argued that the international structure could have been rearranged to permit the payment of royalties and that the taxpayer intentionally disregarded this option. However, the Court found this reasoning to be unpersuasive. Whether ownership potentially could have been modified to allow for the payment of royalties was irrelevant. Taxpayers are not obliged to conduct affairs so as to maximize taxes as long as a transaction in issue has substance.

The IRS argued that the decision placed foreign law in a superior position to domestic US law because the IRS was prevented from making an allocation under Section 482 to cause a taxpayer to properly reflect income. However, the

108. §1.482-4T(e)(2)(i) of the regulations.
109. §1.482-4T(e)(2)(ii)(A) of the regulations.
110. §1.482-4T(e)(2)(ii)(B) of the regulations.
111. §1.482-4T(e)(4) of the regulations.
112. *Commr. v. First Security Bank of Utah*, 405 U.S. 394 (1972).
113. In broad terms, Subpart F provides that certain types of income derived by controlled foreign corporations are to be included in the income of certain US shareholders almost as if the profits of the foreign corporation from the specified income were distributed as a dividend.

© 1993 International Bureau of Fiscal Documentation

Court concluded that Section 482 applies only where the controlling interest has utilized its power to shift income. There was no reason for the provision to apply where that exercise of power was absent as a result of a valid law.

The IRS announced at the end of 1992 that it would not appeal the matter to the US Supreme Court. Rather, it advised that the technical issue would continue to be raised for other taxpayers and would be litigated by the IRS until an appeals court in a different circuit reaches a conflicting decision. At that point, the IRS may request Supreme Court review.

B. *Temporary and proposed regulations*

The temporary and proposed regulations augment the announced IRS litigation policy. Their effect is to change the exclusion into an item of deferral. This merely delays the timing of income recognition.[114] This also defers the tax benefit of deductions that are allocable and apportionable to the item of deferred income. The proposed regulations also impose a set of administrative compliance requirements. Failure to comply with those requirements may prevent a taxpayer from having the opportunity of raising the prohibition of foreign law at a subsequent time.[115]

Under the temporary and proposed regulations, a taxpayer must demonstrate that the receipt of an arm's length payment was prevented by a foreign legal restriction.[116] If that showing can be made, the taxpayer may elect the deferred income method of accounting with respect to the item in issue. An applicable legal restriction is a restriction that:

- is publicly promulgated and generally applicable in a foreign country;
- has been unsuccessfully challenged by the taxpayer or a related party so that all practicable legal remedies afforded under foreign law for obtaining a waiver have been exhausted;
- expressly prevents the payment of an arm's length amount; and – was not circumvented through other transactions between the controlled taxpayers.[117]

If the restriction meets all the foregoing tests and the taxpayer has elected the deferred income method of accounting, any Section 482 adjustment will be deferred until the restriction is removed.[118]

To elect the deferred income method of accounting, a written statement must be attached to a timely US income tax return (including an amended return). The election must identify the affected transactions, the parties involved and the applicable foreign legal restriction. Deductions and credits chargeable against a deferred amount are subject to deferral under Section 461. The return must be filed not later than the date the IRS first contacts any member of the controlled group concerning an examination of the return for the taxable year in which the foreign restriction applies.

If a taxpayer demonstrates that the transaction as structured is arm's length by reference to comparable uncontrolled transactions, the deferred income rules will not be applicable. The item will not be adjusted.[119] This exception is intended to apply to circumstances where foreign governments limit the amount of royalties that may be paid in transactions between uncontrolled parties, and will likely have widest impact in the developing world. These circumstances should be compared to the facts of *Proctor & Gamble* where the Spanish legal restriction applied only to royalties that were paid to foreign shareholders.

The temporary and proposed regulations are illustrated in two examples.

> *Example 1*: DP is a domestic corporation that is the parent company of foreign corporation FS. DP licenses an intangible to FS, but the law in foreign country Y, the jurisdiction of residence for FS, prohibits the payment of royalties to related companies that are not resident in Y. DP attaches to a timely filed US income tax return a written statement that identifies the transaction, the parties and the foreign legal restriction. The arm's length royalty rate is determined to be ten percent of sales, which FS does not pay. However, FS pays dividends that are equal to ten percent of sales.
>
> The deferred income method of accounting is not applicable because the payment of dividends has the effect of circumventing foreign law.[120] The example does not address whether DP is entitled to an indirect foreign tax credit[121] for the full amount of foreign tax paid to country Y at such time as dividends from FS are received. If the dividend is treated as a "royalty" under US concepts, and that "royalty" is a significant expense that is not deductible under country Y law, is the country Y tax an income tax under U.S. foreign tax credit concepts? Presumably, the "royalty" does not bring indirect foreign tax credits with it.
>
> *Example 2*: The facts are unchanged from Example 1, except that the law under foreign country Y permits the payment of a royalty, but limits the amount to five percent of sales. FS pays a five percent royalty to DP and DP demonstrates the existence of comparable uncontrolled transactions in which a controlled licensor accepted a rate of five percent, even though the arm's length amount for the royalty would otherwise have equalled ten percent. The example concludes that no adjustment is to be made.[122]

V. PENALTY PROVISIONS

A. *In general*

Section 6662(a) imposes a penalty in connection with any underpayment of tax that arises, *inter alia*, from a substantial

114. Proposed §1.482-1T(f)(2)(iii) of the regulations.
115. Proposed §1.482-1T(f)(2)(i)(B) of the regulations.
116. Proposed §1.482-1T(f)(2)(i)(A) of the regulations.
117. Proposed §1.482-1T(f)(2)(ii) of the regulations.
118. Proposed §1.482-1T(f)(2)(iii) of the regulations.
119. Proposed §1.482-1T(f)(2)(iv) of the regulations.
120. Proposed §1.482-1T(f)(2)(v), *Example 1* of the regulations.
121. Under IRC Sec. 902, a US corporation may claim a credit for the foreign income taxes paid by its foreign subsidiaries. The credit is claimed at the time dividends are received from the foreign company. Certain minimum levels of ownership must be maintained in the subsidiaries (at least 10% of the voting shares of a first tier subsidiary and at least 5% indirect ownership interest in the voting shares of lower tier subsidiaries). No credit is allowed for foreign taxes paid by subsidiaries lower than third tier subsidiaries.
122. Proposed §1.482-1T(f)(2)(v), *Example 3* of the regulations.

© 1993 International Bureau of Fiscal Documentation

valuation misstatement. The valuation penalty provisions were extended to cover understatements of tax arising from transfer pricing adjustments because of the perceived difficulty faced by the IRS in obtaining information relating to the methodology employed in establishing a transfer price between controlled parties. In the view of the IRS, many taxpayers do not rely upon any specific comparable transaction or other contemporaneous information in planning for or in defending intercompany transactions. These taxpayers defend transfer pricing positions by finding whatever transaction or method gives rise to a result that most closely approximates the controlled transaction reported on their tax returns. As a result, the IRS believes that there is unnecessary delay in the conduct of examinations and undue controversy between the taxpayer and the IRS as each seeks to develop pricing formulas on a post-transaction basis.

B. *Penalty provision*

Section 6662 imposes a penalty when there is an understatement of tax arising from a substantial valuation misstatement. A substantial valuation misstatement includes an allocation under Section 482 if:

- the transfer price claimed on the return in connection with property, services or the use of property received from a controlled party, presumably outside the United States, is inflated so that the taxpayer's payment amounts to 200 percent or more of the amount determined under Section 482 to be the arm's length price – in other words, the deduction or transfer price for goods is reduced by half as a result of the IRS adjustment; or
- the transfer price claimed on a return in connection with property, services or the use of property provided to a controlled party, presumably outside the United States, is understated so that the amount received by the taxpayer is 50 percent or less of the amount determined under Section 482 to be the arm's length price – in other words, sales receipts or other income is doubled as a result of the IRS adjustment; or
- the net transfer price adjustments proposed by the IRS for the year exceed $ 10 million.[123]

The penalty applies if any one of the foregoing provisions is found to be applicable. Thus, a penalty may be imposed with regard to an adjustment of less than $ 10,000,000 if it reflects an overstated payment or an understated receipt.[124]

The penalty equals 20 percent of the adjustment in tax. However, if a gross valuation misstatement exists, the penalty is 40 percent of the underpayment of tax. A gross valuation misstatement arises if:

- the payment to a controlled party which is reported on the US tax return exceeds an arm's length price by more than 400 percent – the deduction is reduced by more than 75 percent; or
- the receipt from a controlled party which is reported on the US tax return is understated so that it does not exceed 25 percent of an arm's length return – sales receipts or other income is increased by more than 300 percent; or
- the net adjustment in tax under Section 482 exceeds $ 20 million.[125]

In determining whether the $ 10 million and $ 20 million thresholds have been met, the IRS compares the amount reported on the original return with the amount determined to be arm's length. Increases in taxable income may be reduced by decreases, including set-offs[126] that reduce adjustments when controlled taxpayers enter into non-arm's length transactions some of which favour the US company (see the discussion of correlative adjustments above at II.H.).[127] If the taxpayer adjusts its results by filing an amended return, the IRS will make its comparison by reference to that amended return, rather than the original return. For this rule to apply, the amended return must be filed before the taxpayer is first contacted by the IRS and advised that an examination is to begin for the year.[128]

If a loss or a credit in one year ("the year of origin") is carried to another year ("carryover year") and reduces the tax in that other year, the penalty may be imposed for the carryover year if the loss or credit reflects a gross valuation misstatement in the year of origin.[129] Only one penalty may arise from the excessive carryover. As a result, the excessive carryover is not again taken into account for the purpose of imposing a second penalty in the carryover year.

C. *Foreign-to-foreign exception*

For purposes of determining whether the $ 10 million and $ 20 million thresholds have been met, adjustments to transactions solely between foreign corporations are not taken into account.[130] This rule does not apply, however, if the adjustment increases the effectively connected income or the US-source income of one of the foreign corporations. In the former set of circumstances, US tax imposed under Section 882 is involved and in the latter set of circumstances, US tax under Section 881 is involved. Of course, if the thresholds have been met without taking the foreign transactions into account, the penalty will be imposed on the increase in tax that results from the foreign transactions.

D. *Reasonable cause exception*

In determining whether the $ 10 million and $ 20 million thresholds have been met, any increases in taxable income that are attributable to a transfer pricing adjustment will be excluded if the taxpayer shows that there was reasonable cause for the result reported and it has at all times acted in good faith.[131]

There are two elements to the reasonable cause and good faith exclusion, both of which must be satisfied in order to

prevent imposition of a penalty.[132] The first element is that the taxpayer must have made a reasonable effort to accurately determine its proper tax liability.[133] The second element is that the taxpayer must have reasonably believed that its transfer pricing methodology produced an arm's length result.[134]

The determination required under the first element addresses the existence of a pricing methodology. It must be made not later than the time the return is filed for the tax year and must be supported by documentation that is contemporaneous with that determination. The documentation must include an analysis indicating that the result was arm's length within the meaning of the temporary regulations. If the documentation cannot be provided within 30 days of an IRS request, it is presumed that the taxpayer did not make a reasonable effort to accurately determine its proper tax liability, notwithstanding the actual existence of that documentation. This element addresses the existence of a pricing methodology. In essence, if the document cannot be presented on short notice, it likely did not exist when the return was filed.

With regard to the second element, the reasonableness of the taxpayer's belief is to be made in light of the experience and knowledge of the taxpayer. This element addresses the quality of the methodology adopted. The taxpayer must show that at the time the tax return was filed, it reasonably believed that the result would more likely than not be sustained on its merits.[135] This element addresses the quality of the methodology adopted. If at the time the prices were established, the taxpayer had a reasonable belief that its methodology would produce an arm's length result and the taxpayer had a reasonable belief that the underlying critical assumptions would not change during the taxable year – and in fact those assumptions had not changed by the time the tax return was filed, the taxpayer's belief in the arm's length nature of the transfer pricing method will be considered reasonable. However, the belief is not reasonable if, before the tax return is filed, the taxpayer learns of a change to a critical assumption but fails to review the reasonableness of its initial result.

In determining the reasonableness of a taxpayer's belief that its transfer pricing methodology is arm's length, factors to be considered include (i) whether the taxpayer used one or more methods prescribed in the substantive regulations,[136] and (ii) whether the taxpayer relied on the advice of a competent professional such as an attorney, accountant or economist.[137] The advice may be in the form of a study and the professional may be in the employ of the taxpayer – the adviser need not be an outside consultant. However, reliance on a professional is considered to be reasonable only if:

- full disclosure of all relevant information has been made by the taxpayer,
- the methodology and critical assumptions underlying the advice are reasonable, and
- the quantity and quality of data used in the study reflects the data available in the taxpayer's industry.

Critical assumptions are comprised of the objective business and economic criteria that are fundamental to the operation of the taxpayer's transfer pricing methodology. They include any fact about the taxpayer, a third party or an industry that would significantly affect the substantive conclusions of the study if the assumption changed.

A taxpayer may be considered to have acted with reasonable cause and good faith even if it chooses to defend its transfer pricing results by way of a methodology that is different than that used in preparing its return.[138] The key issue is not the particular method used to defend a position in an examination, but the reasonableness of the original tax return position.

VI. CONCLUSION

The temporary regulations attempt to bridge the differences that arose between the tax bar and the IRS in connection with the proposed regulations issued in 1992. The temporary regulations reflect an approach that broad guidelines based on reasonableness are preferable to detailed rules setting forth the mandatory use of specific methodology in specific circumstances. The tone throughout the temporary regulations is conciliatory.

Nonetheless, it is too early to determine whether the tone reflects style or substance. To the extent that taxpayers either are required to perform a functional analysis of comparable transactions or cannot avail themselves of a pricing method based on comparable transactions, the changes in the regulations may be of style, only. US-based multinational groups with manufacturing operations in the third world that are not clearly of a stand-alone nature may find this to be the case. For those groups, the existence of non-routine intangibles transferred to the foreign subsidiary may preclude use of any method other than the comparable profit method. On the other hand, to the extent that the CPI is no longer the principal method and another adjustable method is available, the temporary regulations are a major step forward.

Even if the regulations turn out to be favourable for multinational groups, the mood in Congress is much more aggressive with regard to international business. A consensus appears to be forming for the computation of a minimum profit that is taxable in the United States on all international business transactions, whether inbound (i.e. US distributors acting on behalf of foreign parents) or out-bound (i.e. foreign manufacturers acting on behalf of US parent companies). If this type of proposal is enacted, the benefit that may be derived from the use of a method other than the comparable profits method may be ephemeral.

JAPAN:

TAXATION OF DIVIDENDS AND INTEREST

Alum Bati

This article looks at the taxation of dividends and interest paid to, or received from, non-Japanese companies. It concentrates on the new thin capitalization rules as well as withholding taxes and the method of giving tax credits for foreign taxes.

Mr Bati is a British barrister who is currently the British Petroleum Co plc's National Tax Manager for Japan and Korea. He is also Chairman of the Foreign Enterprises Japan Tax Forum based in Tokyo.

I would like to express my thanks to Hiroo Kato and Justin Woodhouse and also to Ritsuko Kinjo, all of Price Waterhouse, Tokyo, for their invaluable comments and suggestions. The views and comments expressed herein, as well as any errors, are, of course, entirely my own.

I. PRINCIPLES OF JAPANESE TAXATION

An overview of general Japanese tax principles (subject, of course, to exceptions and qualification) relating to the giving of tax credits is a helpful starting point.

Foreign withholding taxes, national or local, are creditable. The amount of credit is subject to an overall limitation.[1] Japan applies the overall method in computing Japanese tax on foreign dividends and interest (and other non-Japanese-source income). This allows cumulation of foreign dividends and interest and, therefore, the averaging of foreign taxes paid.

In the case of dividends received from abroad, Japan only gives indirect or underlying tax credits where at least 25 percent of the shares in that company are owned by the recipient and have been owned for at least six months before the dividend becomes payable.[2] The 25 percent rule may be modified by a tax treaty. Indirect credits are also available for dividends from second-tier subsidiaries in certain circumstances.

Foreign taxes may be expensed rather than taken as a credit.[3]

There are special rules applying to tax havens (which treat income of certain non-resident companies as taxable in Japan) but, basically, where a dividend is paid out of income already taxed in Japan, the dividend may be excluded from taxable income.[4]

Indirect or underlying tax credits are not normally available in respect of preference dividends (but see below).[5]

A. *Source of income*

All interest and dividends earned by a resident of Japan are, in theory, taxable in Japan. However, non-permanent residents of Japan (basically, non-Japanese citizens whose residence in Japan has not exceeded five years) are not taxable on non-Japanese- source income if it is not received in or remitted to Japan. Non-residents are taxable only on Japanese-source income.

Japanese-source dividends include dividends from Japanese companies.[6]

Japanese-source interest includes interest on Japanese local or national government bonds, Japanese corporate bonds or debentures, interest on monetary deposits with a branch in Japan, distribution of profits of joint operation trusts or bond and debenture investment trusts, and interest on loans to a person carrying on business in Japan and relating to that business.[7]

However, interest is not regarded as domestic-source income where it is on loans to a non-resident individual or foreign corporation for the purchase of ships or aircraft for use in that person's business, or on loans made to anyone for business carried on outside Japan, or on loans made to a non-resident other than for use in his business.[8]

Normally, only domestic-source income is subject to Japanese withholding taxes, even if foreign-source income is paid in Japan by a Japanese resident (other than one who is a paying agent). The corollary of this is that withholding is required

1. Art. 69 Corporation Tax Law, Law No. 34, 1965 ("CTL") and Arts. 141 and 142 of Corporation Tax Law Enforcement Order (Cabinet Order No. 97 of 1965) ("CTLEO").
2. CTL Art. 69(4), CTLEO Art. 146.
3. CTL Art. 41.
4. Special Taxation Measures Law No. 26, 1957 ("STML"), Art. 66-7.
5. CTLEO Art. 147(2)(iii).
6. Income Tax Law (ITL) Law No. 33, 1965, Art. 161(v); CTL Art. 138(v).
7. ITL Art. 161(iv), (vi); CTL Art. 138(iv), (vi).
8. ITL Basic Circular, 161-20.

© 1993 International Bureau of Fiscal Documentation

from domestic-source income even if it is paid abroad, although it does not have to be accounted for until the end of the month following the month in which tax is withheld (see double tax treaties below for possible modifications to these rules).[9]

Where foreign-source dividends or interest are paid through an agent in Japan, the agent will withhold Japanese income tax at the appropriate Japanese rate.[10]

Example

Hiroshi is entitled to dividends from J Inc., a US corporation, of US$ 10,000 (before US or Japanese withholding taxes). The net amount received by the paying agent in Japan will be $ 8,500 (i.e. after 15 percent US withholding tax). The paying agent will convert into yen and deduct, from the net amount of $ 8,500, a further 20 percent Japanese withholding tax. Net received by Hiroshi will be the equivalent of $ 6,800.

In this example, Hiroshi will be able to take credit for the foreign and Japanese withholding taxes in calculating his final liability to Japanese taxes.[11]

In the case of foreign dividends, withholding tax deducted by Japanese paying agents will be calculated on the net dividend amount received by them. However, in the case of foreign interest paid through an agent, the agent will deduct Japanese withholding tax from the gross amount but give credit for the foreign tax withheld.

Example

Foreign Co. pays dividends of 100 (before foreign withholding tax of 15) and interest of 20 (before foreign withholding of 2). Both payments are received in Japan by an agent. In the case of the dividend, the agent will deduct 20 percent withholding tax from the net amount of 85. In the case of interest, he will deduct withholding tax of 20 percent (i.e. 4) but will give credit for the foreign tax so the net tax withheld will be 2.

B. *Creditable taxes*

Having determined that the source of the dividends or interest is foreign (and tax treaties may have a bearing on this), one has to consider whether the foreign taxes are creditable.

Double tax treaties will specify (sometimes in general terms) which taxes are covered by the treaty. Credit is generally available for national or local taxes corresponding to Japan's corporation tax and charged upon income of a corporation or which is, like Japan's inhabitants' tax, a proportion of another tax which is itself charged on income. Excess profits taxes, and taxes on specified income or on some specific amount, such as withholding taxes on dividends and interest, are also creditable.[12] Penalty taxes are not creditable.

Foreign direct taxes, e.g. withholding taxes, are normally creditable.

Subject to double tax treaties (see II below), foreign indirect or underlying taxes are only creditable in respect of dividends where the recipient is a company which owns at least 25 percent of the issued share capital of the paying company or owns at least 25 percent of the issued voting shares of the paying company. The shares must be owned (or indirectly owned in the case of second tier subsidiaries) for at least six months before the dividend becomes payable for indirect tax credits to apply.[13]

C. *Computation of tax credits*

In principle, foreign dividends and interest are pooled with other income and foreign taxes credited against the total Japanese tax liability. In practice, however, there are a number of restrictions on the availability of tax credits even though foreign taxes may be creditable.

1. Foreign tax credit limitation

The amount of foreign taxes credited against national corporation tax cannot exceed the amount arrived at by applying the following formula:[14]

$$A = \frac{B}{C}$$

where

- A is the amount of Japanese national corporation tax;
- B is total taxable income from foreign sources (but excluding twothirds of income from foreign sources not taxed in the country of source.[15] Foreign-source losses must be deducted from foreign-source income, and foreign-source income must be grossed up for creditable foreign taxes if credit is wished to be taken.[16] The amount in B is usually limited to 90 percent of worldwide income although a higher percentage may be allowed if more than 90 percent of total employees are employed outside Japan or if foreign taxes exceed 50 percent of total income;
- C is total worldwide taxable income before loss relief brought forward from previous years.[17]

Generally, foreign tax exceeding 50 percent of foreign taxable income must be expensed rather than be taken as a credit.[18]

There are special and complex tax credit limitation rules which apply to interest withholding taxes, including "tax spared" credits.[19] The rules differ slightly depending on

9. ITL Arts. 181, 212(1),(2); CTL Art. 139.
10. In the case of interest, the withholding tax will be 20% from the gross, i.e. interest received plus foreign taxes but credit will be given for foreign taxes up to 20%. For dividends, the withholding will be 20% from the net dividend, although in some cases it may be to the advantage of higher rate taxpayers to elect for *bunri kazei*, or a final withholding tax of 35%.
11. On a dividend, net of US withholding tax, of less than ¥ 250,000, or ¥ 500,000 where J Inc. pays only one dividend during the year, Hiroshi could have elected for the *bunri kazei* special withholding tax treatment. Hiroshi will not be entitled to the special tax credit available in respect of domestic dividends; see ITL Art. 92.
If the dividend is less than ¥ 100,000, or ¥ 50,000 where more than one dividend is paid by the company in the year, 20% will be the final withholding tax.
These limits give rise to an interesting, and advantageous, practical anomaly, i.e. many foreign companies pay quarterly dividends and Japanese receiving agents apply the limits on a per dividend basis. Thus, for example, if a company pays quarterly dividends the *bunri kazei* (35% election) could be applied to total dividends from that company of up to ¥ 1 million; see STML Art. 8-4.
12. CTL Art. 69(1); CTLEO Art. 141(1),(2).
13. CTLEO Art. 146.
14. CTLEO Art. 142(1).
15. Special Taxation Measures Law Enforcement Order, Cab. Ord. 43, 1957 ("STMLEO"), Art. 39-18(7). Income deemed to have suffered tax under tax sparing provisions of tax treaties is not considered "untaxed" for this purpose.
16. CTLEO Art. 148(2).
17. CTLEO Art. 142(2).
18. CTLEO Art. 142-3.
19. CTLEO Art. 142-3(2).

© 1993 International Bureau of Fiscal Documentation

whether or not the main business of the company concerned is a financial one (which includes a securities business).[20]

For non-financial businesses, the limit is calculated as follows:

(a) if the following ratio is less than 1:5 there is no special limitation (but the overall 50 percent limitation still applies):
Ratio = gross interest income:(gross interest income + gross profit)

"Gross profit" is sales less cost of sales.

The above calculation is an average over three years.

(b) If the ratio in (a) is more than 1:5, the limitation is as follows:
(i) if the average ratio of adjusted taxable income to the sum of gross profit and non-operating revenue in the year concerned and the two preceding years is more than 1:5, the full amount of withholding taxes are creditable (and the normal 50 percent limitation does *not* apply);
(ii) if the average ratio of adjusted taxable income to the sum of gross profit and non-operating revenue in the year concerned and the two preceding years is equal to or less than 1:5 but more than 1:10, no more than 15 percent of interest received may be credited;
(iii) if the average ratio of adjusted taxable income to the sum of gross profit and non-operating revenue in the year concerned and the two preceding years is equal to or less than 1:10, no more than ten percent of interest received may be credited.

The basic principle in Japan is that only net of foreign tax income need be brought into tax. Any disallowed tax credits may, therefore, be excluded from taxable income.

For financial institutions the exceptional treatment in (a) above does not apply. The ratio in (b) above is similar but the denominator is total revenue and the numerator is taxable income, i.e. taxable income:total revenue (including net capital gains).

2. Calculation of foreign tax credit

In addition to the tax credit limitation calculated as above, one has, of course, also to calculate the amount of foreign tax credit itself. There is normally no problem in the case of withholding taxes but indirect taxes relating to dividends may be more difficult.

Basically, the indirect tax credit is calculated as the lower amount given by applying the following formulas:

$$\text{Foreign taxes of paying company in the accounting period} \times \frac{\text{Dividend before withholding}}{\text{Income of paying company after foreign taxes}}$$

or

Dividends received (including withholding) – (2 x withholding on dividends).[21]

Example

J Co. receives a dividend of 75 from its UK subsidiary. The subsidiary has pre-tax profits of 200 and pays UK corporation tax of 66. The creditable tax for Japanese tax purposes (before applying the limitation in 1. above) will be:

$$66 \times \frac{75}{134} = 37$$

(Applying the alternative formula would give 75 as there is no UK withholding in such cases.)[22]

3. Relationship of foreign tax to accounting periods

The foreign tax which is taken into account is the tax relating to the income out of which the dividend is paid. If the dividend exceeds the distributable income of a particular accounting period (but see 8. below), the dividend is deemed to be paid out of earlier accounting periods on a last-in, first-out basis.

Example

A UK subsidiary started operations in 1989 and has the following distributable profit record (tax paid in brackets):
1989 150 (tax 45)
1990 150 (tax 45)
1991 150 (tax 45)
1992 60 (tax 15)
In 1992, the subsidiary declares and pays a dividend of 200 purportedly out of 1990 profits. As profits in 1990 were only 150, 50 of the dividend must in fact have been paid out of some other year. It is arguable that, for indirect credit purposes, none of the dividend is paid out of 1992 and the balance of 50 is paid out of 1989.[23] If so, the creditable tax calculation will be:

1990 $45 \times \frac{150}{150} = 45$

1989 $45 \times \frac{50}{150} = 15$

Maximum indirect foreign tax credit 60

Total gross dividend subject to Japanese tax is 260.[24]

4. Source of dividend undefined

Where no reference is made to the year out of which the dividend is paid, it is deemed to be paid out of the income of the current accounting period (subject to the rule concerning sufficiency of profits, etc.).

5. Three-year carry-forward of excess foreign tax credits

Foreign taxes in excess of the limitation above, and, to the extent they cannot be offset against local taxes (see 14. below) may be carried forward to an accounting period commencing not more than three years after the start of the period in which the tax credit arose. The carried forward credits are available on a first-in, first-out basis, subject, of course, to not exceeding the limit for the relevant accounting period.[25] Carried forward credits may be applied against national corporation and local inhabitants' taxes. These provisions apply for accounting periods beginning after 31 March 1989 (the

20. There are transitional provisions for loans concluded in accounting periods starting before 1 April 1989; see Corporation Tax Cabinet Order Transitional Measures, Art. 20.
21. CTLEO Art. 147(1).
22. A dividend by a UK company whose Japanese shareholder owns 10-25% of the shares does not get the benefit of either an underlying tax credit or a refund. See Japan/UK tax treaty.
23. CTLEO Art. 147(2)(i) refers to the dividend exceeding the income for the accounting period which has constituted the basis for the computation of the dividend. In such a case, it is assumed that the dividend is paid out of the profits of earlier periods, beginning with the most recent. As UK company law allows a company to designate which year profits have been paid out of, it seems that a year yielding higher foreign tax credits could be chosen.
24. See CTLEO Art. 147(2)(v).
25. CTL Art. 69(2); CTLEO Art. 144.

© 1993 International Bureau of Fiscal Documentation

carry-forward period used to be five years and transitional provisions apply to accounting periods commencing before that date).[26] Tax credits which have been expensed cannot be carried forward.[27]

6. Three-year carry-forward of excess limitation

Where the creditable foreign taxes are less than the limitation calculated in 1. above, the excess limitation may be carried forward for three years. This provision, combined with 5. above, essentially means that excess foreign tax credits can be carried forward or back for three years.

7. Preference dividends

Underlying tax credits are not available in respect of preferred dividends, meaning dividends on shares paid at a specified rate in preference to other shares (see double tax treaties below).[28] However, indirect tax credits are available in respect of dividends declared on participating preference shares to the extent that the basis on which dividends are calculated on the preference shares is the same as that for ordinary shares.[29] Withholding taxes are, in any event, creditable.

8. Income for an accounting period

The income for an accounting period (see 3. above) is the greater of the after-tax profit for the period or the profit for tax purposes in the foreign state (but adjusted for corporation or similar taxes included in expenses and income not subject to tax). Thus, for example, in the United Kingdom, petroleum revenue tax (treated as an expense for corporation tax purposes) will be added to taxable profits[30] before the comparison is made. Similarly, capital gains not subject to tax in, say, the Netherlands or Singapore, will be added back to taxable profits.[31]

9. Taxes imposed late

Creditable taxes in respect of a dividend paid for a particular accounting period include foreign taxes imposed (i.e. paid or assessed) before the end of the accounting period in which the Japanese company receives the dividend. Foreign taxes imposed after the end of that accounting period will not, therefore, be creditable in respect of a dividend received in an earlier period.[32]

10. Gross up

The dividend is grossed up for creditable foreign taxes.[33]

11. Refund of foreign taxes

Where already credited foreign taxes are reduced or refunded during a later accounting period *of the shareholder*, the refunded amount will reduce creditable taxes, if any, in that period. Any excess of refund is then set against brought-forward foreign tax credits and the balance, if any, is used to reduce creditable taxes for the next two accounting periods. If there is still an insufficiency of creditable taxes in those two periods, any balance left at the end of the second period is treated as taxable income in that period.[34]

12. Exchange rates

Foreign taxes are usually translated at the telegraphic transfer mid-rate rate of exchange applying on the date the dividend is payable or some other acceptable consistently applied rate. Acceptable methods include monthly average, the month or week end rate of the preceding month or week, etc.[35]

13. Treating foreign tax credits as expenses

In relatively rare instances, it may be to a taxpayer's advantage to treat foreign taxes as business expenses (effectively, treating only the net dividend as taxable income). However, if the taxpayer makes this election, it must be applied to all foreign direct (i.e. withholding) taxes.[36] In the case of indirect taxes, the taxpayer may opt in respect of each dividend whether or not to gross up for the indirect tax.[37] However, any taxes which are expensed cannot be carried forward.

14. Foreign taxes creditable against local taxes

Foreign taxes in excess of the limitation in 1. above may be offset against Japanese prefectural and municipal inhabitants' taxes, in that order. The former ranges between five and six percent and the latter ranges between 12.3 and 14.7 percent of the corporation tax amount.[38] A limitation applies to the amount of foreign taxes which can be offset against local taxes as it does for corporation tax. This is derived by applying the local tax rate to the limitation for national corporation tax purposes.

For individuals, foreign withholding taxes not exceeding 20 percent (for municipal tax) or ten percent (prefectural inhabitants' tax) of the maximum amount creditable under the ITL may be credited against these local taxes.

Enterprise tax is levied only on net foreign dividends and interest and, therefore, no foreign tax credits are available against it.

15. Allocation of expenses

General expenses, including interest, will normally be rateably apportioned between domestic and non-domestic-source income. However, where foreign income is mainly in the form of dividends, interest or royalties, some other fairer method of allocation may be applied.[39]

16. Branches

A branch of a foreign company is taxable only on domestic-source income and is not entitled to foreign tax credits. Interest and dividends from abroad which are attributable to the business of the branch are regarded as Japanese-source income (subject to double tax treaties). Such income can, however, be excluded from the tax return if it can be shown that it has borne foreign tax.[40]

17. Stock dividends

Stock dividends constitute taxable income in Japan. This is so even where shares are issued rateably to all shareholders and no cash changes hands. Such dividends may not be subject to withholding taxes overseas (e.g. in respect of bonus or scrip issues of shares representing capitalization of reserves in the United States) but will be subject to Japanese taxation. However, withholding tax is only levied on the nominal value of the shares so it may be in a Japanese shareholder's interest to opt for stock dividends if available.

In the United Kingdom, a UK resident is not entitled to repayment of any tax credit associated with a stock dividend (which will be the case where the shareholder has elected to take stock instead of a cash dividend), and so a Japanese shareholder is unlikely to be entitled to a part repayment of the tax credit from the UK government.[41]

18. Unremittable foreign income

Dividends and interest earned overseas which cannot be remitted because of foreign law (e.g. foreign exchange controls) may be omitted from income until the restrictions are lifted.[42]

II. DOUBLE TAX TREATIES

Japan has tax treaties with approximately 40 countries. Most of these reduce the normal Japanese rate of withholding tax on dividends and interest. In the case of dividends, there may be an additional reduction in the rate of withholding tax where the foreign shareholder has a substantial holding. In the case of interest received in Japan, some tax treaties provide for tax-sparing credits (i.e. credit for foreign taxes deemed paid but not actually paid). Some features of the double tax treaty provisions relating to dividends and interest are reviewed below.

A. *Dividends*

The standard rate of Japanese withholding tax on dividends (20 percent) paid to shareholders in treaty countries is generally reduced to 15 percent (or ten percent in the case of substantial shareholdings). In one instance, Zambia, dividends paid to a Zambian shareholder are exempt from Japanese withholding tax.

Most current treaties with Japan were negotiated before the abolition of Japan's split-rate tax system (when distributed profits were taxed at a lower rate than retained income) so relatively high rates of withholding taxes were imposed on distributions overseas. As these high rates are no longer required, new treaties are likely to have lower rates of withholding tax (most likely five percent). Examples of this are the amended Netherlands treaty, the revised Norway treaty and the new Luxembourg treaty.

There are some interesting differences between the treaties and divergences from the OECD model.[43] First, most treaties seem to provide for the reduction of withholding tax to ten percent, usually where a corporate shareholder "owns" (directly or indirectly) at least 25 percent of the voting shares of the dividend paying company (share ownership percentages in fact vary from ten percent, United States, to 50 percent, e.g. Austria. The OECD model treaty refers to "the beneficial owner" of the dividend but this phrase is not generally used. Nor do Japan's treaties normally adopt the OECD model's limitation to direct holdings only.

Secondly, whilst the OECD model commentary expressly states that a time requirement for share ownership should not ordinarily be applied, Japan frequently requires shares to be owned for six months (e.g. Switzerland, France, Ireland) or 12 months (e.g. Germany, United Kingdom) prior to the dividend payment before the reduced rate for large holdings can be applied. In the case of the United States even more than 12 months could be required. It should be noted that Japan expressly reserved its position on this section of the OECD model.

Thirdly, the period of ownership mentioned above is sometimes calculated from the date the dividend becomes payable (e.g. Switzerland) but, more usually, from the date of payment (e.g. United States). In the case of Finland, however, the period of ownership is calculated from the end of the accounting period for which the distribution takes place.

1. Dividends defined

Dividends are usually defined (for withholding tax purposes) basically in accordance with the OECD model as meaning "income from shares, ... mining shares, founders' shares or other rights, not being debt-claims, participating in profits, as well as income from other corporate rights assimilated to income from shares by the laws of the State of which the company making the distribution is a resident".[44] There are, of course, variations from treaty to treaty to take account of foreign law. For instance, in the German treaty, income derived by "a sleeping partner" (Stiller Gesellschafter) from "his participation as such" is included. The treaty with Canada has an interesting addition: for Canada only, "dividends" include income from bonds or debentures which is treated as a distribution of profits.[45] Such recharacterized dividends will

40. CTLEO Art. 176(5), (6).
41. It is, however, not entirely beyond doubt, having regard to the UK–Japan double tax treaty Art. 11(3)(a)(ii), (b).
42. CTL Basic Circular, 16-3-7.
43. Organization for Economic Co-operation and Development Model Double Taxation Convention, 1977. The 1992 Model was not available to the author at the time of writing.
44. "Jouissance" shares and "jouissance" rights are also included in the Brazilian, French and Swiss treaties.
45. See para. 5 of the Protocol of May 1986 to the 1986 Convention between Japan and Canada.

© 1993 International Bureau of Fiscal Documentation

suffer Canadian dividend withholding tax but presumably receive credit in Japan under the interest article of the treaty.

Direct withholding taxes are almost invariably creditable in Japan against Japanese tax on the income but limited to the amount of Japanese tax appropriate to that income (see above for method of calculation).

Indirect taxes (e.g. taxes on the income out of which the dividend is paid) are also creditable under the majority of Japan's tax treaties where the recipient owns a specified percentage of the payer's shares. The requisite shareholding is usually 25 percent (either of voting shares or total shares) but is ten percent in a few cases (e.g. Brazil).

However, until recently, indirect tax credits were only possible in respect of taxes paid by first-tier subsidiaries. It now includes indirect taxes paid by second-tier subsidiaries also.

The general definition of *what* is creditable and *when* raises some important issues and interesting anomalies. First, most treaties, to give credit for foreign taxes, use the following form of words:

"Subject to the laws of Japan regarding the allowance as a credit against Japanese tax ..." but the UK/Japan treaty (and a few others, e.g. Hungary and Switzerland) uses the words "Subject to the *present* provisions of the laws of Japan ... and to any *subsequent modification* of those provisions ..." (italics added). The form of words was presumably preferred by the UK negotiators for the purposes of credit in the United Kingdom and was simply copied by the Japanese. However, "modification" might not include substantial revision, substitution or repeal so it appears, in theory, that the taxpayer in Japan will have to be aware of the law as it stood at the date of the treaty and its subsequent history.

Secondly, it is at least arguable that, as tax conventions override domestic legislation, to the extent that they give the taxpayer more favourable treatment, if a law favourable to a Japanese taxpayer receiving, say, UK dividends were repealed, the taxpayer could still rely on the repealed provisions.[46]

Thirdly, it is arguable that the words "subject to the laws of Japan regarding the allowance of credit" only apply to the method of calculation, e.g. the taxes against which foreign taxes are offsettable, as this is not specified in the treaties.[47] Otherwise, if the words are taken to include the very principle of giving credit for foreign taxes,[48] the treaty provisions could be made otiose by domestic legislation. For instance, the Japan/Australia treaty[49] allows underlying tax credit in Japan for shareholdings of ten percent or more but domestic law only allows it for 25 percent or greater holdings[50] and clearly the treaty provision must prevail.[51] It may also be possible to contend that, as most treaties specify a percentage of voting shares "or of the total shares issued by the company" (clearly envisaging something other than ordinary shares) whereupon "the credit shall take into account" underlying tax credits, is an imperative statement and cannot be overridden by domestic legislation.

To illustrate this point, one could refer to domestic law relating to indirect tax credits in respect of preference share dividends, i.e. dividends paid on specified shares in preference to others.[52] Preference share dividends are not, in terms of domestic law, regarded as dividends for indirect credit purposes and yet Japan's tax treaties define "dividends" (for withholding tax purposes) widely enough to include preference dividends.[53] Unfortunately, the treaties do not impute that definition into the indirect tax credit article but it is reasonable to suppose that the definition would be the same. If it were intended to exclude preference dividends under Japan's treaties, this could easily have been dealt with in the "dividends" definition – otherwise indirect credits for preference dividends are not allowable except perhaps in the case of dividends from Brazil. Finally, perhaps a Japanese taxpayer could argue on the basis of reciprocity in cases where the treaty partner grants underlying credits in respect of preference dividends.

2. Dividends connected with a permanent establishment

Japan's tax treaties invariably exclude the application of the reduced rate of withholding tax where the beneficial owner of the dividends has a permanent establishment (PE) in Japan and the dividend is effectively connected with a business carried on through that PE. In other words, where the shares form part of the assets of the PE, the full rate (20 percent) of Japanese withholding tax will apply.

B. *Tax sparing*

Many of Japan's treaties (principally with developing countries) provide for tax sparing credits, i.e. credits for tax not actually paid, usually in accordance with some investment incentive. The credits may be for withholding tax or in respect of taxes foregone on the income of the dividend-paying company. Examples of the former are the treaties with Brazil,[54] China, Korea and Thailand whilst examples of the latter include the treaties with China, India, Malaysia and Singapore.

C. *Administration*

Tax which must be withheld by the Japanese resident making payment of domestic-source dividends or interest to non-res-

46. See the Constitution of Japan, Art. 98(2), which states that "The treaties concluded by Japan ... shall be faithfully observed".
47. There is perhaps some support for this view in the Commentary to the OECD model. This states that "detailed rules on the computation and operation of the credit" are not given because of their complexity. One could also argue that, as treaties "shall be faithfully observed", this is a rather circular statement.
48. Something the treaties usually forbid with the words "which, however, shall not affect the principle hereof".
49. Art. 17(2).
50. CTL Art. 69(4).
51. The Ministry of Finance accepts this, its view being that express provisions in treaties override domestic legislation but that general provisions do not.
It is interesting that the Japan/Brazil treaty makes no reference to the treaty being "subject to the laws of Japan".
52. CTL Art. 69(4); CTLEO Art. 147(2)(iii).
53. And one would normally expect the payer country's law to apply in determining whether a payment constitutes a dividend for withholding tax purposes. Indeed, even in Japanese domestic law, a preference dividend would be regarded, in ordinary circumstances, as a dividend.
54. Brazil's branch profits withholding taxes are treated as being dividend withholding taxes.

© 1993 International Bureau of Fiscal Documentation

idents must be paid to the tax office by, in the case of a payment made in Japan, the tenth day of the month following the month of payment or, where payment is made abroad, by the end of the month following the month of payment.[55]

Generally, in order for reduced treaty rates of withholding tax to apply, the recipient must complete and send the appropriate form to the payer, who should in turn file it with the tax office. Some treaties (e.g. France) specify that for the reduced rate to apply the application must be made before the payment but, generally, where by oversight an application has not been submitted in good time and too great an amount has been deducted, the payer of dividends or interest may make an application on behalf of the recipient for a refund of the overpaid tax.

D. *Interest*

The "Interest" article of Japan's double tax treaties normally provides for the reduction of withholding tax from the standard domestic rate.[56] Withholding tax on Japanese-source interest paid to non-residents is usually reduced to ten percent. Often interest paid to (or guaranteed by) the Bank of Japan or the Export-Import Bank of Japan is exempt from withholding tax. Similarly, Japan often exempts from withholding tax payments of a like nature (see treaties with, for example, France, Germany, United States). Sometimes the exemption is extended to local authority debt (e.g. treaty with France, Malaysia), government bonds (e.g. treaty with Germany),[57] the interest element of hire purchase payments to the equipment lessor (e.g. France) and any loans to Japanese enterprises (e.g. Pakistan).

The reduced rate of withholding tax is sometimes[58] not applied where the debt-bearing instrument is dealt with on a stock exchange, the beneficial owner of the interest is not taxed on the income (e.g. a pension fund) and he sells the instrument within three months of the date it was purchased.

1. Interest defined

"Interest" is generally defined as meaning income from government securities, bonds or debentures (whether or not secured and whether or not carrying a right to participate in profits) and debt claims of every kind. The definition usually also includes items treated by domestic tax law as interest and sometimes includes the profit on the redemption of debentures or debts (e.g. Italy, Singapore – but Japan's domestic law does not normally regard the profit on redemption as being interest).

2. Source of interest

Interest paid by a resident of Japan is generally subject to Japanese withholding taxes as treaties usually specify that the source of such income is Japan. However, the source of interest paid by a Japanese resident may not be Japan where the payer has a PE in some other state, and the interest is borne by that PE: such interest is normally regarded as having a source in the country where the PE is located.

3. Interest connected with a PE

Reduced rates of withholding tax under Japan's treaties do not usually apply where the recipient of the interest has a PE in Japan and the interest is effectively connected with that PE.

4. Tax sparing

As with dividends, a number of Japan's treaties provide for giving credit to Japanese companies earning interest in respect of tax either not suffered or suffered at lower rates than credited. These tax sparing provisions usually apply in respect of loans for specific purposes (e.g. China, Korea, Malaysia, Philippines, Singapore).

5. Connected parties

Japan's double tax treaties usually provide that any reduced withholding tax rates do not apply to that portion of interest paid in excess of what unrelated parties would have agreed to pay. Japan does not recharacterize such "excess interest" as a dividend but simply applies the normal rate of withholding tax to it.

6. Administration

See under Dividends above.

III. THIN CAPITALIZATION

Rules have recently been introduced which disallow as an expense interest payments by companies (and branches of foreign companies in Japan) in certain circumstances where debt is considered excessive, i.e. the company is considered to be under-capitalized.[59] This section refers to thinly capitalized Japanese companies but the rules apply equally to branches of foreign companies operating in Japan.[60]

A. *Basic rule*

The basic rule is that

- the company has borrowings from a foreign controlling shareholder; and
- the interest-bearing portion of the average of those borrowings exceeds three times the net assets attributable to the shares owned by the foreign lender and average of total interest-bearing debt of the company exceeds three times net assets.

Disallowed interest is not reclassified as dividend.

55. ITL Art. 212.
56. The usual rate of withholding tax on interest in Japan is 20%, which consists of 15% national tax and 5% local inhabitants tax. The latter does not apply in the case of interest paid to non-residents.
57. But, interestingly, not the United Kingdom, even though the United Kingdom unilaterally grants such relief in the case of certain securities.
58. See UK treaty, Art. 12(7).
59. STML Art. 66-5, STML Cabinet Order 1992, No. 39-13 ("STML CO").
60. STML Art. 66-5(7).

© 1993 International Bureau of Fiscal Documentation

Example 1

Nippon KK has borrowings and annual interest payments as follows:

From independent banks	¥ 100m	interest: ¥ 10m p.a.
From its 51% US shareholder	300m	40m
From its 49% Japanese shareholder	250m	25m
	¥ 650m	¥ 75m

Nippon KK's total net equity is ¥ 210m.

In this case there will be no disallowance of interest expense under the thin capitalization provisions (although transfer pricing adjustments may be applied). Whilst total interest-bearing debt exceeds net equity by more than 3:1, borrowings from the US shareholder are less than three times net equity attributable to its holding.

Example 2

The facts are as in Example 1 except that total net equity is ¥ 167 million. In this situation, both the total debt-to-equity ratio and the ratio of US shareholder debt to attributable equity (167 x 51% = 85) exceeds 3:1. There will be a disallowance of interest.

B. *Calculation of interest disallowance*

The method of calculating disallowed interest[61] is best explained by referring to Examples 1 and 2 above.

Example 3

Disallowed interest in Example 2 will be calculated as the smaller of the following:

(1) $40m \times \frac{300 - (85 \times 3)}{300} = 6m$

i.e. the formula $A \times \frac{B - (C \times 3)}{B}$

where
A is the amount of interest payable to the foreign controlling shareholder (F),
B is the average of interest-bearing debt owed to F,
C is net equity attributable to F.

(2) $40m \times \frac{650 - 167 \times 3)}{300} = 20m$

i.e. the formula $A \times \frac{D - (E \times 3)}{B}$

where
D is the average of total interest-bearing debt,
E is the net equity.

C. *Definitions*

1. Foreign controlling shareholder

Direct holdings and indirect holdings through domestic companies are taken into account in determining control.[62]

Example 4

F Co ——(90%)——> Japan Co ——(60%)——> Japan Co 2

F Co is a foreign controlling shareholder of Japan Co 2 as it owns more than 50% (0.9 x 0.6 = 54%).

Control may also be in the form of a special relationship:[63]

- the same person owns, directly or indirectly, 50 percent or more of the shares of the Japanese company and the foreign lender; or
- the foreign company's directors/employees (current or former) constitute 50 percent or more of the board, or representative directors, of the Japanese company. In this situation, two further conditions have to be satisfied: the foreign corporation must provide a substantial proportion of the Japanese company's working capital and most of the latter's business operations must relate to transactions with the former.[64]

The special relationship test is similar to that for transfer pricing purposes.[65]

The rule for indirect foreign holdings applies so as to aggregate the average debt, interest earned, etc. in respect of each of the foreign related shareholders.

Example 5

F1 ——(100%)——> F2 ——(100%)——> Japan Co 1 (JC1) ——(51%)——> Japan Co 2 (JC2)

Each of F1 and F2 has lent ¥ 100 million to JC2. JC1 has lent ¥ 50 million to JC2. JC2's net equity is ¥ 80 million. It has no other interest-bearing debt. The rate of interest in each case is five percent per annum. The thin capitalization rules will apply to interest payments to F1 and F2 (but not JC1) because interest-bearing debt owed to F1/F2 exceeds 80m x 0.51 x 3 and total interest-bearing debt exceeds 80m x 3. Disallowed interest will be the smaller of:

(1) $(5m + 5m) \times \frac{200m - (80m \times 0.51 \times 3)}{200m} = 3.88m$

(2) $(5m + 5m) \times \frac{250 - (80 \times 3)}{200} = 0.5m$

2. Net assets

Essentially total assets less total liabilities, except that, where this is less than the total of share capital/capital surplus accounts (i.e. where there is a deficit on retained earnings), in which case the capital and capital surplus accounts are taken as equal to net assets.[66]

3. Interest-bearing debt

Only interest-bearing debt is included in the calculation. Note that it is the average balance during the year which is important, i.e. repaying debt just before the year end will not usually help escaping the rules.[67] Debt effectively connected with the Japanese branch of a foreign company is not taken into account so long as the branch's interest income is taxable in Japan.[68] Back-to-back loans are covered by a special provision for the inclusion of debt routed through third parties.[69]

61. STML CO Arts. 13, 14.
62. STML CO Art. 10; STML Art. 66-5(3).
63. STML Art. 66-5(3).
64. STML CO Art. 18.
65. STML CO Art. 19.
66. STML CO Arts. 5, 6.
67. STML CO Art. 3.
68. STML CO Art. 2.
69. STML CO Art. 4.

© 1993 International Bureau of Fiscal Documentation

However, the National Tax Administration has said that normal parent company guarantees to a commercial bank will not be caught by this.

4. Interest

"Interest" includes discounts on debenture bonds but only to the extent that it is recorded as an expense in the accounts.[70]

D. *Industry practice exception*

The thin capitalization rules apply basically where the debt-to-equity ratio exceeds 3:1. However, more generous gearing is acceptable where this is industry practice in Japan for a comparable company. Documentary evidence should be maintained to support the proposed treatment.[71]

E. *Effective date*

The new thin capitalization rules apply to accounting periods commencing after 31 March 1992.

IV. TAX HAVENS

Where Japanese shareholders own more than 50 percent of the shares in a tax haven subsidiary, the profits of that subsidiary are, in general, taxable on the Japanese shareholders in proportion to their holdings (so long as the relevant holding is five percent or more).[72] Tax haven countries for these purposes are basically countries which do not impose a corporate income tax or where the *effective* rate of tax is 25 percent or less. These tax haven rules create three special difficulties:

- What happens when a tax haven company pays a dividend out of profits already taxed in Japan?
- What foreign tax credits are available when determining whether a company is a tax haven company or not?
- If a tax haven company's profits are subject to an apportionment, to what extent can be credited the foreign taxes incurred by it on its dividend/interest income?

Each of these three problems is considered below.

A. *Dividend out of taxed profit*

Basically, a dividend paid out of cumulated profits will not be subject to further taxation to the extent that it does not exceed undistributed profit taxed in Japan during the previous five years. However, any tax credits given in respect of tax haven profits taxed in those years will be added back and foreign credits previously given will be recovered.

Example

Haven Co. is a 100 percent subsidiary of Japan Co. Its profits are taxable in Japan and it has the following record of profits ($m):

Year	*1*	*2*	*3*	*4*	*5*	*6*
Profit	10	10	10	20	15	5
Local Tax	-1	-1	-1	-2	-1.5	-0.5
Distributable	9	9	9	18	13.5	4.5
Dividend paid	–	–	–	–	–	63
Less: profit (gross) already taxed						-65
Add: foreign tax credit previously given						6.5
Japan tax on dividend, say, 50%	-5	-5	-5	-10	-7.5	-2.5
Foreign tax	1	1	1	2	1.5	0.5
Total Japan tax	-4	-4	-4	-8	-6	-2

If, the dividend had been paid in Year 7, no adjustment would have been made for that part paid out of Year 1 profits (and, consequently, there would have been no claw-back of the corresponding tax credit).[73]

B. *Foreign dividends/interest received by a tax haven*

A tax haven company which receives foreign dividends or interest will, for the purposes of determining the effective tax rate suffered by that company, be deemed to have paid any tax associated with that company (e.g. withholding taxes, but not indirect corporate taxes relating to dividends received). Any tax-spared credit which a Japanese company would be entitled to will also be treated as taxes borne by the subsidiary.[74]

C. *Taxes paid in the tax haven territory*

Such taxes are available for tax credit. This is the case even where the Japanese company to which profits are apportioned holds less than 25 percent of the shares in the tax haven company.

DENMARK:

TAX STATUS OF EXPATRIATES

Bente Møll Pedersen
Attorney-at-law, Kromann & Münter, Copenhagen, Denmark

I. INTRODUCTION

Foreign employees transferred to Denmark for a period of six to 36 months who would normally be fully liable to tax in Denmark may benefit from a new special tax regime, provided a number of conditions are met. The new 30 percent rule was adopted by the Danish Parliament on 19 June 1992 and implemented by Act 489 of 24 June 1992, which introduced a new provision into Section 48 E of the Act dealing with tax at source.

Contents

I. Introduction
II. Purpose
III. Conditions for Opting into the Regime
A. Temporary connection
B. Full liability to tax in Denmark
C. Salary income
D. Essential influence or ownership of the business
IV. Taxation
A. General
B. Deductions
C. Previous taxation under the scheme
D. Termination of 30 percent taxation and reassessment
V. Effective Dates

II. PURPOSE

Prior to the statutory amendments most highly qualified foreign employees had required that their remuneration be based on a net principle when negotiating with Danish employers, which meant that they required payment of a stipulated amount after tax, leaving it up to the individual employer to determine the appropriate gross amount. Thus, foreign employees were neither interested in the actual gross amount nor in substantive Danish rules of taxation.

This type of pay determination leads to discrepancies within the pay structure of a business, as the remuneration payable to the foreign employee will exceed the remuneration paid to Danish executives. The remuneration of the foreign employee will typically exceed the salary paid to the chief executive officer. As a result of these discrepancies and the financial burden on the individual business, the recruitment of foreign employees has become virtually impossible for Danish firms.

The 30 percent tax option will enable the employer to determine a lower gross income for the employees involved. Consequently, it will be less costly for an individual business to appoint foreign employees, and the discrepancies in the pay structure will be eliminated. With these amendments it will be financially easier for the Danish business community to recruit key expatriate personnel, thereby enhancing Denmark's competitive edge in the international arena.

III. CONDITIONS FOR OPTING INTO THE REGIME

A. *Temporary connection*

Under the new provisions the 30 percent income tax rate is subject to the conclusion of a fixed-term employment agreement of not less than six and not more than 36 months' duration with a private individual, company, association, foundation, etc. which is fully liable to pay taxes in Denmark or which has a branch or any other permanent establishment in Denmark. Subject to similar conditions the employment agreement may be concluded with an organization which is exempt from Danish taxation, including a central or local government, government institution, etc.

B. *Full tax liability in Denmark*

Normally such a foreign employee would be subject to full tax liability in Denmark upon commencement of the employment. Nationality is of no relevance, but the special tax rule is not intended to apply to persons who already have a permanent connection to Denmark. Nor is the rule designed to benefit such persons by

© 1993 International Bureau of Fiscal Documentation

enabling them to leave Denmark with a view to subsequently returning for the purpose of becoming subject to the easier rule. Persons who have previously been subject to full liability to taxes in Denmark may not have terminated such liability with a view to benefiting from the easier rule.

C. *Salary income*

The rule only applies where the salary income equals a monthly basic amount of DKK 42,600 (1992 figures). The basic amount is subject to annual review.

The statutory basic amount entails that only persons whose annual gross income amounts to approximately DKK 511,000 (in 1992) are entitled to opt for the new tax regime. Only highly educated specialists and other key personnel will be in a position to opt for this rule, which will only become effective at a level of income where the number of employees having the required qualifications is relatively small. The determination of this amount takes account of the fact that the rule should not impose unfair competition on Danish employees.

Scientists and researchers may choose this scheme, however, even though their remuneration is lower, provided their service agreements stipulate that they are to undertake their research in Denmark, and that the individual research project to which the taxpayer is to be connected has been approved by a research council.

D. *Essential influence or ownership of the business*

The taxpayer may not have been involved directly or indirectly in the "management or control" of the business or had any ownership of the business for the five years prior to his employment.

The wording of the Act envisages that if the taxpayer is or has been involved in the management of the business the rule cannot be applied. In view of the legislative history of the Act, which deals only with ownership and voting rights, the Act cannot be construed in this way. Also a taxpayer who is appointed an executive of the business and is thus "involved in the management", but who has no ownership rights in the business, may opt for the regime, regardless of the wording.

When determining whether the taxpayer has had control or ownership of the business of the employer, it must be ascertained whether the person owns or has owned 25 percent or more of the share capital, or has had control of 50 percent or more of the voting rights in the paying company, etc. Shares belonging to the taxpayer's immediate family and shares belonging to companies, etc. in which any member of the taxpayer's immediate family has held a controlling interest are taken into consideration in making this determination.

Whether the taxpayer owns or has owned 25 percent or more of the net capital or has held a controlling interest in the business is taken into account if the paying business is that of a sole trader.

IV. TAXATION

A. *General*

The new provisions are designed exclusively to ease, not increase, taxation of the individuals in question. The scheme is thus an optional one. Any person who prefers being taxed according to the ordinary rules governing taxation of individuals who are fully liable to tax in Denmark may opt to be taxed under the ordinary rules.

If the person opts for the 30 percent rule, tax is calculated as 30 percent of the money payments payable under the service agreement. The income tax liability in respect of money payments is finally discharged upon payment of the tax, and the remuneration is not included in the taxable income.

The 30 percent tax is deducted from the money payment, i.e. salary, holiday allowance, fees, bonus, commission and any other such payments. Benefits in kind (e.g. free board and accommodation, company car, etc.) do not form part of the tax base for the 30 percent tax. Consequently, such benefits will be taxed according to the ordinary rules applying to persons who are fully liable to taxation.

The employee is also subject to ordinary tax liability in respect of any other income, and to wealth tax according to the usual rules applying to persons who are fully liable to taxation.

B. *Deductions*

In consideration of the easier tax rules, any employment expenses are not deductible from income which is subject to 30 percent taxation, nor from any other income, including the value of a free company car, etc. which is subject to ordinary income tax. Any other negative income may not be set off against income which is subject to 30 percent tax, nor can earned-income relief in respect of income taxed at 30 percent be converted into relief deductible from any other income.

C. *Previous taxation under the scheme*

Where a taxpayer has previously been in receipt of income taxed according to the 30 percent rule and his full tax liability to Denmark has subsequently ceased, the taxpayer may again choose to be subject to the 30 percent taxation when concluding a new service agreement in Denmark, provided all conditions are still met. However, the total maximum period of the 30 percent rule, i.e. 36 months, will be reduced by any previous periods of such taxation. The right to choose the 30 percent rule again will lapse after ten years from the commencement of the first employment period subject to the 30 percent rule.

D. *Termination of 30 percent taxation and reassessment*

The 30 percent tax rule will terminate (i.e. the beneficial treatment will be cancelled) and tax will be clawed back if within one month after the termination of the employment subject to 30 percent taxation, the taxpayer does not either

© 1993 International Bureau of Fiscal Documentation

take up new employment subject to taxation at the same rate or terminates his full tax liability to Denmark.

Where the taxpayer enters into a new qualifying employment agreement within one month after the termination of his previous employment, and where the earnings under both agreements may be taxed according to the rule, there is no requirement that the tax liability in Denmark should be incurred in connection with the commencement of the employment. Thus, the taxpayer is not required to leave Denmark and thereby discontinue the tax liability during the period between two agreements in order to remain entitled to the 30 percent taxation. When a new agreement is concluded, however, the 36-month period is not extended.

The taxpayer may extend an employment agreement expiring at the end of the total period of 36 months for up to 12 months, giving rise to a reassessment. The employee may remain on the job for the additional 12-month period but he will be taxed under the ordinary rules of taxation. However, there will not be a clawback of tax. The recapture rules will only apply if the taxpayer fails to leave Denmark within one month after the end of the extended employment. During the extension period the taxpayer will be taxed according to the ordinary rules.

Where taxation is terminated, any remuneration and allowances treated for tax purposes according to the 30 percent rule will be included in the taxpayer's income for the relevant income years. In other words, underpaid taxes are recaptured. Any taxes already paid will be treated as taxes withheld on a provisional basis for the year at issue.

During the period of the agreement the taxpayer may choose to revert to the ordinary tax rules, either with retroactive effect as from the commencement of the employment, or with effect for the future only. If the taxpayer opts to be taxed under the ordinary rules, he may not later opt for the 30 percent taxation during the same agreement. Where the taxpayer chooses to be subject to the ordinary tax rules in respect of the future, the conditions for avoiding recapture of taxes will still apply. If the employee chooses to be subject to the ordinary tax rules with retroactive effect, however, any 30 percent tax paid will be treated as taxes withheld on a provisional basis for the income years in question.

V. EFFECTIVE DATES

The 30 percent rule has been notified to the European Community in pursuance of the EC Treaty, Article 93 paragraph (3) on aid granted by states. The EC Commission has announced that it does not find the Bill incompatible with the provisions of the EC Treaty.

The rules on 30 percent taxation apply to service agreements concluded after the effective date of the provisions, i.e. agreements concluded after 27 June 1992. Generally, the provisions only apply to income earned after the effective date of the agreement.

Even though the employee may be subject to full Danish tax liability prior to conclusion of the agreement and prior to the effective date of the provisions, so that the condition that tax liability should be incurred in connection with the commencement of the employment is not met, the 30 percent rule may nevertheless apply to the first employment which is subject to the 30 percent rule. In such a case the maximum 36-month period for application of the 30 percent tax rule is reduced in proportion to the period from incurring tax liability to the commencement of the employment to which the rule is desired to apply. Thus the scheme will also be available, although for a shorter period, to a person arriving in Denmark before 27 June 1992 who subsequently concluded a service agreement provided such person qualifies for the 30 percent rule.

To accommodate persons who were present in Denmark on 1 June 1991 and persons who arrived in Denmark and were employed in Denmark after that date, special transitional rules apply to income earned after 1 June 1991. The scheme applies only to agreements concluded within one month after the effective date of the rule, i.e. on or before 27 July 1992.

I. CORPORATE TAX RATE

The standard rate of corporation tax is reduced to 33.33 percent for profits realized during accounting periods opened on or after 1 January 1993. This provision constitutes the final step in the reduction of the corporation tax rate. It applies to all enterprises subject to corporation tax, i.e. all corporations and corporate entities subject to corporation tax under the normal rules or upon election,[1] and non-resident companies carrying on business activities in France.

This reduction does not modify the amount of the *avoir fiscal* attached to any regular distribution of dividends by companies subject to corporation tax. The avoir fiscal remains equal to 50 percent of the dividends distributed by French corporations, and represents a full refund of upstream corporate tax. Nor does the reduction amend the rules for the *précompte mobilier* (equalization tax).

It should be noted that the equalization tax is levied either on profits which have not suffered corporation tax at the normal rate or on any distribution of reserves which exist for more than five years. The amount of the equalization tax remains equal to one-third of the profits before distribution (i.e. 50 percent of the distributed dividend).[2] Consequently, corporations which distribute dividends derived from profits taxed at the rate of 33.33 percent will no longer be subject to the equalization tax provided the profits have been realized during the five years before the distribution. In addition, the distribution no longer gives rise to the additional corporation tax.[3] The avoir fiscal attached to any regular distribution now corresponds to 100 percent of the corporation tax paid out of the same profits. Thus the reduction of the corporation tax to 33.33 percent and the existence of the avoir fiscal of 50 percent of the distribution totally eliminates the double taxation of profits (unless a French corporation elects for the participation exemption regime). This is discussed in more detail below.

II. PARTICIPATION EXEMPTION

Under the participation exemption, dividends received by a French parent company from foreign or domestic subsidiaries were excluded from the parent company's income to the extent of 95 percent of the gross dividends. To qualify as a "parent" corporation the French company must own at least ten percent of the share capital of the subsidiary, or if the holding is less than ten percent the shares must have cost at least Ffr. 150 million. Further, the shares in the subsidiary must be subscribed by the French parent or acquired by it (in which case the parent company must commit to hold its interest for at least two years). For the determination of profits deriving from accounting periods opened as from 1 January 1993, the French participation exemption regime is amended as follows:

1. Certain entities (e.g. general partnerships, limited partnerships, joint ventures) may elect to be subject to corporate taxation in France. Once such an election is made, however, it is generally irrevocable.

2. Different rules apply in the case of the distribution of long-term capital reserves.

3. Previously, the standard rate of corporate income tax was different, depending on whether the profits after tax were distributed or remained in the company. For profits realized during a financial year between 1 January 1989 and 31 December 1991, which had suffered corporation tax at the rate of non-distributed income, an additional tax was levied to have the profits taxed at an effective rate of 42%, if the profits happened to be distributed. Because the standard rate of corporation tax was harmonized for financial years as from 1 January 1992, the additional corporation tax was:
   - 0% of the net distributed income for profits of financial years opened in 1991;
   - 5/58 of the net distributed income for profits of financial years opened in 1990;
   - 3/58 of the net distributed income for profits of financial years opened in 1989.

   This appeared to be a simple system, but the conditions for application were complex. The 1993 Finance Act abolishes the double standard rate of corporation tax for:
   - any regular distribution paid during financial years opened as from 1 January 1993;
   - other income deemed to be distributed during the financial year which precedes the first one opened as from 1 January 1993.

© 1993 International Bureau of Fiscal Documentation

- application of the regime is now optional;[4]
- the taxation of a notional amount of expenses incurred in respect of the dividend (generally five percent of the dividend plus any tax credit attached to it) is abolished;
- the minimum participation (ten percent) is strictly interpreted;[5]
- in making the ten percent determination shares without any voting rights are not taken into account.

As stated above, under the old regime dividends received under the participation exemption were exempt for 95 percent of their amount. The remaining five percent – or actual expenses if lower – were deemed to correspond to the expenses incurred in connection with the participation, and as such were taxable. The new provision abolishes the five percent rule so that dividends received in accounting periods beginning on or after 1 January 1993 are 100 percent exempt. As a result, the proceeds enjoying the participation exemption regime, which are deducted from the taxable income of the recipient company, are equal to the total amount received during the accounting period.

Because the avoir fiscal is equal to 100 percent of the upstream corporate tax the participation exemption no longer offers advantages in all cases. In practice, however, the participation exemption regime is more favourable in the following cases:

- if the parent company is in a loss position;
- if the dividends do not enjoy a tax credit sufficient to offset the French corporate income tax (dividends distributed by foreign subsidiaries);
- if the dividends are distributed by a subsidiary included in the French tax unity regime, and if the dividends are paid out of profits or long-term capital gains realized during the period the distributing company was a member of the group (in such a situation, the dividends cannot enjoy the avoir fiscal).

IV. CFC LEGISLATION

A. *Previous wording*

Under the old provisions of the French tax code (CGI) Section 209 B, if a French enterprise subject to corporation tax owned, directly or indirectly, at least 25 percent of the shares or stock of a company located in a low-tax jurisdiction, it was taxable in France on the profits derived by its subsidiary (proportionally to its interest therein) whether or not distributed and whether or not remitted to France. The results were taxed separately, which led to their effective taxation, even though the French company would be in a loss-making position.

Paragraph II of Section 209 B provides that this regime does not apply if the French company offers evidence that the transactions of the foreign entity did not have as their main effect the parking of profits in a country enjoying a privileged fiscal regime. This is deemed to be the case generally if the foreign company carries out mainly an industrial or commercial activity, and it realizes its transactions primarily on the local market.

The provisions of Section 209 B are derogatory to normal French rules, as French law generally ignores the concept of worldwide taxation as far as corporations are concerned, and for tax purposes recognizes the separate legal capacity of subsidiaries.

B. *Amendments*

The 1993 Finance Act extends the scope of the regime instituted by Section 209 B, as follows:

- the minimum level of shareholding is reduced from 25 percent to ten percent (or to a participation which cost at least Ffrs. 150 million);
- establishments without legal personality belonging to the French company are henceforth targeted, thus extending the scheme to permanent establishments abroad;
- to rights held in any entity, whatever form;
- valuation of the ten percent interest is by reference to financial rights or voting rights;[6]
- the indirect control concept is codified and made precise in the law;[7]
- the tax regime relevant to such non-resident entity is determined by examining the actual tax burden borne by the non-resident and not by looking at the overall tax regime in the jurisdiction where the non-resident is located;
- French rules continue to apply in computing the taxable result in France, but the benefit of provisions granting special allowances or deductions, write-offs in excess of standard depreciation or accelerated tax depreciation, may no longer be claimed, nor may the favourable taxation provided for in respect of certain proceeds of patent rights.

C. *Timing*

The regime aims at participations acquired and structures implemented as from 30 September 1992, the date the draft Finance Bill was submitted to the French Government for consideration.

The provisions of the current regime should remain unchanged as far as existing participations are concerned for purposes of the taxation of income of accounting periods opened before 1 January 2003. However, for indirect control, the concept of a low tax regime and the exclusion of certain favourable rules for the determination of the foreign result taxable in France, the new provisions apply as from the determination of the results of accounting periods ended 31 December 1992.

4. Although this may be arguable, until now the French tax authorities have considered that the participation exemption was not granted upon election but rather was a compulsory regime. The option appears to be linked to no particular obligation and should result from the action of the company in its annual tax return. The option may be modified each financial year.
5. Thus, if further to a reorganization the stake decreases below 10%, the affiliation privilege will no longer apply.
6. However, the taxable profit in France is proportional to that part of the capital or financial rights belonging to the French parent company.
7. Because the notion of indirect control was previously not provided in the law but rather in a decree, it was questionable whether a taxpayer could raise arguments about its binding effect.

© 1993 International Bureau of Fiscal Documentation

In the case of existing participations of at least ten percent (and lower than 25 percent), any acquisition or subscription to the share capital, the effect of which would increase or even maintain the level of the participation, may lead to the applicability of Section 209 B.

D. *Comments*

As the regime provided by Section 209 B is derogatory to French general principles, it should be strictly interpreted.

1. Privileged regime

It appears that the French revenue authorities envisage applying this provision to entities located in tax treaty countries and enjoying a favourable tax regime. As the Finance Act targets entities subject to a privileged fiscal regime in the sense of CGI Section 238 A, a question is raised about the scope of this provision. Section 238 A provides that persons are regarded as subject to a privileged tax regime in a state or territory if they are not taxable there or if they are subject to tax on income or proceeds "notably lower" than in France.[8]

The concept of privileged regime should be examined in light of comments by the French revenue authorities and court cases.

(a) *Comments of the French tax authorities*

On 26 June 1975, the French fiscal administration declared that the existence of a privileged fiscal regime is established:[9]

- if there is no tax on income or on profits derived from professional activities; or
- if the income, profits or remuneration sourced in the state are not subject to tax in the state; or
- if the recipient is not subject to tax in the foreign state or is subject to a tax notably lower than in France.

With regard to the latter test, a comparison between the French tax regime and that of the foreign state should be made. This comparison must consider taxes taken in their entirety, taxes of the same nature, and the existence of particular tax regimes.[10]

The comparison must be on tax considered as a whole. The French tax administration insisted that the goal of Section 238 A is to prevent the transfer of income to tax havens, i.e. territories characterized notably by the absence of taxation or by privileged tax regimes based on the nature or source of certain income or the status of the recipient. The determination is made by looking at the specific burden borne by the company and not between particular tax regimes, such as the regime in France and the one in the foreign country.[11]

(b) *Jurisprudence*

In a case dated 25 January 1989, the "Commissaire au Gouvernement" Philippe Martin (counsel to the Administrative Supreme Court), emphasized the necessity of examining the "fiscal profile of the non-resident recipient of the remuneration by reference to its specific legal status" for comparison purposes, and not by reference to the overall characteristics of the fiscal regime of the foreign country.[12]

2. Compatibility of Section 209 B with EC law

If the non-resident company is located in an EC country and if a favourable regime has been approved by the EC authorities, it may be argued, without total certainty, that Section 209 B is not compatible with EC law.

3. Compatibility of Section 209 B with tax treaties

Under tax treaties, the income of a non-resident company may be subject to tax in France if such company has a permanent establishment in France (or if the right to tax is attributed to France by virtue of a treaty). Section 209 B allows France to tax a non-resident company even if the latter has no permanent establishment in France. Thus, it may be argued that Section 209 B is incompatible with tax treaty provisions. The French tax authorities could respond that the liability to tax does not fall on the foreign company but rather on the French company.[13] However, it is the income of the foreign company which is subject to tax, even if it is in the name of the French company; this appears to be a means of assessment of corporation tax, the French Government having practical difficulties recovering income tax directly from a non-resident company.

The issue of compatibility is not settled and has never been brought before the courts. Although it is difficult to predict the attitude of the courts, it may be noted that the treaty entered into between Mexico and France of 7 November 1991, recently ratified by French Parliament, includes a specific provision that the treaty does not forbid France from applying Section 209 B.

IV. UCITS[14]

Shares or stock of French or foreign UCITS owned by French companies subject to corporation tax[15] must be estimated at their fair market value at the end of each accounting period. The difference between the purchase price or the subscription price and the evaluation at the end of the accounting period is

8. "Notably lower" means that the tax borne by the non-resident is at least one-third lower than the tax liability which would have resulted in France.
9. 26 June 1975 4 C-8-75.
10. E.g. companies not subject to tax by virtue of a provision of law.
11. This is subject to eventual comments from the French tax authorities, further to the amendments in the 1993 Finance Act.
12. Although the case is issued by a Court of Appeal, it should be noted that on 30 January 1992 this court decided that a privileged tax regime is established solely by comparing the levels of assessment that the taxpayer may have suffered (independently of the tax he has effectively suffered). This case appears rather confusing and not in accordance with the strict wording of the legal provision; however, it should be taken into consideration although the Supreme Court may decide otherwise in the future.
13. In fact in a Guideline issued 6 March 1992 the tax administration declared that Sec. 209 B is in conformity with tax treaties and EC law as well.
14. The term "UCITS" is used to encompass investment companies, investment funds.
15. Companies organized under the insurance legislation do not fall within the scope of this provision, although they are subject to corporation tax. However, this exemption does not cover reinsurance companies (A.N. 22 October 1993, at 4182).
Company shareholders subject to corporate income tax in a transparent entity must also follow the new rules. As a result, transparent entities which are subsidiaries (whether or not directly) of entities subject to corporation tax are covered by this new provision.

© 1993 International Bureau of Fiscal Documentation

included in the taxable income of the said accounting period. This provision applies to accounting periods ending on or after 1 November 1992.[16]

This new regime applies to any investment fund, whether or not resident in France.

The securities covered by the new provision include:
- interests in UCITS, except for certain venture capital funds;
- stock in investment companies (i.e. so-called "SICAVs");
- shares, stock or interests in foreign investment funds.

The new regime applies to shares, stock or interests in investment funds owned directly or indirectly in France by the relevant enterprises. It also includes a specific provision for securities held indirectly by a subsidiary established abroad. The regime applies to any interest held by a person or entity established abroad, and which enterprise owns directly or indirectly stock, shares or rights if the assets of this person or entity are mainly comprised of investment fund units subject to the new regime or if its activity consists mainly of the management of such securities for its own account.

This provision, which is designed to avoid the parking abroad of proceeds in UCITS of French enterprises, requires some comment. The provision applies regardless of the form of the foreign entity which owns the securities, as the legislation is aimed at a person or an entity. This may lead to including individuals or companies in which the French corporation has rights (subsidiaries or individuals holding proceeds owned by the French entity), and entities which may or may not have legal capacity (e.g. trusts, groupings). This implies a broad scope. In fact, the relevant item is the nature of the activity of the foreign entity. To fall within the scope of the provision, one of the following tests should be met:
- either the assets are comprised mainly of interests in investment funds subject to the new regime;[17] or
- the activity consists primarily of the management of such securities for its own account.[18]

The law does not provide any details on indirect shareholdings.

Two categories of securities do not fall within the scope of this new provision:
(1) securities UCITS which principally invest in stock ("OPCVM actions"). The new provision does not apply to interests in French or EC investment funds which simultaneously meet the following tests:
   - at least 90 percent of the market value of the assets owned by the investment fund is permanently comprised of stocks, investment certificates or cooperative investment certificates issued by EC resident companies, subject to corporation tax under normal rules or to a corporation tax comparable to the French tax;
   - as regards the nature of the proceeds, the securities which constitute the numerator of the 90 percent ratio are remunerated by dividends to which an "avoir fiscal" is attached.[19]
(2) interests in venture capital funds ("FCPR").

This exception applies if the enterprise commits itself to retain the interests in the UCITS for at least five years from the date of purchase. However, if the interests are transferred within five years, the enterprise is subject to tax at the standard rate on the proceeds of the transfer and it is also subject to a specific tax, calculated by applying to the tax which should have been paid during each previous accounting period a rate of 0.75 percent per month of delay. This tax should be paid voluntarily by the entity within three months from the end of the financial year in which the interests were transferred. It is not clear whether the tax is also payable during a loss year.

The spirit of the new legislation is to take into account the annual estimation of interests in UCITS, regardless of the fact that the gain or loss would be generated upon the effective transfer of the securities.

The legislation is exclusively of a fiscal nature, i.e. regardless of the accounting treatment.

As far as interests held indirectly through a person or an entity situated abroad are concerned, two remarks should be made:

(1) *Annual estimation*: if the foreign entity falls within the scope of the new regime, it must determine the difference of the estimation as regards the securities it holds. The difference is then taxable in the hands of the French corporation proportionately to its direct or indirect rights in the foreign entity. Once determined, the difference must be allocated; it is deemed to impact the value of the shares or interests of the French corporation in the person or entity situated abroad.

(2) *Depreciation allowance*: under the new regime, a loss impacts directly on the taxable income of the French corporation. If simultaneously the rights in the foreign entity decrease in value, a depreciation allowance should be posted for accounting purposes; such a reserve is deductible for tax purposes only for the portion exceeding the loss already taken into account under the new tax regime.

Example:

A French company owns 60 percent of a foreign subsidiary acquired for 1,000. The value of those securities is 950 on 31 December 1993. On the same date, the interests in the UCITS owned by the foreign subsidiary are estimated at 190, although their value was 200 on 31 December 1992.

The parent corporation posts a depreciation allowance of 50 for the share capital of its subsidiary.

16. The difference in the estimation prior to 1 July 1992 is in principle not taken into account and remains taxable upon transfer of ownership of the securities.
17. Subject to further comments, this condition should be met if the gross market value of the securities in question represent 50% or more than the total fair market value of all the assets owned by the person or the entity at the end of the financial year of the French enterprise.
18. This is the case if the activity constitutes the main part of the economic activity of the company.
19. To the extent that currently, there are almost no UCITS stocks which can meet the above tests, a one-year period is granted to existing mutual funds to fulfil these conditions;

© 1993 International Bureau of Fiscal Documentation

If the new legislation applies, the parent company deducts for tax purposes the following negative difference on the interest in the UCITS:

200 – 190 = 10
10 x 60% = 6

The depreciation allowance is accordingly deductible (for tax purposes) up to 44, i.e. 50 – 6.

V. BUSINESS LICENCE TAX

Taxpayers carrying on commercial, industrial or professional activities are subject to a business licence tax.[20] The tax is based on 16 percent of the annual or deemed rental value of the taxpayers' fixed assets and on 18 percent of gross salaries. The tax applies regardless of whether the user is the owner of the assets in question.[21]

The 1993 Finance Act introduces two amendments:

– the base for business licence tax purposes does not change if upon the termination of a lease of movable property, including a purchase option, the asset is purchased by the lessee;
– the base of the business licence tax remains unchanged in lease-back transactions.

This amendment targets a practice in which an enterprise transferred part of its assets to a leasing company for a residual value and leased them under a new lease agreement with an option to purchase. The enterprise remained taxable under the business licence tax on these assets as it used them, but the base was recomputed from the amount provided in the lease agreement. As this amount was generally the cost price in the balance sheet of the company using the asset before the lease-back transaction, the transaction involved a reduction in the base of the licence tax.

As from 1993, the fair market value of equipment or real property, which is under a lease with an option to purchase or a true lease concluded after 1 January 1991 by the same taxpayer, cannot be lower than the value which was existing on the date of the transfer. In other words, assets which are no longer owned by the taxpayer who retains disposition of them for his professional activities remain taxable at the same base.

Enterprises which fall within the scope of this provision must modify their return before 1 May 1993 for additional taxation.

VI. SPECIAL THREE PERCENT TAX ON FRENCH REAL ESTATE

Since 1983, France has levied a special tax of three percent on the value of real property situated in France which is owned by non-resident companies. The effectiveness of this tax has been limited due to certain decisions of the French Supreme Civil Court. However, the French Government introduced an amendment to the provision in the 1993 Finance Act to improve the effectiveness of the real estate tax. The amendment provides that all corporate entities, wherever their registered office, which own directly or through interposed persons, real property in France or which benefit from real property rights over such assets, are subject to the annual three percent tax. By removing the reference to "a seat outside France", it is believed that CGI Article 990 D no longer conflicts with the non-discrimination clause in tax treaties.

According to the new provision, French resident corporate entities fall within the scope of the three percent tax. Bearing in mind the reason for introducing the tax (i.e. to combat tax evasion and that the French Government does not want to increase the administrative burden for French revenue), the 1993 Finance Act provides for two additional exemptions:

– corporate entities having their effective seat in France and other corporate entities situated in a country which has concluded a tax treaty with France containing a non-discrimination clause, provided they file or commit themselves to file an annual tax return (before 16 May of each year), which includes a description of the real estate and the identity of the shareholders or partners;
– corporate entities which are listed on an official stock exchange.

Details will be made public by a decree or comment of the French tax authorities.

Previously, if a non-resident individual owned a company subject to the three percent tax, the individual was not subject to inheritance tax on the transfer to his heirs of the company stock. This exemption has been abolished.

VII. TRANSFER OF ASSETS IN A FOREIGN JURISDICTION

An enterprise which transfers assets abroad to a third party or any type of entity (including a trust), for the purpose of managing the assets or to ensure meeting existing or future obligations of the enterprise, is subject to corporate income tax in France on income and gains derived therefrom. This provision is targeted at any asset transferred directly or indirectly by the company or through a third party. However, certain transfers (e.g. pursuant to insurance contracts) do not fall within the scope of the provision.

The provision is worded in general terms so it is feared that it may be extensively applied by the French tax authorities, although Parliament, during the discussions of the draft Finance Act, stated that only transactions such as the issuance of (repackaged) subordinated perpetuals (TSDI) and defeasance transactions were targeted. The provision does not refer to the accounting and/or legal analysis.

A. *Scope of the provision*

The notion of transfer is not defined so any kind of transfer may be targeted, regardless of the legal transaction supporting it. However, the relevant factor in determining whether a

20. An exemption from the tax is provided for small traders, certain professions, certain agricultural and certain publishing entities. See CGI Arts. 1449-1466.
21. However, it may not exceed 3.5% of added value.

© 1993 International Bureau of Fiscal Documentation

transaction falls within the scope of the provision should be the reason for the transfer. Although vague, a transfer in order to manage the asset in the interest of the enterprise would at first glance imply that the transfer does not take place for consideration and that the enterprise has a true right to the assets or retains control of them.

The concept of transfer to ensure meeting an existing or future obligation implies that the recipient of the assets is bound to fulfil the obligations of the transferor. These two concepts are not exclusive. The law expressly excludes transfers resulting from the performance of insurance contracts (it does not refer to reinsurance).

B. *Assessment*

The income is determined separately, although taxation is not independent. In other words, and contrary to the provisions of CGI Section 209 B, income generated by the management or sale of assets located abroad is included in French taxable income.

C. *Formalities*

The enterprise must file with its regular annual tax return:

- a particular form describing all characteristics of the transferred assets and the assets purchased to replace them, the recipient of the assets and the country or territory where the resident is established; and
- the return including income and gains derived from the management or sale of the assets.

If an enterprise does not fulfil these requirements, the French tax authorities are entitled to assess the enterprise on the basis of a notional profit, plus penalties for late payment and a fine of 40 percent of income tax not paid.

This provision enters into force for the determination of income in respect of financial years opened as from 1 January 1992 for proceeds generated during this financial year or the previous one.

VIII. ENTERPRISE ZONES

Two new enterprise zones have been created in the Valenciennes region (North of France). New corporations which invest in these zones are entitled to a tax credit in the amount of 22 percent of the investments realized during the first three years following their creation.

IFA NEWS

CANADIAN BRANCH

The Canadian Branch Annual Conference will be held 10 May 1993 in Toronto. Topics for discussion include Canada-US current developments and foreign direct investment by Canadians.

HONG KONG BRANCH

The Annual General Meeting will be held 27 September 1993 to discuss the National Reports. The November branch meeting will focus on source rules: experience to date.

KOREA BRANCH

The Korea branch now holds a monthly study meeting to discuss developments in international tax. An annual seminar is also held each December – the seminar is divided into a panel discussion and a presentation by a government official. Seminar papers are published in the Korean language.

US BRANCH

The Boston region hosted an interesting, informative and well attended annual meeting on 4-5 March. The 40 speakers and panellists included acknowledged experts among practitioners and academics. In addition, the Chief of the Joint Committee Staff, Harry Gutman and former International Tax Counsel, Jim Mogle provided valuable comments during the luncheon and technical sessions. The technical session on the first day comprised several panel discussions focusing primarily on recent US developments and issues, including developments relating to outbound transactions, judicial and administrative developments, the new treaties with Mexico and the Netherlands and the Section 482 regulations. The second day took on a more international flavour as speakers from Canada, France, Germany, Mexico, the Netherlands and the United Kingdom took the floor. Among the topics for discussion were the new US–Mexico and US–Netherlands tax treaties, combining operations from countries with classical and integrated tax systems and European income tax developments of interest to US tax advisors. A number of the papers presented during the meeting will be published in an upcoming issue of the *Bulletin*.

IV. Which Harmonization?
V. Conclusion

I. INTRODUCTION

The establishment of the Single European Market on 1 January 1993, the conclusion of the Treaty on European Union and the publication of the "Report of the Committee of Independent Experts on Company Taxation" (hereinafter referred to as the Ruding Report), together with the Commission's reaction to that Report are the major events which will influence the development of the harmonization of corporate income tax laws of the EC member states.

This article examines the implications of these events for corporate tax harmonization, identifies the crucial factors linked with these events and which affect the future of corporate tax harmonization in the EC and, finally, considers the future of corporate tax harmonization.

II. THE THREE MILESTONES

A. *The Single European Market*

The internal market, established in the EC from January 1993 requires:
- undistorted flow of capital from one member state to another,
- elimination of obstacles to cross-border transactions,
- adherence to the principle of free competition,
- improvement of economic efficiency, and
- abolition of the laws of the member states that discriminate against EC physical or legal persons.

The disparities in the corporate tax laws of the 12 countries do not meet these requirements.[1]

More specifically, the differences between the 12 corporate tax laws influence the flow of investment, impede cross-border operations, affect the competitiveness of competing companies (since the corporate tax component cost of capital differs among member states resulting in a different tax burden), undermine economic efficiency by contributing to waste and misallocation of resources and in certain cases have a discriminatory effect (unrelieved advance corporate tax or précompte, imputation credits not offered to non-residents). Given that other non-tax obstacles which influence cross-border operations are being removed, "...differences between member states' tax rules may well assume a greater importance in influencing transborder investment and merger decisions and the allocation of resources within the Community".[2]

Failure to eliminate these distortions will undermine the single market, thus creating a pseudo-single market replete with tax-induced distortions. Hence, having identified the existence of disparities between the 12 corporate tax laws as the cause of such distortions, the solution lies in the abolition of the disparities through harmonization of the 12 laws.

B. *The Treaty on European Union*

The Treaty on European Union (concluded in Maastricht) which is facing problems with its ratification in two member states (Denmark, United Kingdom) contains certain provisions that may have implications for corporate taxation in the EC. Assuming that the Treaty will finally become a part of EC law[3] it is worth outlining those

1. See Ruding Report, Chapters 2, 4, 5 and 6.
2. Ruding Report, at 29.
3. The commitment of the ten member states to the Treaty and their determination to adhere to it may lead to a division within the EC if the two "dissident" member states do not solve their problems.

© 1993 International Bureau of Fiscal Documentation

provisions which are likely to affect the developments in corporate taxation towards the harmonization process.

First, Article G(5) of the Treaty[4] which establishes the principle of subsidiarity implies that any future legislative intervention on the part of the EC in the field of corporate taxation should be restricted to cases where there is a real and absolute need for centrally imposed legislative measures. Such measures should deal with those elements of corporate taxation which, because they affect the achievement of the real single market and therefore transcend the frontiers of the member states, can be dealt with more effectively by the EC than by the member states acting separately. What remains to be considered and what will cause controversy is the decision on what can be left to member states.

Second, introduction of the principle of fiscal discipline by Article G(25) of the Treaty[5] will have repercussions on national corporate tax policies. As a result, the governments of member states will rely more on taxes than borrowing if they want to finance their spending programmes, and therefore revenues from corporate taxation will become more important, particularly for states which already rely heavily on corporate tax revenues.[6]

Third, the centralization of monetary policy through the establishment of the European Central Bank and the adoption of a single currency from 1 January 1997 or 1 January 1999 will have a spill-over effect on tax policy, since the former is strongly linked with the latter.[7] In view of this, the monetary convergence of the 12 cannot tolerate their present fiscal divergence. Any movement towards a monetary union pursuant to the provisions of the Treaty cannot succeed without a parallel movement towards fiscal union which implies the assimilation of different tax regimes, including corporate income taxation.

C. *The Ruding Report*

The Ruding Report is expected to become the starting point for a debate on corporate taxation in the EC. Although one may question some of the specific recommendations included in the last Chapter of the Report (e.g. the necessity for centrally imposed bands of statutory corporate income tax rates) the Report contains some very important points.

First, it notes that the importance of the corporate tax factor in investment-making within the EC is gradually growing as other "barriers to the location of investment are dismantled".[8] Second, the Report concludes that some of the differences between corporate income tax laws cause distortions to the functioning of the internal market.[9] Third, it indicates that "it is unlikely that such differences will be reduced much further through independent action by Member States".[10] Finally, the Report recommends that action be taken at the Community level and that such action should strive to remove tax obstacles to cross-border operations, that common rules for a minimum tax base be introduced and maximum transparency *vis-à-vis* tax incentives be achieved.[11]

Despite the significance of the findings and conclusions of the Report the EC Commission has shown reluctance towards the full implementation of the Report's recommendations. The Commission's comments on the Report in Sections 48 and 49 of the Communication, the lack of a timetable for action and the implied absence of a long-term objective raise serious doubts about the Commission's strategy on corporate tax harmonization.

III. FACTORS AFFECTING THE DEVELOPMENT OF CORPORATE TAX HARMONIZATION IN THE EC

A. *The legal factor*

The first factor that will affect any future development in corporate taxation is the legal framework within which such development has to take place. This legal framework is formulated by the EC Treaty, in particular by Articles 3b,[12] 100[13] and 220. Given that the latter is of restricted importance (it can be used as the legal basis for coordination measures, especially tax conventions), the focus is on Article 100.

Article 100 plays a pivotal role in corporate tax harmonization, since it constitutes the legal basis for the adoption of centrally imposed measures. Consequently, application of Article 100 to corporate tax harmonization means that: (1) the object of harmonization can be laws, regulations or administrative provisions concerning corporate taxation, (2) the harmonization of rules concerning corporate taxation must be essential for the establishment or the proper functioning of the common market, (3) the instrument by which harmonization is carried out is the directive,[14] (4) corporate tax directives are proposed by the Commission, and after the consultation with the European Parliament and the ECOSOC, the Council of Ministers may adopt them acting unanimously.

Two fundamental problems with Article 100 are that it requires that the provisions under harmonization must "directly affect" the establishment or the proper functioning

4. It will be inserted in the Treaty of Rome as Art. 3b.
5. Especially by the new Art. 104c of the Treaty of Rome and by the Protocol on the Excessive Deficit Procedure.
6. See Ruding Report, Tables 8.2 and 8.3, at 170-171.
7. See the analysis by P. Werner, "Report to the Council and the Commission on the Realization by Stages of Economic and Monetary Union in the Community", *Bulletin of the EC*, Supplement 3/1970; also the Council's Resolution of 22 March 1971 adopting the Werner Report (1971 OJ, C28) and P. Isard, "Corporate Tax Harmonization and European Monetary Integration", 41 *Working Document of the Centre for European Policy Studies* (1990).

12. The "subsidiarity clause" inserted by Art. G(5) of the Treaty on European Union; see *supra* note 4.
13. As amended by Art. G(21) of the Treaty on European Union.
14. Conventions under Art. 220 and Regulations in exceptional cases under Art. 235 are the other options.

© 1993 International Bureau of Fiscal Documentation

of the common market, and it requires unanimity. The first problem can be overcome if it is accepted that the requirement does not mean "of a certain causality, but a certain intensity of effect".[15] The second problem cannot be overcome as the EC Treaty remains in effect, and it is very difficult to achieve the required unanimity given the various interests of member states.

Thus if a proposed measure is outside the legal framework as defined by the EC Treaty the chances for its adoption and implementation would be practically nil. It would be fundamentally wrong to adhere to a solution which might be perfect from a theoretical perspective but which could not be put into effect because it is incompatible with existing EC legal regime. This by no means should be interpreted as an argument in favour of the retention of the EC Treaty in its present form.

Conversely, if the existing legal framework has drawbacks they should be identified and the need for an amendment in the future should not be disregarded. However, it should be noted that amendments to the EC Treaty are not easily agreed upon and agreement in any case requires protracted negotiations. Given the fact that the Treaty was recently amended and that the problem of corporate taxation in the EC requires an immediate solution, the existing legal framework must be used to resolve the issues.

B. *The economic factor*

The future of EC corporate tax harmonization inevitably depends on economic developments and in particular on the progress of economic integration. The validity of this view has been historically proved since the 1969 proposed corporate tax directives were tabled before the Council when the Community had just achieved the stage of Customs Union (1 July 1968), even though the proposed measures corresponded to the needs of a single market. Thus, when the EC embarked on the establishment of that market the need for those measures became obvious and imminent leading to their adoption (July 1990).

Furthermore, the Ruding Committee, recognizing the close links between its proposed corporate tax measures and the process of economic and monetary union (as the latter was decided at Maastricht), allocated those measures to three phases which coincide with the three stages of economic and monetary union.[16] However, the possible adoption of a single currency is inconceivable as the experience of federal states has shown, but such a centralization of economic and monetary policy will have to be supplemented by similar developments in tax policy because of the interdependence between economic-monetary policy and tax policy.[17] Additionally, such a centralization of economic and monetary policy will hardly be legitimized without resolving the democratic deficit problem that is apparent in the EC.

C. *The political factor*

As has been suggested,[18] the links between economic and political developments and particularly between economic and political integration are exceptionally strong. The political evolution of the EC is, and will be, influenced by the way in which economic and monetary union progresses. If the latter reaches an advanced stage,[19] the demand for closing the democratic deficit and achieving a greater degree of democratic accountability may lead to a political structure very similar to the federal one, or at least may force the Community to confront certain issues (such as legitimization of non-accountable or indirectly accountable institutions to make decisions) which it has thus far skilfully avoided.

Whatever measures are selected to deal with the problem of EC corporate taxation must be in accordance with political developments or they will not have any effect, and the measures must also be politically acceptable by the member states in order to be put into effect.

D. *The theoretical factor*

The environment in which corporate tax harmonization will develop in the 1990s dictates the theoretical principles by which any harmonization measures should abide in the future. In fact some of these principles can be included in the factors discussed above[20] but their importance as a whole justifies a separate reference.

The first principle which was discussed above is subsidiarity. The second is tax neutrality which encompasses five conditions:

(1) the decision as to the location of an investment must not be influenced by corporate tax laws (locational neutrality);
(2) the legal form of the enterprise must not be influenced by corporate tax law provisions which favour certain types of enterprises;[21]
(3) corporate tax law provisions must not treat direct investment more favourably than indirect investment (neutrality with respect to the type of investment);
(4) corporate taxation must not affect the means of financing[22] of an enterprise by giving preferences (neutrality toward the financing of investments);
(5) there must be not be discrimination between foreign or domestic investment made by a resident of a state or discrimination between domestic investment made by a resident or a non-resident (international neutrality).

Total tax neutrality exists when all of the above conditions are fulfilled – corporate tax harmonization must achieve as

15. C.D. Ehlermann, Lecture given in Edinburgh University on 18 November 1977, and published as Appendix 3(b) to the 22nd Report of the House of Lords Committee on the European Communities.
16. Ruding Report, at 13.
17. Provided that the single currency era will become reality, since there are still serious doubts.
18. See D. Wyatt-A. Dashwood, *The Substantive Law of the EEC*, 2d ed., (London, 1988), at 13.
19. For example, a centralized planning of monetary and fiscal policy.
20. For example, economic efficiency is included in the economic factor, political acceptability in the political factor.
21. E.g. the corporate tax law of a country may favour public companies over limited partnerships.
22. Equity financing, debt financing, retention and reinvestment of profits.

© 1993 International Bureau of Fiscal Documentation

much neutrality as possible. If some but not all of the conditions for tax neutrality are met in a particular case partial tax neutrality is achieved.

The third principle is economic efficiency which denotes the most productive use of resources at the lowest possible cost. This is one of the most important criteria used to determine whether the resources of a country are used in such a way to guarantee steady and constant economic development. Application of this principle to investments made by companies can determine whether or not a project is economically efficient. An investment is regarded as economically efficient if the following requirements are met:

(1) the investment is made by a company which is most qualified to carry out the project;
(2) the investment is made in an area which has the resources necessary to carry out the project;[23] and
(3) there are no other factors which can influence the economic climate.[24]

The fourth principle is that of equity which extends beyond its classical form (horizontal-vertical equity) to include the multinational aspect resulting from the establishment of the internal market. Thus two new forms of equity should be accepted, i.e. inter-individual equity which concerns EC nationals (including companies) and calls for equitable treatment among individuals who receive income exposed to several tax jurisdictions, and international or inter-jurisdictional equity. The latter suggests a fair distribution of corporate taxes between the member state in which a company resides and the member states in which a part or the entire taxable income of the company accrues. It is worth noting that the principle in question is linked with the classical dispute between the country of residence and the country of source about the right to tax. The latter is given the chance to tax profits first, whereas the former has the privilege of determining a company's final tax liability.

The fifth principle is flexibility which denotes that the corporate tax structure which emerges from the harmonization of national tax laws should be adaptable to the economic, political and legal developments taking place within the EC and to the corporate tax trends of a specific time.

The next principle, certainty, is one of the most important principles to which every efficient tax structure adheres. Certainty requires that a tax system not be subject to continuous and consecutive changes and not raise doubts in the taxpayers minds as to whether or not a tax law is enforceable. Thus the scope and content of tax rules should be clear and any ineffective or outdated provisions or other problems should be identified by studying the performance of a tax system over a period of time and dealt with by appropriate tax reform. This by no means excludes "on the spot reactions" to serious problems which are likely to threaten the functioning of a tax system, causing a loss of revenue.[25]

Finally, corporate tax harmonization should adhere to the principles of administrative feasibility and political acceptability, and must always have an anti-avoidance and anti-evasion orientation.

IV. WHICH HARMONIZATION?

Before mentioning the type of corporate tax harmonization the EC needs it is worth outlining the reasons for which this article rejects the other two instruments of fiscal integration, namely (corporate) tax unification and (corporate) tax coordination.

Corporate tax unification can certainly provide a solution to the corporate tax dilemma in the EC through the imposition of uniform rules. Consequently, in a hypothetical case where the disparities between the national corporate tax laws cause a distortion to the single market these disparities can be eliminated by the adoption of a single rule via a regulation. However, this method, if extensively applied, may lead to a situation where every aspect of corporate taxation would be regulated by uniform rules adopted at the EC level and nothing would be left to the competence of the individual member states. Such a centralized corporate tax model is nothing more than a single European corporate tax law.

The first reason for rejecting corporate tax unification is that although it satisfies most of the above principles it is not consistent with the legal framework, i.e. the EC Treaty. The EC Treaty permits the harmonization of corporate tax laws through Article 100[26] and directives, whereas regulations, which are the instruments for unification, are allowed in exceptional cases under Article 235. Thus unification measures in the field of corporate taxation are the exception not the rule under the present form of the EC Treaty.

Secondly, corporate tax unification does not correspond to the present economic situation of the EC (economic factor). Conversely, it presupposes a centralized economic structure according to which major economic policy decisions are taken at a central level and there is no room for diversities and variations. As a result, this need for uniformity dictates the use of unification measures. It must be emphasized, however, that the EC has not reached such stage and it is not absolutely certain that it will. If the EC does achieve this advanced stage of economic integration, tax unification measures may prove to be necessary, although any comment about corporate taxation during that stage seems very risky and highly speculative for the time being.

Thirdly, there is no compatibility between corporate tax unification and the current political structure of the EC (political factor). The uniformity and centralization that characterize tax unification cannot be politically acceptable by the member states and cannot be justified insofar as the "democratic deficit"[27] in the most powerful institutions as regards decision-making remains so great. In modern democratic states

23. There are cases of deliberate deviations from this rule, for example, for reasons of regional policy.
24. For example, taxation, political circumstances bureaucracy, lack of infrastructure, etc.
25. For example, when a government amends tax provisions aiming at closing loopholes or clarifying those provisions.
26. The exact wording of the article refers to the approximation but this word has the same meaning as harmonization.
27. A term used in EC documents and EC law to denote the gap between the power an institution has in respect of decision-making and the accountability of that institution to the people.

© 1993 International Bureau of Fiscal Documentation

decisions (concerning direct taxation in particular) are taken by the democratically elected national parliament, whereas in a hypothetical corporate tax unification process decisions on corporate taxation will be taken by the Council of Ministers, an institution not directly accountable to Europeans in contrast to the European Parliament.

Finally, due to the transfer of competence from the national level to the Community (supranational) level, tax unification implies that recourse to it should not be sought unless the use of harmonization measures is considered to be inadequate. Thus far what has been called into question is not the adequacy of corporate tax harmonization measures but the necessity for the adoption of such measures. Taking into account that corporate tax harmonization induces controversy over its applicability one can easily conclude that the applicability of corporate tax unification will give rise to more controversy.

Turning to the second instrument of fiscal integration (tax coordination) and applying it to corporate taxation in the EC the comment can be made that corporate tax coordination falls short of the needs of the EC. First, it lacks the binding effect[28] of the other two instruments (unification-harmonization) of fiscal integration, and it corresponds to looser political and economic circumstances than those currently existing in the EC.

Secondly, corporate tax coordination cannot meet the needs of the theoretical factor mentioned above. This is attributed to the function of coordination which aims at securing the concerted coexistence of corporate tax laws of different states in cases where there is ground for conflict[29] or there is a need for combined legal action.[30] What becomes obvious is that corporate tax coordination has little or no contribution to the assimilation of the corporate tax laws of the member states which is fundamental for the elimination of the disparities existing between these laws and the proper functioning of the common market.

Taking into consideration that corporate tax coordination is too little for the problem caused by the different corporate tax laws of the member states and that corporate tax unification is too much the only solution remaining is corporate tax harmonization. But what kind of harmonization?

First, the process of harmonization should be a "horizontal harmonization" in the sense that it should bring national corporate tax laws into alignment with a view to adapting them to the needs of the common market. Further, it is obvious that since there is no special provision in the EC Treaty for corporate tax harmonization there is no case for "vertical corporate tax harmonization".

Secondly, the lack of a special provision for corporate taxation or for direct taxation in the EC Treaty means that corporate tax harmonization can only be positive.[31] Consequently, it must include all measures which are taken according to the EC Treaty and which harmonize national corporate tax laws with the purpose of facilitating the establishment and proper functioning of the common market.

Thirdly, corporate tax harmonization in the EC should not be "single-phased" but should be carried out in more than one stage (gradual harmonization). This approach is also favoured by the Ruding Committee which recommended the adaptation of the corporate harmonization process to the three stages of economic and monetary union.

Fourthly, "total harmonization" of corporate taxation should be avoided in light of the principle of subsidiarity. The consequence of the application of this principle to corporate taxation is that the EC is entitled to take harmonization measures with regard to corporate tax issues when dealing with these issues at the national level is deemed inadequate or ineffective. Thus, the proposed harmonization must be "partial harmonization" and oriented towards those aspects of corporate taxation which pose problems to the establishment or functioning of the common market.

Finally, the most important choice that has to be made in relation to the form of the proposed corporate tax harmonization is whether the harmonization process should be imposed by the EC or led by the market.[32] The solution lies in the middle and can be named the "hybrid solution" which would opt for minimum imposed harmonization. As a result, harmonization measures taken at the Community level should target the disparities between the 12 corporate tax laws which constitute tax obstacles to cross-border operations[33] and should produce common rules for a minimum tax base (elaborating the 1988 Preliminary Draft Proposal for a Directive on the Harmonization of Rules Determining the Taxable Profits of Undertakings). The harmonization of statutory corporate tax rates should be left to market forces and intense consideration should be given to a possible need for a change from separate accounting to formula apportionment due to an expected increase in multijurisdictional activities, and to a possible need for a common system of integration of corporate with personal income taxation.

V. CONCLUSION

The fact that it took 21 years for some corporate tax harmonization measures to be adopted[34] and that three proposed directives which are of vital importance for the proper functioning of the single market have been on ECOFIN's agenda for one and a half years[35] casts doubt on the prospects of cor-

28. For example, the Arbitration Convention is not so binding compared to the two adopted corporate tax Directives.
29. E.g. between the law of the source state and that of the residence state.
30. Cooperation against tax evasion, etc.
31. "Negative harmonization" presupposes the existence of "standstill-clauses" in the Treaty with which national laws comply.
32. "Imposed" or "top-down" approach in contrast to "competitive" or "market-led" or "bottom-up" approach.
33. See Ruding Report, at 203-206. Such an approach includes intra-Community tax treaty network as well as an attempt to assimilate the content of the tax treaties EC countries have with non-EC countries so as to avoid the creation of tax havens within the EC for non-EC companies.
34. The mergers directive, the parent-subsidiary directive and the arbitration convention were adopted in 1990.
35. The proposed directive on interest and royalty payments, the proposed directive on the offsetting of losses and that on the carryover losses (the latter was proposed in 1984 for the first time and was relaunched as a supplement to the proposed directive on the offsetting of losses).

© 1993 International Bureau of Fiscal Documentation

porate tax harmonization. The "principle of an open market economy with free competition" that was inserted in the EC Treaty (Article 3a) by Article G(4) of the Treaty on European Union will suffer serious tax distortions unless appropriate measures are taken in time. Furthermore, the close interrelation between corporate tax harmonization and the economic and political developments in the EC means that the pace of the latter will be reflected in the former. As a result, if the provisions of the Treaty on European Union are implemented and the EC moves towards an economic and monetary union within a truly single market the need and the pressure for corporate tax harmonization measures will be great. Conversely, if the process of economic and monetary union reaches a deadlock the future of corporate tax harmonization will be bleak.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

AFRICA

Sierra Leone

INVESTMENT IN SIERRA LEONE.
Freetown, KPMG Peat Marwick, Att. Raymond Davies, Ludgate House, Wallace-Johnson Street, Freetown, Sierra Leone. 1992, pp. 38.
Booklet guiding companies, organizations and individuals considering investment or business activities in Sierra Leone. Information is given on: the economy, human resources, business organiSation, company law, banking system and exchange control, tax system, taxation of individuals, investment incentives, immigration.
(B. 13.464)

ASIA & PACIFIC

Bhutan

REVISED TAXATION POLICY, 1992.
Bhutan, Ministry of Finance. 1992, pp. 52.
The 1992 tax changes in conjunction with the Seventh Five Year Plan commencing on 1 July 1992.
(B. 54.175)

Macau

ORCAMENTO GERAL PARA O ANO economico de 1992. Posto em vigor pelo Decreto-Lei No. 64/91/M, de 31 de Dezembro.
Macau, Government Printer. 1992, pp. 715.
The 1992 Budget estimates of revenue and expenditures with short explanation and description of taxes.
(B. 57.815)

Malaysia

INVESTMENT IN MALAYSIA.
5th Edition.
Kuala Lumpur, KPMG Peat Marwick Tax Services Sdb Bhd., 3rd Fl., Wisma Perdana, Jalan Dungun, Damansara Heights, 50490 Kuala Lumpur, Malaysia. 1992, pp. 100.
This booklet describes the local law requirements in broad terms and provides general information on tax legislation and business conditions in Malaysia which affect the establishment of businesses. The contents of this fifth edition reflect the laws in force as at 30 September 1992. (B. 57.809)

New Zealand

SANDFORD, Cedric; HASSELDINE, John.
The compliance costs of business taxes in New Zealand.
Wellington, The Institute of Policy Studies. 1992, pp. 159.
The objective of this study is to measure the compliance costs of the principal business taxes imposed by the central government. Business taxes comprise PAYE (including other withholding taxes), fringe benefit tax, goods and services tax and income tax on sole proprietors, partnerships, companies and trusts.
(B. 57.810)

EUROPE

HOLDING COMPANIES IN EUROPE.
Lisbon, Arthur Andersen & Co., Amoreiras Torre 1 15., 1000 Lisbon, Portugal. 1992, pp. 21.
This booklet provides a brief overview of the current tax treatment of holding companies in eight European countries. It highlights the main features, conditions and tax treaty rates which currently apply in each country in an easy-to-use, comparative format.
(B. 112.386)

TANZI, Vito.
Financial markets and public finance in the transformation process. Washington, IMF – International Monetary Fund. 1992 IMF Working Paper WP/92/29, pp. 30.
Paper surveying the role of financial markets and fiscal institutions in the transformation process going on in Eastern and Central Europe with reference to tax system aspects recommendable.
(B. 112.097)

Austria

WIESNER, Werner; KOHLER, Gerhard; QUANTSCHNIGG, Peter.
Besteuerung der Vereine. Handbuch für die Praxis. 5. Auflage.
Vienna, Linde Verlag Wien GmbH. 1992, pp. 288. AS. 417.
Revised and updated fifth edition of a handbook dealing with the taxation of charities.
(B. 112.348)

LECHNER, Karl; EGGER, Anton; SCHAUER, Reinbert.
Einführung in die Allgemeine Betriebswirtschaftslehre. 14. Auflage.
Vienna, Linde Verlag Wien GmbH. 1992, pp. 864. 670.- S.
Revised and updated edition of an introduction to general business management theory.
(B. 112.349)

London, HMSO. 1992 Inland Revenue, International Series IR 20., pp. 42.
The first part of this booklet explains what is meant by residence, ordinary residence and domicile. The second part explains how these factors affect how much income tax and capital gains tax you have to pay in the UK. The booklet is only concerned with individuals. It does not deal with inheritance tax.
(B. 112.362)

BRITISH COMPANIES LEGISLATION.
7th Edition. Chicago, CCH Commerce Clearing House, Inc. 1992, pp. 4500 £ 21.50.
This seventh edition of British Companies Legislation comprises two volumes. It contains the full text of the following eight main statutes: the Companies Act 1985; the Business Names Act 1985; the Company Securities (Insider Dealing) Act 1985; the Companies Consolidation (Consequential Provisions) Act 1985; the Insolvency Act 1986; the Company Directors Disqualification Act 1986; the Financial Services Act 1986; and the Companies Act 1989. Also included are the 14 commencement orders to the Companies Act 1989 and a number of other important 1990, 1991 and 1992 statutory instruments, many resulting from the commencement of 1989 Act provisions.
(B. 112.351)

BLAKE, David.
Issues in pension funding.
London, Routledge, 11 New Fetter Lane, London EC4P 4EE. 1992, pp. 127. £ 35.-.
This book explains how pension funds work in order to highlight their impact on the economy as a whole. The author explains the different systems in operation, both state run and private sector, including a description of recent policy initiatives such as personal pension schemes. The book provides a highly readable account of pension funds which will be ideal for anyone wanting to understand the issues involved when studying, managing or investing in pension funds.
(B. 112.077)

INTERNATIONAL

MUZONDO, Timothy R.
Alternative forms of mineral taxation. Market failure and the environment.
Washington, IMF - International Monetary Fund. 1992 IMF Working Paper wp/92/49., pp. 38.
This paper examines the environmental effects of mineral taxes in a framework that recognizes the importance of rates and cumulative externalities and proposes and appropriate corrective tax.
(B. 112.107)

FISCHER, Lutz.
Aktuelle Entwicklungen bei der internationalen Reform der Unternehmens-besteuerung.
Hamburg, Institut für Ausländisches und Internationales Finanz- und Steuerwesen. 1990 Hefte zur Internationalen Besteuerung, Heft 71., pp. 25.
Developments of the international reform of taxation of enterprises.
(B. 110.907)

WORLDWIDE CORPORATE TAX
compliance procedures.
Amstelveen, KPMG International Headquarters, Burg. Rijnderslaan 20, 1185 MC Amstelveen, the Netherlands. 1992, pp. 458.
The book is designed to familiarise tax directors with the fundamental principles of corporate tax compliance in different tax jurisdictions, with particular emphasis on the requirements of multinational enterprises. The book covers 40 jurisdictions, including the major industrialised countries. Each country chapter begins with a section on corporate tax returns. This forms the principal section for each country chapter and includes: introduction to the system of compliance procedures, reporting requirements, use of estimated returns, payment dates of tax liabilities, procedures for obtaining double tax relief and also includes the company law filing requirements of non-resident corporations. Other sections cover interest and penalty provisions, examination of tax return by the tax authorities including the information powers of the tax authorities, record keeping, appeal procedures including arbitration procedure for transfer pricing disputes.
(B. 112.371)

SÖDERHOLM, Rainer.
Cross-border dividends. Allocation of the right to tax distribution of profits in the light of different taxation systems. A Finnish aspect.
Uppsala, Iustus Förlag AB, Östra Agatan 9, 753 22 Uppsala, Finland. 1992 Nordiska Skattevetenskapliga Forskningsradets Skriftserie NSFS 28., pp. 153.
Treatment of cross-border dividend distributions in the source country and in the terminal country analysed in the light of the tax systems of eleven countries: Austria, Belgium, Denmark, Finland, France, Germany, Ireland, Sweden, Switzerland, the United Kingdom and the United States. The tax legislation reflected in this study is as of 1 January 1992, except in the case of Norway. The double taxation agreements which are in force at that date are taken into consideration.

HEIDELBERG CONGRESS ON TAXING
Consumption. Proceedings of the International Congress on Taxing Consumption, held at Heidelberg, June 28-30, 1989. Editor Manfred Rose.
Heidelberg, Springer Verlag. 1990, pp. 541. 178.- DM.
The volume contains papers dealing with the pros and cons of consumption-based tax system and of taxing lifetime consumption. Papers presented in this volume come from leading international scientists who discuss the tax reform under theoretical, political, legal and administrative aspects. Amongst other it includes: "On choosing the correct tax base. A historical perspective" by R.A. Musgrave; "Taxation of income, consumption, and wages in an open economy" by P.B. Sorensen; "taxing consumption from a public choice and constitutional point of view" by G.Brennan and J.M. Buchanan; "Fiscal principle, fiscal politics, and consumption taxation" by R.E. Wagner; "Legal aspects of taxing consumption" by J. Lang; "Administrative aspects of a consumption-based tax system" by C.E. McLure and G.R. Zodrow.

INTERNATIONAL: US TAX CONSIDERATIONS IN INTERNATIONAL DERIVATIVE PRODUCTS — 235 — *Stanley C. Ruchelman*

Mr. Ruchelman looks at the tax rules currently applicable to innovative derivative products in the international financial markets. The focus begins on notional principal contracts, mark-to-market election and currency gains and losses. Other provisions are also covered, including the treatment of currency gains and losses in currency swap transactions and synthetic currency instruments created by the combination of loans and hedges. Finally, other international tax issues are addressed, such as the treatment of cross-border securities lenders, transfer pricing for investment banks and tax planning for foreign-based groups that may wish to manage funds in the United States.

CANADA: THE PROPOSED NEW SCIENTIFIC RESEARCH AND EXPERIMENTAL DEVELOPMENT RULES – AN UPDATE ON RESEARCH INCENTIVES — 255 — *Ingrid Sapona*

Recent draft legislation and regulations aim to make the tax incentives applying to scientific research and experimental development (SR & ED) less restrictive. The changes expand and clarify the tax incentives available for SR & ED, and make it easier for some taxpayers to claim an investment tax credit.

PEOPLE'S REPUBLIC OF CHINA: THE NEW LAW ON TAX ADMINISTRATION — 263 — *Jinyan Li*

The Law on the Administration of Tax Collection ("ATC Law") came into effect as from 1 January 1993. The ATC Law applies to individuals, Chinese enterprises, foreign-invested enterprises and enterprises doing business in China. Its provisions include rules for general tax administration, tax collections, tax auditing and penalties for non-compliance.

SINGAPORE: 1993 BUDGET: REWARDS FOR GOING ABROAD AND REBATES FOR GST AT HOME — 278 — *Lee Fook Hong*

The tax changes announced in the 1993 budget are designed to promote overseas investment and encourage the repatriation of foreign earnings. More dependence, however, will be placed on broad-based indirect taxes with the proposed introduction of the GST in 1994.

HONG KONG: BUDGET 1993/94: HONG KONG CONTINUES TO ACHIEVE REMARKABLE GROWTH — 283 — *Ian W. Harris*

The primary aim of the new budget is to maintain fiscal prudence while reducing the tax burden as far as possible for the largest number of tax-paying households. The result: changes to the salaries tax estate duty and stamp duty. Additionally, the Financial Secretary announced two measures to improve the tax system, i.e. introduction of a composite tax return and a perceived anti-avoidance proposal in respect of the taxation of royalties.

JAPAN:
TAX HAVEN AND FOREIGN TAX CREDIT RULES: 1992 AMENDMENTS AND THEIR IMPACT ON DUTCH HOLDING COMPANIES — 286 *Ebel Magnin and Eero Rautalahti*

Japan tightened its tax haven legislation in 1992, causing considerable difficulties in tax planning for Japanese multinationals. At the same time, the complex Japanese system of foreign tax credits was amended to allow credit for taxes paid by second-tier affiliates. This article summarizes the current legislation and analyses three scenarios designed to enable Japanese multinationals to continue using Dutch holding vehicles and at the same time to utilize the second-tier indirect foreign tax credit.

INDIA:
1993/94 BUDGET — 294 *G.K. Kawatra*

This article summarizes the most important measures relating to direct taxes as they affect foreigners.

VIII. Conclusion

I. INTRODUCTION

A basic tenet of US tax law is that the tax consequences arising from a transaction are controlled by that transaction's economic substance, not its form. While not codified, this general principle has been part of the tax law for virtually one-half century.[1] At its heart is the recognition that the economic substance of a transaction must be the controlling factor in determining a person's tax.

Economic substance is a difficult concept to define, especially where the facts are complex, the transaction is on the cutting edge, and no clear answer is apparent. In these circumstances, courts have resolved the controversy by establishing a reference point from which the transaction may be examined.[2] Under this approach, the economic circumstances of a taxpayer prior to entering a transaction must be compared with the circumstances that exist after all steps of the transaction are completed. The difference in economic position is explained by reference to transactions that are relatively straightforward or which have been seen before. In essence, the tax effect of the old and new transactions should not be dissimilar if their only significant difference is form.[3]

Those who develop derivative products – including all forms of notional principal contracts, swaps, collars, floors, caps, swap options, options, short sales, wash sales, hedges, forward contracts, futures contracts and others – share a goal to stretch the boundaries of the financial products industries. They are constantly looking forward. Unfortunately, those who tax plan, account for or examine the tax ramifications of those products continue to look backward at products that already exist. For them, the proper tax results are couched in history.

Mr Ruchelman is an attorney whose practice is based in New York City. He advises clients on the tax effect of cross-border transactions Mr Ruchelman lectures on the subject of international taxation and has co-authored numerous journal articles addressed to this subject. He received a B.A. Degree from Brooklyn College (1968) and a J.D. Degree from George Washington University (1972).

This article is based on a paper delivered at a conference entitled: "Innovative Derivative Products in International Financial Markets", held in New York, 15-16 October 1992, and sponsored by the American Conference Institute.

© 1993 International Bureau of Fiscal Documentation

This article will explain the tax rules that are currently applicable to innovative derivative products in the international financial markets. The article will focus initially on notional principal contracts, mark-to-market election that is available to dealers and traders, and currency gains and losses. It will cover other provisions including the treatment of currency gains and losses in currency swap transactions and synthetic currency instruments created by the combination of loans and hedges. Finally, it will address other international tax issues such as the treatment of cross-border securities lenders, transfer pricing for investment banks and tax planning for foreign-based groups that may wish to manage funds in the United States.

II. NOTIONAL PRINCIPAL CONTRACTS

Proposed regulations have been issued by the IRS addressed to the taxation of notional principal contracts.[4] The purpose of the proposal is to provide a method of accounting that will clearly reflect income for both parties so that the results of a notional principal contract reported in the income tax returns of each will reflect the economic substance of the contract as understood by the IRS.[5] In this regard, the proposed regulations principally address the time for recognizing income and expense. Certain notional principal contracts are viewed to result in a distortion of income flows, and if allowed, enable a taxpayer to level its taxable income through the manufacture of deductions or to capture the benefit of expiring credits and deductions through the acceleration of income. In each instance, the economic effect of the immediate recognition of income or expense can be reversed over time. This is illustrated in the following example, where the role of the swap intermediary is ignored.

> On 1 January 1992, Corporation G enters into an interest rate swap agreement with an unrelated counterparty, Corporation H, under which, for a term of five years, Corporation G is obligated to make annual payments at 11 percent and Corporation H is obligated to make annual payments at LIBOR on a notional principal amount of $ 100 million. At the time Corporation G and Corporation H enter into this swap agreement, the rate for similar on-market swaps matches LIBOR with a fixed rate of 10 percent. To compensate for this difference, on 1 January 1992 Corporation H pays Corporation G a premium (referred to in the proposed regulations as a yield adjustment fee) of $ 3,695,897. The amount of the yield adjustment fee was determined as the present value, at 11 percent compounded annually, of five annual payments of $ 1,000,000 (1% rate differential x $ 100,000,000).[6]

This example illustrates that Corporation G can be viewed to recognize income immediately if that were needed to avoid the loss of a deduction or a credit. At the same time, Corporation H made a payment that, in the absence of other rules, would seem to reduce income immediately. By addressing the timing issues, the regulations attempt to limit the distortions of income and loss recognition. In this way, an attempt is made to give economic substance to the contemplated series of payments.

The proposed regulations will first be effective officially when published in final form. Nonetheless, they reflect the views of the IRS and have been followed by prudent investors and swap dealers.

A. *Definition*

The proposed regulations provide that a notional principal contract is a financial instrument that calls for the payment of amounts by one party to another at specified intervals calculated by reference to a specified index upon a notional principal amount in exchange for specified consideration or a promise to pay similar amounts.[7] Notional principal contracts include interest rate swaps, basis swaps, interest rate caps, interest rate floors, commodity swaps, equity swaps, total return swaps, equity index swaps and similar agreements. Where a master agreement to enter into a series of swap agreements exists, each confirmation is treated as a separate notional principal contract.

With one major exception, a contract described in Internal Revenue Code (IRC) Section 1256(b) is not a notional principal contract.[8] Although not in the proposed regulations, a notional principal contract that is traded on a board of trade such as the Chicago Board of Trade is likely both a notional principal contract and a Section 1256(b) contract. This may have attractive results for a foreign-based group.

A contract under which neither party's obligations are determined by reference to a variable specified index is not a notional principal contract.[9] The term "specified index" refers to any one or more of the following:

- a single fixed interest rate, price or amount;
- an interest rate that is made known publicly and offered currently to unrelated borrowers in private lending transactions by a financial institution;
- an interest rate that reflects an average (based on a statistically significant sample) of current yields on a class of publicly-traded debt instruments;
- a price or index of prices of publicly-traded stock, securities, commodities or other publicly-traded property;
- an amount or index of amounts that reflects the total return on one or more publicly-traded stocks or securities;
- an interest rate, price, index or amount that is more or less than a specified index by a constant number of percentage or basis points, dollars or other units in which the specified index is measured;
- an interest rate, price, index or amount that is expressed as a fixed multiple of a specified index;
- any other interest rate, price, index or amount that is designated by the IRS; and
- an amount that is arrived at through any average or combination of the above.

An option or forward contract that entitles or obligates a person to enter into, extend, cancel or change the terms of a notional principal contract is not, itself, a notional principal

4. Proposed Reg. §§1.446-3 and 1.446-4.
5. Proposed Reg. §1.446-3(b).
6. Proposed §1.446-3(e)(3)(iii), *Example 5*.
7. Proposed Reg. §1.44603(c)(1)(i).
8. A Sec. 1256 contract is defined in the IRC to mean any regulated futures contract, any foreign currency contract, any non-equity option and any dealer equity option. Gains on these contracts are reported as 60% long-term and 40% short-term and losses are subject to the loss deferral rule of IRC Sec. 1092(b) where offsetting positions are maintained in property.
9. Proposed Reg. §1.446-3(c)(1)(ii).

contract. However, payments made under such an option or forward contract may be characterized as a non-periodic payment if the option or forward contract is exercised. Non-periodic payments are discussed below.

B. *Payments*

As previously mentioned, the proposed regulations address the timing of income and expenses for periodic and non-periodic payments. The relevant net income (or net deduction) from a notional principal contract for a taxable year must be included in or deducted from gross income for that taxable year. For this purpose, the relevant net income (or deduction) is the total of all of the periodic and non-periodic payments that are recognized from that contract for the taxable year. Rules, discussed more fully below, control the period in which recognition of these payments occurs. Neither the making of a payment currently nor the accrual of an obligation to make a series of future payments will result automatically in revenue or expense recognition. Prepayments prior to the swap period are generally disregarded. Thus, no portion of a payment by a party is recognized prior to the first year to which any portion of a payment by the counterparty relates. This is illustrated by the following example.

> On 1 November 1991, Corporation F pays an unrelated counterparty, Corporation E, $ 600,000 for a contract which obligates Corporation E to make a payment to Corporation F each quarter beginning 1 January 1992, equal to one-quarter of the excess, if any, of three-month LIBOR over 9 percent with respect to a notional principal amount of $ 25 million. Both Corporation E and Corporation F are calendar year taxpayers.
>
> Because no portion of the premium paid for the cap relates to the period prior to 1 January 1992, neither party can accrue any income or deduction with respect to the cap for the period from 1 November 1991 through 31 December 1991.[10]

1. Periodic payments

Periodic payments are payments made or received pursuant to a notional principal contract that (i) are payable at fixed periodic intervals of one year or less during the entire term of the contract and (ii) are based on a single specified index. Payments made or received pursuant to a notional principal contract do not fail to be periodic payments solely because the interval that precedes the first or last payment under the contract is shorter than, or not more than 90 days longer than, the fixed periodic interval between each of the other payments under the contract. This provision accommodates the regulatory definition with industry practice under which settlement dates are not necessarily coordinated with cash flows. As a result, the initial and final payment period may be longer or shorter than other periods. However, if a particular payment period is more than 90 days longer than others, the payment is not a periodic payment. If it is not a periodic payment, the rules for either non-periodic payments or termination payments apply.

For any taxable year, a taxpayer is required to recognize only the ratable daily portion of a periodic payment which is related to that taxable year. This is illustrated by the following example.

> On 1 April 1992, Corporation A enters into a contract with an unrelated counterparty, Corporation B, under which Corporation A is obligated to make a payment to Corporation B each 1 April for a term of five years beginning 1 April 1993. Each payment is to be in an amount equal to LIBOR determined on the immediately preceding first day of April, multiplied by a notional principal amount of $ 100 million. Under the contract, Corporation B is obligated to make a payment to Corporation A on each of the days in an amount equal to 8 percent multiplied by the same notional principal amount. Corporation A and Corporation B are calendar year taxpayers that use the accrual method of accounting. On 1 April 1992, LIBOR is 7.80 percent.
>
> All of the payments to be made by Corporation A and Corporation B are viewed to be periodic payments because they are each based on a single specified index and are payable at fixed periodic intervals of one year or less throughout the term of the contract. Under the terms of the swap agreement, Corporation B is obligated to make a payment of $ 8,000,000 (8% x $ 100,000,000) to Corporation A and Corporation A is obligated to make a payment of $ 7,800,000 (7.80% x $ 100,000,000) to Corporation B.
>
> The ratable daily portions for 1992 are the amounts of these periodic payments that are attributable to Corporation A and Corporation B's taxable year ending 31 December 1992. In each case under these facts, this portion is 275 days out of a potential 365 days. The ratable daily portion of the 8 percent fixed leg is $ 6,027,397 (275 days ÷ 365 days x $ 8,000,000) and the ratable daily portion of the floating leg is $ 5,876,712 (275 days ÷ 365 days x $ 7,800,000).
>
> The net amount for the taxable year is the difference between the ratable daily portions of the two periodic payments, or $ 150,685 ($ 6,027,397 – $ 5,876,712). Accordingly, Corporation A has net income of $ 150,685 from this swap for 1992, and Corporation B has a corresponding net deduction of the same amount. The unrecognized balance of $ 49,315 ($ 200,000 – $ 150,685) that is made on 1 April 1993, will be included in the net income or net deduction from the notional principal contract reported by Corporations A and B for 1993.[11]

2. Unfixed amount at year-end

If the amount of a periodic payment is not determinable at the end of a taxable year because the value of the specified index is not fixed until a date that occurs after the end of the taxable year, the ratable daily portion of a periodic payment must still be determined. The year-end closes a measuring period for income tax purposes. Allowing unlimited deferral until the amount becomes fixed in a succeeding year would be viewed by the IRS to be an abuse.

The proposed regulations adopt a two-step procedure to determine the ratable daily portion when the amount is not known by year-end. First, the portion that relates to the taxable year which ends in the middle of the accrual period under the notional principal contract is based on the specified index that would have applied if the value were fixed as of the last day of the taxable year. The second step occurs in the following taxable year. Any difference that arises due to a change in the specified index between the last day of the taxable year and the date on which the payment becomes fixed is taken into account as an adjustment to the income or

10. Proposed Reg. §1.446-3(e)(3)(iii), *Example 1(e)*.
11. Proposed Reg. §1.446-3(e)(2)(iii), *Example 1*.

© 1993 International Bureau of Fiscal Documentation

deduction reported in the succeeding taxable year.[12] This is illustrated by the following example.

> Assume that the facts are the same as in the preceding example, except that Corporation A's obligation to make payments based upon LIBOR is determined by reference to LIBOR on the day each payment is due. LIBOR is 8.25 percent on 31 December 1992, and 8.16 percent on 1 April 1993. Thus, under the contract, the obligation of Corporation A is premised on a payment of 8.16 percent. However, the effect of the transaction for income tax purposes (i.e. for computing the tax liability of Corporations A and B for taxable year 1992) must be determined as of 31 December 1992, when the amount of the payment is not yet known.
>
> The two-step procedure must be followed in computing the 1992 and 1993 tax returns. For income tax purposes, the ratable daily portion of the periodic payment from Corporation A to Corporation B will be based initially on the value of LIBOR on 31 December 1992. Thus, in the first step, the ratable daily portion of the floating leg is $ 6,215,753 (275 days ÷ 365 days x 8.25% x $ 100,000,000) while the ratable daily portion of the fixed leg is $ 6,027,397 (275 days ÷ 365 days x $ 8,000,000). The net amount for 1992 on this swap is $ 188,356 ($ 6,215,753 – $ 6,027,397). Accordingly, for 1992, Corporation B reports $ 188,356 of net income from the swap in 1992, and Corporation A reports a net deduction of $ 188,356.
>
> However, the actual net payment that is made by Corporation A in 1993 is based on an index that is different from the index used to compute tax for 1992. The actual net payment to Corporation B is $ 160,000 ($ 8,160,000, on the floating leg, – $ 8,000,000, payment on the fixed leg). For purposes of determining net income or deduction from this contract for the year ended 31 December 1993, Corporation B and Corporation A must include an adjustment to correct the net income and deduction recognized in 1992. This is the second step. In this instance, the adjustment is $ 67,808 (275 days ÷ 365 days x ($ 8,250,000 presumed payment on the floating leg – $ 8,160,000 actual payment on the floating leg) and is accounted for as net income by Corporation A and as net deduction by Corporation B.
>
> The net periodic payment recognized for 1993 is $ 39,452 (90 days ÷ 365 days x $ 160,000). Hence, for 1993, Corporation A reports net income of $ 28,356, reflecting the ratable portion of its periodic payment (a deduction of $ 39,452) and the adjustment for 1992 (income of $ 67,808). In a similar way, for 1993, Corporation B reports a net deduction of an equivalent amount ($ 28,356). This is comprised of the ratable portion of its receipt of a periodic payment (income of $ 39,452) and the adjustment for 1992 (a deduction of $ 67,808).[13]

3. Non-periodic payments

A non-periodic payment is any payment made or received pursuant to a notional principal contract that is not a periodic payment or a termination payment.[14] Examples of non-periodic payments are the premium for a cap or floor agreement (even if it is paid in instalments), the yield adjustment fee (or premium) for an off-market interest rate swap agreement, and as previously mentioned, the premium for an option to enter into a swap which is treated as a non-periodic payment only if and when the option is exercised. If a non-periodic payment takes the form of instalment payments of an amount determined at the settlement of the notional principal contract, the instalments must be divided between the discounted current value of the premium and the additional amounts that relate to the right to make the non-periodic payment in instalments.[15]

A non-periodic payment must be recognized over the term of a notional principal contract in a manner that reflects the economic substance of the contract.[16] For any taxable year, a taxpayer is required to recognize only the ratable daily portion of a non-periodic payment which is related to that taxable year. The amount recognized is included in or deducted from the taxpayer's gross income.

The timing of income and deductions from the contract depends upon the type of notional principal contract involved and its economic characteristics. The proposed regulations are premised on the assumption that notional principal contracts resemble other financial instruments and the amount of a non-periodic payment made pursuant to the notional principal contract corresponds to the value of those instruments, adjusted to reflect a discount for early payment or a premium for late payment.

(a) *Swaps*

A non-periodic payment that relates to a swap must be recognized over the term of the contract by allocating it in accordance with the values of a series of cash-settled forward contracts that reflect the specified index and the notional principal amount. For purposes of this allocation, the IRS will respect the forward prices, interest rate and compounding method used by the parties to determine the amount of the non-periodic payment, if reasonable. It is understood that the premium for an off-market swap is frequently determined by reference to the present value of a stream of payments equal to the difference between the payments that arise from the off-market terms of the swap and the payments that would have been due under a swap at par. The difference is discounted using the interest rate under the fixed rate leg. This is illustrated in the following example.

> Assume that the terms of a notional principal contract interest rate swap at par calls for a five-year swap of 8 percent interest in return for interest at LIBOR. Corporation A enters into an off-market swap with Dealer B calling for standard five-year terms, but with the swap of 6 percent interest in return for interest computed at LIBOR. If the periodic payments are made on a semi-annual basis, the yield adjustment fee that will be required is $ 1,677,520. That is the present value of a stream of ten semi-annual payments reflecting one-half the difference of the fixed payment interest at par (8 percent) with the fixed payment under the off-market arrangement (6 percent). The need for dividing the difference in half reflects the semi-annual nature of the payment under the income stream. Here, the difference is $ 2.5 million (2% x $ 25 million x 5 years = $ 5 million ÷ 2). The stream of payments is $ 250,000 for each of the ten semi-annual periods and the discount rate is 8 percent, the standard rate at par.

(b) *Alternative for swaps*

As an alternative, a non-periodic payment made or received with respect to an interest rate swap – and only an interest rate swap – may be allocated to each period of the swap contract by assuming that the non-periodic payment represents

12. Proposed Reg. §1.446-3(e)(2)(B).

15. Proposed Reg. §1.446-3(e)(3)(iii), *Example 3*.
16. Proposed Reg. §1.446-3(e)(3)(ii).

© 1993 International Bureau of Fiscal Documentation

the present or future value, determined under the constant yield to maturity method, of a series of equal payments made throughout the term of the swap contract (the "level payment constant yield to maturity method").[17]

Under this method, an up-front payment may be allocated by dividing each equal payment into two components. These are the principal recovery and time value components. The principal recovery components are treated as periodic payments made on each date that periodic payments are required of the party making the non-periodic payment. If no periodic payments are made by that party, deemed payments are made on each date that the swap contract calls for periodic payments from the other party.

Generally, the calculation must use semi-annual compounding and a discount rate equal to the overpayment rate established under IRC Section 6621(a)(1) on the date the non-periodic payment is fixed. However, if the parties actually use the level payment constant yield to maturity method to determine the amount of the non-periodic payment, the calculation may employ the actual interest rate and compounding method used in that determination. This is illustrated in the following example.

> On 1 January 1992, Corporation G enters into an interest rate swap agreement with an unrelated counterparty, Corporation H, under which, for a term of five years, Corporation G is obligated to make annual payments at 11 percent and
>
> Corporation H is obligated to make annual payments at LIBOR on a notional principal amount of $ 100 million. At the time Corporation G and Corporation H enter into this swap agreement, the rate for similar on-market swaps matches to a fixed rate of 10 percent. To compensate for this difference, on 1 January 1992 Corporation H pays Corporation G a yield adjustment fee in the amount of $ 3,695,897. Corporation G provides Corporation H with information that indicates that the amount of the yield adjustment fee was determined as the present value, at 11 percent compounded annually, of five annual payments of $ 1,000,000 (1% x $ 100,000,000). Corporation G and Corporation H are calendar year taxpayers.
>
> This contract is an interest rate swap and the yield adjustment fee is a non-periodic payment. The method used to allocate that payment is the level payment constant yield to maturity method. Under this method, the yield adjustment fee (premium) may be recognized over the life of the agreement using the discount rate and compounding method adopted by the parties. With annual compounding at 11 percent, the ratable daily portions are:

Year	Level Payment	Time Value Component	Ratable Daily Portion
1992	$ 1 mil.	$ 406,549	$ 593,451
1993	$ 1 mil.	$ 341,269	$ 658,731
1994	$ 1 mil.	$ 268,809	$ 731,191
1995	$ 1 mil.	$ 188,378	$ 811,622
1996	$ 1 mil.	$ 99,098	$ 900,902
Total	$ 5 mil.	$ 1,304,103	$ 3,695,897

> The net of the ratable daily portions of the 11 percent payments by Corporation G, the ratable daily portions of the LIBOR payments by H, and the ratable daily portions of the yield adjustment fee paid by Corporation H equals the annual net income or deduction from the contract for both Corporation G and Corporation H. The time value components are needed to compute the ratable daily portions of the yield adjustment fee paid by Corporation H, but do not otherwise affect the parties' method of accounting for this contract.[18] Since the time value component has neither been paid nor accrued, it is given no further effect for income tax purposes.

(c) *Caps or floors*

If a non-periodic payment relates to a cap or a floor, the payment must be recognized over the term of the agreement by allocating it in accordance with the values of a series of cash-settled option contracts that reflect the specified index and the notional principal amount. For purposes of this allocation, the option pricing used by the parties to determine the total amount paid for the cap or floor will be respected, if reasonable. Only the portion of the purchase price that is allocable to the option contract or contracts that expire during a particular period is recognized for that period. Accordingly, straight-line and accelerated amortization methods are not permissible. However, the proposed regulations emphasize the importance of the Black-Scholes[19] method of option pricing under which the risk value increases as the period is lengthened. This tends to defer recognition of the payment to later years. Allocations which vary significantly from the Black-Scholes method may not be reasonable. For example, an allocation of value to the front end of a series of options would exist if, in the instance of a three-year option, the cost of a two-year option acquired at the end of the first year is subtracted from the cost of a three-year option. This method is not acceptable.[20]

The allocation method for a non-periodic payment in the case of a cap or floor is illustrated in the following example.

> On 1 January 1992, when LIBOR is 8 percent, Corporation F pays unrelated party Corporation E $ 600,000 for a contract which obligates Corporation E to make a payment to Corporation F each quarter equal to one-quarter of the excess, if any, of three-month LIBOR over 9 percent with respect to a notional principal amount of $ 25 million. Both Corporation E and Corporation F are calendar year taxpayers. Corporation E provides Corporation F with a schedule of allocable premium amounts that indicates the cap was priced according to a variation of the Black-Scholes option pricing formula and that the total premium is allocable to the following periods:

1992	$ 55,000
1993	$ 225,000
1994	$ 320,000
Total	$ 600,000

> The $ 600,000 cap premium paid by Corporation F to Corporation E is a non-periodic payment. Although the cap has been allocated under a modified version of the Black-Scholes formula, the schedule generated by Corporation E's proprietary model is not inconsistent with the economic substance of the cap, and may be used by both Corporation E and Corporation F for calculating their ratable daily portions of the cap premium. Corporation E recognizes the ratable daily portion of the cap premium as income, and Corporation F recognizes the ratable daily portion of the cap premium as a deduction based on the pricing schedule.

(d) *Alternative method for caps or floors*

At the time the proposed regulations were published, the IRS published a draft form of a revenue procedure providing for an alternative recognition method for notional principal con-

17. Proposed Reg. 1.446-3(e)(3)(ii)(D)(1).
18. Proposed Reg. §1.446-3(e)(3)(iii), *Example 5*.
19. Black and Scholes, "The Pricing of Options and Corporate Liabilities", 81 *J. Pol. Econ.* 637 (1973).
20. See proposed Reg. §1.446-3(e)(3)(iii), *Example 4*.

© 1993 International Bureau of Fiscal Documentation

tracts that are caps or floors. The revenue procedure will be effective when the proposed regulations become final. If elected, the alternative method applies only to interest rate caps and floors that are based on a specified index that is known publicly and offered currently to unrelated borrowers in private lending transactions by a financial institution or that reflects an average (based on a statistically significant sample) of current yields on a class of publicly-traded debt instruments. For this purpose, both an index that reflects an average of the foregoing indices or is expressed as a fixed number of basis points above or below such indices or such average is acceptable.

For each taxable year in which the taxpayer enters into an interest rate cap or floor agreement, it may elect to use the optional method for all interest rate cap and floor agreements entered into in that year. The election is irrevocable for the year and is made by attaching a statement to a timely filed federal income tax return.

Amortization tables are set forth to derive a schedule of annual amortization rates to be applied to the unadjusted amount of the premium paid or received for an interest rate cap or floor agreement. One table lists a series of factors corresponding to the years covered by the interest rate cap agreement and the number of basis points by which the cap rate differs from the specified interest rate index. A second table relates to interest rate floor agreements and sets forth factors for years covered and basis points by which the specified interest rate index differs from the floor rate.

(e) *Limitations on alternative methods*

The regulations caution that none of the optional methods to amortize any non-periodic payment made or received with respect to the hedged notional principal contract will be available to a taxpayer that hedges a notional principal contract, either directly or through a related party, by purchasing, selling or otherwise entering into other notional principal contracts, futures, forwards, options or other financial instruments.[21] Moreover, the IRS may require that amounts paid to or received by the taxpayer under the notional principal contract be treated in a manner that is consistent with the economic substance of the transaction as a whole. Unfortunately, no illustration of the economic substance is provided.

The optional method for caps or floors may not be used by dealers or traders.[22] It is not available to any cap or floor which, at the inception of the contract, falls outside of the range of rates specified in the appropriate table.[23]

4. Termination payments

A payment that extinguishes or assigns all or a proportionate part of the rights and obligations of any party under a notional principal contract is a termination payment.[24] A termination payment may be made between the original parties to the contract, in which case the termination payment is an extinguishment, or it may be made between one party to the contract and a third party. In that instance, the payment is an assignment.

Except as otherwise provided in IRC Section 1092 relating to deferrals of losses that arise where offsetting positions are maintained with respect to property, both parties to a notional principal contract recognize a termination payment that is received or made with respect to that contract in the year of the extinguishment or assignment.[25] This may be illustrated by the following example.

> On 1 January 1992, Corporation P enters into an interest rate swap agreement with an unrelated counterparty, Corporation O under which, for a term of seven years, Corporation P is obligated to make annual payments based on 10 percent and Corporation O is obligated to make semi-annual payments based on LIBOR. The notional principal amount of the contract is $ 100 million. Corporation P and Corporation O are both calendar year taxpayers. On 1 January 1994, when the fixed rate on a comparable LIBOR swap has fallen to 9.5 percent, Corporation P pays Corporation O $ 1,895,393 to terminate the swap.
>
> The payment from Corporation P to Corporation O extinguishes the swap contract and is a termination payment. Corporation P recognizes a loss of $ 1,895,393 in 1994 and Corporation O recognizes $ 1,895,393 of income or gain in 1994.[26]

The termination payment is an immediate taxable event for both of the original parties to the notional principal agreement. If the payment is not made to an original counterparty, but instead is made to an assignee, the result is unchanged. The original counterparty is deemed to have income or gain from the payment. In addition, any payments that have been made or received previously pursuant to a notional principal contract, but that have not been recognized by the time of the termination payment, are also recognized in the year of the extinguishment or assignment. An assignee treats a termination payment as if it were a non-periodic payment made for the notional principal contract that is in effect after the assignment. Thus, the full taxable event for the assignee is deferred. These rules are illustrated by the following example:

> On 1 January 1992, Corporation O pays Corporation P a yield adjustment fee to enter into the seven year interest rate swap. Corporation P and Corporation O included the ratable daily portions of that non-periodic payment in their net income or deduction from the contract for 1992 and 1993. As of 1 January 1994, $ 300,000 of the non-periodic payment has not yet been recognized by Corporation P and Corporation O.
>
> On 1 January 1994, Corporation P pays an unrelated party, Corporation R, $ 1,895,393 to assume all of Corporation P's rights and obligations under the swap with Corporation O. In return for this payment, Corporation R agrees to pay 10 percent of $ 100 million annually to Corporation O and to receive LIBOR-based payments from Corporation O for the remaining five years of the swap.
>
> The payment from Corporation P to Corporation R terminates P's interest in the swap contract with Corporation O and is a termination payment. Corporation P recognizes a loss of $ 1,895,393 in 1994. However, it also recognizes income from the remaining $ 300,000 of the previously unrecognized yield adjustment fee it

26. Proposed Reg. §1.446-3(e)(6)(vi), *Example 1*.

© 1993 International Bureau of Fiscal Documentation

received in 1992. At the same time, Corporation O recognizes $ 1,895,393 of income or gain in 1994 even though it receives no payment. However, Corporation O also recognizes $ 300,000 of loss from the previously unrecognized yield adjustment fee. The net income of Corporation O as of the date of the termination payment is $ 1,595,393. It may be capitalized into the basis in the notional principal contract and may be amortized over the remaining term of the swap agreement as if it made a non-periodic payment.

The payment that Corporation R, the assignee, receives from Corporation P is a non-periodic payment received in connection with the interest rate swap. The proposed regulations conclude that the payment is not a significant non-periodic payment in relation to the present value of the stream of fixed payments. Accordingly, the in terrorem rules discussed below for swaps are inapplicable and Corporation R can amortize the $ 1,895,393 over the remaining five-year term of the swap agreement.

The balance of the rules for termination payments are relatively simple. If only a proportionate part of a party's rights and obligations is extinguished or assigned, then only that proportion of the unrecognized payments is recognized. The termination rules do not apply to any contract that is integrated with other property or debt which may be controlled by IRC Section 988(d). Finally, substance controls over form, and the IRS may treat any economic benefit that is given or received by a taxpayer in lieu of a termination payment as a termination payment.

C. *In terrorem rule for swaps*

The regulations contain two principal in terrorem rules. One is applicable to swaps and the other to caps or floors. Under the first rule, a swap that involves significant non-periodic payments is treated in substance as including one or more loans, which must be accounted for by both parties to the contract as part of the swap.[27] The proposed regulations do not expressly define when non-periodic payments are viewed to be significant. However, examples indicate that a non-periodic payment clearly is not considered to be significant when it is less than 10 percent of the discounted present value of the total fixed payments required under the contract.[28] On the other hand, a non-periodic payment clearly is considered to be significant when it amounts to more than 66 percent of the discounted present value of the total fixed payments.[29]

Where this rule applies, the non-periodic payment is considered to be an interest-bearing, self-amortizing loan. The principal is considered to be repaid as the loan is amortized under the fixed payment constant yield-to-maturity method previously discussed. However, in comparison to the optional method discussed above where the time value component is ignored for tax purposes, here the time value component is viewed to be interest and is treated as such for all purposes of US tax law.

As the principal of the deemed loan is amortized and the element for the time value is determined, the deemed recipient (i.e. the person making the up-front payment) is considered to make additional swap payments in an amount equal to the amortized principal and the interest for the period. The following example illustrates how this is accomplished.

On 1 January 1992, Corporation M and Corporation N enter into an interest rate swap contract. The corporations are unrelated. Under the terms of the contract, Corporation N agrees to make five annual payments to Corporation M equal to the rate of interest under LIBOR multiplied by a notional principal amount of $ 100 million. In return, Corporation M agrees to pay Corporation N 6 percent of $ 100 million annually, plus $ 15,163,147 on the settlement date, also 1 January 1992. At the time Corporation M and Corporation N enter into this swap agreement, the rate for similar on-market swaps is LIBOR to 10 percent, and the amount of the initial payment was determined as the present value, at 10 percent compounded annually, of five annual payments from Corporation M to Corporation N of $ 4,000,000 (4% of $ 100,000,000), each.

Although the parties have characterized this transaction as an interest rate swap, the proposed regulations conclude that the $ 15,163,147 payment from Corporation M to Corporation N is significant when compared to the present value of the total fixed payments due under the contract, i.e. the present value of $ 30 million. Accordingly, the transaction is recharacterized in accordance with its substance. The proposed regulations treat the payment as a $ 15,163,147 loan from Corporation M to Corporation N that Corporation N repays in instalments over the term of the agreement. In addition, the interest rate swap between Corporation M and Corporation N is revised for tax purposes to include a notional provision under which Corporation M is required to pay the amortized principal back to Corporation N as part of its fixed payments on the swap in exchange for the LIBOR based payments by N.

The loan is amortized using the level payment constant yield to maturity method by finding the level payments needed to amortize the $ 15,163,147 payment over five years. The level payment may be determined in this case using the parties' deemed discount rate of 10 percent and annual compounding. Corporation M and Corporation N must account for the principal and interest as follows:

Year	Deemed Level Payment	Deemed Interest Component	Principal Component
1992	$ 4 mil.	$ 1,516,315	$ 2,483,685
1993	$ 4 mil.	$ 1,267,946	$ 2,732,054
1994	$ 4 mil.	$ 994,741	$ 3,005,785
1995	$ 4 mil.	$ 694,215	$ 3,305,785
1996	$ 4 mil.	$ 363,636	$ 3,636,364
Total	$ 20 mil.	$ 4,836,853	$ 15,163,147

Corporation M recognizes interest income, and Corporation N claims an interest deduction, each taxable year equal to the interest component of the deemed instalment payments on the loan. The principal components are needed to compute the interest component of the level payment for the period, but do not otherwise affect the parties' income or deductions from this contract.

Corporation N makes swap payments to Corporation M based on LIBOR, and receives swap payments from Corporation M at a fixed rate that is equal to the sum of the stated fixed rate and the rate calculated by dividing the annuitized annual loan payments (i.e. the sum of the principal and interest, here $ 4 million) by the notional principal amount. Thus, the fixed rate on this swap is 10 percent, which is the sum of the stated rate of 6 percent and the rate calculated by dividing the annual loan payment of $ 4,000,000 by the notional principal amount of $ 100,000,000, or 4 percent. The 10 percent swap payments from Corporation M to Corporation N and the LIBOR swap payments from Corporation N to Corporation M are included in the parties' net income or deduction from the contract for each taxable year.

D. *In terrorem rule for caps and floors*

The second in terrorem rule relates to caps and floors that are significantly in the money on the date the cap or floor is entered. A cap is said to be in the money if it appears that a payment will be received because the floating leg of the transaction exceeds the fixed leg. A floor is in the money if the floating rate is less than the fixed leg.

If the current value of the specified index in a cap agreement exceeds the cap rate by a significant amount, or the floor rate exceeds the current value of the specified index in a floor agreement by a significant amount, then the cap or floor is treated as including one or more loans. As a result, the time value component of a cap or floor that is significantly in-the-money is recognized as interest for tax purposes. In general, the portion that is treated as interest is computed by multiplying (i) the ratable daily portion of the premium that is recognized for the taxable year by (ii) the discount rate used by the parties to determine the amount paid for the cap or floor compounded from the date the premium is paid to the earlier of the date such option contracts expire or the end of the taxable year. However, the amount treated as interest cannot exceed the net income or deduction from the cap or floor for the taxable year. For this purpose, a significant amount is more than 25 basis points.

E. *Anti-abuse rule*

The regulations contain an anti-abuse rule[30] which reflects an admission by the IRS that no matter how the rules are drafted, investment bankers may be able to devise an instrument that will accelerate tax benefits in unanticipated circumstances. Under the anti-abuse rule, none of the foregoing rules are to apply if a taxpayer enters into a transaction that is not a customary commercial transaction, the rules discussed above would produce a material distortion of the taxpayer's income from that transaction, and the taxpayer would not have entered into the transaction but for that material distortion. Only the IRS may apply the anti-abuse rule when necessary to clearly reflect the income from the transaction.

II. MARK-TO-MARKET ELECTION

Dealers and traders of derivative financial products may elect to account for those instruments at market value.[31] An entity is considered to be a dealer or a trader in derivative financial instruments if it maintains an established place of business from which one of two activities are carried on. The first activity relates to the making of a market in derivative financial instruments.[32] The entity must regularly and actively offer to enter into, offset, assign or otherwise terminate positions in these instruments with customers in the ordinary course of its trade or business. The second activity relates to the regular and active course of conduct by which the taxpayer engages in the frequent and substantial trading of derivative financial instruments for the principal purpose of deriving gains and profits from trading those instruments rather than from periodic income.[33] Periodic income includes dividends, interest, net income from notional principal contracts or long-term appreciation.

A. *Conditions for election*

To make the election, certain conditions must be met. First, the entity must have purchased or entered into the instrument in its capacity as a dealer or trader.[34] Alternatively, the instrument must have been purchased or entered into as a hedge of another financial instrument that the dealer or trader holds or intends to hold in its capacity as a dealer or trader.

Second, the dealer or trader must value all of the derivative financial instruments that it holds in its capacity as a dealer or trader (or as hedges of such instruments) at market for purposes of computing net income or loss on its applicable financial statement and its income tax return.[35] The definition of an applicable financial statement is the same as provided for alternative minimum tax purposes. Thus, it includes statements filed with the SEC, certified financial statements used for credit purposes and a financial statement submitted to a government regulator.[36]

Third, for tax return purposes, the dealer or trader and all related persons must account for the securities and commodities that they hold in their capacity as dealers or traders (or as hedges of such securities or commodities) either on the basis of cost or on the basis of market value, but not at the lower of cost or market value.[37] A relatively standard definition is provided for the term "related person". Under this definition, a person is related if it would be treated as a related person under the tests of either IRC Sections 267(b) or 707(b). Although these provisions describe various relationships, they address in substantial part relationships in which greater than 50 percent common ownership exists among various entities. Thus, for example, an individual is related to a corporation in which he owns more than 50 percent of the value of the outstanding stock; two corporations are related if they are members of the same controlled group determined by reference to more than 50 percent common ownership; and a corporation and a partnership are related if the same persons own more than 50 percent of the value of the outstanding stock of the corporation and more than 50 percent of the capital or profit interests in the partnership.[38]

Finally, a description of the methods employed to value each class of derivative financial instruments must be attached to the income tax return filed by the dealer or trader for each year in which the election is in effect and the method elected must be used consistently in subsequent years.[39] Of course, another method may be authorized by the IRS pursuant to a written request for a change of accounting method.

B. *Effective date*

As with the regulations addressed to the recognition of income from notional principal contracts, this regulation is effective when published in final form. If the mark-to-market election is made, the loss deferral rules applicable to straddles will not apply. Those rules are discussed below.

III. COORDINATION WITH OTHER PROVISIONS

As mentioned previously, the proposed regulations relating to notional principal contracts address issues of timing for the recognition of net income and net deductions. However, they affect other provisions of US tax law, ranging from the loss deferral rules for straddles where offsetting positions in property are maintained, to Subpart F under which income of controlled foreign corporations may be accelerated, to the allocation and apportionment of deductions. This portion of the article will discuss those rules.

A. *Straddle rules*

IRC Section 1092 contains several provisions that limit the benefits allowed to taxpayers that invest in straddles. One of those provisions mandates the deferral of losses when less than all of the offsetting positions in property are sold or otherwise disposed of. For persons other than dealers or traders that have a mark-to-market election in effect, the loss deferral provision is problematic.

1. Straddle definitions

For US income tax purposes, a straddle is the holding of offsetting positions in actively traded personal property. Both positions are liquid and each fluctuates inversely in relation to the other. The positions need not be identical so as to eliminate all risk from change in value. Thus, for tax purposes the term "straddle" is broad enough to include what is commonly referred to in the market as a spread. In general, personal property is any property or interests in personal property that may result in gain or loss on disposition. While US currency is not considered personal property for these purposes, an interest rate futures or option contract is considered to be personal property if the contract is actively traded. US dollars, Swiss francs, English pounds sterling, German marks, Japanese yen, Australian dollars, Canadian dollars and ECUS (European Currency Units) are actively traded on a board of trade.

Under proposed regulations, actively traded property includes any personal property for which there is an established financial market.[40] An established financial market for these purposes includes the following:

- a national securities exchange registered under the Securities Exchange Act of 1934;
- an exchange that is exempt from registration because of its limited volume of transactions;
- a domestic board of trade designated as a contract market by the Commodities Futures Trading Commission;
- a foreign securities exchange or board of trade that satisfies analogous regulatory requirements under the law where it is organized;
- an interbank market; and
- an interdealer market that is characterized by a system of general circulation which regularly disseminates price quotations or pricing information by identified dealers, brokers or traders.[41]

Proposed regulations designate a notional principal contract as personal property of a type that is actively traded if an established financial market for similar contracts exists, thereby allowing for the notional principal contract to be actively traded. The proposed regulations also state that the rights and obligations of a party to a notional principal contract constitute an interest in personal property.[42] The proposed regulations state that when final regulations are adopted, they will be effective for notional principal contracts entered into on or after 8 July 1991.

2. Loss deferral

If a taxpayer holds an offsetting position in a straddle, any loss incurred from closing one of the positions is deferred to the extent that there is unrecognized gain in an offsetting position.[43] The loss deferral rule also applies to successor positions, offsetting positions to loss positions and offsetting positions to successor positions.[44] If the deferral rule applies, the loss may be deducted in subsequent years, but only if no unrecognized gain exists in offsetting positions during the subsequent year.[45] The foregoing demonstrates that the loss deferral rule can exacerbate the deferral of deductions that is otherwise required under the recognition rules for non-periodic payments. This is illustrated in the following example.

> Corporation P purchases an interest rate floor from a recognized swap dealer on 1 January 1992. Under the floor, the counterparty is obligated to make a payment to Corporation P if LIBOR is less than 6 percent on specified dates. The notional principal amount of the contract is $ 100 million. Corporation P is calendar year taxpayer.
>
> Corporation P pays $ 600,000 upon settlement of the contract, of which $ 55,000 is recognized on a ratable daily basis in 1992. During 1992, Corporation P maintains an interest in a portfolio of floating and fixed rate interest bearing instruments. Also during 1992, LIBOR does not drop below the floor rate.
>
> Of the $ 600,000 paid by Corporation P, $ 55,000 is recognized in 1992 and is a net deduction under the contract. However, if the floor agreement is viewed to be an offsetting interest in property (i.e. the portfolio of debt instruments) which has at least $ 55,000 of unrecognized gain, no portion of the premium is deductible in 1992. The net loss on the contract will be deferred until the offsetting position is recognized.

An exception to the loss deferral rules is provided for identified straddles.[46] An identified straddle is treated as a unit for income tax purposes. Thus, the recognition of a loss leg on

46. IRC Sec. 1.1092(a)(2)(A)(i).

© 1993 International Bureau of Fiscal Documentation

the straddle is not deferred because of the existence of unrecognized gain in a position that is outside the straddle.[47] For a straddle to be an identified straddle, four tests must be met. All the positions of the straddle must be acquired on the same day. All the positions of the straddle must be identified clearly in the taxpayer's records as being part of an identified straddle. (The designation must be made before the end of the day on which the identified straddle positions were acquired.) All the positions of the straddle must be disposed of on the same day (or held at year-end). The straddle cannot include positions that are part of a larger straddle.[48]

3. Effect on notional principal contracts

While it is clear that a large network of swap dealers exists and that notional principal contracts are traded on the Chicago Board of Trade, it is not clear whether a swap agreement that is not purchased or sold through a dealer intermediary is actively traded. If it is, presumably the loss deferral rules could apply to the extent that the notional principal contract offsets other property having unrecognized gain. It is anticipated that the IRS will address this issue in final regulations.

B. *Foreign currency gains and losses*

The proposed regulations relating to notional principal contracts do not override the rules issued under IRC Section 988 with regard to currency swaps. Those rules relate to the recognition of gains and losses attributable to the movement of currency values. To the extent that the notional principal contract is also a Section 988 transaction, the recognition rules under IRC Section 988 remain applicable.

1. Background

As a general rule, a foreign currency gain resulting from a Section 988 transaction is treated as ordinary income. A foreign currency gain is defined in general to mean the gain or loss arising from a Section 988 transaction to the extent the gain or loss is attributable to the movement in value of a non-functional currency in relation to a taxpayer's functional currency between a booking date and a payment date.[49] For US corporations, the US dollar is generally treated as the taxpayer's functional currency. However, if a qualified business unit (QBU) is maintained outside the United States, a different currency may be treated as the functional currency of the QBU. In that instance, a QBU's functional currency is the currency of the economic environment in which a significant portion of its operations are carried on.[50] Tests are provided in the regulations to determine the appropriate functional currency of a QBU.

If the amount that a taxpayer is entitled to receive or is required to pay is either denominated in a non-functional currency or is determined by reference to the value of one or more non-functional currencies, a Section 988 transaction includes any of the following:

- acquiring a debt instrument or becoming the obligor under a debt instrument;[51]
- accruing (or otherwise taking into account) any item of income or expense that is to be paid or received after the date of accrual;[52]
- entering into or acquiring a forward contract, futures contract, option or similar financial instrument (except for regulated futures contracts and non-equity options) if the underlying property to which the contract relates is, itself, a non-functional currency or a debt instrument denominated in foreign currency;[53] and
- disposing of non-functional currency.[54]

2. Application of Section 988 to a notional principal contract

IRC Section 988 applies to a notional principal contracts only if the underlying property to which the instrument ultimately relates is money (i.e. functional currency), non-functional currency or property the value of which is determined by reference to an interest rate. Thus, a currency swap is included, but a swap referenced to a commodity or equity index is outside the definition.[55] This is illustrated by the following example in which the taxpayer is a US entity that reports income under the accrual method of accounting using the calendar year as its taxable year.

> On 1 January 1989, Corporation X purchases at original issue a three-year bond for £ 74,621.54 maturing on 31 December 1991, at a stated redemption price of £ 100,000. The bond provides for no stated interest. The bond has a yield to maturity of 10 percent compounded semi-annually and has £ 25,378.46 of original issue discount. On these facts, the acquisition of the bond is a Section 988 transaction. The accrual of original issue discount with respect to the bond is a Section 988 transaction with respect to the translation of original issue discount and the determination of exchange gain or loss upon receipt of those amounts.[56]
>
> On 11 May 1989, Corporation X purchases a one year note at original issue for its face amount of $ 1,000. The note pays interest in dollars at the rate of 4 percent compounded semi-annually. The amount of principal received by Corporation X upon maturity is equal to $ 1,000 plus the equivalent of the excess, if any, of (a) the Financial Times One Hundred Stock Index (the FT 100) determined and translated into US dollars on the last business day prior to the maturity date, over (b) £ 2,150, the "stated value" of the FT 100, which is equal to 110 percent of the average value of the index for the six months prior to the issue date. That amount is translated into US dollars at the exchange rate of £ 1 = $ 1.50. On these facts, the purchase by Corporation X of the instrument is not a Section 988 transaction because the index used to compute the principal amount received upon maturity is determined with reference to the value of stock and not non-functional currency.[57]

3. Forward and futures contracts and non-equity options

While a forward, futures or non-equity option is covered by Section 988, the instrument must not be of a kind that would be marked to market under IRC Section 1256 if held on the last day of the year.[58] If it is, its acquisition or disposition is not a Section 988 transaction unless so elected. The election enables a taxpayer to use those types of instruments as a hedge without risking a mismatching of the instrument with the underlying asset being hedged because of differences in character. The election to have these instruments covered must be made on or before the first day a contract is held for the year. Once made, it is binding on all succeeding years.

4. Dual currency debt instruments

In 1991, the original issue discount regulations were revised to address the treatment of certain debt instruments that are issued after 20 February 1991, for cash or publicly-traded property.[59] The affected instruments provide for non-contingent payments at least equal to the issue price and one or more contingent payments determined in whole or in part by reference to the value of a publicly-traded stock, securities, commodities or other publicly-traded property.

The regulations require, in general, that the instrument must be separated into contingent and non-contingent components and thereafter treated as two separate instruments. The non-contingent element is generally treated as a separate element of an investment unit and the stated redemption price at maturity for original issue discount purposes is determined without reference to the contingent payments. The contingent component is treated as if its issue price were equal to the balance remaining after the hypothetical issue price of the non-contingent component is removed from the issue price. This is illustrated by the following example.

> On 1 April 1991, Corporation A purchases Corporation B's contingent instrument at original issue for cash in the amount of $ 1,000,000. The instrument, with a term of five years, calls for a non-contingent payment at maturity of $ 1,000,000 and a contingent payment at maturity in an amount derived by multiplying $ 1,000,000 by the percentage increase, if any, in a nationally known composite price index of publicly-traded stocks over the term of the instrument. There is no publicly-traded property that is substantially equivalent to the right to the contingent payment. The mid-term, Applicable Federal Rate with semi-annual compounding for April 1991 is 8.15 percent and the parties agree to discount the separate non-contingent debt instrument at 9 percent compounded semi-annually.
>
> On these facts, the non-contingent payment of $ 1,000,000 at maturity is treated as a separate non-contingent debt instrument for purposes of the original issue discount rules. Based on a discount rate of 9 percent compounded semi-annually, the issue price of the separate non-contingent debt instrument equals $ 643,927.68. The stated redemption price at maturity is $ 1,000,000.
>
> The contingent payment is treated as the equivalent of a cash settlement option on the index. The portion of the $ 1,000,000 issue price that is allocated to the contingent component equals $ 356,072.32 ($ 1,000,000 – $ 643,927.68). The contingent payment is treated in the same manner as a payment pursuant to a cash settlement option on the index.[60]

Where the contingent component is expressed in terms of a foreign currency index, the original issue discount rules are applied first and the foreign currency gain rules of IRC Section 988 are applied thereafter.[61] Thus, if the contingent component in the above example is denominated in terms of the FT 100, the contingent and non-contingent components are separated. Thereafter, a determination is made regarding any potential currency gain. In the example, no currency gain would exist because the contingent element is based on a stock index and is unrelated to foreign currency values. However, currency gain or loss would exist potentially if, instead of being tied to an equity index, the contingent payment would be based on a basket of foreign currency values.

If a debt is a dual currency or multiple currency instrument and the amount of non-functional currency units is fixed, the instrument is non-contingent.[62] A dual currency debt instrument is a debt instrument with respect to which the qualified periodic interest payments are denominated in or determined by reference to a single currency, the stated redemption price at maturity is denominated in or determined by reference to a different currency, and the amount of all payments in each currency is fixed on the issue date.

A dual currency debt instrument is separated into two component hypothetical debt instruments, each of which is treated separately. First, a hypothetical zero coupon bond is considered to exist. This hypothetical bond is denominated in the currency of the stated redemption price at maturity. The stated redemption price at maturity is discounted at an appropriate rate for loans in that currency to determine the hypothetical issue price.

In addition, a second hypothetical instrument is considered to exist. This second instrument is a hypothetical instalment obligation denominated in the currency of the qualified periodic interest payments. The difference between the stated redemption price at maturity of the actual dual currency debt instrument and the hypothetical issue price of the hypothetical zero coupon bond (translated at the spot rate on the issue date) is considered to be the principal amount of an instalment obligation. Section 988 applies to each hypothetical debt instrument created to the extent it is denominated in a non-functional currency. This is illustrated by the following example.

> On 1 January 1993, Corporation X issues a three-year bond priced at par with a principal amount of $ 100. Under the bond, Corporation X is obligated to make payments of $ 5.28 on 31 December of each year, and upon maturity, to repay SwF 200 in satisfaction of the principal due. The spot rate on 1 January 1993 is SwF 1 = $ 0.50.
>
> The debt instrument is a dual currency debt instrument. The dual currency debt instrument must be separated into two hypothetical debt instruments. The first is a hypothetical Swiss franc denominated zero coupon bond with a stated redemption price at maturity of SwF 200, discounted at an appropriate rate in that currency, which may be 5 percent compounded annually. The hypothetical

58. IRC Sec. 988(c)(1)(D).

62. Proposed Reg. §1.988-4(a)(4).

© 1993 International Bureau of Fiscal Documentation

issue price for this instrument is SwF 172.77. The second hypothetical instrument is a three-year dollar denominated, self-amortizing instalment obligation with annual payments of $ 5.28, a principal amount of $ 13.62 ($ 100 – $ 86.38, which is the dollar denominated value of Swiss francs at an exchange rate of SwF 1 = $ 0.50), and a yield to maturity of 8 percent compounded annually. The issuance of a hypothetical dollar denominated instalment obligation is not a Section 988 transaction for a US corporation such as Corporation X. However, the issuance of the hypothetical Swiss franc zero coupon bond is a Section 988 transaction.[63]

A multi-currency instrument is subject to similar rules, but the order in which the computations are made is not clear.[64]

5. Currency swaps

Exchange gain or loss is determined for notional principal contracts other than currency swaps according to the taxpayer's method of accounting, so long as that method clearly reflects income.[65] The rules for currency swaps appear in the Section 988 regulations. In general, these regulations apply solely for purposes of determining the realization, recognition and amount of exchange gain or loss.[66] They do not apply for purposes of determining the source of such gain or loss or to characterize the gain or loss as interest. In general, the gain or loss realized with respect to a currency swap contract is characterized as exchange gain or loss, not as interest income or expense.

For purposes of the currency rules, a currency swap contract is a contract involving different currencies between two or more parties under which each is required to exchange periodic interim payments on or prior to the maturity of the contract and to exchange the swap principal amount upon maturity of the contract.[67] For this purpose, the swap principal amount is an amount of two different currencies which is used to determine the periodic interim payments. An exchange of periodic interim payments occurs when payments in one specified currency are made in return for payments in a different specified currency. The payments in each currency must be computed by reference to an interest index applied to the swap principal amount.

Except for certain abuse rules and transactions that are known as Section 988 hedges, the payments made under the swap are treated as having been made pursuant to a hypothetical borrowing denominated in the currency of the payment. Payments received under the swap are treated as having been received pursuant to a hypothetical loan that is denominated in the currency in which payments are received. The hypothetical issue price for each of those transactions is the swap principal amount. The hypothetical stated redemption price at maturity is the total of all payments (exclusive of the initial exchange of the swap principal amount) under the hypothetical borrowing or loan other than periodic interest payments.

For purposes of determining economic accrual under the currency swap, a semi-annual compounding convention is generally required unless the currency swap contract indicates otherwise.

The amount treated as exchange gain or loss by the taxpayer with respect to the periodic interim payments for the taxable year is the amount of hypothetical interest income and exchange gain or loss attributable to that interest income which may exist between the accrual date and the payment date. That sum is reduced by the hypothetical interest expense and exchange gain or loss attributable to the interest expense from such hypothetical borrowing.[68] These rules may be illustrated by the following examples.

Corporation C computes income under the accrual method of accounting. It uses the calendar year as its taxable year. The dollar is its functional currency.

On 1 January 1989, Corporation C enters into a currency swap with Corporation J. Under the terms of the swap, the principal amounts are $ 150 and £ 100. £ 100 is the equivalent of $ 150 on the effective date of the contract, assuming a spot rate of £ 1 = $ 1.50. The swap agreement provides that on 31 December 1989 and 31 December 1990, Corporation C is required to make payments equal to 10 percent of the dollar-principal amount and Corporation J is required to make payments equal to 12 percent of the sterling-principal. On 31 December 1990, Corporation C is required to pay to Corporation J the $ 150 principal amount and Corporation J is required to pay to Corporation C the £ 100 principal amount.

For purposes of this example, it is assumed that the spot rates for sterling are £ 1 = $ 1.50 on 1 January 1989, £ 1 = $ 1.40 on 31 December 1989, and £ 1 = $1.30 on 31 December 1990. It is also assumed that the average rates are £ 1 = $ 1.45 for 1989 and £ 1 = $ 1.35 for 1990.

Solely to determine the realization of Corporation C's currency gain or loss, Corporation C treats its dollar payments as if they were made pursuant to a dollar-borrowing in which the issue price is $ 150, the stated redemption price at maturity is $ 150, and the yield to maturity is 10 percent. Corporation C treats the sterling payments from Corporation J as payments received pursuant to a sterling-loan in which the issue price is £ 100, the stated redemption price at maturity is £ 100, and the yield to maturity is 12 percent. Corporation C computes its hypothetical accrued sterling-interest income at the average rate for the accrual period and determines its exchange gain or loss on the day payment is received.

Accordingly, Corporation C accrues $ 17.40 (£ 12 x $ 1.45 average rate) of interest income in 1989 and $ 16.20 (£ 12 x $ 1.35 average rate) of interest income in 1990. Corporation C also computes hypothetical exchange losses of $ 0.60 on 31 December 1989, which is derived by subtracting $ 17.40 (£ 12 x $ 1.45 average rate) from $ 16.90 (£ 12 x $ 1.40 spot rate), and $ 0.60 on 31 December 1990, the loss incurred when $ 16.20, the interest computed under the average rate (£ 12 x $ 1.35), is subtracted from $ 15.60, the interest computed under the spot rate (£ 12 x $ 1.30). All hypothetical interest income and exchange losses are characterized and sourced as exchange gain and loss. Finally, Corporation C is treated as having paid $ 15 ($ 150 x 10%) of hypothetical interest on 31 December 1989, and again on 31 December 1990. These items of hypothetical interest expense are characterized and sourced as exchange loss.

In total, Corporation C has a net exchange gain of $ 1.80 ($ 17.40 – $ 0.60 – $ 15.00) with respect to the periodic interim payments in 1989 and a net exchange gain of $ 0.60 ($ 16.20 – $ 0.60 – $ 15.00) with respect to the periodic interim payments in 1990. Corporation C also realizes an exchange loss on 31 December 1990 with

respect to the exchange of the swap principal amount. This loss is determined by subtracting the value of the units of swap principal paid of $ 150 from the value of the units of swap principal received, $ 130 at the exchange rates then in effect.[69]

6. Off-market currency swaps

An "off-market currency swap" is a currency swap contract under which the present value of the payments to be made is not equal to the present value of the payments to be received on the day the taxpayer enters into or acquires the contract.[70] A premium payment is required to balance the positions.

The regulations acknowledge that there are two potential reasons why the present values of the swap payments will not be equal.[71] The first is that the swap exchange rate is not the spot rate on the date the agreement is entered. Here, the swap principal will be valued at an off-market exchange rate. The second possible reason is that the interest indices used to compute the periodic interim payments do not reflect current values on the day the transaction is entered. Here, the periodic payments will be off-market. Whichever reason applies, the swap requires a premium payment from one party to the other to bring the transaction into balance. The regulations address the rules under which this payment is recognized for tax purposes.

Under the regulations, the payment must be amortized in a manner which places the taxpayer in the same position it would have been in had the currency swap been entered at par either as to the currency exchange rate or the interest rate. If the currency exchange rate is off par, the premium attributable to the difference between the swap exchange rate and the spot rate must be measured as of the date of the contract. The premium is the amount required so that the present value of the amounts to be paid will equal the present value of the amounts to be received. That premium is taken into account and recognized as income or expense on the same date the swap principal amounts are taken into account for currency gain or loss purposes.[72] For this purpose, the swap exchange rate is the single exchange rate set forth in the contract at which the swap principal amounts are determined. If the swap exchange rate is not clearly set forth in the contract, the IRS may determine the rate.

On the other hand, if the premium is required to balance an interest index that is not at par, the difference in the values of the periodic interim payments is amortized in a manner that is consistent with the principles of economic accrual. Thus, it is amortized on a daily basis using a constant yield.[73]

Any premium amount taken into account is treated as exchange gain or loss. Similar rules apply to discounts. The rules for off-market currency swaps is illustrated in the following example.

> Corporation X reports income under the accrual method of accounting and the dollar is its functional currency. It uses the calendar year as its taxable year.
>
> On 1 January 1989, Corporation X enters into a three-year currency swap contract with Corporation Y. The swap agreement provides that the swap principal amount is $ 100 and SwF 200, its Swiss franc equivalent translated at a swap exchange rate of $ 1 = SwF 2. There is no initial exchange of the swap principal amount. The interest rates used to compute the periodic interim payments are 10 percent compounded annually for US dollar payments and 5 percent compounded annually for Swiss franc payments.
>
> Thus, under the currency swap, Corporation X agrees to pay Corporation Y $ 10 (10% x $ 100) on 31 December of 1989, 1990 and 1991 and to pay Corporation Y the swap principal amount of $ 100 on 31 December 1991. In turn, Corporation Y agrees to pay Corporation X SwF 10 (5% x SwF 200) on 31 December of 1989, 1990 and 1991 and to pay Corporation X the swap principal amount of SwF 200 on 31 December 1991. The average rate for 1989 and the spot rate on 31 December 1989, is $ 1 = SwF 2.5.
>
> On these facts, Corporation X realizes an exchange loss of $ 6 on 31 December 1989. This is comprised of $ 10 of loss attributable to the $ 10 periodic interim payment paid to Corporation Y and $ 4 of gain, the value of SwF 10 received from Corporation Y. If the value of the Swiss Franc had not gone down in the example, Corporation X would have had a $ 5 loss.
>
> On 1 January 1990, Corporation X transfers its rights and obligations under the swap contract to Corporation Z, an unrelated corporation. Corporation Z uses the dollar as its functional currency, reports income in accordance with the accrual method of accounting and has the calendar year as its taxable year. On 1 January 1990, the exchange rate is $ 1 = SwF 2.50. The relevant dollar interest rate is 8 percent compounded annually and the relevant Swiss franc interest rate is 5 percent compounded annually.
>
> Because of the movement in exchange and interest rates, the agreement between Corporation X and Corporation Z to transfer the currency swap requires Corporation X to pay Corporation Z $ 23.56. This would be considered to be a termination payment under a notional principal contract, but is merely a swap discount under the currency swap rules.
>
> Corporation X may deduct the loss of $ 23.56 in 1990. The loss is characterized as a currency loss and is sourced in the United States.
>
> Corporation Z is required to recognize the receipt of the $ 23.56 payment as follows. To the extent the payment is attributable to movements in exchange rates ($ 20 of principal and $ 4 of periodic interim payments), the payment is taken into account as exchange gain on 31 December 1991, the date the swap principal amounts are exchanged. This amount must be discounted to its present value. The discount rate for this purpose is the rate called for in the currency swap contract for dollar periodic interim payments. Here, that rate is 10 percent. (This computation ignores the change in interest rates.) Corporation Z requires $ 2 on 31 December 1990 and a total of $ 22 on 31 December 1991. The present value of $ 2 on 31 December 1990 and $ 22 on 31 December 1991 discounted at the rate of 10 percent is $ 20 ($ 1.82 + $ 18.18).
>
> In addition, Corporation Z is required to amortize the portion of the $ 23.56 payment attributable to movement in interest rates under principles of economic accrual over the term of the currency swap agreement. This is $ 3.56, the present value of the $ 4 excess periodic interim payments Corporation Z is required to make because the currency swap agreement does not reflect current interest rates on the day Corporation Z acquired the swap contract. The discount rate is the appropriate dollar interest rate as of 1 January 1990. Corporation Z includes $ 1.71 in income on 31 December 1990 and $ 1.85 on 31 December 1991.[74]

© 1993 International Bureau of Fiscal Documentation

The foregoing example illustrates that an effect of the off-market swap rules is to defer the recognition of income by a counterparty when a party to a currency swap makes a payment that would be characterized as a termination payment in the context of a notional principal contract. Also, the off-market currency swap rules are currently silent where the premium is significant with regard to the stream of payments that are to be received under the swap. (However, they except to provide that for purposes of IRC Section 956, relating to investments in US property that may accelerate the imposition of US tax for US shareholders of a CFC, the IRS may treat any prepayment of a currency swap as a loan.) Proposed regulations provide that the in terrorem rules for notional principal contracts under which swaps with significant non-periodic payments are treated as loans will apply to all currency swaps (whether on-market or off-market) once final regulations are effective.[75]

C. *Foreign currency hedges – Section 988(d)*

IRC Section 988(d) addresses the circumstances in which a US taxpayer is an obligor or obligee under a foreign currency denominated debt instrument and wishes to hedge its position.[76]

1. Tax treatment of hedged transaction

If a transaction constitutes a qualified hedging transaction, the qualifying debt instrument and the hedge are integrated and treated as a single transaction during the period that the transaction is a qualified hedging transaction.[77] Neither the qualifying debt instrument nor the hedge that makes up the qualified hedging transaction are subject to the capitalization requirements for interest and carrying costs that appear in IRC Section 263(g), the loss deferral and other rules of IRC Section 1092 or the mark-to-market and 60/40 rules of IRC Section 1256 for that period. An exception exists for a straddle, which remains subject to those rules.

The effect of integrating and treating a transaction as a single transaction is to create a synthetic debt instrument for income tax purposes. The denomination of the synthetic debt instrument is the same as the currency paid under the terms of the hedge to acquire the currency used to make payments under the qualifying debt instrument.[78] Where the qualifying debt instrument is a lending, the denomination of the synthetic debt instrument is the same as the currency received under the terms of the hedge in exchange for amounts received under the qualifying debt instrument. To illustrate, the hedge is a forward contract to acquire sterling for dollars, and the qualifying debt instrument is a borrowing denominated in sterling, the synthetic debt instrument is considered a borrowing in dollars.

The term of the synthetic debt instrument is the period beginning on the identification date and ending on the date the qualifying debt instrument matures or an earlier date on which the qualifying debt instrument or hedge is disposed of or otherwise terminated.[79] Unless otherwise clearly indicated, the accrual period is six months.

The issue price of the synthetic debt instrument is the adjusted issue price of the qualifying debt instrument translated into the currency in which the synthetic debt instrument is denominated at the spot rate on the identification date.[80]

Where the qualifying debt instrument is a borrowing, the stated redemption price at maturity is determined on the identification date by reference to the amounts to be paid under the hedge to acquire the currency necessary to make interest and principal payments on the qualifying debt instrument.[81] Where the qualifying debt instrument is a lending, the stated redemption price at maturity is determined on the identification date by reference to the amounts to be received under the hedge in exchange for the interest and principal payments received pursuant to the terms of the qualifying debt instrument.

Interest income from a synthetic debt instrument is sourced by reference to the qualifying debt instrument.[82] The character for purposes of Section 904 of interest income from a synthetic debt instrument is determined by reference to the character of the interest income from qualifying debt instrument.

Special rules are provided to integrate hedge income/expense and interest income/expense when the taxpayer is a foreign person that is engaged in a trade or business in the United States to which the interest is effectively connected[83] and to separate the interest income/expense and the hedge income/expense when the interest income is not effectively connected with a trade or business in the United States.[84]

2. Qualifying debt instrument

A qualifying debt instrument is a borrowing, other than one arising from an account payable or receivable generated by an expense or an item of income, that may be denominated in or determined by reference to non-functional currency. It includes dual currency debt instruments, multi-currency debt instruments and contingent payment debt instruments.[85] If less than the entire instrument is hedged, a portion of an instrument may qualify if payments of interest and principal are proportionally protected.

3. Hedge

A hedge may be a spot contract, futures contract, forward contract, option contract, notional principal contract, currency swap contract, similar financial instrument or series or combination thereof. When the hedge is integrated with the debt instrument, the calculation of a yield to maturity under original issue discount principles may be computed in the currency in which the synthetic debt instrument is denominated under the rules discussed above.[86]

4. Integrated economic unit

A debt instrument and a hedge are considered to be an integrated economic transaction if certain tests are met. First, all payments to be made or received under the qualifying debt instrument (or amounts determined by reference to a nonfunctional currency) are fully hedged on the date the taxpayer identifies the hedging transaction.[87] Any contingent payment features of the qualifying debt instrument must be fully offset by the hedge such that the synthetic debt instrument is not classified as a contingent payment debt instrument.

Second, the hedge must be properly identified.[88] To comply with this requirement, a taxpayer must establish a record showing:

- the date the qualifying debt instrument and hedge were entered into;
- the date the qualifying debt instrument and the hedge are identified as a qualified hedging transaction;
- the amount of currency gain (and information relating to its source and character) that may have arisen with regard to the debt prior to the establishment of the hedge; this gain is deferred until maturity and is discussed below, in connection with legging-in transactions;
- a description of the qualifying debt instrument and the hedge; and
- a summary of the cash flow resulting from treating the qualifying debt instrument and the hedge as a qualified hedging transaction.[89]

The identification must occur not later than the date on which the financial instrument (or instruments) constituting the hedge is settled or closed.

Third, none of the parties to the hedge may be related. The standard by which a party is deemed to be related is based on IRC Sections 267(b) and 707(b) which were discussed above.[90]

Finally, if the hedging transaction relates to a QBU outside the United States, both the qualifying debt instrument and the hedge must be properly reflected on the books of the QBU throughout the term of the qualified hedging transaction.[91]

5. Legging in and out

The term "legging in" means that a hedge is entered into after the date the qualifying debt instrument is acquired.[92] If a taxpayer legs into integrated treatment, exchange gain or loss is realized with respect to the qualifying debt instrument. The gain or loss is determined by reference to changes in exchange rates between the date the instrument was acquired (or the date the obligor assumed its obligations) and the leg-in date. Recognition of the gain or loss is deferred until the date the qualifying debt instrument matures or is otherwise disposed of. The source and character of such gain or loss is determined on the leg-in date as if the qualifying debt instrument were actually sold or otherwise terminated by the taxpayer.

The term "legging out" of integrated treatment means the disposition or termination of all or a part of the qualifying debt instrument or hedge prior to the maturity of the qualified hedging transaction.[93] Legging out includes a change in a material term of the qualifying debt instrument or hedge. The change may be the exercise of an option to change the interest rate or the maturity date of the instrument or the exercise of an option to change the interest or exchange rates underlying the hedge.

If a taxpayer disposes of or terminates a qualified hedging transaction by disposing of or terminating both the qualifying transaction and the hedge on the same day, the taxpayer is considered to have disposed of or otherwise terminated the synthetic debt instrument. This transaction is not a leg-out.

If a taxpayer legs out of integrated treatment, the transaction is treated as a qualified hedging transaction until the leg-out date. The qualifying debt instrument is treated as sold for its fair market value on the date the hedge is disposed of or otherwise terminated and any gain or loss from the identification date to the leg-out date is realized and recognized. The spot rate on the leg-out date is used to determine exchange gain or loss thereafter. Proper adjustment to the principal amount of the debt instrument must be made to reflect any gain or loss taken into account.

If the qualifying debt instrument is disposed of or otherwise terminated, the hedge is treated as having been sold for its fair market value on the leg-out date, and any gain or loss from the identification date to the leg-out date is realized and recognized. The spot rate on the leg-out date is used to determine exchange gain or loss on the hedge thereafter.

The part of the qualified hedging transaction that has not been terminated cannot be part of a qualified hedging transaction for any period subsequent to the leg-out date.

If a taxpayer legs out of a qualified hedging transaction and realizes a gain with respect to the terminated instrument, a wash sale rule is triggered. No loss is recognized on the retained position if during the 61-day period beginning 30 days before the leg-out date the taxpayer enters into another transaction that hedges at least 50 percent of the remaining currency flow with respect to the qualifying debt instrument.

D. *Source of income*

The source of income is important for both enterprises that are based in the United States and enterprises based abroad. For a US entity, the source of income is an important factor in determining the portion of its US tax that may be offset by foreign tax credits.[94] For foreign entities, the source of income controls the jurisdiction of the United States to impose tax. In general, a foreign entity is subject to US tax only on its US-source income[95] and its income that is effectively connected with the conduct of a trade or business in the

87. Reg. §1.988-5(a)(5)(i).
88. Reg. §1.988-5(a)(5)(ii).
89. Reg. §1.988-5(a)(8).
90. Reg. §1.988-5(a)(5)(3)(iii).
91. Reg. §1.988-5(a)(5)(3)(iv).
92. Reg. §1.988-5(a)(6)(i).

95. IRC Sec. 881(a).

© 1993 International Bureau of Fiscal Documentation

United States.[96] Only certain types of foreign-source income may be treated as effectively connected income.[97]

1. Notional principal contracts

In general, the source of income or loss from notional principal contracts is determined by reference to the residence of the taxpayer.[98] If a taxpayer conducts business through a QBU outside its country of residence, the source of notional principal income and loss will be the location of the QBU if the notional principal contract is properly recorded on the books of the QBU.[99] To be properly recorded, the personnel of the QBU must participate in negotiating or acquiring the notional principal contract. The source rule is illustrated by the following example.

> Corporation X is a domestic corporation that reports income under the accrual method of accounting. It uses the calendar year as its taxable year. On 1 January 1990, Corporation X enters into an interest rate swap contract with Corporation Z, an unrelated foreign corporation. Corporation X does not have a QBU outside the United States. Under the contract, Corporation X is required to pay Corporation Z fixed rate dollar amounts, and Corporation Z is required to pay X floating rate dollar amounts, each determined solely by reference to a notional dollar denominated principal amount specified under the contract.
>
> On these facts, the contract is a notional principal contract. During 1990 Corporation X reports net income from the notional principal contract income $ 100. In addition, Corporation X receives $ 5 from Corporation Z because payments are received more than 30 days late.
>
> The source of Corporation X's $ 100 of net income from the interest rate swap agreement is domestic. The $ 5 fee is not notional principal contract income. Its source may be foreign if the fee is a payment for the use of money and the equivalent of interest.

2. Currency swaps

If a notional principal contract is a Section 988 transaction because it relates to a non-functional currency, as is the case in a currency swap, the source rules of IRC Section 988 apply to determine the source of income.[100] In general, the source rule of a currency gain or loss is determined by reference to the residence of the taxpayer or the QBU on whose books the currency gain is recorded.[101] However, if the notional principal contract is part of a Section 988(d) hedge transaction that creates a synthetic debt instrument, the currency gain or loss on the swap leg will be integrated with qualified indebtedness, and to the extent of that integration, the source of the resulting income will be controlled by the identity of the borrower under the qualified indebtedness (see discussion above). To maintain the primacy of the integration concept of the hedging rules, the source rules of Section 988 take precedence over the source rules for notional principal contracts with regard to currency swaps.

3. Interest on deemed loans

If the notional principal contract is a currency swap with significant non-periodic payments or a cap or floor that is significantly in the money, the premium payment is treated as a loan (See the discussion of the in terrorem rules above. If those in terrorem rules cause a contract to include a loan feature, the loan is treated as a loan for all purposes of US tax law). As a result, there will be a hypothetical payment of interest or original issue discount as the loan is deemed to be repaid. That deemed payment of interest or original issue discount is technically income from US sources if the recipient of the premium is a US person or a US branch of a foreign corporation.[102] If the deemed recipient of the interest, i.e. the party that paid the premium, is a foreign person, US-source interest income will be subject to 30 percent withholding tax unless a benefit is extended under an income tax treaty or the interest is considered to be interest on an item of portfolio indebtedness.

4. Withholding tax on deemed interest

The deemed payor technically will be required to collect and pay over US withholding tax at the statutory rate.[103] Failure to comply with the US rules will cause the withholding agent and any officer and director considered to be a "responsible person" to be liable for the tax.

Even when an applicable income tax treaty may eliminate the tax in principle, there are compliance requirements for both the payor and the recipient of the interest. For example, in the absence of a properly completed Form 1001 which notifies the withholding agent of the applicable income tax treaty benefit, the IRS may contend that the 30 percent tax should have been withheld at the time of payment. Failure to collect tax may result in the imposition of an interest charge on the unpaid withholding tax from the due date until the first day of the next succeeding year.

5. Effectively connected income

If the taxpayer is a foreign corporation and the notional principal contract arises from the conduct of a trade or business in the United States, the income will be taken into account in computing effectively connected income.[104] As discussed more fully below, trade or business in the United States requires more than the carrying on of investment and trading activities for a foreign corporation's own account.

E. *Allocation and apportionment of expense*

Notional principal contracts must be taken into account by taxpayers when determining US or foreign-source taxable income. For US entities, the expenses allocated to foreign-source income must be computed. For foreign entities that are engaged in a trade or business in the United States, taxable income must be computed. Each computation requires that expense must be determined.

© 1993 International Bureau of Fiscal Documentation

1. Background

As mentioned above, US taxpayers that wish to claim the benefit of the foreign tax credit are required to determine the expenses which are allocable and apportionable to the foreign-source gross income. This enables a taxpayer to compute its foreign-source taxable income. Only US tax that is attributable to foreign-source taxable income may be offset by the foreign tax credit. Increases in the level of expenses allocated to foreign-source gross income directly reduce foreign-source taxable income. As a result, the amount of US tax that may be offset by foreign tax credits is also reduced.

Interest expense must be allocated and apportioned on a group- wide basis even if no consolidated income tax return is filed by all US members of an affiliated group. The expense is apportioned between the group's foreign-source and domestic-source income in substantial part on the basis of the tax book values of its assets and the income that may be produced by those assets. Assets that can generate foreign-source income attract an apportionment of interest expense.

Foreign entities that are engaged in a US trade or business can reduce their US tax by increasing the level of expenses. Interest expense that is allocated to the US business is one expense that may reduce taxable income.[105]

2. Integration with interest

Under a rule that is applicable to interest equivalents, any deductible expense or loss that is incurred in a transaction or in a series of integrated or related transactions in which the use of funds is secured for a period of time must be allocated and apportioned if the expense or loss is substantially incurred in consideration of the time value of money.[106] In essence, the net income or expense of a notional principal contract must be taken into account for purposes of determining the amount of interest expense that must be allocated and apportioned. This is illustrated by the following example.

> Corporation X is a domestic corporation with a dollar functional currency. On 1 January 1987, Corporation X enters into a dollar interest rate swap contract with Corporation Y, an unrelated domestic corporation.
>
> Under the terms of the agreement, Corporation X agrees to pay Corporation Y floating rate interest with respect to a notional principal amount of $ 100 for five years. In return, Corporation Y agrees to pay Corporation X fixed rate interest at 10 percent with respect to a notional principal amount of $ 100 for five years.
>
> On the settlement day, Corporation Y prepays the fixed leg of the swap by making a lump-sum payment of $ 37 to Corporation X. This lump-sum payment represents the present value of five $ 10 swap payments. Because Corporation X secures the use of $ 37 in this transaction, any net swap expense arising from the transaction represents an expense incurred substantially in consideration of the time value of money.
>
> Assuming this lump-sum payment is not otherwise characterized as a loan from Corporation Y to Corporation X, Corporation X must amortize the $ 37 lump-sum payment. Any net swap expense incurred by Corporation X over the term of the loan with respect to this transaction (i.e. the excess, if any, of Corporation X's annual swap payment to Corporation Y over the annual amortization of the $ 37 lump-sum payment) represents an expense equivalent to interest expense. The result would be the same if Corporation X sold the fixed leg to a third party for $ 37.[107]

3. Interest on deemed loans

If the notional principal contract is a currency swap with significant non-periodic payments or a cap or floor that is significantly in the money, the premium payment is treated as a loan (see the discussion of deemed interest income above). If the time value component is treated as interest expense for the payor it must be taken into account for purposes of the allocation and apportionment regulations.[108]

As with a net deduction from a notional principal contract that is the equivalent of interest expense, the allocation and apportionment of interest expense on a deemed loan likely will have the practical effect of limiting the benefit of the foreign tax credit under US tax law for a US entity.

VI. CROSS-BORDER SECURITIES LENDING

In a typical short sale transaction, a party borrows shares in return for an undertaking to return identical property at a later date. The borrowed shares are sold to a third party. Even though the shares have been borrowed, the sale is given legal effect. If a dividend is paid on borrowed stock or if interest is paid on borrowed interest-bearing debt securities, the new owner is the party legally entitled to the payment from the disbursing agent. In addition to returning equivalent property, the borrower/seller of the securities must pay to the lender/old owner an equivalent amount in lieu of the dividend or the interest.

A. *Treatment of lender*

For the lender/old owner, the transaction is given non-recognition treatment even though there has been a legally effective exchange of the securities in return for the promise of the borrower/seller to return the securities, provided that certain requirements are met.[109] In general, a written agreement must be in effect calling for (i) the return to the lender/old owner of securities which are identical to those that were lent to the borrower/seller, (ii) the payment to the lender/old owner of amounts equivalent to all interest, dividends, and other distributions to which the owner of the securities is entitled, (iii) the maintenance by the lender/old owner of the risk of loss or opportunity for gain with regard to the securities, and (iv) the termination of the loan upon notice of not more than five business days given by the lender/old owner. If these conditions are met, the transfer of ownership in the securities in return for the obligation of the borrower is acknowledged, but gain is not recognized on the borrowing or the repayment of the securities and the borrower is given a carry-over basis.

B. *Cross-border substitute payments*

These rules have resulted in a tax saving opportunity for UK pension funds that receive substitute payments under securities lending transactions. US-source dividend income received by the foreign pension funds generally is subject to a 15 percent US withholding tax. Because the funds are exempt from tax in the United Kingdom, the withholding tax is a real cost. By taking advantage of the securities lending rules, UK pension funds have been able to convert taxable dividend income into a substitute payment. It is not clear whether a substitute payment is a dividend for tax treaty purposes. The pensions treated the substitute payment as so-called other income. Under the US/UK income tax treaty, other income of a UK resident is not subject to US tax.

Under the practice that was adopted, a brokerage house borrowed the security in return for the standard undertaking. It was treated as the owner and it received the dividend. Although the dividend might have been taxable income, the brokerage house was entitled to an offsetting deduction for the substitute payment to the lender/old owner. If the brokerage house balanced its position and sold the security to a customer under a short sale order executed on behalf of that customer, the brokerage house received a substitute payment which was passed on to the UK pension fund.

The transaction is illustrated by the following diagram.

C. *Proposed regulations*

In 1992, revisions to regulations were proposed affecting the source of income, the tax of foreign persons on investment income and the interpretation of treaties. The proposals affect the character and source of the substitute payments and are intended to limit the foregoing benefits.

For purposes of the source rule, the substitute payments are to be treated as US-source dividend income if made with regard to borrowed shares of stock[110] or as US-source interest income if made with regard to borrowed notes, bonds, debentures or other evidences of indebtedness.[111] This treatment is afforded to substitute payments made under securities lending transactions described in IRC Section 1058(a) or substantially similar transactions. Where provision of US income tax treaties refer to US domestic law for purposes of defining the term "dividend", substitute payments on borrowed shares of stock are to be included in the definition.

Substitute payments are subject to US withholding tax.[112] However, substitute interest payments may be treated as interest on portfolio indebtedness if the underlying debt obligation would be viewed to generate that type of income in the hands of the foreign person.[113] Subject to certain exceptions, interest on portfolio indebtedness is exempt from US tax in the hands of a foreign person. A Form W-8 must be provided to the withholding agent. Substitute payments are not entitled to the dividends received deduction under IRC Section 243 and are not eligible for the exclusion extended to tax-free municipal bond interest under IRC Section 103.

The regulations are to be effective with regard to transfers of securities made more than 30 days after adoption in final form. For transfers made prior to that date, a facts and circumstances test will apply.

VII. ADVANCE PRICING AGREEMENT

Tax authorities in virtually all jurisdictions have begun to review the way income from cross-border transactions is reported. They are concerned that a party entering into a multinational transaction is not paying a fair share of local tax with regard to that transaction.[114]

A. *Potential double taxation*

A dealer serving as an intermediary in the sale of a cross-border derivative product faces a real possibility of double taxation of the same profits. Regardless of where profits are booked for management or financial accounting purposes, two or more jurisdictions could contend that each has the primary right to impose tax. The problem may be illustrated by the following example.

> Investment Bank B is a dealer in derivative products. It maintains offices that are fully staffed in Hong Kong, London and New York. The offices may be branches of one corporation or may be locally incorporated affiliates of a larger group. The personnel assigned to these offices act independently to seek out customers. However, they act in concert to match the offsetting needs of those customers for foreign currency. When two customers are matched, the investment bank's London office books the counter position with each customer leaving an effectively balanced position, but for its spread. Fees also are paid by both customers and Bank B reports a profit.
>
> Whether Bank B's international operations are conducted through separately incorporated subsidiaries or through local office of one corporation, the tax exposure remains the same. No matter which office or entity formally books the profit, total profits from the transaction are exposed to tax wherever services were performed, customer relationships maintained or the financial product developed.
>
> Under the internal laws or practice in those jurisdictions, each may have a legitimate claim to tax the predominant share of the aggregate profits. To illustrate, one jurisdiction may emphasize the

110. Proposed Reg. §1.861-3(a)(6).
111. Proposed Reg. §1.861-2(a)(7).
112. Proposed Reg. §1.1441-2(a)(1).
113. Proposed Reg. §1.881-2(b)(2).
114. To put this in perspective, many of the international tax examiners recently added to the staff of the New York District Office of the IRS are alumni of the tax shelter groups that were formed during the 1980s.

© 1993 International Bureau of Fiscal Documentation

value inherent in the financial product itself. Under this view, the party owning the proprietary rights to the product should receive a royalty or an override fee for the use of the idea. Another jurisdiction may emphasize formal booking procedures, contending that form and substance are identical in this circumstance. A third may emphasize the importance of the client relations that are necessary to close a transaction.

If the tax authorities in each jurisdiction succeed in their assertions, the customary mechanism to limit the effect of double taxation – foreign tax credits in some jurisdictions, exemption of foreign-source income in other jurisdictions – may not provide adequate relief.

B. *Advance pricing agreements*

The IRS has adopted a mechanism to resolve this type of issue. It is known as the Advance Pricing Agreement (APA),[115] and in conjunction with procedures under income tax treaties known as Competent Authority Agreements, the mechanism affords taxpayers an opportunity of paying tax only once on worldwide profits.

The basic premise of the APA is that an agreement can be reached with taxpayers in applying the methodology by which profits are allocated among the members of a multinational enterprise. While the procedure has been established with a principal focus on manufacturers and distributors, APAs have been entered with at two investment banks, Sumitomo Bank Capital Markets Inc. and Barclays Bank PLC. In each instance, the APA relates to the internal pricing of derivative financial products such as cross currency swaps and interest rate swaps and allows profits from these products to be allocated among group members. As the methodology for apportioning profits is agreed in advance, the risk of double taxation disappears.

It is understood that the pricing agreement allows for profits to be computed under the mark-to-market rules such as those applicable to dealers or traders of derivative products. Those profits will be allocated to each relevant jurisdiction based on the volume of deals for each office and the number of personnel involved in the selling effort. It also is understood that a Competent Authority Agreement has been reached with Inland Revenue in the United Kingdom under which it has acquiesced in the internal pricing methodology. In addition, Sumitomo has announced that the Inland Revenue in Hong Kong has accepted the methodology of the APA.

VIII. US TAX PLANNING FOR THE FOREIGN-BASED GROUP

With planning, a foreign-based group not otherwise engaged in a trade or business in the United States should be able to trade freely in notional principal contracts without incurring a US tax liability. The income should be neither US-source fixed and determinable annual and periodical income – which is subject to 30 percent tax on the gross amount paid – nor income that is considered to be effectively connected with the conduct of a trade or business in the United States. The latter income is subject to graduated rates of tax that are imposed on net income or alternative minimum income.

A. *Fixed and determinable income*

Except for the deemed interest element that attaches to a non-periodic payment treated as a loan under the in terrorem rules for certain forms of notional principal contracts and which are discussed above, it is unlikely that income from notional principal contracts will be treated as US-source income. Under Reg. §1.863-7, that income should be foreign-source income in the hands of a foreign corporation. A similar rule should apply to currency swaps except to the extent the swap is attributable to a transaction that is effectively connected with the conduct of a trade or business in the United States.

B. *Effectively connected income*

With planning, trading stocks and securities and carrying on ancillary activities in the United States should not be considered to be the equivalent of carrying on a trade or business. The income tax regulations provide that the term "engaged in trade or business within the United States" does not include the effecting of transactions in the United States in stocks or securities for the taxpayer's own account.[116] For this purpose, the term "security" means any note, bond, debenture, or other evidence of indebtedness, or any evidence of an interest in or right to subscribe to or purchase any of the foregoing. The effecting of transactions in stocks or securities includes buying, selling (whether or not by entering into short sales), or trading in stocks, securities, or contracts or options to buy or sell stocks or securities, on margin or otherwise, for the account and risk of the taxpayer. Any other closely related activity such as obtaining credit for the purpose of effectuating such buying, selling or trading is covered by the same rule.

It does not matter whether these transactions are effected by or through employees of the taxpayer who are present in the United States while effecting the transactions, or a broker, commission agent, custodian or other agent of the taxpayer in the United States. The answer will not change even if the employee or agent has discretionary authority to make decisions regarding trading activity or if a large volume of transactions are effected.

If, however, the principal business of the corporation is trading for its own account and the corporation is relatively widely held or is partly held by US persons, the principal office of such corporation must not be in the United States at any time during the taxable year.[117]

C. *Principal office*

In determining the location of a foreign corporation's principal office, a comparison is made of the activities (other than trading in stocks or securities) which the corporation conducts from its office located in the United States with the activities it conducts from offices located outside the United States. A foreign corporation is considered to have only one

115. Rev. Proc. 91-22, 1991-11 I.R.B. 11, as corrected by Rev. Proc. 91-22A, 1991-22 I.R.B. 27.

117. Reg. §1.864-2(c)(2)(iii).

© 1993 International Bureau of Fiscal Documentation

principal office, and an office outside the United States will be considered to be the principal office if it is a general business office in which management carries on all or a substantial portion of the following activities:
- communication with shareholders (including the furnishing of financial reports);
- communication with the general public;
- solicitation of sales of its own stock;
- acceptance of the subscriptions of new stockholders;
- maintenance of its principal corporate records and books of account;
- audit of its books of account;
- disbursement or payment of dividends, legal fees, accounting fees, and officers' and directors' salaries;
- publication of the offering and redemption price of the shares of stock issued by it;
- conduct of meetings of shareholders and board of directors; and
- redemptions of its own stock.

D. *Interest rate swaps*

In a private letter ruling issued on 24 October 1991, and distributed to the public in April 1992,[118] the IRS addressed whether trading in interest rate swaps was an activity that was closely related to trading in stocks and securities. If so, the trading activity would not be the equivalent of conducting a US trade or business under the above standard.

In the ruling, a non-dealer foreign partnership traded in a variety of financial instruments including interest rate swap contacts. The trades were part of an integrated investment strategy for managing interest risk within a portfolio. The IRS ruled that the trading activities did not constitute a trade or business because they were closely related to the activity of buying and selling interest-bearing securities.

The IRS viewed the interest rate swaps as being the functional equivalent of contracts or options – instruments that are specifically covered by the regulations. According to the ruling, the tax treatment for a foreign person should not differ merely because the hedging activities are comprised of swaps rather than options. The foreign entity is not engaged in a trade or business and accordingly cannot have income that is taxed as effectively connected income.[119]

If the principal office of the entity is outside the United States, the holding in the private letter ruling should apply even though the ruling related to a foreign partnership. The tests for determining the principal office of a foreign partnership are similar to the tests for corporations.

IX. CONCLUSION

Innovation in derivative instruments continues unabated, particularly in the international context. Yet the tax rules are designed and applied by persons whose reference point is the past. For them, certainty of tax treatment is a virtue that can only be attained by looking back to past transactions. Clearly, this dichotomy can result in tension. However, like Janus, the prudent tax adviser can look in both directions. When planning for the next product development, the tax adviser can assist investment bankers who are moving forward at great speed – and can keep their pace. At the same time, when looking beyond the next product to its tax consequences, the tax adviser can turn attention to the rules that exist. This two-step approach blends the drive to create with the need for certainty. To manage tax developments affecting derivative products, both skills are needed.

118. PLR 9204015. The effect of a private letter ruling as precedent is limited to the taxpayer to whom it is issued. Nonetheless, a private letter ruling demonstrates the views of the IRS at the time of issuance and has been cited by courts and the staff of Congressional committees in explaining US tax law.
119. IRC Sec. 864(c)(1)(B).

IFA NEWS

The IFA wants to provide scholars who prepare a paper or dissertation on a topic of international law, the opportunity to discuss their topic with interested participants to the annual IFA Congress. To that end, IFA offers them the possibility:
- to attend the Congress free of congress registration fee, but they are to bear their own travel and accommodation expenses;
- to prepare a poster, indicating the issues and parts of their thesis, which they will exhibit at the Congress (near the various book exhibitions);
- to discuss with interested Congress participants the issues of their thesis, thus exchanging their views with international academics and professionals.

One of the aims of this initiative is to introduce young people to the IFA world. Therefore IFA expects them to become acquainted with the IFA organization and procedures so that they will be able to take an active part in the IFA's work in the future.

The initiative, which will begin this year on a trial basis for up to ten scholars, will be particularly attractive to those who live not too far from the city where the annual IFA Congress will take place; however, scholars from anywhere in the world are welcome to participate. Further information, particularly regarding the implementation of this programme during the forthcoming IFA Congress in Florence from 3-8 October 1993, will be provided by the IFA General Secretariat:

CANADA:

THE PROPOSED NEW SCIENTIFIC RESEARCH AND EXPERIMENTAL DEVELOPMENT RULES – AN UPDATE ON RESEARCH INCENTIVES

Ingrid Sapona

Ingrid Sapona, J.D., Price Waterhouse National Tax, Toronto. The author wishes to thank Scott A. Wilson, FCA, of Price Waterhouse Ottawa, for his insightful comments.

In its February 1992 Federal Budget the Canadian government reaffirmed its commitment to encourage scientific research and experimental development (SR & ED)[1] and announced it was studying ways of making the tax incentives applicable to SR & ED less restrictive. On 5 October 1992 draft legislation and regulations were released, which were subsequently amended and re-released on 2 December 1992. According to the Minister of Finance, these changes "will help create a framework within which Canadian companies can take on the world and win".

For the most part, the changes expand and clarify the tax incentives available for SR & ED, and make it easier for some taxpayers to claim an investment tax credit. The proposed changes do not reflect any drastic changes in the scope or nature of Canada's already generous system of tax incentives for research.

- B. Expenditures on domestic SR & ED
- C. Expenditures on SR & ED carried on outside Canada

III. Investment Tax Credits for SR & ED
- A. Qualified expenditures
- B. Claiming ITCs with respect to SR & ED

IV. Refund of ITCs

V. Conclusion

I. OVERVIEW OF INCENTIVES FOR PROMOTING SR & ED

Canada's Income Tax Act (the Act)[2] contains three basic types of incentives for promoting R & D:

- deductions can be claimed for expenditures that qualify as SR & ED expenses (under Section 37 of the Act);
- investment tax credits (ITCs) can be claimed with respect to qualifying R&D expenditures (under Section 127 of the Act); and
- refundable investment tax credits can be claimed in certain circumstances (under Section 127.1).

The ability to deduct an amount with regard to qualifying SR & ED expenditures can be carried forward indefinitely and applied against future income.[3] ITCs can be carried back three years and forward ten years.[4] Furthermore, under Canada's system of refundable tax credits, individuals, certain trusts[5] and certain corporations can opt to have their ITCs refunded rather than carry them forward.[6]

II. SECTION 37 DEDUCTION OF SR & ED EXPENSES

A. *What is SR & ED?*

Before determining whether a taxpayer can claim deductions for SR & ED it is necessary to consider what types of activities constitute SR & ED, as well as what expenditures in support of SR & ED activities qualify for deduction under Section 37.

The Regulations define SR & ED as "systematic investigation or search (sic) carried out in a field of science or technology by means of experiment or analysis".[7] Currently, three basic activities are considered SR & ED under the Regulations:

- basic research, which is research performed for the advancement of scientific knowledge without a specific practical application in view;[8]
- applied research, which is research performed for the advancement of scientific knowledge with a specific practical application in view;[9] and

1. The term "Scientific Research & Experimental Development" was substituted in the 1985 federal budget for "research & development" (and consequently throughout the Income Tax Act thereafter). According to the government, this change was made to reinforce the idea that projects involving only routine engineering or routine development are excluded from the tax incentive programmes.
2. Income Tax Act (Canada), R.S. C. 1952, c. 148, as amended by S.C. 1970-71-72, c. 63, and as subsequently amended [hereinafter the Act].
3. Sec. 37(1).
4. Sec. 127(9) definition of investment tax credit, specifically subpara. (c)(ii) thereunder.
5. Sec. 127.1(2) definition of refundable investment tax credit, specifically subsec. (a)(iii) thereunder.
6. Sec. 127.1(2) definitions of refundable investment tax credit and of qualifying corporation.
7. Reg. Sec. 2900(1).
8. Reg. Sec. 2900(1)(a).
9. Reg. Sc. 2900(1)(b).

© 1993 International Bureau of Fiscal Documentation

– experimental development, which is research performed for the purpose of achieving technological advancement for the purpose of creating new, or improving existing, materials, devices, products or processes.[10]

Under the existing Regulations there has been uncertainty as to whether research that yields only incremental improvements in technological advancement is included in SR & ED. The Draft Regulations specifically state that such research is included in SR & ED.[11]

Work with respect to engineering, design, operations, research, mathematical analysis, computer programming, data collection (other than of a routine nature), testing and psychological research also qualify as SR & ED if performed in direct support of otherwise qualifying activities.[12] For clarification, the Draft Regulations have added the requirement that for such work to be considered SR & ED it must be commensurate with the needs of, and directly in support of, qualifying SR & ED activities.[13] Activities such as market research, sales promotion, quality control, routine testing, research in the social sciences, and prospecting and exploring for minerals, petroleum or natural gas, are specifically excluded from the definition of SR & ED.[14]

It is important for taxpayers to properly identify activities that qualify as SR & ED. Whether an activity qualifies is determined based on an examination of the nature and characteristics of the activity itself.[15] Guidance regarding identification of eligible activities can be found in Revenue Canada's Information Circular IC 84-4R2, which was issued 29 August 1988. The circular sets out Revenue Canada's administrative position concerning the criteria that must be met in order for any activity to be considered SR & ED. The criteria include: scientific or technological advancement;[16] the presence of scientific or technological uncertainty;[17] a systematic programme of investigation, i.e. from hypothesis formulation through testing and experimentation to the state of logical conclusions.[18] Revenue Canada also notes that when determining whether a particular activity constitutes SR & ED, it is not sufficient to merely look at the overall purpose of the activity or programme. Instead, what is relevant is whether the particular activity, at a technical level, is SR & ED.[19]

When considering the deductibility of expenses incurred in SR & ED it is important to distinguish between expenditures incurred for SR & ED carried on in Canada and expenditures on SR & ED carried on outside of Canada. This distinction is significant because current and capital expenditures incurred with respect to SR & ED carried on in Canada[20] (hereafter domestic SR & ED)[21] are pooled and may be carried forward indefinitely and applied against income from any other business carried on by the taxpayer, so long as the taxpayer carried on business in Canada when claimed.[22]

Expenditures incurred with respect to SR & ED carried on outside of Canada do not get pooled and can only be deducted in the year incurred,[23] i.e. they cannot be carried forward. (As will be seen below under III. "Investment Tax Credits for SR & ED", ITCs are not available with respect to expenditures on foreign SR & ED either.) The tax treatment of expenditures for domestic SR & ED and for SR & ED carried on outside Canada are discussed separately below.

It should be noted that no deduction can be claimed under Section 37 for expenditures incurred by a taxpayer to purchase the results of a scientific research programme in which the taxpayer did not participate.[24] In addition, expenditures to acquire patents and other forms of intellectual property protection related to the results of SR & ED are not deductible under Section 37. Such costs (i.e. costs for patents and certain expenditures on SR & ED) may, however, be deductible or amortizable under other provisions in the Act.[25]

B. *Expenditures on domestic SR & ED*

As noted above, domestic SR & ED expenditures are pooled. The size of the pool can vary. For example, new expenditures on domestic SR & ED get added to the pool, while deductions are made for such things as ITCs earned with respect to qualifying SR & ED expenditures.

1. Additions to the pool

Adding an amount to the pool has the effect of allowing the taxpayer a deduction for that expense.[26] Therefore, throughout this portion of the article, references to deductible expenditures mean expenses that are added to the pool.

Basically, an expenditure incurred for SR & ED carried on in Canada will qualify as a domestic SR & ED expense (and therefore be eligible for addition to the SR & ED pool) if all or substantially all (which is generally considered to be greater than 90 percent) of the expense is attributable to:[27]

10. Reg. Sec. 2900(1)(c).
11. Draft Reg. Sec. 2900(1)(c).
12. Reg. Sec. 2900(1)(d).
13. Draft Reg. Sec. 2900(1)(d).
14. Reg. Sec. 2900(1)(d)-(j).
15. Information Circular IC 86-4R2, para. 2.6.
16. Id. at para. 2.10.1.
17. Id. at para. 2.10.2
18. Id. at para. 2.10.3.
19. Id. at para 2.8.
20. Sec. 37(1).
21. It should be noted that the expression "domestic SR & ED" is not a term used under the Act. It is merely a convenient way to refer to SR & ED that is "carried on in Canada", which is the expression used throughout the Act and Regulations.
22. Preamble to Sec. 37(1). It is interesting to note that prior to the 1987 Tax Reform a carried forward amount could only be deducted by a taxpayer in a year if the taxpayer made some expenditures on SR & ED in the year the deduction was claimed.
23. Sec. 37(2).
24. Sec. 37(4).
25. For example, patents that have a limited life can be depreciated as a Class 14 asset under Canada's capital cost allowance system. A payment made to obtain a patent is added to the capital cost of the patent and can therefore be depreciated along with the cost of the patent. If, however, the taxpayer pays to acquire a business, for example, and does not obtain an existing patent, but only the right to apply for a patent, the taxpayer cannot add the acquisition cost to the cost of the property. Such amount may, however, qualify as an eligible capital expenditure, which would mean that three-fourths of the cost could be amortized on a declining balance basis at 7% per year. For more information on the tax treatment of patents, see Revenue Canada's Interpretation Bulletin IT-477.
26. Sec. 37(1).
27. Sec. 37(7)(c)(ii).

© 1993 International Bureau of Fiscal Documentation

- the prosecution of SR & ED in Canada; or
- the provision of premises, facilities or equipment for the prosecution of SR & ED in Canada.

Such expenditures on domestic SR & ED can be deducted if either the SR & ED was directly carried out by the taxpayer or if it was carried out on behalf of the taxpayer.[28] To the extent that the SR & ED is performed by someone else on behalf of the taxpayer, in order to deduct the expense (i.e. add the amount to its pool), the taxpayer must be entitled to exploit the results of the SR & ED.[29]

Generally, the SR & ED must be related to the taxpayer's business. However, a corporation can deduct SR & ED expenses it incurs for SR & ED it performs for a related corporation. This allows a corporate group to form a separate corporation to carry on the group's research while allowing the separate corporation to deduct the SR & ED expenses even though the research is not related to its own business per se.[30]

(a) *Current expenditures*

Current expenditures that are considered "directly attributable" to SR & ED carried on in Canada are also added to the pool.[31] The Regulations describe what expenditures are considered directly attributable to the carrying out of SR & ED. Among the expenses described as directly attributable are the cost of materials consumed,[32] the salaries and wages paid to or for employees who directly carry on or supervise the SR & ED,[33] and other expenditures directly related to the prosecution of SR & ED that would not have been incurred if the SR & ED were not carried on.[34] There has been some confusion in interpreting this provision. For example: if a taxpayer has a building it uses 30 percent to carry out SR & ED activities and 70 percent for administrative purposes, it could be argued the taxpayer would not be able to add any of its utility costs associated with the building to its SR & ED pool because such costs would have been incurred regardless of the SR & ED activities. This is obviously a harsh result. A change proposed in the Draft Regulations clarifies that, applicable to taxation years after 1990, a *portion* of an expenditure may be considered directly attributable to SR & ED, so long as the portion of the expenditure is directly related to the SR & ED.[35]

Currently, the Regulations also specify that expenditures incurred for the provision of premises, facilities or equipment for the prosecution of SR & ED, including the cost of maintenance and upkeep of such property[36] and other expenditures directly related to such property that would not have been incurred if the SR & ED were not carried on, can be deducted.[37] These Regulations are also being clarified to state that, applicable to the 1990 and subsequent taxation years, a *portion* of an expenditure that directly relates to the provision of premises, facilities or equipment can be deducted.[38]

The Regulations concerning expenses "directly attributable" to SR & ED have generally been interpreted to include overhead expenses. However, the compliance burden on taxpayers to support their claim for overhead expenditures related to SR & ED is significant. According to the Department of Finance, the issue of allocation of overhead expenses that could be considered "directly attributable" to SR & ED has been one of the most problematic areas for small businesses.[39] Taxpayers who are unable to effectively track overhead expenditures can take advantage of a new method of calculating the SR & ED pool (discussed below under the heading "Proposed elective method"). Under the new method, taxpayers effectively forgo the ability to add an amount to the SR & ED pool for overhead expenses, but they are permitted, instead, to claim ITCs on an amount (the prescribed proxy amount) in lieu of actual overhead expenses.

(b) *Capital expenditures*

Under the current rules, most capital expenditures incurred for domestic SR & ED are deductible if they are for SR & ED related to the taxpayer's business and so long as greater than 90 percent of the expense is attributable to the prosecution of SR & ED in Canada or to the provision of premises, facilities or equipment for the prosecution of SR & ED in Canada.[40] Certain capital expenses cannot be claimed, however.[41] For example, expenses incurred for most buildings[42] (including leasehold interests) and rental expense incurred in respect of most buildings cannot be claimed. In addition, payments made to certain non-arm's length parties, e.g. non-profit research corporations, approved research institutes or approved associations, do not qualify to the extent that the expenditure is used to acquire a building or leasehold interest in a building.[43]

Proposed changes in the legislation clarify *when* expenditures of a capital nature in respect of premises, facilities and equipment will be included in the SR & ED pool.[44] Under the proposals, such a capital expense will be deductible if, at the time the expense was incurred:

- it was intended that the premises, facilities or equipment would be used greater than 90 percent of its operating time on domestic SR & ED, or
- greater than 90 percent of the value of the property would be consumed in the carrying out of domestic SR & ED.[45]

Because the deductibility of a capital expense is based on the intent at the time the expense is incurred, unexpected changes in circumstance should not affect the determination of what expenditures qualify for inclusion in the pool. In other words, so long as the intent when the expenditure was incurred was that the property would be used greater than 90 percent of the time on domestic SR & ED, if the use changes over time, this should not affect its inclusion in the pool. These proposals are to be applicable with respect to taxation years ending after 2 December 1992.

The maximum that can be added to the pool for capital expenditures is basically limited to the lesser of the capital expenditures made in Canada in the year and the undepreciated capital cost of the capital property as of the end of the taxation year.[46]

Capital property that was acquired by an expenditure for which the taxpayer can claim an SR & ED deduction is not eligible for depreciation under Canada's capital cost allowance (CCA) system.[47] However, like a depreciable asset subject to CCA, each such capital property is deemed to be in its own CCA class and when such a property is disposed of the taxpayer may have to recognize recapture.[48]

(c) *Proposed elective method*

The draft legislation contains a so-called elective method for determining what SR & ED expenditures can be added to the pool.[49] According to the Department of Finance's press release initially announcing the draft proposals, the elective method will be simpler for many taxpayers. Under the elective method, taxpayers basically forego their claim to overhead expenses under Section 37 in exchange for the ability to claim ITCs with regard to the "prescribed proxy amount".

The items that can be added to the pool under the elective method are basically a combination of the items currently set forth in the Act and those currently set forth in the Regulations. One big difference, however, is the removal of the ref rence to expenses of a current nature that are "directly attributable" to SR & ED.

Under the proposed elective method the following expenditures are added to a taxpayer's domestic SR & ED pool:

(1) current expenditures incurred by the taxpayer in respect of the purchase or lease of premises, facilities or equipment (other than expenditures for general purpose office equipment or furniture), so long as greater than 90 percent of the premises, facilities or equipment are used for domestic SR & ED;[50]

(2) expenditures in respect of the prosecution of domestic SR & ED carried out on behalf of the taxpayer;[51]

(3) capital expenditures incurred for the provision of premises, facilities or equipment (other than expenditures for general purpose office equipment or furniture) if, at the time the expense was incurred, it was intended that either:
   - the premises, facilities or equipment would be used greater than 90 percent of its operating time on domestic SR & ED, or
   - greater than 90 percent of the value of the property would be consumed in the carrying out of domestic SR & ED;[52]

(4) expenditures on salary, wages or related benefits of employees directly engaged in domestic SR & ED to the extent that such amounts can reasonably be considered to relate to such work, having regard to the time spent by the employee on the SR & ED, including time spent in the management of SR & ED;[53]

(5) expenditures on materials consumed in the prosecution of domestic SR & ED;[54] and

(6) one-half of current expenditures in respect of the purchase or lease of premises, facilities or equipment (other than general purpose office equipment or expenditures described in item (1) above), so long as the premises, facilities or equipment are used more than 50 percent in domestic SR & ED.[55]

According to the explanatory notes accompanying the proposals, expenditures of a general overhead nature are not accounted for under the elective method, even if such expenses would normally be considered directly attributable to the prosecution of domestic SR & ED or the provision of premises for the prosecution of domestic SR & ED.[56] The Department of Finance points out, however, that to the extent that a taxpayer chooses to use the new elective method, the taxpayer will be eligible for tax relief with regard to overhead expenses through the prescribed proxy amount mechanism available under the ITC provisions. (The prescribed proxy amount, which is only available to taxpayers who use the elective method, is explained below under the heading: "Prescribed Proxy Amount".)

Obviously, there are trade-offs in choosing the elective method. First, the taxpayer's SR & ED pool will be smaller because of the exclusion of overhead expenses under the elective method. Of course, such amounts not added to the SR & ED pool can still be deducted as business expenses. (This, in itself, may create another trade off: for corporations in a loss position, amounts deducted as normal business expense will increase a corporation's losses. Such business losses can be carried forward seven years.[57] On the other hand, amounts included in the SR & ED pool, to the extent that they are not used to offset income in the current year, can be carried forward indefinitely.) However, to the extent that a taxpayer does not have a sophisticated information system for tracking such expenses, using the elective method will

© 1993 International Bureau of Fiscal Documentation

entitle the taxpayer to special treatment (i.e. ITCs) with regard to a portion of its overhead-type expenses.

The alternative method is to be applicable to taxation years ending after 2 December 1992. To take advantage of the alternative method, a taxpayer will have to file the appropriate election form annually with its tax return.[58]

2. Deductions from the pool

Certain amounts must be subtracted from the SR & ED pool. For example, government assistance the taxpayer received or is entitled to receive in respect of SR & ED expenditures must be deducted from the pool.[59] Grants, subsidies, forgivable loans and deductions from tax are among the items included in the definition of "government assistance".[60] Non-government assistance, such as reimbursements and inducements, are also subtracted from the pool.[61] To the extent that a taxpayer repays any government or non-governmental assistance, however, the taxpayer can add the amount back to the pool.[62] As noted earlier, the pool is also decreased by any ITCs claimed in respect of SR & ED.[63]

The proposed legislation also requires that ITCs claimed on the so-called "prescribed proxy amount" (described in detail below) must be subtracted from the pool.[64]

3. Claiming the SR & ED deduction for domestic research

If the taxpayer's pool is negative after all of the above items are subtracted, the taxpayer must include in income the negative amount.[65] Requiring the taxpayer to include such amounts in income is similar to the recapture of excess depreciation claims under the capital cost allowance system.

To the extent that a taxpayer's domestic SR & ED pool is positive, the pool amount can be carried forward and applied against future years' income. SR & ED expenditures cannot be carried back, *per se*. A taxpayer that is in a loss position, however, may want to claim the SR & ED expenditure to trigger a non-capital loss, which can be carried back three years.[66]

The carryforward of the SR & ED pool by a corporate taxpayer is restricted if the control of the corporation is acquired. Similar to the restrictions on loss carryforwards after a change in control, a taxpayer's SR & ED pool can be carried forward and set-off against income from a taxation year after the change in control only if the business to which the expenditures relate is carried on by the corporation for profit after the change in control, and only to the extent of its income for the year from that or a similar business.[67]

C. *Expenditures on SR & ED carried on outside Canada*

Expenditures of a current nature for SR & ED carried on outside Canada can be deducted in the year incurred.[68] Such expenditures are deductible regardless of whether the SR & ED is carried on directly by the taxpayer or by another party on the taxpayer's behalf, so long as the taxpayer is entitled to exploit the results of the research. Like expenditures on domestic SR & ED, the deduction for current expenses on SR & ED carried on outside Canada can be used to offset a taxpayer's income from any business.[69] Expenditures of a capital nature for SR & ED carried on outside Canada cannot be deducted.

Under the Act, payments made to non-residents can be subject to withholding tax of 25 percent. Payments made to non-residents for SR & ED are exempt from the withholding tax if the person making the payment and the non-resident have entered a bona fide cost-sharing arrangement where the parties share the R & D expenses in exchange for an interest in any or all property that results from the research.[70]

III. INVESTMENT TAX CREDITS FOR SR & ED

The second type of tax incentive for SR & ED is under the Act's system of investment tax credits.[71] Basically, a taxpayer can claim an ITC for "qualified expenditures", which is currently defined as expenditures on SR & ED that qualify for inclusion in the taxpayer's SR & ED pool.[72] The rate of the tax credit depends on the type of taxpayer and the location in which the SR & ED is carried out. No ITCs can be claimed with regard to expenditures on foreign SR & ED. (The ITC rates as well as rules regarding how to claim ITCs are set forth below under the heading: II. "Claiming ITCs with respect to SR & ED".)

A. *Qualified expenditures*

One of the most significant changes announced in the draft legislation is the broadening of the definition of "qualified expenditures" for ITC purposes. In addition to being able to claim ITCs with regard to expenditures that currently qualify for inclusion in a taxpayer's SR & ED pool, under the proposed legislation two additional amounts will also be considered qualified expenditures for ITC purposes:[73]

- amounts representing a portion of the capital cost of certain "shared-use-equipment"; and
- an amount representing the so-called "prescribed proxy amount".

1. Shared-use equipment

One of the main complaints raised regarding Canada's ITCs for SR & ED is that little allowance is made under the current system for equipment that is purchased for use in both SR & ED and non-SR & ED production. Currently, expenditures on equipment that is used for non-SR & ED qualify for ITCs only if the non-SR & ED use is less than ten percent.

Under the proposals, a portion of the cost of depreciable equipment that is used in part for SR & ED and in part for other production will be considered "qualified expenditures" for the first two taxation years that such equipment is used, so long as the equipment is used "primarily" (i.e. greater than 50 percent) for the prosecution of SR & ED in Canada. The test for determining whether shared-use equipment is used primarily for SR & ED in Canada is to be based on the actual use of the property in the year the ITC claim is made, not the intended use at the time the equipment is purchased (as is the case for determining the inclusion of capital expenditures in the SR & ED pool).[74]

The proposed provisions speak in terms of claiming ITCs with regard to a portion of expenditures on "first term shared-use-equipment" and "second term shared-use-equipment". Basically, "first term shared-use-equipment" is shared-use equipment that was used primarily (i.e. greater than 50 percent) for SR & ED in Canada during the period from the time the property was acquired (and available-for-use) and ending at the end of the first taxation year that is at least 12 months from the time it was acquired. "Second term shared-use-equipment" is first term shared-use-equipment that is used during the second taxation year after its acquisition. Property that was not used within its first 12 months primarily for SR & ED, but which is used greater than 50 percent for SR & ED in the second year cannot be considered second term shared-used-equipment, since it was not "first term shared-use-equipment".

Under the proposals, buildings and leasehold interests in buildings, and property that is used for SR & ED during the assembly, construction or commissioning of a commercial facility that will be used (or consumed) during its useful life primarily (greater than 50 percent) for non-SR & ED activities, are specifically precluded from qualifying as "first term shared-use-equipment".[75]

If a taxpayer has first or second term shared-use-equipment, one-fourth of the capital cost of the equipment will be treated as a qualified expenditure, and therefore will be eligible for an investment tax credit, in the first or second taxation year, as the case may be.[76] The provisions regarding shared-use property are to be applicable with respect to purchases made after 2 December 1992.

The capital cost of shared-use property will have to be reduced by any government or non-government assistance that the taxpayer receives (or expects to receive) if the assistance is in respect of, or for the acquisition of, such property.[77] Furthermore, to the extent that ITCs are claimed in respect of such shared-use property, the undepreciated capital cost of that property's CCA class must also be reduced.[78]

2. The prescribed proxy amount

Under the current system, taxpayers can claim ITCs with regard to overhead expenses related to SR & ED to the extent that the overhead expenses are included in the SR & ED pool. As explained under the description of how to calculate the SR & ED pool, overhead expenses that are "directly attributable" to domestic SR & ED can be added to the pool, but taxpayers must track the actual overhead expense and be able to provide supporting documentation to justify their claims. This has proven to be one of the most difficult areas with which taxpayers have had to comply.

To alleviate compliance problems associated with tracking overhead expenses, the concept of the "prescribed proxy amount" is being introduced. Basically, taxpayers who calculate their SR & ED pool using the new elective method can claim ITCs with regard to overhead expenses using a simple formula based on wages and salaries of employees.[79] Therefore, for taxpayers choosing the elective method, the prescribed proxy amount is basically in lieu of adding overhead expenses to the SR & ED pool, and no supporting documentation for the actual overhead expenses will be required.

The prescribed proxy amount is 65 percent of the total portion of salaries and wages of employees that are directly engaged in SR & ED in Canada.[80] The portion of an employee's salary that is included in the formula is based on the time spent by the employee in the execution of SR & ED activities. Employment benefits and remuneration based on profits or bonuses are not included in the calculation of salary for purposes of the prescribed proxy amount.[81] The amount of salary of a "specified employee" (defined as a person who either does not deal at arm's length with the taxpayer or who owns ten percent or more of any class of shares of the corporation)[82] that can be included in the prescribed proxy amount is limited.[83]

The prescribed proxy amount must be reduced by the amount of governmental or non-governmental assistance the taxpayer receives (or can expect to receive) that can reasonably be considered in respect of expenditures that the prescribed proxy amount is considered in lieu of.[84]

And finally, if the taxpayer claims an ITC in respect of the prescribed proxy amount, in the year following that in which the credit is claimed, the SR & ED pool must be reduced by

74. Draft Legislation Sec. 127(9) definitions of "first term shared-use-equipment" and "second term shared-use-equipment".

76. Draft Legislation Sec. 127(11.1)(e).
77. Draft Legislation Sec. 127(11.1)(e).
78. Sec. 13(7.1).
79. Draft Legislation Sec. 127(11.1)(f) and Draft Reg. Sec. 2900(4).
80. Draft Reg. Sec. 2900(4).
81. Draft Reg. Sec. 2900(7).
82. Draft Legislation Sec. 248(1) definition of "specified employee".
83. Under Draft Reg. Sec. 2900(5), the limitation is the lesser of two amounts: (i) 75% of the salary and wages of the specified employee, and (ii) 2.5 times the Year's Maximum Pensionable Earnings (YMPE), which is set under the Canada Pension Plan legislation. The YMPE amount is indexed, and for 1993 it is $ 33,400. So, if a specified employee's income is less than $ 111,333, the maximum amount that can be included in the proxy amount will be 75% of the salary and wages. If the specified employee's wages are greater than $ 111,333 for 1993, a maximum of 2.5 times the YMPE, i.e. $ 83,500, will be included.
84. Draft Legislation Sec. 127(11.1)(f).

© 1993 International Bureau of Fiscal Documentation

the amount of the ITC claimed with regard to the prescribed proxy amount.[85]

B. *Claiming ITCs with respect to SR & ED*

As noted, the rate of the tax credit depends on the type of taxpayer and the location in which the SR & ED activities are carried out. For Canadian-controlled private corporations whose taxable income in the year before the ITC is claimed is $ 200,000 or less (including the income of associated corporations), the rate of the tax credit is 35 percent of the SR & ED[86] up to the corporation's expenditure limit, which is $ 2 million (and which must be shared by associated corporations).[87] For all other taxpayers (including corporations whose taxable income in the year before the ITC is claimed exceeds $ 200,000), the rate of the credit is 30 percent for SR & ED carried out in the Atlantic Provinces[88] and the Gaspé Peninsula[89] and 20 percent for SR & ED carried out anywhere else in Canada.[90]

In determining the amount of ITC available, government and non-government assistance that the taxpayer receives (or can expect to receive) that is related to the property or the qualified expenditures must be deducted.[91] (Of course, to the extent that such assistance was deducted in computing the prescribed proxy amount or the capital cost of shared-use-equipment, the amount need not be deducted again.)[92] To the extent that the taxpayer subsequently repays such assistance, the re-paid amounts are added back to the ITCs available.[93]

Since 1988, the amount of the ITCs that can be claimed in a taxation year has been limited by the taxpayer's "annual investment tax credit limit". The amount of the annual investment tax credit limit depends on whether the taxpayer is a corporation (with different amounts available for Canadian-controlled private corporations) or another type of taxpayer. Basically, a corporation can claim ITCs of up to three-fourths of the amount of income tax that is payable for the year (exclusive of the federal surtax) on its tax otherwise payable.[94] Canadian-controlled private corporations (CCPCs) can claim an additional amount equal to three percent of the amount of income eligible for the small business deduction, which is generally the first $ 200,000 of the corporation's active business income (including that of associated corporations).[95]

The annual investment tax credit limit for other taxpayers is $ 24,000 plus three-fourths of income tax payable in excess of $ 24,000.[96] Individuals can also use ITCs to offset up to three-fourths of the federal surtax.[97]

Unused ITCs can be carried back three years and carried forward ten years.[98]

IV. REFUND OF ITCs

Under Canada's refundable investment tax credit provisions, certain taxpayers who earn ITCs have the choice of receiving a cash refund equal to a portion of the ITC they could claim, instead of using the ITC to offset their tax liability. This mechanism provides a cash flow benefit to qualifying taxpayers and is an attractive alternative for taxpayers who cannot currently use a tax credit.

Under Section 127.1 of the Act, individuals, "qualifying corporations", and certain trusts[99] are eligible for refunds of ITCs related to SR & ED. Corporations that were Canadian-controlled private corporations throughout the year are considered qualifying corporations, so long as their taxable income in the year prior to claiming the refundable ITCs did not exceed $ 200,000 (including income of associated corporations).[100]

The amount of the ITC refund that can be claimed depends on the type of taxpayer and the nature of ITC claimed. For individuals, certain trusts and qualifying corporations, the refund rate for ITCs relating to SR & ED is 40 percent.[101] Qualifying corporations can also claim refunds of 100 percent of ITCs earned for SR & ED expenditures that are not of a capital nature.[102]

To claim a refundable ITC the taxpayer must file a prescribed form with its annual income tax return.[103] On filing the form the taxpayer is deemed to have paid tax in an amount equal to the amount of the refundable ITC claimed. Therefore, to the extent that a taxpayer is considered to have overpaid its tax liability, a cash refund is made. Of course, the amount of ITCs otherwise available for deduction will be reduced to the extent that a refundable ITC is claimed.[104]

V. CONCLUSION

The proposed changes to the incentive provisions concerning SR & ED do not reflect a change in government policy. Instead, they merely clarify existing assessing practice, with a view to simplifying compliance requirements placed on taxpayers.

As of 30 January 1993, the proposals remain in draft legislation form. Though there has been no indication as to the timeframe in which a bill will be presented to Parliament, based on the government's stated commitment to fostering scientific research and experimental development, it is likely that a bill will be submitted in the near future. Of course, further refinements and changes are always possible, so readers are cautioned to seek professional advice before implementing any changes based on the draft legislation discussed herein.

TAXATION & INVESTMENT IN CANADA

A review of the Canadian tax structure, outlining and clarifying the laws and systems of federal and provincial government. An invaluable source of reference, including:

- Basic information on the economy, exchange controls, competition law and trade practices
- Detailed coverage of individual, corporate, business and property tax systems
- Determination of the taxable base, application of rates and tax credits

- C. Judicial appeal

V. Conclusion

The Law of the People's Republic of China Concerning the Administration of Tax Collection (the ATC Law) was promulgated on 4 September 1992 and became effective as of 1 January 1993.[1] The ATC Law applies to individuals, Chinese enterprises, foreign-invested enterprises and foreign enterprises doing business in China. It sets forth provisions with respect to general tax administration (including tax registration, administration of accounting books and vouchers, and tax statements), tax collection, tax auditing and penalties for non-compliance with tax formalities.

The author wishes to express her gratitude for the financial support from the Max Bell Foundation.

I. FEATURES OF THE ATC LAW

Before the commencement of the economic reforms in the late 1970s, China had a very simple tax system that levied mainly turnover taxes.[2] The government relied on profits delivery from state-owned enterprises. As the economy undergoes a gradual change to a more market-oriented economy, a tax system has been developed, and tax revenue has become an important source of revenue to the government. In 1991, for example, more than 300 billion yuan of tax revenue was collected, accounting for about 90 percent of the total budget revenue to the government.[3]

As the tax system becomes more complex as a result of the reforms, tax administration must adapt to new challenges. The introduction of the ATC Law is an important step in China's tax reform.

A. *Uniform application to all taxpayers*

Unlike most countries where there are two or three major taxes, China has about 30 taxes,[4] including seven income taxes, five taxes on goods and services and numerous property and resource taxes. Taxes were introduced on a piecemeal and ad hoc basis to meet the requirements of the reforms. The tax system distinguishes between

1. The ATC Law was adopted at the 27th Session of the Standing Committee of the 7th National People's Congress on 4 September 1992. For the author's English translation of the ATC Law, see Appendix A. The ATC Law supersedes the "Provisional Regulations of the People's Republic of China Concerning the Administration of Tax Collection", issued by the State Council on 21 April 1986.
2. For further discussion, see Jinyan Li, *Taxation in the People's Republic of China* (New York: Praeger, 1991).
3. *Zhongguo Shuiwu* (*Chinese Tax Affairs*), No. 1 (1991), at 3.
4. China's tax system is highly centralized. Local governments derive their taxing powers from the Central Government; accordingly, the taxes that they are empowered to levy, and the maximum rates of such taxes, are commonly prescribed by the Central Government. Local governments have the authority to introduce implementing rules with respect to the local tax laws promulgated by the Central Government; they also have powers to grant reductions or exemptions from local taxes.
Taxes are designated to be local taxes if revenues derived from them accrue exclusively to local governments. Local taxes include the Real Estate Tax, Urban Land Use Tax, Farmland Use Tax, Vehicle and Vessel Use Tax, Slaughter Tax, Stamp Tax, Banquet Tax, Market Transaction Tax and Livestock Transaction Tax.

© 1993 International Bureau of Fiscal Documentation

Chinese citizens and foreigners,[5] Chinese enterprises and foreign corporations, state-owned firms and non-state-owned firms. For example, business profits are taxed under five laws applying separately to foreign-invested enterprises, state enterprises, collective enterprises, private enterprises and individual households.[6] Similarly, goods and services are subject to five taxes: Chinese enterprises are taxed under the Value-Added Tax,[7] Product Tax,[8] Business Tax[9] and Salt Tax,[10] and foreign-invested enterprises (joint ventures and foreign subsidiaries in China) and foreign enterprises doing business in China are subject to the Consolidated Industrial and Commercial Tax (CICT).[11] Most of the tax revenue is collected from four major taxes: Product Tax, Value-Added Tax, Business Tax (together accounting for more than 50 percent of the total tax revenue), and the State Enterprise Income Tax, accounting for 19 percent of the tax revenue.

Along with the movement toward a more developed tax system and the creation of checks and balances has come an increase in the number of rules, procedures and tax forms for all participants in the system, both taxpayers and tax administrators. Different taxes required different procedures for administration and compliance.

One major reason for the amount of tax administrative work and huge number of forms filed is the large number of tax rates and the application of many different taxes. Efforts have been made to simplify the tax system.[12] The provisional regulations introduced in 1986 adopted uniform administrative rules with respect to Chinese enterprises and individuals while taxes imposed on foreigners and foreign enterprises were left to be administered separately under the CICT, Individual Income Tax Law and the Foreign Income Tax Law. The ATC Law now applies the same rules to all taxpayers. Tax administration will thus be simplified.

B. *Powers of the tax authorities*

1. Organization of the STB

The State Tax Bureau (STB) is the government department in charge of general tax administration in China.[13] The STB is responsible for collecting all sales and income taxes.[14] It is a quasi-independent bureau of the State Council. The Commissioner of the STB reports directly to the Minister of Finance. It has a professional staff of around 500 and is responsible for setting national goals or quotas on the amount of revenue to be collected in each province.[15]

5. Non-Chinese citizens are subject to the Individual Income Tax. This tax was created in 1980 to apply to both foreigners and Chinese citizens, although it was intended to apply primarily to the growing community of foreigners working in China. The tax is levied on the worldwide income of residents of China and on Chinese-source income of non-residents. Income from employment is now taxed at progressive rates ranging from 2.5 to 22.5%, and income from investment and property is taxed at a flat rate of 20%.
Chinese citizens are taxed under the Individual Income Regulatory Tax. This tax was introduced in 1986, and from the beginning of 1987 has applied to Chinese citizens domiciled in China. It is charged at progressive rates of 20 to 60% on income from employment, personal services and rental income. Income from investment is taxed at a flat rate of 20%.
A consolidation of these two taxes is being considered in China.

6. The five taxes imposed on business income are the following:

(i) The State Enterprise Income Tax is levied on state enterprises. Large and medium-sized firms pay a flat rate tax of 55% on profits. In addition, state enterprises are liable for a State Enterprise Income Regulatory Tax if their profit level is higher than average. Small enterprises pay an eight-grade progressive tax, which rises from 7% to 55%.

(ii) The Collective Enterprise Income Tax is applied to urban and rural collective enterprises. The business profits of these enterprises are taxed at an eight-grade progressive scale, as is the case with small state enterprises.

(iii) The Household Income Tax is applied to individually owned industrial and commercial firms that employ fewer than seven employees. Net profits are taxed on a ten-grade progressive scale, which rises from 7 to 60%. In addition, a surtax of from 10 to 40% (determined by the local authorities) is imposed on taxable income in excess of 50,000 yuan a year.

(iv) The Private Enterprise Income Tax is charged on privately-owned firms that employ more than seven people. Unlike other taxes, a flat tax rate of 35% is adopted. No surtax is charged. Profits distributed by a private enterprise are taxed again, in the hands of the owner, at a rate of 40% under the Private Investors' Individual Income Regulatory Tax.

(v) The Foreign Income Tax applies to foreign enterprises doing business in China and Chinese-foreign joint ventures. This tax is charged on the worldwide income of resident enterprises at a flat rate of 30%. A local tax of 3% is also payable, bringing the effective rate to 33%. Various incentives are offered to taxpayers engaged in productive ventures and/or established in special open areas. In reality, about 80% of foreign investment is in costal regions and the standard tax rate thus is 15% or 24%. Such foreign investment is also eligible for tax holidays and reductions. Non-residents are taxed in China only on income derived from sources in China. Investment income is subject to a withholding tax of 20%. The tax is normally reduced by tax treaties.
For more discussion of this tax, see Jinyan Li, "The New Income Tax on Foreign Investment", 45 *Bulletin for International Fiscal Documentation* (October 1991), at 482; and "The Implementing Regulations for the New Consolidated Income Tax on Foreign Investment," 46 *Bulletin for International Fiscal Documentation* (April 1992), at 170.

7. The value added tax applies to some selected manufactured products which had been subject to cumulative taxation under the previous tax system. Originally there were two taxable categories, but there are now 24; rates of tax vary from 8 to 45%.

8. In terms of raising revenue and regulating prices through taxation, the Product Tax is China's most important tax. It applies to about 270 items of products taxable at 26 different rates. It is collected at the manufacture and import stage for industrial goods and at the purchase stage for agricultural products.

9. The Business Tax is charged on businesses engaged in construction, transportation, services and trades; rates range from 3 to 15%.

10. The Salt Tax is an excise tax imposed on salt producers and distributors. Tax rates vary from one area to another and depend upon the kind of salt and type of producer.

11. The Consolidated Industrial and Commercial Tax was a general tax on goods and services in force before the reforms of 1983-84, and was retained to apply to enterprises with foreign investment. It was anticipated at the beginning of the economic reforms that tax laws would be constantly amended to reflect the transition from a strict state-planned economy to a market-oriented economy. In order to avoid frequent changes in legislation and to create a stable investment environment for foreign investors, it was decided that foreign investment would continue to be taxed under this tax.
Since 1988, the CICT was no longer levied on foreign-invested enterprises and foreign enterprises in Shenzhen. These enterprises are subject to the Product Tax, Value-Added Tax and the Business Tax. See Guo, Hongde, "Opinions on Consolidating the Two Systems of Turnover Taxes", *Shewai Shuiwu* (*International Taxation*), No. 2 (1992), at 9-12.

12. For example, the income taxes imposed on foreign-invested enterprises and foreign enterprises were consolidated in 1991. The Chinese government is in the process of consolidating the two individual income taxes and the taxes on domestic enterprises. In Shenzhen Special Economic Zone, such consolidation has already been experimented.

13. The STB was formerly known as the "State General Tax Bureau".

14. The Ministry of Finance is responsible for administering the Agriculture Tax, Animal Husbandry Tax, Farmland Use Tax and Contracts Tax.

15. The STB has the following departments: turnover tax department, income tax department, local tax department, foreign tax department, tax collection department, tax reform and administrative review department, planning and accounting department, personnel and education department, general office, supervision department, offshore petroleum tax bureau, research institute of tax science, tax newspaper and periodicals publishing house, administrative service centre and Yangzhou tax staff training centre.

© 1993 International Bureau of Fiscal Documentation

Tax offices are also set up at the provincial and local levels. Provincial level tax bureaus have parallel structures. These tax offices are under dual leadership: tax officials are employees of the local government, but under the leadership of the STB with respect to tax administration. Taxes are collected by 500,000 provincial and local tax officials. The STB and its local offices hire a staff of half million, roughly one tax official for every 35 to 40 enterprise taxpayers.

Most of the staff are recently recruited with high school or post-secondary school education, which has created enormous training problems. Only about 20 percent of the tax staff have a college education, but not necessarily in law or accounting. Since taxes are collected by provincial and local offices, provincial tax bureaus seem to have their own local collection measures. There is little information exchange or coordination between tax offices in different provinces. Data processing equipment is not much used in China and a national computer network is yet to be developed.

2. Discretionary powers

The Chinese tax authorities may have more discretionary powers than those possessed by their counterparts in the developed countries. Chinese tax legislation tends to be broadly worded allowing the tax administrators to exercise their discretionary powers. In some cases, the tax authorities are empowered to make discretionary decisions. For example, Article 2(6) of the Individual Income Tax Law provides that taxable income includes "other kinds of income specified as taxable by the Ministry of Finance";[16] Article 19(4) of Foreign Income Tax Law provides that the tax authorities have the power to reduce or waive the 20 percent withholding tax on certain royalty payments to non-residents.

Chinese tax legislation includes laws enacted by the legislature,[17] regulations introduced by the State Council[18] where the NPC has delegated the legislative power to the State Council and implementing regulations issued by the State Council or the Ministry of Finance.[19] At the top of the legislative hierarchy are tax laws enacted by the legislature. Tax laws usually concern the broad principles of fundamental tax matters and tax regulations typically deal with legislative issues which may be subject to further development. Both tax laws and tax regulations tend to leave the detailed provisions to be dealt with by implementing regulations issued by the State Council or the STB.[20] The STB is normally responsible for drafting the implementing regulations.

The STB's power of statutory interpretation also goes beyond mere administrative interpretation. Under the Chinese Constitution, the power of statutory interpretation is shared among the legislature, courts and the government agency implementing the legislation. The body introducing the legislation is empowered to interpret the legislation. The legislature has the sole power to interpret tax laws, although this is typically delegated to the State Council. The State Council has the power to interpret tax regulations. Again, the State Council usually delegates this power to the Ministry of Finance or the STB.[21] The STB has the power to interpret the implementing regulations. Article 113 of the Foreign Income Tax Regulations provides, for example, that "the Ministry of Finance and the STB shall be responsible for interpreting these implementing regulations". The STB frequently issues interpretation bulletins, circulars or implementing measures to provide clarification with respect to specific tax matters, whether raised by the local tax authorities or by individual taxpayers. These rulings do not have the force of law, but they are binding on the tax authorities and provide some interpretative guidance to taxpayers and the courts.

Unlike courts in most other countries, Chinese courts are ~~not~~ empowered under the Constitution to make general statutory interpretations. In fact, Chinese courts are not independent of the legislature, but directly under its leadership.[22] Courts may only make judicial interpretation of the legislation, such as issues on application of the law or regulations, jurisdiction of the government department under the legislation and determination of penalties. In respect of the general interpretation of the tax legislation, courts normally follow the interpretation given by the STB.

3. Tax collection powers

While the STB and its local offices have a great degree of discretionary powers, their collection powers are limited to the power of seizure of property in some cases. More powers are now provided under Part III of the ATC Law, under which the tax authorities have the power to demand from any person any information or additional information including a return of income, books, invoices, statements or other documents;

16. The STB was previously under the Ministry of Finance.
17. The National People's Congress (NPC), or its Standing Committee. At present, such laws include the CICT Law, the Individual Income Tax Law, the Foreign Income Tax Law and the newly introduced ATC Law.
18. The State Council is the executive body of the Chinese government and consists of the premier, vice-premier, state councillors, ministers of the ministries and state commissions, the auditor general and the secretary general of the State Council. Under the Constitution, the State Council is empowered to adopt administrative measures, rules and regulations to carry out laws enacted by the NPC and to conclude treaties and agreements with foreign states. The NPC may also delegate some of its legislative power to the State Council. The State Council has used this delegated power to introduce all of the taxes except the Individual Income Tax, the Foreign Income Tax and the CICT.
The ministries under the State Council formulate administrative rules, measures, decisions and orders within their respective jurisdiction in accordance with the laws and administrative regulations of the State Council.
19. The Ministry of Finance has primary responsibility for the development and administration of tax legislation. Most of the tax laws and regulations are initially drafted by officials of the STB. The draft is then submitted to the Ministry of Finance. Upon approval of the Minister of Finance, the draft is submitted to the State Council. Where the State Council has the power to introduce the law or regulations, the Premier promulgates the law or regulations. Where the law is to be enacted by the NPC or its Standing Committee, the draft will be submitted to the NPC for promulgation. At each stage, opinions and comments on the draft are solicited from both legal and accounting experts and on occasion by taxpayers.
20. For example, the Individual Income Tax Law contains 15 articles, whereas the implementing regulations have 27 articles.
21. For example, Art. 29 of the Foreign Income Tax Law authorizes the State Council to introduce implementing regulations for the law. Under Art. 113 of the Foreign Income Tax Regulations, the State Council authorizes the Ministry of Finance and STB to interpret the implementing regulations.
22. The Chinese Constitution provides that courts are the judicial organs of the state (Art. 123), that the Supreme People's Court is responsible to the National People's Congress and its Standing Committee (Art. 128) and that the President of the Supreme People's Court is appointed by the National People's Congress (Art. 62).

© 1993 International Bureau of Fiscal Documentation

to investigate and examine a taxpayer's records and books of account for purposes of administering the tax laws; to obtain information from other departments of government; to search and seize taxpayers' property without pre-authorization by a court; to enforce tax collection by suspending the taxpayers' bank in making payments out of the taxpayer's account, and to charge penalties.[23]

C. *Restricting the powers of the local government*

Another feature of the Chinese tax system is the competing interests within the tax area. Not only is the Central Government's interest at odds with that of taxpayers, but the Central Government's interest is also at odds with provincial and local governments.[24] China differs from many other countries in that the Central Government collects very few taxes.[25] It is the tax offices under the local governments, especially county-level governments, that are responsible for the collection of taxes. This heavy reliance on local governments for collection of the bulk of taxes gives local governments substantial leverage with respect to the revenues they collect, and makes it critical for the Central Government to distinguish and secure its share of the revenue.[26] In order to protect local interest, local governments frequently grant unauthorized tax reductions and exemptions to local enterprises and compete with each other in offering tax incentives to attract investors and businesses to their regions.

The ATC Law provides clearly that the STB is responsible for the national tax administration and no other government agencies, institutions or individuals may interfere with STB's work. Local governments must support the tax authorities in collecting the target amount of tax. According to Article 55 of the ATC Law, any unauthorized tax reductions and exemptions are null and void and individuals making the decisions are held personally liable.

D. *Declaration of taxpayers' rights and obligations and duties of the tax authorities*

1. Taxpayers' rights and obligations

Chinese legal and cultural traditions emphasize more on obligations and duties than on individual rights. Taxpayers' rights are not clearly specified under the existing tax legislation. The Constitution provides that citizens have the right to be treated equally before the law,[27] the right to personal dignity and the right not be insulted, falsely charged or framed-up in any means,[28] and the right not be unlawfully searched at home.[29] The ATC Law provides that taxpayers have the right to a refund of the overpaid tax,[30] the right to compensation if the damages are caused by the misconduct of tax officials,[31] the right to an extension of time limitation for tax payment in the event of unforeseeable diasters,[32] the right to both administrative and judicial appeal over a dispute with the tax authorities[33] and the right to confidentiality in respect of the information provided to the tax authorities.[34]

Taxpayer's duties and obligations are provided in both the Constitution and the ATC Law. Article 56 of the Constitution provides, for example, that every citizen has the duty to pay tax in accordance with law. Extensive obligations are also prescribed in the ATC Law, such as the obligation to cooperate with the tax officials, to provide all relevant information in the course of tax audit or inspection,[35] to inform the tax authorities where there is a non-compliance with tax laws by other taxpayers,[36] and to comply with the requirements on tax registration, tax payment and record-keeping.[37]

2. Duties of tax officials

In view of the broad discretionary powers of the tax officials, Article 6 of the ATC Law provides that tax officials must administer tax laws and regulations impartially and devote themselves to their duties. Tax officials are prohibited from extorting or taking bribes, practising favouritism, committing malpractice, neglecting their duties.[38] They are required not to abuse their powers to overcollect tax or deliberately create difficulties for taxpayers and withholding agents.[39] In a case where a tax official colludes with a taxpayer or assists a taxpayer to commit non-compliance or tax evasion, the official

23. See Note of the Editor of China's Tax Affairs, "An Important Milestone in Tax History in China", *Zhongguo Shuiwu* (*China Tax Affairs*), No. 10 (1992), at 10-11.
24. "Local" government refers here to all governments below the national level. Thus, provincial, municipal, county and township are included unless otherwise specified.
25. Upon the establishment of the People's Republic in 1949, China adopted a centralized political and economic structure. All major economic plans are formulated under the direction of the State Council. The fiscal system has been centralized, under which all revenue and expenditure must be handled by the Central Government. However, in a vast country like China, where economic developments and cultural background vary greatly from region to region, centrally issued policies and regulations tend to be interpreted in diverging ways by local authorities to best suit their local interests. Underneath the surface of a highly centralized hierarchy, "regionalism" or "localism" has always existed and has become more obvious since the adoption of the new economic policies. Enterprises are mostly under the administrative control of local governments. They often bypass the instructions issued by the central planning commissions in order to avoid the rigidity which the planning process involves. In attempting to maximize their objective functions, local governments often intervene in the management of enterprises situated in the region, sometimes without a sufficient legal base; and in other cases they form an alliance with local businesses against the Central Government to protect local interests.
26. Revenues to the Central Government include income taxes collected from state enterprises owned by the Central Government; Business Tax collected from the railway companies, banks, insurance companies and other enterprises controlled by the Ministry of Finance; customs duties, CICT, and income tax collected from foreign-invested enterprises or foreign enterprises engaged in offshore oil exploration.
Local tax revenues include revenues from income taxes on other domestic enterprise and local taxes.
Revenues from the Product Tax, Value-Added Tax, Business Tax, Salt Tax, Individual Income Tax and Foreign Income Tax are shared between the central and local government.
27. Art. 33 of the Constitution.
28. Art. 38 of the Constitution.
29. Art. 39 of the Constitution.
30. Art. 30 of the ATC Law.
31. Art. 31 of the ATC Law.
32. Art. 20 of the ATC Law.
33. Art. 56 of the ATC Law.
34. Art. 7 of the ATC Law.
35. Arts. 33 and 34 of the ATC Law.
36. Art. 7 of the ATC Law.

will face administrative sanctions imposed, and/or be jointly liable as an accomplice in any criminal charge brought against the taxpayer.[40]

II. TAX ADMINISTRATION

A. *Tax registration*

Enterprises and individuals engaged in business activities are required to register with the local tax office within 30 days after a business licence is issued. The tax authorities will issue a tax registration certificate to the taxpayer. If the business of a taxpayer is changed as in the case of mergers, divisions, liquidations or change in locations, the taxpayer must file another registration with the tax authorities in respect of the change.[41]

B. *Books and records*

Books and records must be kept by taxpayers and withholding agents.[42] Withholding agents are required to deliver itemized records with respect to the underlying tax upon the remittance of the tax withheld. Taxpayers engaged in business or production operations must keep inside China their accounting books, accounting records and other supporting documents. Vouchers, account books and accounting statements of the taxpayer must be completed in the Chinese language, or in both Chinese and foreign languages. Taxpayers using computers for bookkeeping must treat the accounting records in computer storage or output as account books. Magnetic tapes and diskettes must be kept properly before hard copies are printed. These records must be kept for at least 15 years.

Sales invoices and business receipts of the taxpayers must be submitted to the local tax authorities for approval before they are printed and put into use.[43] Such invoices and business receipts can only be printed by firms designated by the tax authorities. Taxpayers are prohibited from printing their own invoices without the permission of the tax authorities.

C. *Returns*

Taxpayers are required to file annual tax returns.[44] With respect to individual income taxes, most items of income are subject to withholding tax and withholding agents are required to file returns on a monthly basis. Where no withholding tax is imposed a taxpayer must pay the tax and file a monthly return within the first week of the following month.[45] Taxpayers who earn income outside China are obliged to file a tax return within 30 days after the end of each year.

Enterprises are required to file their income tax returns and final accounting statements with the local tax authorities within a specified time period after the end of the taxation year, irrespective of making profits or sustaining losses in the taxation year.[46] The final tax return must be filed together with the final accounting statements. The audit reports signed by a certified public accountant registered in China must also be submitted. Audits carried out by non-Chinese firms, even if such firms have offices in China, are generally not acceptable on their own for tax purposes.[47] In the event that a taxpayer cannot submit the income tax returns and the final accounting statements within the time limit due to special reasons, an application can be made to the local tax authorities within the filing time limit for approval of an appropriate extension. If the final due date for filing tax returns falls upon Sunday or an official public holiday, the day following the public holiday is treated as the final due date.

Branches or business establishments of foreign enterprises are required to submit a copy of their final accounting statements to the local tax authorities, at the same time as they submit them to their respective head office, or to the business establishment in charge of consolidated tax filing.[48] Foreign enterprises that have two or more business establishments in China may select to file a consolidated return, and appoint one establishment for consolidated tax filing and payment. However, that establishment must assume the supervisory and management responsibility over the business of the other establishment, and keep complete accounting records and vouchers that correctly reflect the income, costs, expenses, profits and losses of other business establishments. An application to file a consolidated return must be made to the local tax authority.[49] Once the consolidated tax return of a foreign enterprise is approved, any establishment of new business organizations, merger, change of address, termination or close-down of the enterprise must be reported to the tax authorities.

When a taxpayer's business is liquidated, a return must be filed with the local tax authorities prior to its dissolution.

D. *Assessment*

According to Chinese law, income tax is levied on an annual basis. The taxation year is the calendar year unless a taxpayer obtains special approval for a taxation year other than the calendar year. There is no statutory requirement for the issue of a formal assessment by the tax authorities. However, the tax authorities are obliged to release a certificate for tax payment upon receipt of the tax payment.[50]

40. Art. 52 of the ATC Law.
41. Arts. 9-11 of the ATC Law.
42. Arts. 12-15 of the ATC Law.
43. Art. 14 of the ATC Law. See also "Interim Rules Concerning the Administration of Invoices Used by Foreign-Invested Enterprises and Foreign Enterprises", issued by the STB, 27 December 1991.
44. Arts. 16 and 17 of the ATC Law.
45. Art. 7 of the Individual Income Tax Law, and Art. 13 of the Individual Income Regulatory Tax Regulations.
46. For example, the time limit is four months after the year-end for foreign-invested enterprises and foreign enterprises under Art. 16 of the Foreign Income Tax Law, and 35 days after the year-end for state enterprises under Art. 14 of the State Enterprise Income Tax Regulations.
47. Art. 17 of the Foreign Income Tax Law.
48. Arts. 89-93 of the Foreign Income Tax Law.
49. Where all the business establishments involved in the consolidated tax return are located in the same locality, the application is subject to approval by the tax authority of provincial tax bureau of that locality. Where the establishments are located in two or more different provinces, the application is subject to approval by the STB.
50. Art. 22 of the ATC Law.

© 1993 International Bureau of Fiscal Documentation

In assessing taxable income of a taxpayer, the tax authorities have the right to inspect the financial, accounting and tax affairs of the taxpayer. To this end, the taxpayer is obliged to produce factual reports, provide all relevant information and it must not refuse to cooperate nor conceal any important evidence.

The tax authorities are normally bound by a return or information supplied by or on behalf of a taxpayer. If no return has been filed, or no proper records of accounting or books are kept by the taxpayer, the tax authorities may make an arbitrary assessment of the amount of tax payable.[51] The ATC Law does not specify any basis or time limitation for such assessment. Presumably, the assessment must be made within the time limitations specified under the ATC Law. The methods of assessment may include a "net worth" method or a profit comparison with other taxpayers in similar situations. The onus of proof to show that the assessment made by the tax authorities is in error will be on the taxpayer.

E. *Payment of tax*

Taxes are normally paid by way of withholding at source, instalment payment or payment at the end of a taxation year.

1. Tax payment in respect of payments to residents of China

Every person paying salaries, wages, remuneration for independent personal services, rental income or royalties to individuals must deduct or withhold therefrom the amount determined in accordance with prescribed rules under the Individual Income Tax or Individual Income Regulatory Tax and must, at such time and as may be prescribed, remit that amount to the State Treasury on account of the payee's tax. The withholding agents must keep the amount deducted or withheld separate and apart from their own money, and must file withholding returns to the local tax authorities with respect to the tax deducted and remitted. Failure to comply with this requirement may result in penalties and in criminal prosecution. The withholding agent is entitled to a service fee of one percent (three percent in the case of tax payable by citizens) of the tax withheld.[52]

Once tax is deducted by the withholding agent, the payee is under no obligation to file tax returns unless the income is subject to progressive tax rates under the Individual Income Regulatory Tax. Under the Individual Income Regulatory Tax, a taxpayer must also file a monthly return with the local tax authorities if the taxpayer's monthly aggregated income from employment, contractual fees, independent personal services and rentals exceeds the monthly basic exemption of about 400-450 yuan.[53]

2. Withholding tax in respect of payments to non-residents

Residents of China must deduct and remit 20 percent (15 or 10 percent if the recipient is a resident of a country with which China has a tax treaty) of an amount paid to a non-resident subject to withholding tax under Article 19 of the Foreign Income Tax Law.[54] This includes fees paid in respect of construction, installation, assembly and exploration, fees for services (such as consultation, management, training and other labour services), dividends, interest, taxable capital gains, royalties, rental or leasing income. Withholding tax on dividends is currently exempt.[55]

Where a person has failed to deduct or withhold any amount as required by law from an amount paid to individuals or non-residents, that person is liable to pay as tax on behalf of the non-resident the whole amount what should have been deducted or withheld. The only defence to the withholding agent is that the tax authorities have been advised of the fact that the payee of the amount has refused to have the tax deducted.[56]

3. Instalment payments

Under the individual income tax laws, individuals are required to pay tax on a monthly basis. No instalment payment is thus required. Payments of tax can be made in Chinese currency in cash or by way of remittance or transfer of accounts. Where payments are made in marketable securities or in kind, the value of the payment must be determined in terms of money. Where there is income in foreign currency, the amount is calculated according to the exchange rate fixed by the Chinese government as of the date the tax payment is due. Foreigners are generally required to pay tax in Bank of China foreign exchange certificates.

All enterprises and corporations must remit income tax in monthly or quarterly instalments in accordance with the provisions in the tax laws. Under the Foreign Income Tax Law, for example, income tax must be paid in advance in quarterly instalments. The amount of tax is computed as one quarter of the planned annual profit or the actual income in the preceding year. Such payments must be made within 15 days from the end of each quarter and the final settlement must be made within five months from the end of each taxation year. Any excess payment is refunded and any deficiency is repaid. Taxpayers must also file quarterly provisional tax returns in respect of advance payments with the local tax authorities.[57]

4. Payment notwithstanding appeal

The taxpayer must, within the specified time limitations, pay to the State Treasury any part of the tax payable, fines or penalties. A taxpayer who does not agree with an assessment or the penalties imposed may file an application for administrative review or judicial appeal. Taxes and penalties that are determined to be owing must first be paid, however, before the commencement of the appeal process.[58]

51. Art. 23 of the ATC Law.
52. Art. 19 of the ATC Law.
53. For further discussion, see Jinyan Li, "The New Regulatory Tax on Individual Income", 41 *Bulletin for International Fiscal Documentation* (April 1987), at 167.
54. Persons making payments to individuals who are not resident in China are liable to withhold tax under Art. 6 of the Individual Income Tax Law.
55. Art. 19 of the Foreign Income Tax Law.
56. Art. 47 of the ATC Law.
57. Arts. 15-16 of the Foreign Income Tax Law.
58. Art. 56 of the ATC Law.

© 1993 International Bureau of Fiscal Documentation

5. Demand for payment

Where, in the opinion of the tax authorities, a taxpayer is attempting to avoid payment of tax by transferring or concealing assets or income, the tax authorities may direct that all taxes and penalties be paid before the deadline for tax payment. Legal proceedings including bank-stops and seizure of assets may be taken if payment is not made.[59]

6. Refund of overpaid tax

If there is an overpayment of tax, the excess must be refunded to taxpayers without delay.[60] Within three years of payment, a taxpayer has the right to demand such refund. If there is a deficient payment due to the mistake of the taxpayer in computing the tax payable, the tax authorities may enforce the payment within three years. In certain special cases, the limitation period can be extended to ten years.[61]

F. *Collection of taxes*

All taxes and penalties payable under the tax legislation are debts to the government recoverable as such in court or in other manners. The necessary procedures for paying or providing security for the payment of taxes and penalties owing to the tax authorities are provided in the ATC Law.

The tax authorities must inform the taxpayer that an amount payable under the tax laws has not been paid on the expiration date and allow the taxpayer to pay the tax within a newly determined time limit. If the taxpayer fails to pay the tax within the time limit, the tax authorities may impose penalties. Enforcement measures, such as seizure of assets and bank stops, can only be taken in certain situations.

1. Seizure of assets

Where taxpayers who carry on business without a business licence have failed to make a payment of the tax assessed by the tax authorities, the tax authorities are empowered to direct that the goods and chattels of the person in default be seized.[62] Once seized, the property may be sold by public auction if the taxpayer does not pay the amount of tax due within a reasonable period of time. Any surplus resulting from the sale after the deduction of the outstanding tax payment must be paid to the owner of the property seized. The tax authorities must issue a receipt to the taxpayer for the assets seized. Upon payment of the tax in default, the seized assets must be returned to the taxpayer.[63]

Similar procedures can be taken in two other cases:

(i) where the tax authorities have discovered that a taxpayer has transferred or concealed business assets or other property to avoid tax payment and the taxpayer has failed to make a tax payment or provide a satisfactory security for the tax payment when the tax authorities demanded for such payment or security; and

(ii) where a taxpayer carrying on business in China has failed to pay the tax within the time limitations, or a withholding agent has failed to withhold and remit the tax within the time limitations, or a guarantor for tax payment has failed to pay the tax on behalf of the taxpayer.[64]

2. Bank-stops

As an alternative to seizing the taxpayer's assets, the tax authorities may also enforce tax payment by directing the taxpayer's bank to suspend payments out of the taxpayer's bank account.[65] Where such bank-stop was imposed because the tax authorities have reasonable grounds to believe that a taxpayer has attempted to evade a tax payment by concealing assets, if the amount of tax has been paid as demanded by the tax authorities, the tax authorities must immediately authorize the bank to resume payment from the taxpayer's account. Otherwise, the bank must pay the amount of tax outstanding out of the taxpayer's account. If the bank-stop is imposed because the taxpayer (or withholding agent or guarantor for the tax payment) has not paid the tax within the time limitations, the tax authorities may direct the taxpayer's bank to pay the amount of tax from the taxpayer's account to the tax authorities on account of the tax liability.

3. Taxpayers leaving China

Taxpayers leaving China are required to settle their tax payments first. If such persons fail to pay the tax and fail to provide security to the tax authorities, the tax authorities may notify the customs to deny their exit.[66]

G. *Tax audit and demand for information*

The ATC Law authorizes any investigation and examination of a taxpayer's records and books of account by the tax authorities for any purpose related to the administration and enforcement of the tax laws.[67] A tax official may, at all reasonable times, enter any premise or place where any business is carried on, where property is kept, where anything is done in connection with any business or where any records are or should be kept.[68] The tax official may audit or examine the books, records and any account or document relevant to the information in the books or records or the tax payable.

Tax officials may demand that a taxpayer or withholding agent provide information or additional documents in connection with the administration and enforcement of the tax laws. The tax authorities may also examine mails and shipments of the taxpayer at railway stations, ports, airports and postal offices. With the approval of a local bureau commissioner, the bank accounts of taxpayers can be examined.[69]

In the course of investigation of non-compliance with the tax law, tax officials may take notes, make video and audio recording or photocopy of the relevant documents. Tax offi-

cials must present proof of identification before the investigation.[70]

III. FINES AND PENALTIES

In case of non-compliance with the provisions of the ATC Law or other tax laws and regulations, fines and penalties may be imposed by the tax authorities to enforce the payment of the tax. The ATC Law does not, however, provide for charging of interest on late payment. The amount of the fines or penalties is not computed by any reference to interest rate.

A. *Fines*

A fine can be imposed by the tax authorities where a taxpayer has failed to pay the tax within the time limitations, or a withholding agent has failed to withhold tax and remit the tax to the State Treasury within the time limitations. The fine is normally computed on a daily basis from the day on which the payment was required to be made at the rate of 0.2 of the amount of tax in default.[71]

There is no provision in the ATC Law requiring that interest or its equivalence is paid by the tax authorities to taxpayers in respect of overpayment of taxes.

B. *Penalties*

Where a taxpayer or withholding agent has failed to comply with the law, the taxpayer is normally given an opportunity for compliance. If the taxpayer or withholding agent has failed again, penalties are imposed.In general, penalties are levied in the following cases: delay in making returns, failure to complete tax registration, failure to keep proper records and books of account, failure to withhold an appropriate amount of tax or failure to provide the tax authorities with proper documents and information.[72] The amount of penalties varies from 2,000 yuan to 10,000 yuan depending on the seriousness of the offence.

Penalties may also be imposed in the following cases:

(i) where a taxpayer has failed to pay the tax within the time limitations;[73]
(ii) where a withholding agent has failed to withhold and remit the tax or withheld tax at an amount less than that required by law;[74]
(iii) where a taxpayer has transferred assets or other property to defeat the collection of the tax by the tax authorities;[75]
(iv) where a taxpayer has bribed tax officials for the purpose of paying no or less tax;[76]
(v) where a taxpayer has fraudulently claimed a tax refund for export;[77]
(vi) where a taxpayer has used violent means to resist tax payment;[78] or
(vii) where a taxpayer has illegally printed and used invoices and business vouchers.[79]

C. *Tax avoidance*

Tax planning is not as common in China as in many other countries. The principle that one can arrange his or her affairs in such a way as to avoid or minimize the tax liability has not been enshrined in China. There seems to exist a presumption in Chinese legal thinking that whatever is not prohibited by law is not necessarily permitted. "Tax avoidance" is often not distinguished from "tax evasion".

Chinese tax laws do not contain any general anti-avoidance provisions which are commonly found in the tax laws of Western countries. The tax laws require that in order for an expenditure to be deductible the amount must be reasonable.

Transfer pricing rules are found in Article 13 of the Foreign Income Tax Law. According to this provision, foreign investment enterprises and Chinese establishments and sites of foreign companies are required to conduct business transactions with their affiliated companies on an arm's length basis. The tax authorities are empowered to make reasonable adjustments if such transactions are not conducted on an arm's length basis and the amount of tax payable to China consequently is reduced. Article 24 of the ATC Law requires that enterprises or establishments of foreign enterprises in China deal with their affiliates at an arm's length basis. This provision may have the effect of extending the transfer pricing rule to domestic enterprises. It is questionable, however, whether such a construction is appropriate considering that none of the income tax laws governing domestic enterprises contains a transfer pricing provision. This ambiguity may be cleared by the implementing regulations to be issued by the State Council.

D. *Tax evasion*

The term "tax evasion" is defined to mean the non-payment or underpayment of tax by a taxpayer by the deliberate omission of revenue, fraudulent claiming of expenses or allowances, or a misrepresentation, concealment or withholding of material facts, or by destroying or fraudulently altering business records.[80]

Although most taxpayers are state-owned and collective enterprises in China, tax evasion is nevertheless a serious problem.[81] According to investigations by the tax authorities,

70. Art. 35 of the ATC Law.
71. Art. 20 of the ATC Law.
72. Arts. 37-39 of ATC Law.
73. Art. 40 of the ATC Law.
74. Arts. 39, 40 and 46 of the ATC Law.
75. Art. 41 of the ATC Law.
76. Art. 43 of the ATC Law.
77. Art. 44 of the ATC Law.
78. Art. 45 of the ATC Law. In the past few years, several thousands of tax collectors have been violently attacked and some tax officials have been killed or seriously injured by taxpayers. See, for example, *Renmin Ribao (Haiwai Ban) (People's Daily) (Overseas Edition)*, 8 March 1989 and 20 November 1989, at 1; *Zhongguo Shuiwu* (*Chinese Tax Affairs*), No. 6 (1992), at 6-7.
79. Art. 48 of the ATC Law.
80. Art. 40 of the ATC Law.
81. There may be several explanations for this: (a) there is a lack of rule of law in China where traditions and cultural values place more emphasis on the rule of man; (b) taxation is new in China and taxpayers have not fostered a sense of observing the tax laws on their own initiative, nor do they have the habit of paying taxes; (c) the lack of efficiency in tax administration and, in some cases, the acceptance of bribes by tax collectors make it possible for taxpayers to abuse the tax system; (d) the discriminatory taxation of different types of enterprises and different categories of goods and services create incentives for evasion, particularly in an environment where evasion and avoidance were practices of long standing.

© 1993 International Bureau of Fiscal Documentation

tax evasion cases are found in about 50 of state and collective enterprises and about 80 of households and private businesses.[82] Each year, about 4-6 billion yuan of tax revenue is recovered through tax inspection conducted by 1,000 tax officials, which may indicate the scale of tax avoidance and tax evasion in China.[83]

The techniques of evasion reported are not new or unusual, such as double invoicing to minimize the amount of total sales subject to tax, misrepresenting the quality and hence the taxable value of goods, failure to record some purchases and sales and underpricing commodities for accounting records only. Some taxpayers, private businesses in particular, simply destroy or keep no accounting records, or set up multiple bank accounts to conceal actual taxable income.

Severe penalties are imposed under the ATC Law and the Criminal Law. For example, where any person has committed an offence of tax evasion, the tax authorities may, in addition to recovering the tax overdue, impose a penalty not exceeding five times the amount of tax overdue.[84] The amount of penalty depends on the amount of tax evaded. If the amount of tax evaded exceeds 100,000 yuan, the term of imprisonment can be as long as seven years, and the amount of penalty is up to five times the amount of tax evaded. Tax evasion is also a criminal offence punishable under the criminal law.

E. *Criminal prosecution*

The Criminal Law was amended at the same time when the ATC Law was enacted.[85] Every person who has committed an act of tax evasion or tax resistance is guilty of an offence and, in addition to any penalty otherwise provided, may be punishable by imprisonment. The term of imprisonment depends on the amount of tax evaded and whether the offence is repeated by the taxpayer.

A maximum term of three-year imprisonment is provided in the following situations:

(1) where a taxpayer has evaded a tax payment by not filing tax returns, by making false entries in records or books of account, by destroying, altering or otherwise disposing of records or books of account, or by hiding assets to defeat tax collection, and the amount of tax evaded exceeds 10,000 yuan, accounting for more than ten percent of the tax payable by the taxpayer;[86]

(2) where a lesser amount of tax is evaded, but the taxpayer has committed a crime of tax evasion after paying a penalty for an earlier offence of tax evasion and the cumulative amount of tax evaded exceeds 10,000 yuan;[87] or

(3) where the amount of refund fraudulently claimed for export products exceeds 10,000 yuan.[88]

A maximum term of seven years of imprisonment is provided where the amount of tax evaded is more than 100,000 yuan and accounts for more than 30 percent of the tax payable, or where the taxpayer uses force to resist tax payment or tax collection, irrespective of the amount of tax concerned. A more severe punishment applies if the violent tax resistance has caused personal injuries or death; the offender may face criminal charges for assault or manslaughter.[89]

A corporation officer, agent or director who directed, authorized or assented to the commission of the offence is party to and guilty of the offence and is liable to punishment provided for the offence, but the maximum imprisonment period is three years.

IV. TAX DISPUTES

A. *Objections and appeals*

There are no formal procedures for taxpayers to file objections to the assessment by the tax authorities. Article 56 of the ATC Law allows both administrative and judicial appeals, although the former is much preferred by both taxpayers and tax administrators.

B. *Administrative review*

Under Article 56 of the ATC Law, a taxpayer may request an administrative review if the taxpayer disagrees with the assessment made or penalties imposed by the tax authorities. An administrative review is conducted in accordance with the "Rules for Administrative Review in Taxation Matters" (the "Administrative Review Rules").[90] These rules allow citizens, legal persons, stateless persons, foreign persons, foreign organizations and other organizations to apply for administrative review if such persons consider that their lawful rights and interests have been infringed by any conduct or decisions of the tax authorities.

The Administrative Review Rules provide for specified time limitations for submitting an application for administrative review. In general, applications in respect of the payment or withholding of income tax must be submitted within 60 days of receiving a certificate for tax payment.[91] Applications for

83. See *Zhongguo Shuiwu* (*Chinese Tax Affairs*), No. 6 (1992), at 6-7.

84. Art. 40 of the ATC Law.

85. The Criminal Law has been amended by "The Supplementary Provisions of the Standing Committee of the National People's Congress on Severely Fighting the Crimes of Tax Evasion and Tax Resistance" (the "Supplementary Provisions") issued by the 27th session of the 7th Standing Committee of the National People's Congress.

86. The same rules apply where a withholding agent has committed tax evasion in similar fraudulent manner.

87. Art. 1 of the Supplementary Provisions.

88. Art. 44 of the ATC Law.

89. Art. 6 of the Supplementary Provisions.

90. These Rules were issued by the STB on 29 September 1991 and became effective from 15 October 1991.

91. Art. 56 of the ATC Law. Under the Administrative Review Rules, in cases where the payment of Consolidated Industrial and Commercial Tax or individual income taxes is involved, applications must be made within 15 days of receipt of proof of tax payment. This provision, however, has been overridden by Art. 56 of the ATC Law.

© 1993 International Bureau of Fiscal Documentation

the review of a penalty must be submitted within 15 days of receipt of the notice of the penalty. In other cases, applications should be made within 15 days of becoming aware of the specific administrative act.[92]

Applications for administrative review must be filed in writing containing the name and address of the taxpayer and the respondent tax office(s), a statement of facts, arguments and claim for remedies. A decision must be made by the administrative review agency within 60 days after the receipt of the taxpayer's application.[93] The tax review agency may order the tax authorities to perform a specific act within a time limit. Failure to perform such act, the review agency may apply to a court for enforcement. The review agency may also award monetary compensation to taxpayers where the tax authorities have caused damages to the taxpayer.

C. *Judicial appeal*

If a taxpayer is not satisfied with the review decision, the taxpayer may institute legal proceedings in court within 15 days from the date of receipt of the review decision.If a taxpayer does not accept a penalty imposed by the tax authorities, the taxpayer may, within 15 days from the date of receipt of the notice of the penalty, directly file a law suit in court. If the taxpayer has failed to apply for administrative review to the higher tax authorities or institute legal proceedings in court within the time limit and has failed to comply with the penalties imposed, the tax authorities may apply to a court for mandatory enforcement of their decisions.[94]

Tax litigation is rare in China. Most tax disputes are resolved by negotiations or administrative appeal. There is a traditional preference for informal settlement of disputes. There is no specialized tax court in China and there are no sophisticated legal and accounting professionals to assist taxpayers. More importantly, Chinese courts do not have a general power of statutory interpretation; the tax authorities are often authorized to both administer and interpret the implementing tax regulations, which constitute the bulk of the tax legislation.

V. CONCLUSION

The tax administration system in China has developed rapidly during the past decade. The STB and its local offices have been expanded from a staff of 178,000 in 1979 to the present of 500,000. Although there are still problems, such as the shortage of highly trained tax collectors and resources, the lack of coordination between the STB and local tax offices, and the complexity in the tax system, the promulgation of the ATC Law is an important step forward in China's tax reform. Because the ATC Law is enacted by the legislature, tax administrators will find that their tax collection and enforcement powers have been strengthened while taxpayers will find that their rights and interests will be protected under the law.

92. Art. 28 of the Administrative Review Rules.
93. Art. 56 of the ATC Law.
94. Art. 56 of the ATC Law.

Appendix A

LAW OF THE PEOPLE'S REPUBLIC OF CHINA CONCERNING THE ADMINISTRATION OF TAX COLLECTION

(Promulgated by the 27th Session of the Standing Committee of the 7th National People's Congress on 4 September 1992)

PART I. GENERAL PRINCIPLES

Article 1:

This Law has been promulgated for the purposes of strengthening the administration of tax collection, securing tax revenue to the state and protecting the legal rights and interests of taxpayers.

Article 2:

This Law shall apply to the administration of taxes collected by the tax authorities.

Article 3:

Matters with respect to the commencement or cessation of tax collection, tax reduction, tax exemption, tax refund and the payment of any underpaid tax shall be dealt with in accordance with law; where the State Council is authorized to introduce regulations on such matters, these regulations shall apply.

No government departments, entities or individuals may be allowed to make decisions in violation of law or regulations with respect to the commencement or cessation of a tax collection, tax reduction, tax exemption, tax refund, and payment of any underpaid tax.

Article 4:

The term "taxpayers" refers to entities or individuals that are liable to pay tax in accordance with law or regulations.

The term "withholding agents" refers to entities or individuals that are liable to withhold tax as required by law or regulations.

Taxpayers or withholding agents must pay tax, withhold (or collect) and remit tax in accordance with law or regulations.

Article 5:

The competent tax department under the State Council (the State Tax Bureau, "STB") shall be responsible for the national tax administration.

Local people's governments at various levels shall strengthen their leadership in tax administration within their jurisdictions and support the local tax authorities in carrying out their duties and complete their tasks of tax collection.

© 1993 International Bureau of Fiscal Documentation

Other government departments or entities shall support and assist the tax authorities in carrying out their duties.

No entities or individuals shall impede the tax authorities from carrying out their legal duties.

Article 6:

Tax officials shall administer the tax legislation impartially and devote themselves to their duties. They shall not extort or accept bribes, practise favouritism, commit malpractice, neglect their duties, or fail to collect or undercollect the amount of tax payable. They shall not abuse their powers to overcollect tax or deliberately create difficulties for taxpayers or withholding agents.

Article 7:

Any entity or individual has the right to report any act of non-compliance with the requirements of law or regulations. The tax authorities shall keep the identity of the informant confidential and reward the informant according to the relevant regulations.

Article 8:

For the purpose of this Law, "tax authorities" refers to tax bureaus at various levels and their sub-bureaus or tax stations.

PART II. TAX ADMINISTRATION

Chapter 1: Tax Registration

Article 9:

All enterprises, branches of enterprises in other jurisdictions, sites engaged in production and business operations, individual households engaged in industrial or commercial activities, and institutions engaged in production or business operations ("Business Taxpayers") shall, within 30 days after the obtaining of a business licence, register with the local tax authorities on presentation of the relevant supporting documents. Upon examination and verification of the supporting documents, the tax authorities shall issue a certificate of tax registration to the taxpayer.

The State Council shall issue detailed measures concerning the scope and formalities of tax registration for taxpayers other than Business Taxpayers.

Article 10:

Where a change occurs in the production or business of a Business Taxpayer, the taxpayer shall, within 30 days after the date of completing the business registration with the Administration for Industry and Commerce ("AIC") or prior to the submission of an application for cancellation of a business registration to the AIC, change or cancel the tax registration with the tax authorities on presentation of the relevant supporting documents in respect of the change.

Article 11:

Certificates of tax registration shall be used by taxpayers according to the regulations of the STB. Such certificates shall not be lent, altered, damaged, traded or forged.

Chapter 2: Administration of Accounting Books and Supporting Vouchers

Article 12:

Business Taxpayers or withholding agents shall, in accordance with the regulations issued by the relevant finance department under the State Council or the STB, establish accounting books, and keep records based on legitimate and valid vouchers. Industrial and commercial households that are unable to keep accounting books may be permitted by the local tax authorities not to keep accounting books.

Article 13:

The financial and accounting systems or accounting methods of a Business Taxpayer shall be submitted to the tax authorities for records.

Where the financial and accounting systems or methods of a Business Taxpayer do not conform with the regulations of the finance department under the State Council or the STB, the amount of tax payable shall be computed in accordance with such regulations.

Article 14:

Invoices or vouchers must be printed by enterprises authorized by the tax authorities at the level of the government of provinces, autonomous regions and municipalities directly under the Central Government. No enterprises are permitted to print invoices without such authorization.

The measures regarding the administration of invoices shall be issued by the State Council.

Article 15:

Business Taxpayers or withholding agents shall maintain their accounting books, supporting vouchers for the accounts, receipts for tax payments and other relevant information for the period prescribed by the competent fiscal or tax department under the State Council.

Accounting books, supporting vouchers for the accounts, tax payment receipts and other relevant information shall not, without approval of the tax authorities, be forged, revised or destroyed.

Chapter 3: Tax Returns

Article 16:

Taxpayers shall file tax returns and submit tax returns, financial, accounting statements and other relevant information required by the tax authorities based on the practical needs within the time limit prescribed in law or regulations, or the time limit determined by the tax authorities in accordance with law or regulations.

A withholding agent shall submit a return on the tax withheld and remitted and other relevant information demanded by the tax authorities based on practical needs within the time limit provided in law or regulations, or within the time limit determined by the tax authorities in accordance with law or regulations.

Article 17:

Where a taxpayer or withholding agent is unable to file a tax return or to submit a withholding return within the prescribed time limits, the time can be extended upon approval of the tax authorities.

PART III. TAX COLLECTION

Article 18:

The tax authorities shall collect tax payments according to law or regulations, and shall not collect, cease to collect, overcollect or undercollect tax in violation of law or regulations.

© 1993 International Bureau of Fiscal Documentation

Article 19:

A withholding agent shall withhold tax according to law or regulations. The tax authorities shall not require any enterprise or individual to withhold tax where the enterprise or individual has no legal obligation to withhold.

The tax authorities shall, according to the relevant regulations, pay a service fee to withholding agents for withholding or collecting the tax.

Article 20:

Taxpayers or withholding agents shall pay or remit tax within the time limit prescribed in law or regulations, or within the time limit determined by the tax authorities according to law or regulations. Where a taxpayer is unable to pay the tax within the prescribed time limits as a result of special difficulties, the time can, upon approval of a tax bureau (or a sub-bureau) above the county level, be extended for a period of three months or less.

Where a taxpayer has failed to pay the tax within the time limit provided in the preceding paragraph or a withholding agent has failed to remit the tax within the time limit provided in the preceding paragraph, the tax authorities shall, in addition to demanding the taxpayer or withholding agent to pay or remit the tax within the time limits, impose a fine on a daily basis at the rate of 0.2% of the amount of tax in arrears, commencing on the day due for payment.

Article 21:

A taxpayer may, in accordance with law or regulations, apply to the tax authorities in writing for a tax reduction or exemption.

Applications for tax reductions or exemptions shall be examined and approved by the agency authorized under law or regulations. Any decision on tax reductions or exemptions shall be null and void if it is made by unauthorized local governments, government departments, entities or individuals.

Article 22:

A certificate for tax payment must be issued by the tax authorities to a taxpayer when a tax payment is made or when tax is withheld and remitted by a withholding agent.

Article 23:

The tax authorities may make an arbitrary assessment of the tax liability of a taxpayer in any of the following situations:

a) the taxpayer is permitted under this Law not to keep any accounting books;
b) this Law requires the taxpayer to keep accounting books and the taxpayer has failed to do so;
c) the taxpayer has kept accounting books, but the accounting entries have not been entered in an appropriate manner or the information on costs, vouchers for receipt and expense are incomplete so that the tax authorities are unable to audit the books; or
d) the taxpayer has failed to file tax returns within the prescribed time limit, and failed again within the prescribed time limit set by the tax authorities when the tax authorities demand the taxpayer to file tax returns.

Article 24:

An arm's length price shall be charged when fees are received from or expenses paid to an affiliated enterprise by an enterprise, or an establishment or site in China of a foreign enterprise engaged in production or business operations. Where an arm's length price is not used and the amount of tax payable in China is thus reduced, the tax authorities shall have the power to make reasonable adjustments.

Article 25:

Where an entity or individual is carrying on business without a business licence, the case shall be dealt with by the AIC. Additionally, the tax authorities shall assess the amount of tax payable by the entity or individual and demand for tax payment. Should the entity or individual refuse to pay the tax, the tax authorities may seize goods or commodities with a value of not more than the amount of tax payable. If the amount of tax payable is paid thereafter, the tax authorities must immediately release the seized goods or commodities. If tax is not paid after the seizure, the seized goods or commodities may, upon approval of the commissioner of a tax bureau above the country level, be sold by public auction and the proceeds from the auction may be used to pay the outstanding tax.

Article 26:

Where the tax authorities have reasonable grounds to believe that a Business Taxpayer has taken actions to evade a tax payment, the tax authorities may, prior to the deadline for tax payment, demand the taxpayer to pay the tax within a time limit. In the event that the tax authorities have discovered that there is evidence showing that a taxpayer has transferred or concealed taxable goods, commodities, other assets or taxable income, the tax authorities may demand the taxpayer to provide a security for tax payment. Where the taxpayer is unable to provide such security, the tax authorities may, upon approval of the commissioner of a tax bureau at county level or above, take the following measures to enforce tax payment:

a) to notify in writing the bank or other financial institutions with which the taxpayer has kept an account to suspend making payments out of the taxpayer's account for an amount equal to the amount of tax payable; or
b) to seize the taxpayer's commodities, goods or other assets with a value equal to the amount of tax payable.

If tax is paid within the time limit, the tax authorities shall immediately terminate the above measures. If tax is not paid within the time limit, the tax authorities may, upon approval of the commissioner of a tax bureau (or a sub-bureau) above the county level, notify in writing the above-mentioned bank or another financial institution to pay the tax authorities the amount of tax payable from the taxpayer's account, or may sell by public auction the seized commodities, goods or assets and use the sales proceeds to pay the amount of tax outstanding.

The tax authorities shall compensate a taxpayer for damages caused by inappropriate enforcement actions of the tax authorities or the failure of the tax authorities to end the enforcement actions immediately upon payment of the tax within the time limit.

Article 27:

Where a Business Taxpayer or a withholding agent has failed to pay or remit the tax within the time limit, or a guarantor for tax payment has failed to pay the guaranteed amount of tax within the time limit, the tax authorities shall demand for payment of the tax within a time limit. If tax is not paid within the time limit, the tax authorities may, upon approval of the commissioner of a tax bureau (or a sub-bureau) above the county level, take the following actions:

a) to notify in writing the bank(s) or other financial institutions with which the taxpayer, withholding agent or a guarantor for tax payment has opened an account to pay the amount of tax from such account to the tax authorities; or

© 1993 International Bureau of Fiscal Documentation

b) to seize and sell by public auction commodities, goods, or other assets of the taxpayer, withholding agent or guarantor for tax payment, with a value equal to the amount of tax payable, and to use the proceeds to pay the tax in default.

In taking the above enforcement measures, the tax authorities may also collect the amount of fines imposed on late payment of the tax from the taxpayer, withholding agent or guarantor for tax payment.

Article 28:

Taxpayers who are liable to pay tax in China and desire to leave the country are required to pay off the tax to the local tax authorities or provide the tax authorities with security for tax payment. If the taxpayer has failed to pay off the tax or provide a security, the tax authorities may notify the administration in charge of exit to stop the taxpayer from leaving the country.

Article 29:

When seizing commodities, goods or other assets of taxpayers, the tax authorities shall issue a receipt for the seized items. When sealing up commodities, goods or other assets, the tax authorities shall make a list of the sealed items.

Article 30:

Where the tax authorities have become aware of an overpayment of the tax by a taxpayer, the excess shall be refunded to the taxpayer without delay. Where a taxpayer has become aware of the overpayment himself, the taxpayer may apply for a refund within three years from the date of payment of the tax. Upon examination and verification of the application, the tax authorities shall immediately refund the taxpayer the excessive amount of tax.

Article 31:

Where a non-payment or underpayment of tax by a taxpayer or withholding agent is caused by the tax authorities, the tax authorities may, within three years from the due date, demand for payment of tax in arrears. No fines shall be imposed by the tax authorities.

Where a non-payment or underpayment of tax by a taxpayer or withholding agent is caused by the mistake of the taxpayer or the withholding agent, the tax authorities may enforce the collection of the taxes in arrears within three years. In certain cases, the statutory limitation can be extended to ten years.

PART IV. TAX INSPECTION

Article 32:

The tax authorities shall have the power to do the following:

a) to inspect the accounting books, supporting vouchers for the accounts, statements and any relevant information of a taxpayer or a withholding agent with respect to withholding and remittance of the tax;
b) to inspect a taxpayer's commodities, goods or other assets at the taxpayer's place of production or business and the place where these commodities, goods or assets are stored; to inspect a withholding agent's compliance with withholding (or collecting) and remittance of tax;
c) to demand a taxpayer or withholding agent to provide documents, evidential materials and information with respect to the payment or withholding (or collecting) and remittance of the tax;
d) to make inquires of the payment or withholding (or collecting) of tax by taxpayers or withholding agents;
e) to inspect invoices, certificates and other documents with respect to the transportation or mail of the taxpayer's taxable goods, commodities or other assets at railway stations, docks, airports and postal offices;
f) upon approval of the commissioner of a tax bureau (or a sub-bureau) above the county level, after presenting a permit (in a standard form printed for national use) for the inspection of deposit accounts, to examine and verify the deposit accounts of a Business Taxpayer or withholding agent at banks or other financial institutions; to examine and verify the savings account of a Business Taxpayer, provided that the savings account is verified by the regional office of a county or municipal branch of a bank which has designated some bank officers to provide information to the tax authorities.

Article 33:

A taxpayer or withholding agent shall accept the lawful inspection of the tax authorities, shall provide them with accurate and truthful information and documents, and shall not refuse the tax inspection or conceal any facts.

Article 34:

In conducting tax inspections, other government departments and entities shall support and coordinate with the tax authorities and provide information and evidence about taxpayers, withholding agents or other parties in connection with the payment or withholding (or collecting) and remittance of the tax.

Article 35:

In investigating a case of non-compliance with tax laws, the tax authorities may record (tape-record or video-record), photograph and reproduce the relevant evidence and documents.

Article 36:

Officials sent by the tax authorities to conduct a tax inspection shall produce identification cards and undertake to keep secret.

PART V. LIABILITIES

Article 37:

In case where a taxpayer has committed one of the following acts of non-compliance and failed to remedy it within the time limit set by the tax authorities, a penalty of not more than 2,000 yuan, or in case of serious non-compliance, a penalty of more than 2,000 but less than 10,000 yuan can be imposed:

a) failure to complete tax registration, to change or cancel tax registration within the time limits;
b) failure to establish or maintain a system of accounting, or to keep the supporting vouchers for accounts and other relevant information as required by regulations; or
c) failure to submit financial and accounting systems or the financial and accounting methods to the tax authorities for records.

Article 38:

Where a withholding agent has failed to keep and maintain accounting books, supporting vouchers for the accounts and other relevant information in respect of the tax withheld and remitted, the tax authorities may impose a penalty of not more than 2,000 yuan, or,

© 1993 International Bureau of Fiscal Documentation

in case of serious non-compliance, a penalty of not more than 5,000 yuan.

Article 39:

Where a taxpayer has failed to file tax returns on time, or a withholding agent has failed to file withholding returns on time, the tax authorities may demand for such returns within a time limit and impose a penalty of up to 2,000 yuan; if the taxpayer or withholding agent has failed to file the returns within the time limit, the amount of penalty can be more than 2,000 yuan but less than 10,000 yuan.

Article 40:

"Tax evasion" means the non-payment or underpayment of tax by a taxpayer through forging, revising, concealing or destroying without authorization accounting books or supporting vouchers for the accounts, or by overstating expenses or understating or non-reporting of income, or by filing false tax returns. Where the amount of tax evaded is more than 10,000 yuan accounting for more than 10 percent of the amount of tax payable, or where the taxpayer has evaded tax payment after having been subject to an administrative penalty for a previous offence of tax evasion, the tax authorities shall, in addition to pursuing the collection of the tax evaded, impose a penalty on the taxpayer in accordance with Article 1 of the "Supplementary Provisions on Punishing the Crimes of Tax Evasion and Tax Resistance" (the "Supplementary Provisions"). Where the amount of tax evaded is less than 10,000 yuan, accounting for less than 10 percent of the amount of tax payable, the tax authorities may, in addition to pursuing the collection of the tax evaded, impose a penalty of not more than five times the amount of tax evaded.

Where a withholding agent has failed to withhold or withheld an insufficient amount of tax by using the means mentioned in the preceding paragraph and the amount of tax evaded is more than 10,000 yuan, accounting for more than 10 percent of the tax to be withheld, Article 1 of the Supplementary Provisions shall apply. Where the amount of tax evaded is less than 10,000 yuan, the tax authorities may, in addition to pursuing the collection of the tax, impose a penalty of not more than five times the amount of tax evaded.

Article 41:

Where a taxpayer who has failed to pay tax on time has transferred or concealed his assets so that the tax authorities are unable to collect the tax payment, if the amount of tax in question is more than 10,000 yuan, the tax authorities may, in addition to collecting the tax, impose a penalty under Article 2 of the Supplementary Provisions. If the amount of tax is less than 10,000 yuan, the amount of penalty may not exceed five times the amount of tax evaded.

Article 42:

Any enterprise or institution that has committed a crime under Article 40 or 41 shall be dealt with under Article 3 of the Supplementary Provisions. Where no crime is committed, the tax authorities may, in addition to collecting the tax, impose a penalty of not more than five times the amount of tax evaded or underpaid.

Article 43:

Where a taxpayer has paid no tax or has underpaid tax as a result of offering a bribe to tax officials, a penalty shall be imposed under Article 4 of the Supplementary Provisions.

Article 44:

Where an enterprise or institution has obtained a tax refund for export by fraudulently claiming that its products are export products, if the amount of tax refund fraudulently obtained exceeds 10,000 yuan, the tax authorities shall, in addition to pursuing the repayment of such refund, impose a penalty in accordance with Article 5(a) of the Supplementary Provisions. If the amount of refund concerned is under 10,000 yuan, the amount of penalty shall not exceed five times the amount of the refund.

Where an entity or individual other than those mentioned in the preceding paragraph has fraudulently obtained a tax refund for export, the tax authorities shall, in addition to pursuing the repayment of the refund, impose a penalty on the entity or individual under Article 5(b) of the Supplementary Provisions. Where the amount of tax refund involved is small and no crime has been committed, the tax authorities shall pursue the repayment of the tax refund and impose a penalty of less than five times the amount of tax refund.

Article 45:

The term "tax resistance" refers to the refusal of taxpayers to pay tax by means of violence or threat. In case of tax resistance, the tax authorities may, in addition to collecting the tax, impose a penalty in accordance with Article 6(a) of the Supplementary Provisions or, if the case is not serious and no crime has been committed, impose a fine of not more than five times the amount of tax in default.

An act of tax resistance causing personal injury or death constitutes an offence of assault or manslaughter under criminal law. The offender shall be severely punished and a penalty shall be imposed in accordance with Article 6(b) of the Supplementary Regulations.

Article 46:

Where a Business Taxpayer has failed to pay the tax or paid an insufficient amount of tax or where a withholding agent has failed to withhold or withheld an insufficient amount of tax within the time limit, and failed again within the time period set by the tax authorities for the payment, the tax authorities may, in addition to collecting the tax payment, impose a penalty not exceeding five times the amount of tax in default under Article 27 of this Law.

Article 47:

Where a withholding agent has failed to withhold tax as required by law, the tax shall be paid by the withholding agent, except in a case where the withholding agent has promptly reported to the tax authorities about the fact that the taxpayer has refused to have the amount withheld by the withholding agent.

Article 48:

Where invoices are printed in violation of Article 14 of this Law, the tax authorities shall destroy the illegally printed invoices, confiscate the profit from printing such invoices, and impose a penalty.

Article 49:

Administrative penalties mentioned in this Law shall be imposed by a tax bureau (or sub-bureau) above the county level. Where a penalty is less than 1,000 yuan and is imposed on an industrial and commercial household or an entity or individual that carries on business without a business licence, the penalty shall be imposed by the local tax station.

Upon receipt of a payment of penalty, the tax authorities shall issue a receipt to the taxpayer.

© 1993 International Bureau of Fiscal Documentation

Article 50:

According to Article 157 of the Criminal Law, criminal charges shall be brought against individuals who, by using violent means or threat, obstruct tax officials from carrying out their lawful duties. Where the obstruction of duties does not involve violence or threat, a punishment shall be imposed by the public security authorities according to the Law Concerning the Administration of Public Security and Punishment.

Article 51:

All fines and confiscations received by the people's courts or the tax authorities shall be turned over to the State Treasury.

Article 52:

Where a tax official has colluded with, instigated or assisted a taxpayer or withholding agent in committing the offenses mentioned in Articles 40, 41, 42 and 44 of this Law, he shall be punished under the Criminal Law. If no crime has been committed, he shall be punished administratively.

Article 53:

Where a tax official has taken advantage of his position and powers to accept or take property from taxpayers or withholding agents and has committed a crime, he shall be charged for bribery under the Criminal Law. If no crime has been committed, administrative sanctions shall be imposed.

Article 54:

Where tax officials have neglected their duties and failed to collect tax or have collected tax at an amount less than that required by law thereby causing a substantial loss of revenue to the state, these officials shall be investigated for criminal offenses under Article 187 of the Criminal Law. If no crime has been committed, administrative sanctions shall be imposed.

Tax officials who have abused their powers and deliberately created difficulties for taxpayers and withholding agents shall be subject to administrative sanctions.

Article 55:

Where a decision is made in violation of law or regulations with respect to the commencement or cessation of tax collection, tax reduction, tax exemption, tax refund, or the payment of underpaid tax, the decision shall be revoked, the amount of tax underpaid shall be collected, and the amount of tax overcollected shall be refunded to the taxpayer. Persons directly responsible for making such decisions shall be investigated by the tax authorities at a higher level for administrative liabilities.

Article 56:

In the case of a dispute with the local tax authorities, a taxpayer, withholding agent or guarantor for tax payment shall first pay the amount of tax, fines and penalties in accordance with law or regulations. Within 60 days from the date of receipt of a certificate for tax payment from the tax authorities, such person may apply to the tax authorities at a higher level to the local tax authorities for review. A review decision must be made by the tax authorities at the higher level within 60 days after the receipt of the application. If the review decision is not acceptable to the applicant, he can bring the matter before the local people's court.

PART VI. SUPPLEMENTARY PROVISIONS

Article 57:

A taxpayer or withholding agent may appoint an agent to represent him in tax matters.

Article 58:

The collection of Agriculture Tax, Animal Husbandry Tax, Farmland Use Tax, and Contracts Tax shall be administered with reference to the provisions of this Law.

The collection of Customs Duties, Shipping Tonnage Tax and other taxes collected by the Customs shall be administered according to other laws and administrative regulations.

Article 59:

Where there is a conflict between the provisions of this Law and those of a tax treaty or agreement concluded between China and other countries, the provisions of the treaty or agreement shall govern.

Article 60:

Where there is a discrepancy between the provisions of existing laws and the provisions of this Law, the provisions of this Law shall govern.

Article 61:

The detailed rules and regulations for the implementation of this Law shall be introduced by the State Council in accordance with this Law.

Article 62:

This Law shall become effective as of January 1, 1993. The "Provisional Regulations of the People's Republic of China Concerning the Administration of Tax Collection" issued by the State Council on April 21, 1986 shall be repealed at the same time.

I. INTRODUCTION

The 1993 Budget, released on 26 February 1993, comprised three sections:
Part I – Review of the economy
Part II – The Fiscal Year 93 Budget
Part III – Fiscal position, tax changes and offsets for the GST.

In Part I, the Minister reported that the Singapore economy grew by 5.8 percent in 1992. This was largely due to double-digit growth in the construction sector and strong growth in the transport and communications sector. Manufacturing and commerce sector growth was weak while performance in the financial and business services sectors was moderate. For 1993, the Ministry of Trade and Industry is forecasting economic growth of between 6 to 7 percent. In the next few years, economic performance is expected to average around 5 to 6 percent.

In the longer term, higher growth rates require new strategies, key among which is to build an external wing to the Singapore economy. The focus will be on the rapidly growing Asia-Pacific region where Singapore entrepreneurs, government-linked companies and statutory boards have increasing investments in Malaysia, Indonesia, China, Vietnam and Cambodia. To encourage enterprise both in and out of Singapore, on top of incentives for specific offshore activities, a comprehensive approach is being adopted to lower direct taxes, both corporate and personal income taxes. The long-term aim is for a corporate tax rate of 25 percent and a marginally higher top personal tax rate. Higher dependence will be placed on broad-based indirect taxes with the proposed introduction of the Goods and Services Tax (GST) from 1 April 1994.

In Part II of his speech, the Minister reiterated the Government's expenditure policies of investing to promote future growth, control of costs, and efficient allocation of financial and manpower resources. Key areas of expenditure will be economic infrastructure, education, health care, public housing and national security. Budgeted operating and development expenditure (S$ 15.5 billion) will be met from estimated operating revenue of S$ 17.2 billion. Spending is projected to be within 20 percent of GDP.

In Part III of the budget speech, the Minister announced tax changes. He dealt with the tax changes in two sections. In the first section, he dealt with tax changes specific to fiscal year 1993 and the incentives to develop an external economy and to attract new investments to Singapore. In the second section, he dealt with tax changes for fiscal year 1994 with the introduction of GST. This section covers corporate and personal tax cuts, property tax rebates, compensating adjustments to existing indirect taxes as well as additional rebates and expenditures to help lower income groups cope with the GST.

II. FISCAL YEAR 1993 CHANGES[1]

A. *Tax changes for companies*

1. Tax incentives to promote an external economy

Seven incentives to promote the development of an external economy are proposed:

1. Unless otherwise noted all changes are effective as from the 1994 year of assessment.

© 1993 International Bureau of Fiscal Documentation

(a) *Unilateral tax credit for dividend income*

Dividend income remitted from non-treaty countries will be granted a unilateral tax credit. Provided the company or individual owns at least 25 percent of the capital of the foreign company paying the dividend, a unilateral tax credit will be given for the underlying profits out of which the dividend is paid. A unilateral tax credit will also be given where a tax treaty does not provide for an underlying tax credit. The total tax credit claimable is restricted to the Singapore tax payable on the gross dividend.

(b) *Extension of unilateral tax credit scheme for services*

The existing unilateral tax credit scheme, intended to encourage professionals to export their services, is now extended to cover management consultancy services and qualifying services prescribed under the Finance and Treasury Centre tax incentive. The scope of countries is also extended to include Fiji, Kampuchea, Laos, Myanmar and Vietnam.

(c) *Double tax deduction for promotion of export of services*

A double tax deduction, currently given on certain approved expenses incurred in the promotion of the export of goods manufactured in Singapore, will be extended to approved expenses incurred in the promotion of the export of services. Qualifying services would include feasibility studies, product certification and packaging for export. Further details will be forthcoming from the Trade Development Board which will administer the scheme.

(d) *Double tax deduction for developing overseas investment opportunities*

A double tax deduction will also be given for expenses incurred in exploring and developing overseas investment opportunities. The Economic Development Board (EDB) will administer this scheme and details of eligible expenses, including consultation and legal fees for setting up development offices and conducting feasibility studies, are forthcoming.

(e) *Removal of requirement for intermediate holding company* [2]

The requirement for an intermediate holding company under the existing Overseas Investment Incentive will be removed. The incentive permits the investor to claim capital losses against his domestic income. With the proposal, the holding company need only maintain separate accounts for each approved investment.

(f) *Overseas Enterprise Incentive*

Currently, under the Income Tax Act, a company may apply for tax exemption on remitted foreign income on a case-by-case basis. In order to give companies greater certainty in planning their overseas ventures, it is proposed that approved companies be exempt from tax for up to ten years on their qualifying income under the Overseas Enterprise Incentive.

An approved Overseas Enterprise will be issued with a certificate from the EDB stating the approved overseas investments and projects, the related qualifying income, the exemption period and commencement date. A portion of any incremental domestic income which is connected to the approved investments and projects may also be included as qualifying income.

The Overseas Enterprise must be a Singapore incorporated resident company which is at least 50 percent owned by Singapore citizens, permanent residents, statutory boards or the Government. It will be able to declare exempt dividends to its ordinary shareholders out of its tax-exempt income. If the shareholder is the holding company, it may in turn declare exempt dividends to its ordinary shareholders.

(g) *Tax exemption scheme for venture capital and regional funds*

To encourage companies to invest in the Asia-Pacific region by pooling together venture capital and regional funds, there will be tax exemption on the gains from disposal of approved local and overseas investments, regardless of the holding period, and on interest income from convertible loan stocks and dividends derived from approved overseas investments. The exemption, to be granted by the EDB, shall be for a period of ten years.

2. Tax incentives to attract offshore activities to Singapore

Six incentives are proposed to attract offshore activities to Singapore:

(a) *International arts and antiques centre incentive*

To promote Singapore as an international centre for the trading of arts and antiques, income derived by approved art and antique dealers from transacting on behalf of non-residents with approved auction houses will be taxed at the concessionary rate of 10 percent. The concession will be granted for an initial period of five years with the possibility of further extension.

Additionally, well-established auction houses which conduct substantial auctioning activities and private museum operators in Singapore can qualify for the Pioneer Services tax incentive. The approved income of such a company will be tax exempt for a period of five years with possible extension for up to another five years. Donations to the National Museum will qualify for tax deduction of up to twice the value of the donation.

The Ministry of Information and the Arts and the EDB will jointly administer these incentives.

(b) *Extension of Approved Trustee Company Incentive*

To further develop the trustee business in Singapore, the range of exempt income under the Approved Trustee Company incentive will be extended to include specified income of non-resident beneficiaries of trusts.

2. The effective date of this change was not stated.

© 1993 International Bureau of Fiscal Documentation

(c) *Extension of tax holiday for SIMEX*[3]

To strengthen the capital base of the Singapore International Monetary Exchange Limited (SIMEX), the tax holiday which SIMEX has enjoyed since 1984 will be extended for another five years. This is intended to sustain its rapid growth and maintain the confidence of international investors.

(d) *Extension of Warehousing and Servicing Incentives*

Introduced in 1978, the Warehousing and Servicing Incentives provided for one half of the income of the approved warehousing or servicing company to be tax exempt for five years. To encourage companies to make initial investments in excess of the minimum requirement of S$ 2 million and expand further after the exempt period, it is now proposed that the tax relief period be extended by periods not exceeding five years at a time.

(e) *Extension of tax exemption scheme for syndicated loan facilities*[4]

Due to expire on 31 December 1993, the Syndicated Credit and Underwriting Facilities Scheme was introduced in 1983 to promote the development of loan syndication activities in Singapore. Income derived under the scheme is exempt from tax. To secure Singapore's position as a leading syndication centre in Asia, the scheme will be extended by another five years.

(f) *Tax exemption for interest paid by members of RAS Commodity Exchange*[5]

To make it more attractive for non-residents to trade on the RAS Commodity Exchange, tax exemption will be given on interest paid by members of the Exchange on the margin deposits for futures transactions of non-residents. Interest paid by the Exchange to its non-resident members on their margin deposits, security deposits and adjusted net capital will similarly be exempt from tax.

3. Other tax changes for companies

(a) *Property tax rebate*[6]

A one-off 25 percent rebate will be granted for commercial and industrial properties for the year commencing 1 July 1993. Property-owning statutory boards and Government agencies will pass on this rebate to their tenants. Private sector landlords are encouraged to pass on at least half of the rebate to their tenants.

(b) *Adjustment factor for capital allowances and tax losses of companies with tax incentives*

Companies granted tax incentives will usually have income taxed at a concessionary rate and income taxed at the normal corporate rate. To date, a dollar-for-dollar set off has been given where a company has a loss and a profit in the two different categories. This resulted in a tax reduction which is different from that based on the tax rate at which the income is taxed. To correct this position, an adjustment factor of the ratio which the tax rate of the loss or capital allowance to be set off bears to the tax rate of the income against which the loss or capital allowance is to be set off will be made.

The adjustment does not apply where incentives provide for complete exemption of income.

(c) *Deduction cap on medical expenses*

To instil greater cost consciousness by employers and employees in the consumption of medical services, the tax deductibility of expenses on medical benefits incurred by employers will be capped at 2 percent of total employees' remuneration.

For companies which exceeded the 2 percent cap in year of assessment 1992, a transitional cap starting at 4 percent will be given. In year of assessment 1994, the cap will be 4 percent of payroll costs or the percentage in year of assessment 1992, whichever is the lower. The transitional cap of 4 percent will be reduced by 0.5 percent per year until it reaches 2 percent after 5 years, i.e. in year of assessment 1998.

For companies enjoying concessionary tax treatment, the resulting increase in income from disallowing expenses in excess of the cap will not be treated as concessionary income but will be taxed at the normal corporate tax rate.

The cap for new companies will be 2 percent.

Medical benefits for public sector employees are currently under review.

B. *Personal income tax changes*

Several tax changes affecting individuals were announced:

1. Individual income tax rebate[7]

An across-the-board one-off 5 percent rebate is given on individual income tax for year of assessment 1993.

2. Election to be non-resident[8]

Singapore citizens who work abroad for more than six months in any calendar year can elect to be treated as non-residents for tax purposes. As non-residents, income remitted to Singapore is not subject to tax.

3. Separate claims for normal and enhanced child relief[9]

Normal child relief and enhanced child relief (ECR) may now be claimed separately. ECR will continue to be claimable only by the married woman.

3. This incentive is effective from 1994-1998.
4. This incentive is effective from 1 January 1994-31 December 1998.
5. The effective date of this incentive is not stated.
6. The rebate applies from 1 July 1993-30 June 1994.
7. Effective for the 1993 year of assessment.
8. Effective for the 1993 year of assessment.
9. Effective for the 1993 year of assessment.

© 1993 International Bureau of Fiscal Documentation

4. Unilateral tax credit for overseas employment income and director's fees

Singapore citizens who work abroad for less than six months in any calendar year are considered tax residents whose remitted foreign income is taxable. However, relief is available under Singapore's tax treaty network. Where there is no tax treaty, it is now proposed that unilateral tax credit will be given on remitted employment income and director's fees.

5. Taxation of retirement benefits

Other than contributions to the Central Provident Fund (CPF), all retirement benefits received from private employers, including gratuities and pensions, will be taxable upon receipt by the employee. The proposal affects only benefits paid out of funds contributed after 31 December 1993. For existing approved pension and provident funds, the tax-free benefits accrued up to 31 December 1993 will be computed for each intended recipient, and remain tax exempt when paid.

6. Waiver of residence requirement for certain dependants

Currently, on condition that they reside under the same roof, relief is given for taxpayers who support their aged parents or handicapped dependants. The only exception is when the dependant is confined to a hospital or nursing home for medical reasons. This residence requirement is now waived provided the taxpayer has expended at least S$ 1,500 per year in the maintenance of each aged parent or handicapped sibling.

7. Separate assessment for married women on all income

Married women are currently allowed separate assessment on their earned income and income derived from accumulated earned income. It is proposed that election for separate assessment be extended to all sources of a married woman's income.

8. Tax relief for CPF contributions by the self-employed

The current relief of 17.5 percent (maximum cap of S$ 12,600) against assessable self-employment income will be increased to 18 percent with the maximum cap at S$ 12,960.

C. *Other changes*

1. CPF contributions[10]

With effect from 1 July 1993, employer CPF contributions will go up by 0.5 percent to 18.5 percent while employee CPF contributions will go down by an equal percentage to 21.5 percent. If the economy sustains its projected growth, the two rates will be equalized at 20 percent from 1 July 1994.

2. CPF share ownership top-up scheme[11]

In September 1993, each CPF member who is a Singapore citizen and over 21 years of age will receive a grant of S$ 200. To be eligible, the member or his employer must have contributed at least S$ 500 during the six-month period from 1 March 1993 to 31 August 1993. Contributions below S$ 500 will receive a pro-rated top-up.

Citizens without CPF accounts, including housewives, retired people and the self-employed, will be allowed to start an account to benefit from the scheme.

3. Rebate for service and conservancy charges[12]

The Government will pay the December 1993 service and conservancy charge for Singapore citizens residing in one to three-room Housing and Development Board (HDB) flats. This one-off payment is the equivalent of the 5 percent tax rebate for year of assessment 1993.

4. Duties on cigarettes and tobacco[13]

With immediate effect, import duty on cigarettes is raised from S$ 100 to S$ 115 per kilogram. In addition, the import duty on tobacco and excise duty on cigarettes will be raised from S$ 50 to S$ 60 per kilogram.

III. TAX CHANGES TO ACCOMPANY THE GST

A. *Corporate tax rate*

The corporate tax rate will be reduced from 30 to 27 percent. This is in line with the long-term target corporate tax rate of 25 percent.

B. *Personal tax changes*

1. Top personal tax rate reduced to 30 percent

The top tax rate of 33 percent will be reduced to 30 percent with progressive reductions in the lower tax brackets as shown in Appendix I.

2. Personal relief

The current personal relief of S$ 2,000 will be increased to S$ 3,000.

3. Annual tax rebate[14]

From year of assessment 1994, resident individuals will be granted an annual rebate starting at S$ 700, decreasing by S$ 50 each year until it reaches S$ 500 in year of assessment 1998, after which it will remain at S$ 500 per annum.

10. Effective 31 July 1993.
11. Effective in September 1993 only.
12. Effective for December 1993 only.
13. Effective as from 26 February 1993.
14. Applicable from year of assessment 1994-1998 and thereafter.

© 1993 International Bureau of Fiscal Documentation

C. *Property tax rebate*[15]

Owner-occupied residential properties with annual values of less than S$ 10,000 will be given a property tax rebate. This will be on a sliding scale with the maximum rebate of S$ 150 per annum for annual values of S$ 5,000 or less. For annual values between S$ 5,000 to S$ 10,000, the rebate will be from S$ 150 to zero.

D. *Changes in other existing indirect taxes to offset GST*[16]

	Current rate	*New rate*
Tourism cess	4%	1%
Tax on domestic telephone bills	5%	Suspended
Tax on PUB bills in excess of $ 40	5%	2%
Entertainment duty	5%	Suspended
Cinematograph film hire duty	15%	Suspended
Petrol and diesel duties	Various rates	Rate adjustments to nullify GST effect
Import duties on cars, taxis, motorcycles and buses		

E. *Other changes to offset GST*

1. Rental rebates[17]

Rental rebates ranging from S$ 8 to S$ 16 per month will be given over five years for Singapore citizens who are tenants of one and two-room rental HDB flats.

2. Rebates for service and conservancy charges[18]

Rebates for service and conservancy charges ranging from S$ 4 to S$ 12 per month will be given over five years to Singapore citizens who are dwellers of one, two and three-room HDB flats.

3. Edusave grant

The Edusave grant to each pupil of S$ 50 per annum will be increased to S$ 100 per annum in order to offset the GST payable on school books and other miscellaneous school items.

4. Increase in public assistance[19]

Public assistance is given to aged destitutes, widows or deserted wives with young dependent children and those certified medically unfit to work. The monthly allowance currently given ranges from S$ 150 for a single-person household to S$ 430 for a four-person household. The proposed corresponding increases range from S$ 5 to S$ 15 per month.

5. Increase in Singapore allowance[20]

The Singapore allowance is given to pensioners whose monthly pensions are less than S$ 850. Subject to a monthly cap of S$ 100, the difference between S$ 850 and what the pensioner receives constitutes the Singapore allowance. The specified pension level will be increased to S$ 900 per month and the maximum allowance increased to S$ 130 per month.

6. Grants to Citizens' Consultative Committees (CCCs)[21]

The CCCs will receive an annual grant of S$ 3 million for the purpose of assisting those identified as not benefiting from the other proposed relief schemes to offset GST. The amount per household is not expected to exceed S$ 200 per annum.

IV. CONCLUSION

In concluding his most broad-based budget in recent years, the Minister cautioned that although the outlook for 1993 looked better than the last three years, there is a need to change the orientation of the people towards venturing abroad. This is to ensure that Singapore can continue enjoying high economic growth. The tax changes he announced are designed to promote overseas investments and encourage the repatriation of foreign earnings. Additionally, with the implementation of GST, Singapore will become more competitive.

There has been favourable post-budget reaction from businessmen and the community at large and all welcome the budget as one offering rewards to go abroad and rebates for GST at home.

APPENDIX I

REDUCTION IN PERSONAL INCOME TAX RATES (EFFECTIVE YEAR OF ASSESSMENT 1994)

Chargeable income $	YA 1993 Existing rates* %	YA 1994 Revised rates** %
1 – 5,000	3.5	2.5
5,001 – 7,500	6	5
7,501 – 10,000	8	6
10,001 – 15,000	8	7
15,001 – 20,000	9	8
20,001 – 25,000	12	11
25,001 – 35,000	14	13
35,001 – 50,000	17	15
50,001 – 75,000	21	19
75,001 – 100,000	24	22
100,001 – 150,000	26	24
150,001 – 200,000	28	25
200,001 – 400,000	31	28
> 400,000	33	30

* Rates do not include the 15% tax rebate on the first $ 10,000 of chargeable income which has been given since Y/A 1987

HONG KONG:
BUDGET 1993/94
HONG KONG CONTINUES TO ACHIEVE REMARKABLE GROWTH

Ian W. Harris
Group Tax Adviser, HSBC Holding plc.

In a period when many developed economies are facing increased taxes and substantial cutbacks in expenditure it was a very pleasant change to listen to the Budget Speech of Hong Kong's Financial Secretary Mr Hamish Macleod which he delivered to the Legislative Council on 3 March 1993. While many people see Hong Kong as an insignificant dot on the map facing severe political problems as the clock ticks by towards 1 July 1997 when Hong Kong becomes a Special Administrative Region of the People's Republic of China, the facts tell a somewhat different story.

Probably the most significant fact is that GDP grew 5 percent in real terms with GDP per head growing to US$ 16,000, and in this connection Hong Kong has already overtaken Spain and New Zealand and has almost caught up with Australia and the United Kingdom. With GDP expected to grow at 5.5 percent in 1993/94 this will put Hong Kong ahead of both Australia and the United Kingdom and will be fast approaching Italy and the Netherlands.

Exports grew in the period by 19 percent and are expected to grow by 18.5 percent in 1993/94 while re-exports are expected to grow by 25 percent and imports by 19 percent. This places Hong Kong as tenth in the world in terms of international trade. This growth has been achieved not in Hong Kong's traditional markets in North America and Western Europe but in South East Asia in general where trade expanded 23 percent, and in particular China where the rate was 25 percent.

One unsatisfactory part of Hong Kong's economy is that inflation remains stubbornly high and although it dropped during the year it is still running at about 9.5 percent. However, the Financial Secretary is of the firm view that with one of the lowest unemployment rates in the world and a significant growth in GDP inflation is not such a serious problem as it might otherwise be. He pointed to the many western economies where price stability (low inflation) has only been achieved at the cost of high unemployment and low economic growth. At the same time low unemployment has produced its own problems and labour has had to be imported from China and other countries in the region. However, emphasis is also being placed on increasing productivity and retraining of labour where HK$ 1.3 billion of Government funds has been committed to this end. A further problem is the shortage of land and its effect on domestic prices and industrial costs. The latter has been solved to a great extent by the relocation of many industries to Southern China where despite inflation export prices have only risen by 1 percent.

Much speculation took place in the weeks leading up to the Budget on the size of the surplus which had been forecast in 1992 as HK$ 7.5 billion but was expected to be considerably larger. This optimistic view was often fuelled by various statements made by Government spokesmen in the run up to the Budget who spoke of "buoyant revenue" and the like. And so it turned out that few were surprised when Mr Macleod announced that the estimated surplus for the year was expected to be HK$ 20.5 billion. However, what was surprising was that the difference was not accounted for solely through increased revenues but approximately one half resulted from underspending on capital works programmes. This the Government proposes to address in the future by allowing more private sector involvement in the control and management of projects. Despite the welcome surplus the Financial Secretary said that he remained committed to the main principles of Government budgeting policy:

- public spending must not grow faster than the economy; and
- the reserves must provide an adequate cushion to meet known commitments and future uncertainties.

EXPENDITURE

The forecast expenditure for 1993/94 calls for an increase of HK$ 17.4 billion over the original estimate for 1992/93 to HK$ 132.5 billion. The major beneficiaries of the increased spending arose out of the Governor's policy address to the Legislative Council in October 1992 and relate mainly to social services, the environment and the transport infrastructure. The principle areas of focus of the additional expenditure will include an increase in welfare payments for the Elderly and Comprehensive Social Security Assistance Scheme, a new hospital in the New Territories, a total of HK$ 17.2 billion for community health care, an additional HK$ 7.3 billion to upgrade the Hong Kong Sewage Scheme so as to improve the water quality of Hong Kong's harbour, HK$ 2 billion to the Housing Society to assist the sandwich class in obtaining housing, improvements to one of the major highways in Hong Kong and the construction of a new road to the border with China.

REVENUE PROPOSALS

In setting his proposals for Revenue for 1993/94 the Financial Secretary said that his main aim had been to maintain fiscal prudence while at the same time reducing the tax burden as far

© 1993 International Bureau of Fiscal Documentation

as possible for the largest number of tax-paying households. In so doing Mr Macleod faced three challenges:

(1) Because tax concessions are current in nature even a modest cut can have a multiplying effect in subsequent years.
(2) It is necessary to avoid measures which would add significantly to inflation.
(3) No measures should be taken which complicate the existing simple tax system.

The principle proposals that he recommended were therefore:

1. *Salaries Tax*

	1992/93	1993/94
	HK$	HK$
Personal Allowance	46,000	56,000
Married Persons Allowance	92,000	112,000
First Child	15,500	17,000
Second Child	11,500	17,000
Subsequent Children	No Change	
Dependent Children	13,500	17,000
Single parent	23,000	20,000

These concessions will mean that some 250,000 existing taxpayers will no longer have to pay any tax at all and a further 1.2 million taxpayers will pay less tax, thus benefiting a total of some 90 percent of salaries taxpayers at a cost of HK$ 2.6 billion in 1993/94 and HK$ 17 billion up to 1997. Other concessions were as follows:

2. *Profits Tax*

No change.

3. *Estate Duty*

The nil rate band has been extended from HK$ 4 million to HK$ 5 million and thereafter the rates will be 6 percent on estates between HK$ 5-6 million and 12 percent for estates between HK$ 6-7 million and 18 percent in respect of estates over HK$ 7 million.

4. *Entertainments Tax*

The remaining tax under this heading is the entrance fee to race meetings. This has been abolished at a cost of some $ 10 million which sum the Royal Hong Kong Jockey Club has undertaken to donate to the Community Chest.

5. *Stamp Duty*

In line with the reduction in Stamp Duty on stock transfers from 0.5 percent to 0.4 percent in the previous Budget a further reduction has been proposed to 0.3 percent.

6. *Cosmetics Duty*

This has now been abolished.

7. *Fuel, Alcohol and Tobacco*

The Financial Secretary has recommended an increase of 9.5 percent in the specific duty rates on these commodities.

8. *Rates*

The Financial Secretary did not recommend any change to the charge for rates; however, he did say in this connection that there would be the usual three-yearly revaluation which would become effective from 1 April 1994 which may see an increase in rates depending on the revaluation.

TAX POLICY

The Financial Secretary took the opportunity to announce two measures to improve the tax system. The first was to introduce a Composite Tax Return which would avoid the need for taxpayers to submit separate returns under Profits, Salaries and Property Taxes. The other measure was a perceived anti-avoidance proposal in respect of the taxation of royalties. At present tax is levied at the standard rate on 10 percent of royalties paid by a Hong Kong company. In order to counteract avoidance the tax in future will be levied on the full amount of the royalties payment or a ten-fold increase in the tax burden which perhaps means a mention in the record books as the largest increase in tax ever proposed. How this proposal will impact on Hong Kong's aim to improve technical know-how remains to be seen. The Financial Secretary also proposes to provide additional resources to the Inland Revenue Department to assist in the further development of the Field Audit programme.

CONCLUSION

While the good news of surpluses and growth is most encouraging it is perhaps surprising to find that the Financial Secretary is budgeting for a deficit in 1993/94 of HK$ 3.4 billion, particularly in view of the requirement in the Basic Law of the future Special Administrative Region for a regime of balanced budgets. While this is not expected to impact on the Government's reserves it does appear that the Financial Secretary has been unnecessarily generous. The substantial decrease in the number of salaries tax payers could, in the view of this author, seriously impact on future reserves as the measures have seriously narrowed the already narrow tax base. One might consider that the Financial Secretary has mortgaged the future for short-term popularist gains.

JAPAN:

TAX HAVEN AND FOREIGN TAX CREDIT RULES: 1992 AMENDMENTS AND THEIR IMPACT ON DUTCH HOLDING COMPANIES

Ebel Magnin and Eero Rautalahti

I. INTRODUCTION

The amendments made in 1992 to the Japanese legislation on tax havens and foreign tax credits have a significant impact on Japanese multinationals having holding companies in the Netherlands. Under the new legislation such Dutch holding companies are likely to be considered tax haven companies, thus causing the Japanese parent company to lose the tax advantages offered by the Dutch participation exemption.

These amendments to the Japanese Income Tax Act (ITA) were enacted in connection with the Japanese State Budget for 1992, and they became effective as of 1 April 1992. In this article, these amendments will be referred to as the "1992 Amendments".

From the Dutch point of view, the essential effect of the 1992 Amendments is to make the hitherto tax-exempt capital gains accrued through Dutch holding companies fully taxable in Japan in the hands of the Japanese parent company, regardless of whether such gains are distributed or not. Similarly, dividends from operations in low-tax countries routed through the Netherlands will also be fully taxable in Japan, unless such dividends are redistributed to Japan within two years.

On the other hand, the 1992 Amendments also expanded the indirect foreign tax credits available to Japanese parents. Under the new rules, the parent may claim tax credit for the income tax paid by secondtier subsidiaries, whereas the earlier legislation allowed a credit for the first tier only.

This article outlines the contents of the legislation in its current form, and proposes certain structural scenarios, which could (i) enable Japanese multinationals to escape the application of the tax haven rules to their Dutch holding companies and, at the same time, (ii) allow them to utilize the second-tier indirect foreign tax credits.[1]

II. OUTLINE OF THE TAX HAVEN RULES

The Japanese legislation against operations in tax havens was originally introduced in 1978. The rules were tightened extensively both in 1981 and 1985 in response to the various tax planning schemes created by Japanese businesses to circumvent their application. Despite the legislation, the number of tax haven corporations owned by Japanese companies have continuously increased.[2] The 1992 Amendments are a further attack against aggressive tax planning. As seen below, the new rules effectively prevent (or at least complicate) the use of many commonly accepted international tax planning techniques.

As background, it should be borne in mind that under the Japanese ITA:

- dividends received from foreign corporations are fully taxable (although a credit is available subject to certain limitations), whereas dividends received from other Japanese corporations are either wholly or 80 percent tax-exempt depending on the level of shareholding;
- capital gains are in principle fully taxable at normal income tax rates;
- the corporate tax rate in Japan amounts to approximately 52 percent, and the domestic tax system allows only limited flexibility for profit calculation.

Ebel Magnin is a tax partner with Loeff Claeys Verbeke in Amsterdam, specializing in international taxation and tax planning of multinational companies.

Eero Rautalahti is legal counsel with Outokumpu Oy, a Finland-based international mining and metals company.

  B. Alternative B: sourcing
  C. Alternative C: avoiding Japanese control
V. Conclusion

1. When preparing this article, we had limited access to the Japanese legislation, and even then only in the form of free translations. Accordingly, the structural scenarios presented below should be treated as general ideas only, and their implementation in practice would obviously require careful planning and consideration by Japanese tax practitioners.
2. Takaki Tokuoka and Simon Takagi, "Black and Grey Areas in Japanese CFC Legislation", *International Tax Review* (July/August 1991), at 11.

© 1993 International Bureau of Fiscal Documentation

The purpose of the tax haven rules is to prevent taxpayers from avoiding Japanese tax by structuring their operations through low-tax jurisdictions and retaining the after-tax income in such low-tax jurisdictions.

A. *Definition of a tax haven corporation*

Prior to the 1992 Amendments, a corporation could be regarded as operating in a tax haven only if it had its principal office or main business interests in a jurisdiction designated by the Japanese Minister of Finance as a tax haven. The list of tax havens (as it was in force until 30 March 1992) included 42 countries or territories. Most of these were typical tax havens (such as Cayman Islands, Panama, Netherlands Antilles). Luxembourg holding companies and Swiss holding and domiciled companies were also included in the list. However, high-tax countries offering limited tax advantages to certain types of businesses (such as the Netherlands, Belgium, Singapore or Ireland) were not considered tax havens.

The 1992 Amendments abolished the entire concept of designated tax haven and the lists of tax haven countries. The new rules define as a tax haven any country or jurisdiction where the effective income tax rate is substantially low. The further definition of "substantially low" is determined by Cabinet Orders promulgated under the ITA. According to the Cabinet Order in force[3] at the time of writing, an effective income tax rate is substantially low if it amounts to 25 percent or less.

1. Application of the 25 percent effective tax rate test

For the purposes of the 25 percent test, the effective income tax rate is calculated by comparing the actual tax burden suffered by a foreign affiliate to its total net income. If the actual tax burden is less than 25 percent of the total net income, then the affiliate is deemed to be a tax haven corporation (for the sake of brevity, the term "tax haven corporation" will be abbreviated here as "THCO").

In this determination, the net income of the affiliate is calculated according to the rules of the Japanese ITA.[4] Accordingly, the income which is tax-exempt in the affiliate's home country (for example, capital gains) is added to the income.

However, dividends that the affiliate has received from its domestic and foreign subsidiaries are excluded from calculation of the net income, if such dividends are tax-exempt for the receiving affiliate under an affiliation privilege. Consequently, a Dutch holding company is not caught by the 25 percent test, as long as it only channels dividends from foreign operations or investments to the Japanese parent. However, when the holding company realizes a capital gain in the Netherlands, such capital gain is likely to bring the holding company within the scope of the tax haven rules.[5]

For the purposes of the 25 percent test, all income taxes actually paid by the foreign affiliate are taken into account, including taxes paid in other countries. Consequenly, if the affiliate operates in another country through a permanent establishment (PE), income tax levied on the income of the PE is included in the calculation of the tax burden.[6]

The 25 percent test is applied individually to each foreign subsidiary or affiliate of a Japanese taxpayer. It is also applied separately in respect of each fiscal year.

Example 1:

A Japanese multinational ("Nippon Co") has a holding company in the Netherlands ("Nippon BV"). Nippon BV has three wholly-owned operating subsidiaries, one in the United Kingdom, one in Sweden and one in Germany.

In Year 1 Nippon BV receives dividends from all three subsidiaries, but does not declare a dividend to Nippon Co. None of the operating companies is caught by the tax haven rules, because they all operate in countries where the tax rate is above 25 percent (United Kingdom 33 percent, Germany approximately 50 percent, Sweden 30 percent). Nor is Nippon BV caught, because its sole income consists of inter-group dividends.

In the course of Year 2 Nippon BV sells its Swedish subsidiary for a profit of Dfl. 50 million. At the same time it acquires all shares in an Irish finance company operating under the special ten percent corporate income tax rate. The UK and German subsidiaries distribute dividends to Nippon BV, who again declares no dividend to Nippon Co. For the Year 2, Japan will impose income tax on Nippon Co on (i) the capital gain of Dfl. 50 million realized by Nippon BV; and (ii) on the after-tax profits of the Irish subsidiary (as the effective income tax rate in Ireland is only 10 percent).

2. Practical complications

In practice, the Japanese tax administration may confront difficulties in enforcing the new 25 percent tax haven rule. Under the earlier legislation, it was very clear to both the taxpayer and the authorities whether or not a foreign affiliate was within the scope of the tax haven rules.

In order to enforce the 1992 Amendments, the Japanese tax administration will continuously have to monitor all the foreign affiliates of Japanese businesses to determine whether any of them is a THCO for any given year. Similarly, Japanese multinationals need to carefully monitor the tax burden of their affiliates in order to avoid unpleasant surprises. The administrative burden imposed on Japanese multinationals is massive, as they will have to calculate the tax burden and net income (following the Japanese rules) for each foreign affiliate every year.

If a foreign affiliate is considered a THCO, then its Japanese shareholders (provided that they hold over 5 percent of shares) are required to include their share of the THCO's profits in their income, and to report that to the Japanese tax authorities. Presumably, the Japanese tax authorities may find it difficult to verify that this actually happens. In order to check the effective tax rate of a certain foreign affiliate, the authorities will have to obtain detailed information regarding its accounts. Such information could either be requested from the Japanese taxpayer or could be accessed through mutual assistance from tax authorities in the affiliate's home country.

3. Enforcement Order issued on 31 March 1992.
4. See D below, where a similar calculation is described in more detail.
5. This situation might arise where a Dutch company realizes a capital gain by selling shares in an affiliated company, which gain is tax-exempt under the Dutch participation exemption.
6. Hirotomi Kimuro, "The current tax situation affecting foreign enterprises doing business with or in Japan", *CCH Journal of Asian Pacific Taxation* (May 1992), at 26.

© 1993 International Bureau of Fiscal Documentation

However, Japanese groups' operating companies in the countries offering special tax advantages can presumably expect to be under closer scrutiny by Japanese authorities. The Dutch holding companies are a rather obvious target in this respect, due to the beneficial treatment of capital gains on disposal of shares under the participation exemption.

B. *Other applicable tests*

Although the 25 percent tax rate test is the key element in the application of the Japanese tax haven rules, it is not the only applicable criterion. The tax haven rules apply only if three further conditions are fulfilled:

- the affiliate is a foreign related company, i.e. under substantial Japanese control;
- the Japanese taxpayer has over 5 percent equity interest in the affiliate; and
- the affiliate does not qualify for the exception for "legitimate and proper business".

The last condition will be discussed under C below.

1. Japanese control test (50 percent test)

In order to be a foreign related company, over 50 percent of the foreign company must be directly or indirectly controlled by Japanese residents or entities. The concept of Japanese residents and entities is very broad, encompassing Japanese companies and individuals, as well as foreign companies affiliated with the Japanese.[7]

Prior to the 1992 Amendments, the 50 percent Japanese control test was fulfilled only if more than half of the total number of shares issued and outstanding in the capital of the THCO were held by Japanese residents or entities. No distinction was made between voting or non-voting shares.

The 1992 Amendments introduced a further test, which is applied in addition to the previous one. Under the new rules, a foreign company is also a foreign related company if more than 50 percent of the voting shares issued and outstanding are held by Japanese residents, regardless of the number of non-voting shares issued.

It should be noted that for the purposes of the 50 percent test, the Japanese shareholders need not have any affiliation or other relationship with each other. The mere fact that half of the foreign company is owned by Japanese suffices (regardless of the actual relations between the Japanese shareholders).

2. Major ownership test (5 percent test)

Under current legislation, an interest in a THCO has consequences for a Japanese taxpayer only if the taxpayer holds more than 5 percent of the shares in the THCO. Prior to the 1992 Amendments, a 10 percent interest was required.

For purposes of the 5 percent holding test, the term "holding" has the widest conceivable interpretation. Both direct and indirect holdings are included; holdings by any affiliated or related parties (including personnel, family member, etc.) are counted together as one ownership interest.[8]

The 5 percent test is based on the total number of shares issued and outstanding in the THCO, regardless of the voting or other rights attaching to such shares.[9]

Example 2:

A Bermudan corporation ("BerCo") has issued 1,000 voting shares and 1,000 nonvoting preference shares. In Year 1 a Japanese multinational ("Nippon Co.") owns 47 (4.7 percent) of the voting shares and 400 (40 percent) of the non-voting preference shares. The remaining shares are owned by a US corporation with no connection to Japan. Nippon Co. does not need to report its share of BerCo's profits in Japan, as the 50 percent test is not met (Nippon Co. has only 22.35 percent of all the shares).

In the end of Year 2, 60 percent of the US corporation is acquired by a Japanese-controlled entity, who has no ownership connection to Nippon Co. Nippon Co. will need to report its share of the BerCo's profits for Year 2, because its ownership interest of total shares is 22.35 percent and the majority of BerCo is now controlled by the Japanese residents.

3. Moment of determination

Both the 50 percent Japanese control test and the 5 percent ownership test are determined on the basis of the ownership situation at the end of the business year of the THCO.

C. *Exception: legitimate and proper business*

The Japanese tax haven legislation is not intended to prevent Japanese companies from doing business in countries offering low tax rates. A specific exception is provided in the law for such legitimate business activities. A foreign affiliate has to fulfil four tests in order to qualify as legitimate and proper business. If all four tests are met, the Japanese shareholders of such a company need not report the income under the tax haven rules. The tests are defined very narrowly to cover only real operational business activities.

The tests are the following:

(1) the main business of the foreign affiliate must be other than holding securities or debt instruments, licensing industrial property rights or leasing of vessels or aircraft;
(2) the foreign affiliate must have a fixed place of business (shop, office, factory) where it actually conducts its business and which is also necessary for its business;
(3) the foreign affiliate must have local staff and management who operate the business in an independent manner as a separate business entity independent from its owners; and
(4) over 50 percent of the business of the foreign affiliate is conducted in the country where it is located (e.g. over half of the manufacturing takes place there, or over half of the revenues in retail sales are from domestic sales).

If the foreign affiliate is in the business of wholesale, banking, trust, securities, insurance, shipping or air transport, the last test is replaced with a requirement that over 50 percent of

8. Id.
9. The text of the relevant legislation is not entirely clear on this point; this interpretation represents our best understanding on the basis of available information.

© 1993 International Bureau of Fiscal Documentation

its business must be conducted with unrelated and non-affiliated persons. The term "non-affiliated person" is defined narrowly, excluding not only group companies but also any unrelated Japanese company or individual who is subject to Japanese anti-avoidance measures, majority shareholders of such companies and any intervening persons in a structure involving tax haven companies.

The last-mentioned test is aimed to ensure that the tax haven rules cannot be circumvented by operating captive insurance or financing companies or intra-group service entities in low-tax jurisdictions.

The application of the legitimate and proper business exception was tested in a court case 1990.[10] In this case a Japanese group operated a subsidiary in Hong Kong as a captive service company for the purposes of procuring raw materials to the parent from South Asian countries. The subsidiary had local staff of two persons, and the taxpayer claimed that it had compelling business reasons for operating this subsidiary in Hong Kong.

The court ruled that the legitimate business reasons do not suffice to exclude the application of the tax haven rules. Although the Hong Kong subsidiary met all other tests, the court found that it was not sufficiently independent in its management and business. The court stated that the independent character of business should be evaluated on the basis of the overall fact situation, considering factors such as:

- where board meetings and shareholder meetings take place;
- where the actual management decisions are taken;
- where the books and accounts are held;
- to what extent the subsidiary has discretion in deciding matters relating to its business.

It is quite clear on the basis of the legislation and the above court case that mere "window dressing" will not suffice to exclude the application of the tax haven rules. The exception applies only to fully-fledged business operations. However, this does not mean that the exception could not be used in tax planning, provided the taxpayer actually has real business operations (a manufacturing operation, sales office, etc.) in a low-tax country.

D. *Calculation of income when tax haven rules apply*

When the tax haven rules are applicable, the Japanese taxpayer must include in its income a proportionate portion of the undistributed profits of the THCO. Thus, Japan taxes the profits of the THCO directly in the hands of the shareholder, regardless of whether such profits are distributed or not.

The law provides two alternative methods for the calculation of the net profits of the THCO, both leading essentially to the same end result. Profits can be calculated (i) entirely in accordance with the Japanese ITA, or (ii) in accordance with the rules of the country of the THCO with adjustments prescribed in law.

If the latter method is applied, the taxable profits of THCO are subject to the following adjustments:

(i) the following items are added to the net income:
- any exempt income;
- dividends deducted as expense;
- losses on revaluation of assets;
- depreciation in excess of what is allowed under Japanese tax law;
- directors' remuneration in excess of what is deductible in Japan;
- donations and entertainment expenses in excess of what is deductible in Japan;
- tax losses applied as a deduction; and
- foreign corporate taxes applied as a deduction.

(ii) The following items are subtracted from the net income:
- gains on revaluation of assets; and
- refund of foreign corporate tax (if considered taxable income at the THCO's country).

These adjustments are designed to bring the taxable profits of the THCO in line with the rules applicable to Japanese businesses.

Once the taxable profits of THCO have been calculated in the manner described above ("constructive profits"), the Japanese shareholder includes in its taxable income in Japan a portion of the constructive profits that corresponds with its shareholding interest in the THCO. If the constructive profits are negative, the Japanese shareholder is entitled to carry forward such constructive losses and deduct them from constructive profits of the THCO in later years.

E. *Relief from multiple taxation*

The calculation of constructive profits as described above does not take into account that the THCO may indeed distribute its profits. Hence, the same income would be taxed in Japan twice, first as income of the shareholders and then as a dividend received. Also, as the profits of each THCO are taxed separately in Japan, income earned by one THCO would be subject to multiple tax when routed through other THCOs in the form of a dividend. To alleviate these effects Japanese tax haven legislation provides certain relief rules.

When calculating the constructive profits of the THCO, dividends that the THCO distributes directly or indirectly to the Japanese shareholder are deducted from the net income. This deduction is denied, however, if the distribution is routed through a company which is subject to less than 25 percent tax on its dividend income. The Japanese shareholders of the THCO can, however, exclude such dividends (at the time of actual receipt) from their taxable income in Japan, provided that the intermediary company did not retain such profits for more than two years (see example 2 above).

When calculating the constructive profits, dividends which a THCO has received from another THCO are excluded from the net income, provided that the undistributed profits of the other THCO are directly taxed in the hands of the ultimate Japanese shareholder.

10. Tokyo District Court, decision dated 19 September 1990 (1368 Hanrei Jiho 53); the appeal on the case was subsequently dismissed by the Tokyo High Court, which confirmed the decision taken by the District Court (27 May 1991); the case is described in more detail in Tokuoka-Takagi, *supra* note 2.

© 1993 International Bureau of Fiscal Documentation

Finally, if a foreign country has imposed tax on the undistributed profits of the THCO, Japan allows a credit for such tax paid by the THCO.

III. OUTLINE OF THE INDIRECT FOREIGN TAX CREDIT RULES

Japan has a highly complicated set of rules on foreign tax credits, and the allowable credits have been made subject to various limitations. The following discussion does not purport to describe the system in its entirety, but rather concentrates on issues relevant to the tax haven rules and the structural scenarios presented below.[11]

A. *Foreign taxes entitled to credit*

Japan generally allows a tax credit on foreign income taxes which the Japanese taxpayer has paid abroad. The tax credit is normally available for any foreign taxes levied on net income (including federal, state and local taxes). The revenues subject to foreign tax are grossed up for Japanese tax purposes and added to the income of the taxpayer. Accordingly, the taxpayer is entitled to deduct from his Japanese income tax the amount of foreign taxes paid. The excess credits can be carried forward for three years.

Normally the tax credit is allowed only to the extent the Japanese taxpayer has paid itself the foreign tax (for example, for profits of a foreign PE). There are two exceptions to this rule:

- a Japanese taxpayer can claim a tax credit for the foreign income tax imposed on the undistributed profits of a THCO to the extent such profits are included in the taxpayer's income in Japan; and
- a Japanese company can claim an indirect tax credit for the underlying income tax paid by a foreign subsidiary in respect of dividends received from such subsidiary (first-tier indirect foreign tax credit). If the subsidiary has paid the dividends out of dividends received from a further subsidiary, the Japanese parent can claim tax credit also in respect of the income tax paid by the second subsidiary (second-tier indirect foreign tax credit). The second-tier credit was introduced to the Japanese tax law in the 1992 Amendments.

The indirect foreign tax credits are available only if the Japanese taxpayer has owned at least a 25 percent interest in the foreign company for a minimum of six months prior to the date when the decision regarding the declaration of dividend is made.

It is our understanding that foreign flow-through entities (US partnerships, Dutch VOFs and CVs) are treated for the purposes of indirect tax credit as if they were branch operations of the parent. Consequently, an intermediary flow-through partnership between first and second-tier subsidiaries should not prevent utilizing the tax credit for the taxes paid by the second-tier subsidiary.

If the second-tier subsidiary files a consolidated tax return with lower-tier subsidiaries, the allowable credit is calculated as if the second-tier subsidiary had filed a separate return.[12]

Example 3:

A Japanese corporation ("Nippon Co") owns 100 percent of a Dutch BV, which in turn owns 100 percent of a US corporation (USCo1). USCo1 has a further wholly-owned subsidiary (USCo2), and files a consolidated tax return. USCo1 and USCo2 have a pre-tax, non-consolidated income of 1,000 and 2,000, respectively, and pay an income tax on the consolidated basis of 1,020. Following the above formula, the allowable credit amounts to:

$$\text{Credit} = 1{,}020 \times \frac{1{,}980}{3{,}000 - 1{,}020} \times \frac{1{,}000}{3{,}000} = 340$$

As shown in the above example, only the tax underlying the dividend received from USCo1 which is sourced from its own after-tax income is creditable.

B. *Calculation of allowable foreign indirect tax credit*

The available indirect foreign tax credit is calculated according to the following formula:

$$\text{Credit} = \text{Foreign Tax} \times \frac{\text{Dividend}}{\text{Net Income} - \text{Foreign Tax}}$$

where
Foreign Tax = income tax paid by the foreign subsidiary.
Dividend = amount of dividend received by the Japanese shareholder.
Net Income = net taxable income of the foreign subsidiary.

Example 4:

A Japanese multinational ("Nippon Co") holds 100 percent of the shares of a UK-based operating company ("UK Co"). The profits before tax of UK Co are equal to £ 1,200 million which are subject to a corporate income tax rate of 33 percent. The UK Co applies a pay out ratio of 60 percent of its after-tax income.

The dividend declared by UK Co equals 60 percent of the after-tax profits or 60 percent of £ 804 million or £ 482.4 million. The corporate income tax paid by UK Co equals 33 percent of £ 1,200 or £ 396. Hence, the underlying tax credit available to the Nippon Co on the dividend received from UK Co is equal to:

$$\text{Tax Credit} = 396 \times \frac{482.4}{1{,}200 - 396} = £\ 237.6$$

The purpose of this formula is to ascertain that the allowable tax credit is equal to the proportionate amount of underlying tax that the dividend carries.

The allowable credit calculated in accordance with the above formula may result in an amount higher than the actual tax paid by the foreign affiliate. In such case, the allowable tax credit is quite obviously restricted to the amount of taxes actually paid.

If the dividend payment has been subject to foreign withholding tax, the allowable tax credit is limited to an amount calculated according to the following formula:

Maximum Credit = Dividend Paid – 2 x Foreign Withholding Tax

11. For a comprehensive analysis of the indirect foreign tax credits, see Tom Anderson, "A Survey of the Foreign Tax Credit System", 45 *Bulletin for International Fiscal Documentation* (May 1991), at 203-213.
12. Id.

C. *Overall limitations on tax credits*

The Japanese tax legislation imposes a number of overall limitations to the amount of foreign tax credits which a Japanese taxpayer can utilize to offset its Japanese taxes.

Each taxpayer is subject to an overall, annual limitation calculated according to the following formula:

$$\text{Limit} = \text{Japanese Tax} \times \frac{\text{Total Net Foreign Income}}{\text{Total Worldwide Income}}$$

where
Japanese Tax = taxpayer's Japanese tax burden before deduction of credits.
Total Net Foreign Income = aggregate amount of taxpayer's foreign-source income.
Total Worldwide Income = aggregate amount of taxpayer's income from both Japanese and foreign sources.

When calculating the overall limitation, 66.6 percent of the foreign income which has not been taxed abroad must be excluded from total net foreign income. Prior to the 1992 Amendments, only 50 percent was excluded.

A number of other limitations apply to the foreign tax credits, including
- no tax credit is available for foreign taxes in excess of 50 percent of the relevant income (the excess can be treated as a deduction from income);
- for financial institutions and other businesses where significant amounts of interest income are received, special limitations on allowable credit apply, depending on the level of profitability of the business.

The foreign tax credits are utilized in the first instance to offset state corporate income taxes. To a limited extent, credit is also allowed against prefecturate and local taxes.

Japanese corporate taxpayers may also opt for deducting the foreign taxes from their income rather than as a credit against tax. The choice is either credit or deduction, and once chosen, the same method must be applied to all foreign taxes entitled to credit during the fiscal year.

IV. ALTERNATIVE STRUCTURES

As seen above, the Japanese tax haven legislation in its current form encompasses the capital gains and undistributed dividend income of Dutch holding companies belonging to Japanese multinational groups of companies. The possibility for avoiding tax on capital gains and non-distributed dividends has been a leading incentive for multinationals in setting up holding companies in the Netherlands. Consequently, the 1992 Amendments are causing considerable anxiety to Japanese multinationals which have routed their international holdings through the Netherlands.

The following structural scenarios are attempts to create alternative ways for retaining the benefits of the Dutch holding companies even after the 1992 Amendments. At the same time, the scenarios purport to draw maximal benefit from the second-tier indirect foreign tax credit in Japan.

A. *Alternative A: utilizing existing Dutch operations*

This structural scenario is based on the "legitimate and proper business" exception from the tax haven rules. Its application requires that the Japanese multinational has real and substantial business operations in the Netherlands. Such operations could, for example, include operating a manufacturing plant, having substantial sales (and a sales office) or conducting financing business in the Netherlands. As seen above, captive operations do not qualify in most cases.

Provided that all other conditions for the exception exist (substance, independence), an operating subsidiary may also hold shares in other operations or investments, provided the holding activity accounts for less than 50 percent of its business. Accordingly, a Dutch operational company owned by a Japanese multinational can assume tax-exempt capital gains to an extent such gains do not exceed the amount of its operational revenues.

Example 5:

A Japanese parent company (Nippon Co) has a wholly-owned subsidiary in the Netherlands (NL-OPCo), which owns and operates a plant and sells the products within the Netherlands. NL-OPCo also owns 50 percent in a UK company (UK-OPCo). In Year 1 NL-OPCo has operational revenues of Dfl. 10 million and sells its participation in UK-OPCo for a profit of Dfl. 9.5 million. The Japanese tax haven rules should not be triggered because the Dutch NL-OPCO still qualifies as a legitimate and proper business, regardless of whether its actual tax burden in the Netherlands is less than 25 percent.

This scenario has some obvious limitations:
- it can be utilized only by multinationals having substantial domestic operations in the Netherlands;
- it requires an operational company to hold participations in other companies, which may be difficult from a business perspective; and
- it is based on balance between the operational revenues and capital gains. In practice it may be difficult to estimate in advance how much capital gains may accrue from a given transaction. If capital gains exceed the operational revenues, the whole Dutch operation is deemed to be conducted in a tax haven.

On the other hand, this scenario is relatively safe against further amendments to the tax haven rules. It would be difficult for the Japanese legislator to prevent the use of a structure of this type without causing undue detriment to the legitimate foreign business operations of the Japanese multinationals.

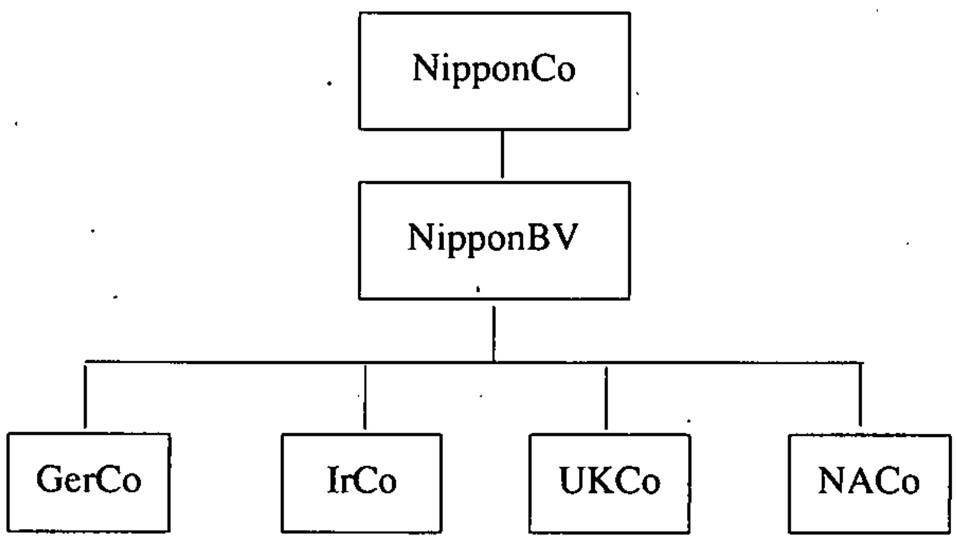
B. *Alternative B: sourcing*

This alternative structure is based on the requirement that the foreign operations must bear a tax burden of 25 percent, lest they are characterized as tax haven operations. The current Japanese corporate income tax rate amounts to approximately 52 percent.[13] If the foreign non-distributed profits suffer a tax of 25 percent, the remaining 32 percent tax saving (i.e. the difference between the Japanese tax rate and 25 percent) can be deferred until the profits are ultimately distributed to

13. See *supra* note 3.

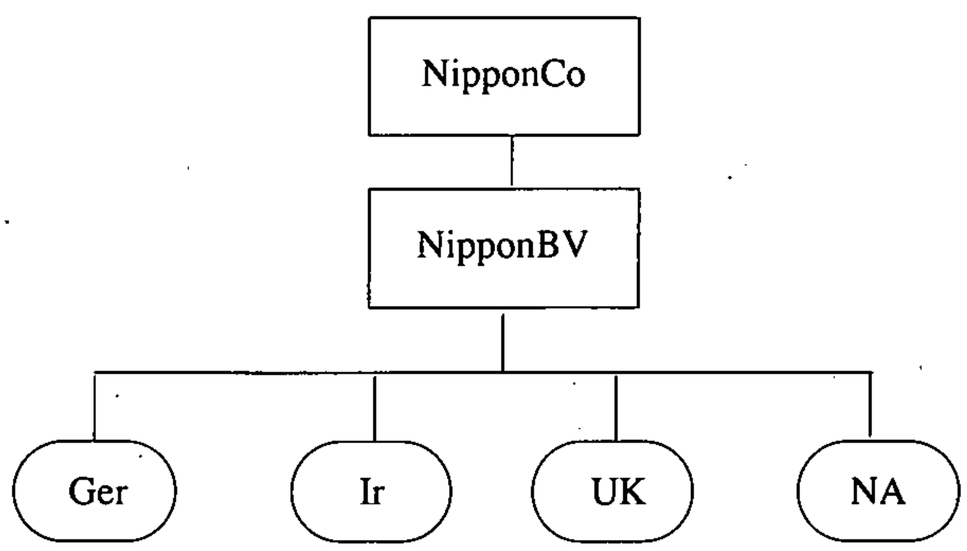
© 1993 International Bureau of Fiscal Documentation

Japan. Moreover, if the structure enables the maximal use of indirect foreign tax credits, the effective tax burden is reduced even further.



It is possible to create a structure where the taxes suffered in the high tax jurisdictions offset lower tax burdens in others, and the resulting overall tax burden at the level of first-tier subsidiary is only marginally over 25 percent.

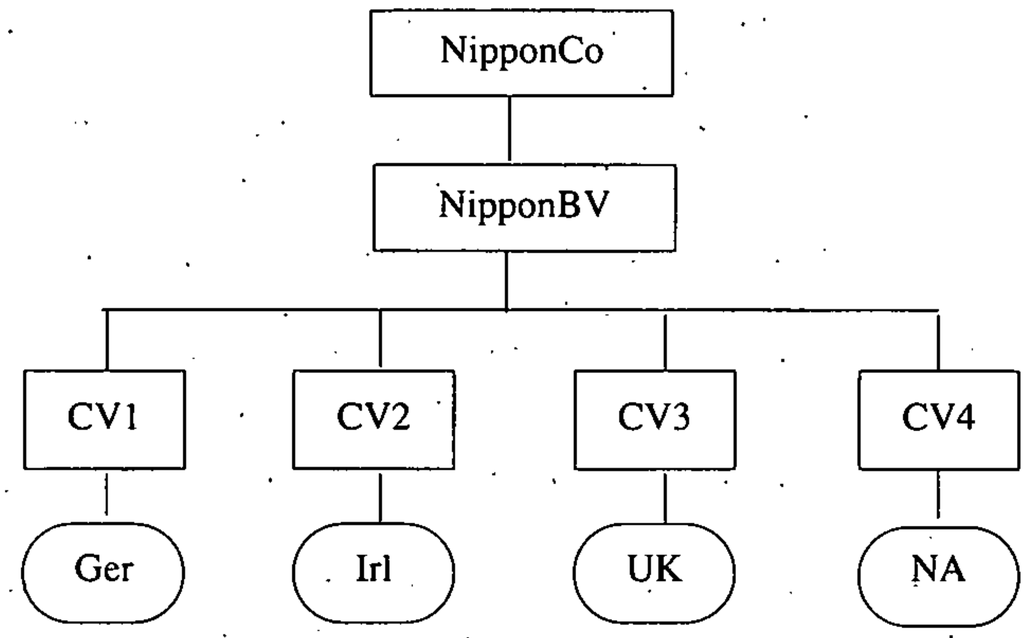
Prior to the 1992 Amendments, Dutch holding company structures tended to be in line with the following scenario (countries used as examples only):



Example 6:

A Japanese parent company (NipponCo) owns manufacturing and sales operations in Germany (GerCo), Ireland (IrCo) and United Kingdom (UKCo). It also has a subsidiary in the Netherlands Antilles (NCo). Nippon Co has a wholly-owned Dutch holding company (NipponBV), which owns the foreign operational companies.

The corporate tax rates in the example countries are: United Kingdom 33 percent, Germany 60 percent, Ireland 10 percent and Netherlands Antilles 3 percent. Consequently, the Irish and Netherlands Antilles companies are both treated as THCOs (assuming that neither qualifies for an exception as legitimate and proper business). Moreover, the Dutch Nippon BV is also a THCO in respect of dividends and capital gains. The 1992 Amendments effectively prevent utilization of any tax advantages of this structure. Under the earlier legislation, only the Netherlands Antilles company would have been characterized as a tax haven company.



The mixing of tax rates can be achieved only by liquidating[14] the subsidiaries in the United Kingdom, Germany, Ireland and Netherlands Antilles, as then the Dutch BV would operate the business in those countries through PEs. In this case, the above structure would result in an effective income tax rate for the Dutch BV at the level of 25.75 percent. Thus the tax haven rules should not apply to the BV or to any of the operations of the PEs. However, the BV cannot realize capital gains without risking its effective tax rate to fall below 25 percent.

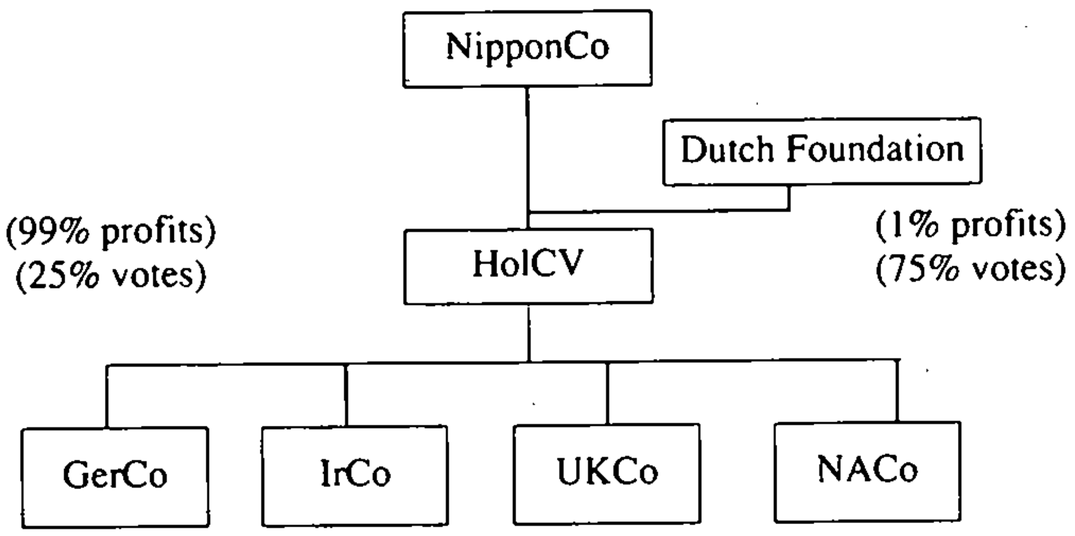
Operating PEs might not be a preferred alternative from a business perspective, as NipponBV would be directly liable for all debts of the PEs. Therefore, the model can be further enhanced by interposing Dutch CVs between NipponBV and the PEs. A Dutch CV (commanditaire vennootschap) is a partnership vehicle which imposes limited liability for certain partners (limited partners) and unlimited liability for others (general partners). A CV is not considered a tax subject under Dutch law, but its income is taxed directly as income of its partners.[15] However, for corporate and civil liability purposes, a CV is considered a legal person separate from its partners.

In order to limit the liability and to separate different operations from each other, one could interpose a separate CV between NipponBV and each of its foreign operations:[16]

This alternative would bring the structure as close as possible to the starting position. The Japanese tax haven provisions should not apply and, when NipponBV distributes its profits to NipponCo, the parent should be able to utilize the income taxes paid in Germany, Ireland, United Kingdom and Netherlands Antilles as indirect foreign tax credit. It is assumed that Japanese tax authorities will treat a CV for the purposes of tax haven legislation in the same manner as for purposes of indirect foreign tax credit, i.e. as equivalent to a branch.

Through this scenario, a Japanese multinational could continue deferring the Japanese tax on foreign dividends routed through the Netherlands. Moreover, if the dividends are redistributed to Japan, the Japanese parent can utilize the foreign income taxes paid as an indirect foreign tax credit.

The major disadvantage of this scenario is that the Dutch holding company will have to continuously monitor the effective tax burden in each country in order to maintain the desired mix of tax rates. Also, it allows only a limited possibility for realizing capital gains, as the tax-exempt capital gains of the Dutch holding company will have to be offset by a sufficient income tax in other countries.



14. In this example liquidation would mean converting the local subsidiary into a branch. Obviously, such conversion might trigger a capital gains tax liability and/or other taxes which might seriously affect the economics of this scenario. We will not discuss possible scenarios to mitigate such adverse tax liabilities.
15. Under certain conditions a limited partnership in the form of a CV could be a separate tax paying entity subject to corporate income tax.
16. The CV obviously requires also a general partner, which can be a separate entity within the same group of companies. For the sake of clarity, general partners are not included in the chart.

© 1993 International Bureau of Fiscal Documentation

C. *Alternative C: avoiding Japanese control*

The third scenario is based on the Japanese control and major ownership tests, i.e. on reconstructing the holding company structure in a manner that the majority ownership of the Dutch holding company belongs to non-Japanese owners. This would exclude the application of the tax haven rules altogether, and enable unlimited operations in low-tax jurisdictions.

Using the same starting point as in the example in B above, the proposed structure could be as follows:

In this scenario the Dutch holding company (for which purpose now a BV is normally used) is replaced by a Dutch CV (HolCV). The rights and obligations of the partners of a CV can be determined rather freely by the terms of the partnership contract, making this form of business entity highly flexible.

Although a CV is normally treated as look-through partnership entity for the purposes of Dutch taxation, it is equally possible to create a CV which is a separate tax subject in the Netherlands. If the general partner is allowed to accept new partners into the partnership without the consent of all the limited partners, the CV is regarded as a separate taxpayer ("an open CV"). As a separate taxpayer, the CV should be able to enjoy protection of tax treaties as well as the benefits of the Dutch participation exemption.

Moreover, the partners of a CV can also freely agree on the distribution of profits (which does not necessarily follow the proportion of capital that the partners have contributed).

In the above example the Japanese parent company (NipponCo) is a limited partner in the HolCV, where it has contributed 75 percent of the capital. Under the terms of the partnership agreement, NipponCo is nevertheless entitled to receive 99 percent of the profits of the HolCV. The general partner (in this example a Dutch foundation) has 75 percent of stake of the capital but receives only 1 percent of the profits. Accordingly, over 50 percent of the HolCV is controlled by non-Japanese, and consequently the criteria for Japanese control are not met.

A Dutch foundation is a separate legal entity and in principle not subject to corporate income tax. In essence, it is not owned by anyone, although it does have a board to decide its investments and other relevant matters. Considering that Japan has no general anti-avoidance legislation, its seems possible that NipponCo could itself establish the foundation. In order to facilitate the defence of this structure, it may be advisable to have independent persons in the board of the foundation as well as provide for its dissolution in certain circumstances. The foundation may also issue a share certificate to NipponCo, under which any dissolution proceeds will be handed back to NipponCo.

Alternatively, the foundation could also be replaced by an independent trust company. However, the disadvantage then would be the fact that the effective control of the foreign operations is in the hands of an outsider, adding an element of uncertainty to NipponCo's position.

As the Japanese parent company controls 25 percent of the votes in the HolCV, it can utilize the indirect foreign tax credit for the income taxes paid by HolCV and its subsidiaries. As CV in this scenario is used as a separate taxpayer, it will most likely be regarded as such also for the purposes of indirect tax credit in Japan. Therefore, no intermediary holding companies can be interposed between HolCV and the operational companies, if JapCo desires to utilize the income taxes paid by operational subsidiaries in Germany, Ireland, United Kingdom and Netherlands Antilles.

The advantage of this scenario is that it excludes the application of the tax haven legislation altogether. Consequently, the subsidiaries of HolCV can engage in operations in tax havens, HolCV can realize capital gains as well as route and accumulate dividends without the intervention of the Japanese tax haven legislation. Moreover, when dividends are ultimately distributed to Japan, the parent company can utilize the indirect foreign tax credits.

On the other hand, when the profits are distributed to Japan, 1 percent would have to be channelled to the foundation. These funds could, however, be utilized to cover the running costs of the foundation.

This scenario is quite aggressive and vulnerable to further amendments to the Japanese tax haven legislation. It would be very easy for the Japanese legislator to prevent the use of such structures by specifying the provision regarding the major ownership (5 percent) test. Moreover, we realize that the split between the economic ownership and the legal ownership might be a concept which might not fit into the business philosophy of the Japanese parent company.

V. CONCLUSION

The 1992 Amendments in respect of the tax haven rules have put the use of Dutch holding companies in international structures in a less favourable light than before. The ideas presented above might form the basis for further thoughts to overcome the apparent tax disadvantages triggered by these amendments. How these new CFC rules will work out in practice remains to be seen. One thing is already clear now: these new rules have added more complexity to the already very complex Japanese tax system.

INDIA:
1993/94 BUDGET

G.K. Kawatra

LL.M., International Tax Program (Harvard); Additional Secretary, Federation of Indian Chambers of Commerce and Industry, Former Honorary Secretary, Indian Branch of IFA.

The 1993/94 Indian Budget may be viewed as a growth-oriented people's budget. It is completely different and more refreshing than many of the previous budgets, and has left everyone wondering how the Finance Minister managed to reduce the budget deficit to around Rs. 43,140 million, while surprisingly sacrificing revenue to the extent of Rs. 45,220 million on account of rationalization and reduction of customs and excise duties, and at the same time increasing the central plan outlay by about 32 percent. Further, there is no new direct or indirect tax burden affecting individuals to any appreciable extent. The overall objective of the budget proposals has been to check the economic recession, speed up economic reform and internationalize Indian trade.

The Finance Minister announced a number of customs and excise duty reductions, not proposing any major amendment to the direct tax laws, leaving personal taxation intact, except for an increase in the standard deductions for salaries tax payers (from Rs. 12,000 to Rs. 15,000).

In framing the tax proposals, the Finance Minister stated that he was aware of the conflicting requirements of comprehensive reform of the tax structure and the need to protect revenue to finance the large increase in the plan. In principle, the Finance Minister accepted the Chelliah Committee proposals as set forth in its final report but decided to temporarily defer the reform of corporate taxation.

In respect of direct taxation the Finance Minister focused on encouraging foreign institutional investors to undertake a longer term involvement in India, accelerating industrialization of underdeveloped areas, increasing power generation and distribution, promoting a cleaner and healthier environment, and creating a strong base for science and technology, and the export of software.

This article summarizes the most important measures relating to direct taxes as they affect foreigners.

Corporation Tax Rates

100% Depreciation on Plant and Machinery relating to Environmental Protection and Pollution Control

Advance Rulings Introduced for Non-residents

Tax incentives

Conclusion

CORPORATION TAX RATES

Appreciating the worldwide trends in both corporate and personal taxation, the Chelliah Committee made several far-reaching recommendations in both of these areas. In its interim report the Committee recommended that in case of domestic companies, the tax rates inclusive of surcharge should in the course of the next three years (i.e. by assessment year 1995/96) be reduced to 40 percent. In the final report the Committee recommended lowering the corporate tax rate for all domestic companies to 45 percent in 1993/94 by abolishing the surcharge, and to 40 percent in 1994/95. Widely-held companies are currently subject to tax at 51.75 percent and closely-held companies at 57.5 percent, inclusive of surcharge. Although the Finance Minister accepted the broad thrust of the Chelliah Committee's recommendations its implementation has been postponed until next year.

100% DEPRECIATION ON PLANT AND MACHINERY RELATING TO ENVIRONMENTAL PROTECTION AND POLLUTION CONTROL

With a view to promoting a cleaner and healthier environment, a 100 percent depreciation allowance for pollution control equipment is proposed to replace the existing 40 percent on capital goods under the income tax rules.

© 1993 International Bureau of Fiscal Documentation

ADVANCE RULINGS INTRODUCED FOR NON-RESIDENTS

Pursuant to the announcement made in last year's Budget speech, the Finance Minister proposed a scheme for advance rulings in respect of transactions involving non-residents. Under the proposed scheme, advance rulings will be given on a question of law or fact in respect of a proposed transaction or a transaction undertaken by a non-resident. An application must be made to the authority in the form and manner to be prescribed by rules along with a fee of Rs. 2,500.[1] A request for a ruling may be withdrawn within 30 days. The authority has discretion to accept or reject an application, although no ruling will be issued where the request involves an issue already pending before the income tax authority, the Appellate Tribunal or any court; involves the determination of the fair market value of any property; or relates to a transaction which is designed prima facie for the avoidance of income tax.

The authority is required to issue an advance ruling within six months from the date of receipt of the application. The ruling will be binding on the applicant and in respect of the specific transaction to which the ruling was sought. The Commissioner will also be bound by the ruling. The proposed scheme does not provide for any right of appeal to the courts from the advance ruling.

An advance ruling may be revoked if it is subsequently discovered that it was obtained by fraud or misrepresentation of facts. The ruling will continue to remain in force unless there is a change in law or in fact on the basis of which it was granted.

TAX INCENTIVES

Tax Incentive for Foreign Institutional Investors Investing in Securities

While introducing a scheme for promoting foreign institutional investors in the Indian capital market the Government indicated that such investors will be liable to tax at 20 percent on investment income, and 10 percent on long-term capital gains. A new Section 115AD is proposed to be included in the Income Tax Act (ITA) relating to tax on income derived by foreign institutional investors from securities or capital gains arising from the transfer of securities.

Income received from securities (other than units referred to in Section 115AB) listed on a recognized stock exchange in India in accordance with the Securities Contracts (Regulations) Act, 1956 is proposed to be taxed at the rate of 20 percent. Long-term capital gains arising from the transfer of said securities are to be taxed at the rate of 10 percent, and short-term capital gains at the rate of 30 percent.

A new Section 196D is also proposed to be inserted in the ITA to provide for deduction of tax at source (20 percent) from income derived by foreign institutional investors in respect of securities. The deduction must be made either when the income is credited to the payee's account, when payment is made in cash, or when a cheque or draft is issued, whichever is earlier. No deduction of tax is to be made from any capital gains arising from the transfer of such securities.

Measures to Encourage Foreign Investment

Under the EC International Investment Partners Scheme the European Economic Community (EEC) will provide grants, interest-free loans and equity participation of dividend income accruing in India from investments made under the scheme, to be used for further investment in India. To facilitate investment by the EEC in India such income from investment has been proposed to be exempt from income tax. Accordingly, a new clause (23BBB) in Section 10 will provide a complete income tax exemption for Indian-source income in the form of dividends, interest or capital gains derived by EEC investors from investments made out of funds under the scheme.

Deduction of Head Office Expenditure for Non-Residents

ITA Section 44C currently contains a limit on the deduction for head office expenses in computing the taxable profits of non-resident taxpayers. The allowable amount is limited to either 5 percent of the taxpayer's "adjusted total income" for the relevant year or the annual average of the head office expenditure allowed during the base period of the previous three years, i.e. the previous year relevant to assessment year 1974/75 to 1976/77, or the actual amount of head office expenditure attributable to the business or profession of the assessee in India, whichever is less. Since the limit relating to average head office expenditure may operate to the disadvantage of persons who came to India before 1976, it is proposed to omit clause (b) of Section 44C and clause (iii) of the explanation to that section in order to remove the reference to "average head office expenditure". This amendment should place all non-resident assessees on equal footing with respect to allowability of the deduction.

Extension of the Tax Concession to Non-Resident Technicians Holding Indian Citizenship

ITA Section 10(6)(vii) exempts from tax perquisites paid by an employer on the salary of an employee who is not a citizen of India and who is engaged as a technician and renders services after 31 March 1988. This exemption is proposed to be extended to non-resident technicians who are Indian citizens.

Extension of Deduction for Profits from Export of Computer Software

ITA Section 80HHE provides for a 100 percent deduction in respect of income derived from software exports. The deduction is available for export profits derived during the previous year relevant to assessment years 1991/92, 1992/93 and 1993/94, and has now been extended for one more year, i.e. for assessment year 1994/95.

1. After receipt of the application, the authority will send a copy of the application to the relevant Commissioner and if necessary may request records.

© 1993 International Bureau of Fiscal Documentation

Tax Concession for Contributions to Universities and Institutions

Under ITA Section 80G, a 100 percent deduction is allowed in respect of donations made by a taxpayer to certain institutions. With a view to encouraging higher learning, it is proposed to increase the deduction for contributions to approved universities institutes of technology, institutes of management and equivalent institutions from 50 to 100 percent.

Tax Holiday for New Industrial Undertakings Set Up in Underdeveloped Areas

With a view to encouraging new investment in industrially underdeveloped States and Union Territories, a five-year tax holiday is proposed, to commence from the year of production for new industrial undertakings located in all the North-Eastern States, Jammu & Kashmir, Himachal Pradesh, Siukkim, Goa and Union Territories of the Andamann and Nicobar islands and Dadra and Nagar Haveli, Daman & Diu, Lakshdweep and Pondicherry.[2]

After completion of the fifth year the industrial undertaking will be entitled to the deduction under Section 80IA[3] for the remaining period, i.e. deduction from the profits from such undertakings will be allowed at the normal rate of 30 percent in the case of companies, and 25 percent in the case of non-corporate assessees. The deduction, at both the enhanced rate and normal rate, will be limited to 12 assessment years in the case of cooperative societies and ten assessment years in the case of other assessees as provided under ITA Section 80IA.

Tax Holiday for the Power-Generating Sector

A five-year tax holiday has been proposed in respect of profits and gains of new industrial undertakings set up anywhere in India for power-generating projects. The five-year tax holiday will be granted to undertakings which begin the generation of power on or after 1 April 1994. For subsequent assessment years the deduction from the profits of such undertakings will be allowed at the normal rate of 30 percent in the case of companies, and 25 percent in the case of non-corporate assessees. However, the deduction at the enhanced rate and the normal rate will be limited to 12 assessment years in the case of cooperative societies and ten years in the case of other assessees.

Expenditure on Scientific Research

Section 35 allows a deduction for contributions to approved scientific research associations, universities, colleges or other institutions to be used for scientific research. With a view to encourage industry to make use of facilities offered by the National Laboratories and Research Institutes, it is proposed to allow a weighted deduction of 125 percent of the contribution to approved National Laboratories and Institutions[4] carrying out research and development in natural and applied sciences.[5] This weighted deduction will be available only to users and producers of research which are approved by the prescribed authority.

Special Tax Concession for Contributions to the National Foundation for Communal Harmony

A deduction of 50 percent is allowed for donations made to certain trusts and institutions under Section 80G. However, a 100 percent deduction is allowed for donations made to specified funds. It is proposed to extend the benefit of the 100 percent deduction to donations made to the National Foundation for Communal Harmony. Further, it is also proposed to amend ITA Section 10(23C) to include the National Foundation for Communal Harmony as a fund whose income will be exempt from income tax.

CONCLUSION

The result of various relaxations proposed in the direct tax laws would be a net loss to the extent of Rs. 3,000 million according to the Finance Minister, but he hopes that improved tax collection will cover the estimated loss. It is quite refreshing to find that the Finance Minister has not attempted to unnecessarily meddle with the direct tax laws as in the past because invariably every amendment in some way or the other adds to the complexity of the already complicated tax laws. As the Finance Minister himself stated in the Budget speech, he has deferred the corporate tax reforms for the time being while in principle accepting the recommendations of the Chelliah Committee. The enlarged provision for education and health, tax incentives for scientific research, encouraging donations to educational institutions, and the emphasis on building infrastructure are all the positive socio-economic aspects of the Budget. The Budget proposals should speed up the process of economic recovery by accelerating industrial development, strengthening the capital market and attracting sufficient foreign exchange into India. This is all the more necessary in the area of foreign investment. Foreign investments can and must play a primary role in bolstering India's external reserves position.

---

2. A new Eighth Schedule to the ITA is to be inserted which lists the States and Union Territories eligible for a new tax holiday.
3. Under ITA Sec. 80IA an assessee is entitled to a deduction at either 30% or 20% for a specified period of time (i.e. 10 or 12 years) in respect of profits of an industrial undertaking established anywhere in India. Under the new provision an industrial undertaking established in an underdeveloped area will benefit from the five year tax holiday and for the remaining five or seven years will be eligible for the deduction under Sec. 80IA.
4. A National Laboratory is defined as a scientific laboratory functioning at the national level under the aegis of the Indian Council of Agricultural Research, the Indian Council of Medical Research and the Council of Scientific and Industrial Research, and which is approved by the prescribed authority for this purpose.
5. A new sub-section 2(AA) in Sec. 35 is to be inserted for this weighted deduction.

STELLA, Peter.
Tax farming. A radical solution for developing country tax problems?
Washington, IMF – International Monetary Fund. 1992
.IMF Working Paper No. WP/92/70, pp. 21.
This paper examines tax farming as an alternative tax collection mechanism. (Tax farming is a system whereby the right to collect taxes is auctioned off to the highest bidder)
(B. 57.797)

BOUTIN, Michel-Pierre.
Guide fiscal international. Pays par pays.
Paris, Editions ESKA, 27 rue Dunois, 75013 Paris, France. 1991, pp. 850.
International tax guide containing country-by-country summary of the corporate income tax and individual income tax of most of the countries and territories in the world. The withholding tax on dividends, interest and royalties under effective double taxation treaties concluded with other countries are dealt with.
(B. 112.339)

READY, N.P.
Ship registration.
London, Lloyd's of London Press Ltd., Sheepen Place, Colchester, Essex C03 3LP, England. 1991, pp. 216. £ 45.-
The book aims to provide a concise overview of ship registration, its fundamental concepts, the factors governing a shipowner's choice of flag and the impact of registration formalities on ship sale and purchase transactions. The author discusses the emergence of flags of convenience, offshore national registries and the concept of dual registration and completes the book with a detailed look at the registration procedures of six major flags: the United Kingdom (including the British offshore registries), Cyprus, Panama, Liberia, Vanuatu and the Bahamas.
(B. 112.312)

THE LAW OF THE SEA.
National Legislation on the Continental Shelf.
New York, UN – United Nations. 1989, pp. 289.
Compilation containing the national legislation of States on the continental shelf.
(B. 112.383)

CONTENTS

VOL. 47 NO. 6 **JUNE 1993**

UNITED STATES: HOW TO ESCAPE THE WRATH OF THRASYBULUS' SWORD AND ESTABLISH REASONABLE ROYALTY RATES IN INTERCOMPANY LICENSING OF INTANGIBLES UNDER THE "BEST METHOD RULE" OF THE NEW SECTION 482 REGULATIONS — 307 — *Stephen A. Mihaly*

The new Section 482 regulations list four methods of determining an arm's length rate of royalty in a controlled transaction but they do not provide for any strict priority rules. Rather the regulations adopt a new approach referred to as the "best method rule", under which the arm's length rate of royalty must be determined by using the method which provides the most accurate arm's length result under the relevant facts and circumstances.

INTERNATIONAL: RECENT TAX REVENUE DEVELOPMENTS IN OECD COUNTRIES AND SOME POLICY IMPLICATIONS — 323 — *Ken Messere*

Mr Messere comments on recent trends in government tax revenue levels and structures, sub-central government tax revenues and general government financial balances. Also discussed are the fiscal policy implications of these revenue developments, primarily in the G7 countries, with special reference to what should be government reactions to the increase in fiscal deficits that are predicted to continue over the next few years in most of these countries.

THE US–NETHERLANDS INCOME TAX TREATY: TAX COLLECTION ASSISTANCE AND EVIDENCE-GATHERING — 342 — *Bruce Zagaris*

This article discusses the collective assistance provisions in the new US–Netherlands tax treaty. In particular, it examines how the provisions operate and the requirements to exhaust the treaty evidence-gathering prior to the right of the US government to invoke techniques under IRC Section 6038. Also examined are the procedural aspects of exchange of information, tax collection assistance (including such provisions in other treaties) and the OECD/COE convention on mutual administrative assistance in tax matters. To bring the new treaty into perspective the article discusses other means to gather evidence to collect taxes.

FINLAND: FUNDAMENTAL TAX REFORM: 25 PERCENT RATE ON CAPITAL INCOME AND CORPORATE INCOME — 348 — *Kari S. Tikka*

Finland launched a comprehensive income tax reform effective from 1 January 1993, covering the taxation of capital income of individuals and the taxation of business profits. Professor Tikka overviews the background to the reform, and then discusses the main features of the new system.

UNITED STATES:

How to Escape the Wrath of Thrasybulus' Sword and Establish Reasonable Royalty Rates in Intercompany Licensing of Intangibles under the "Best Method Rule" of the New Section 482 Regulations

Stephen A. Mihaly

International licensing of valuable intangible properties, such as patents, know-how, manufacturing technology, trademarks or copyrights has been in existence for many years. When a useful new product or process is invented in one country, it is likely that it could be commercially exploited in other parts of the world also. Nowadays, most of the valuable intangibles, at least in the area of industrial property rights such as patents, know-how, technology or trademarks, are developed and acquired by companies. Therefore, for the sake of simplicity, we will refer to a "company" as the owner of the intangible.

The company developing a new product is not likely to be content with the commercial exploitation of the product in its own country. It is more likely that it will expect or hope to derive additional profits from the sale and marketing of the product in other markets. Sometimes, the manufacture of the products in the company's own country and the shipment of such products to destinations abroad might not be the most economical way of exploiting the opportunities in other markets of the world. In many cases, it may be more beneficial and preferable for the company to sell the invention (perhaps the foreign patent and related property rights) to a buyer located in a particular foreign country or to license the manufacture of such products to a local enterprise for royalty.

Quite often, the most efficient way of commercial exploitation of the product or invention is for the company to establish a manufacturing facility in one or several foreign countries. In most cases this will mean that the company will establish a subsidiary incorporated in the foreign country in which the manufacturing facility will be located. Numerous business considerations may dictate the use of such an offshore manufacturing subsidiary. For example, a US company desiring to sell its products in the European Economic Community (EEC), may find that the only way it can do so on a competitive basis is by establishing a local subsidiary to manufacture the products within the EEC. It is likely to find that the direct shipment of its products from the United States to the EEC would not be profitable because of the additional freight costs and EEC customs duties imposed on finished products imported from the United States. A lack of "presence" within the EEC might also be harmful. A Japanese manufacturing company may find that it is desirable to establish a manufacturing subsidiary in Thailand, Malaysia or Indonesia where the labour costs would be a fraction of the comparable labour costs in Japan. A German car manufacturer may find that it is preferable to establish a subsidiary company in the United States to produce its cars in this country in order to make its products more acceptable in the US market.

Normally, the foreign manufacturing subsidiary will need the manufacturing technology, know-how and perhaps patent protection of its parent corporation. When such industrial property rights are furnished to the offshore subsidiary as part of the licensing arrangement, the subsidiary will pay a royalty to its parent corporation for the license which permits it to use such manufacturing intangibles in its business. This will then raise the question what should be the rate of royalty payable by the

Stephen A. Mihaly is a partner at Mihaly, Schulyer & Mitchell in Los Angeles, California. He obtained his J.D. from the University of San Diego Law School, and is a member of the California Bar. He has written numerous publications on international taxation.

manufacturing subsidiary to its parent corporation for the license of such intangibles.

I. TRADITIONAL RULE OF DETERMINING ARM'S LENGTH RATE OF ROYALTY

In most cases, the rate of royalty paid by the manufacturing subsidiary to its parent corporation for the use of its intangibles could have significant tax ramifications. This is so partly because most countries do not tax on a current basis the profits realized by the company's offshore manufacturing subsidiary. Thus, if the corporate tax in the particular foreign country is significantly lower than the rate of the corporate tax in the parent corporation's home country, the parent corporation could derive a substantial tax benefit by receiving a relatively modest royalty from its manufacturing subsidiary.

Therefore, fiscal authorities of industrially developed countries have been giving attention to the matter of the rate of royalty payable by the offshore manufacturing subsidiary to its parent corporation and the rate of royalty in international licensing arrangements in general for some time.

The general principle has developed that the rate of royalty payable under such circumstances should be "arm's length". This general principle was adopted by the Council of the Organization for Economic Cooperation and Development (OECD) in 1979. Section 91 of the Report of the OECD Committee on Fiscal Affairs (entitled "Transfer Pricing and Multinational Enterprises"), approved by the OECD Council, stated this general rule as follows:

> The general principle to be taken as the basis for the evaluation for tax purposes of transfer prices between associated enterprises under contracts for licensing patents or know-how is that the prices should be those which would be paid between independent enterprises acting at arm's length. It follows from this that such transactions should not be treated differently for tax purposes from similar transactions between independent parties solely by virtue of the fact that the enterprises are associated.

The OECD Report also describes other methods of determining the arm's length rate of royalty "where a sufficiently similar transaction involving an unrelated party cannot be found, or does not provide satisfactory evidence" (Section 98).

This general approach, with emphasis on comparables involving unrelated parties, has been adopted by the tax laws of most industrially developed countries.

Substantially the same approach was in existence in the United States, at least since 1968. In that year, the IRS promulgated regulations under Section 482 of the IRC. Reg. §1.482-2(d)(2)(ii)(1968) contained the following general principle:

> In determining the amount of an arm's length consideration, the standard to be applied is the amount that would have been paid by an unrelated party for the same intangible property under the same circumstances. Where there have been transfers by the transferor to unrelated parties involving the same or similar intangible property under the same or similar circumstances the amount of the consideration for such transfers shall generally be the best indication of an arm's length consideration.

The 1968 Regulations stated that, in the event comparable transactions between unrelated parties for the same or similar intangibles could not be found, various other factors had to be considered in determining the arm's length rate of royalty. The following 12 factors were listed:[1]

(1) prevailing rate in the same industry or for similar property;
(2) competing offers or bids;
(3) terms of the licensing, such as limitation on the geographic area covered and the exclusive or non-exclusive character of the license;
(4) uniqueness of the property and the period of time for which it is likely to remain unique;
(5) duration and extent of legal protection of the property;
(6) value of services rendered by the licensor to licensee in connection with the license;
(7) licensee's prospective profits or cost savings;
(8) licensee's capital investment and start-up costs;
(9) availability of substitutes;
(10) arm's length rates and prices paid by unrelated parties where the property is resold or sublicensed to unrelated parties;
(11) cost of developing the intangible property;
(12) other relevant facts or circumstances.

In applying these regulations, the IRS had the added advantage that the taxpayer had the burden of proof to show that the determination made by the IRS that the income or deductions should be re-allocated between related parties was arbitrary, unreasonable or capricious. In the event the taxpayer was not able to satisfy this burden of proof, the determination of the IRS would be upheld. Thus, in practice, the taxpayer would have to prove that the determination made by the IRS was not correct and that the method used by the taxpayer in determining the arm's length royalty or some other alternative licensing arrangement satisfied the arm's length standard.[2]

It would have been reasonable to expect that the IRS should be able to prevent abuses of Section 482 by taxpayers based on the rules contained in its 1968 Regulations and enjoying the substantial tactical advantage that the burden of proof to prove the incorrectness of the determination of the IRS was on the taxpayer.

II. ADOPTION OF SUPER ROYALTY CONCEPT BY TAX REFORM ACT OF 1986

During the years 1984 and 1985, the US Treasury Department was becoming increasingly unhappy about the 1968 Regulations, claiming that the "arm's length" approach of such regulations was not sufficiently effective to protect the Treasury's interests. Apparently, the IRS auditing agents were not able to cope with the arguments and evidence advanced by the taxpayers' representatives.

Often, the taxpayers prevailed by relying on prevailing rates of royalties in the particular industry, even though the intangible property licensed to its controlled party was unique and highly profitable. The Treasury Department asked Congress to remedy the situation. By the summer of 1985, a rather

© 1993 International Bureau of Fiscal Documentation

highly charged atmosphere had developed on this issue in Congress.

As a result, in the Tax Reform Act of 1986 Congress added a sentence to Section 482 reading as follows:

> In the case of any transfer (or license) of intangible property (within the meaning of section 936(h)(3)(B)), the income with respect to such transfer or license shall be commensurate with the income attributable to the intangible.

This, of course, is a rather cryptic statement. It does not tell how the rate of royalty should be determined in such a manner as to satisfy the "commensurate-with-income" requirement. Congress instructed the Treasury Department and the IRS to deal with the details of the new rule and to determine how the provisions of the 1968 Regulations should be amended in order to comply with the new commensurate-with-income rule. The new rule has subsequently become known as the "super royalty rule".

The legislative history makes it clear, however, that the new rule does allow, or even provides for, a periodical review or adjustment of the rate of the royalty in order to bring the royalty rate in conformity with the income stream of the licensee. For example, if a royalty equal to 10 percent of sales was arm's length when the controlled licensee's after-royalty pre-tax income was equal to 20 percent of its sales, the 10 percent royalty would no longer be arm's length in a subsequent year when the controlled licensee's after-royalty pre-tax income was equal to 50 percent of sales. The rate of royalty would have to be increased to make it commensurate with the income realized by the controlled licensee from the use of the intangibles.

In its Report, the House Ways and Means Committee stated that "in requiring that payments be commensurate with the income stream, the bill does not intend to mandate the use of the "contract manufacturer" or "cost-plus" methods of allocating income...".[3] This statement in the Congressional Report made the "contract manufacturer" approach a sort of taboo to the officials of the Treasury Department and the IRS charged with the duty to develop the regulations applying the new super royalty rule. The drafters faced the dilemma that in most cases the new super royalty rule could not be given meaningful application unless the controlled licensee would be treated, in effect, as a contract manufacturer, so that the task then became to accomplish approximately such treatment and result without ever using the words "contract manufacturer" or "contract manufacturer method".

III. HISTORICAL DEVELOPMENT OF 1993 REGULATIONS

When the super royalty rule was enacted by Congress in 1986, the new provision became effective in the taxable year beginning after 31 December 1986. The super royalty rule was heralded as one of the most revolutionary and significant changes in our tax laws. Thus, it would have been reasonable to expect that the IRS would promulgate regulations explaining the exact meaning of the new rule within a short period of time. Nevertheless, the IRS did not succeed in promulgating such regulations until 13 January 1993. Thus, amazingly, six full years went by without giving any guidelines to taxpayers about the meaning of the new provision. This is also likely to mean that six full years were wasted in actual application and enforcement of the new super royalty rule, thus presumably allowing the perceived abuses of the arm's length standard of the 1968 Regulations and the resulting perceived huge revenue losses to the US Treasury to continue.

The first effort of the IRS, in explaining the meaning of the super royalty rule, was the issuance of "A Study of Intercompany Pricing", also known as the "White Paper", on 18 October 1988.[4] The White Paper stated that when so-called "exact comparables" were available, the arm's length rate of royalty would be determined on the basis of such exact comparable transactions. However, the exact comparable transactions were defined rather narrowly so that it was not likely that this method could in fact be used. In the absence of exact comparables, the taxpayer was supposed to use inexact comparables or the so-called basic arm's length return method ("BALRM" method) which was based on the application of arm's length rate of return on the assets and functions of the relevant line of business of the controlled party. In practice, the principal rule of the White Paper would have been the BALRM method. In addition, the White Paper provided for periodic review and adjustments in the rates of intercompany royalties.

The "basic arm's length return method" was quickly discredited as nothing but a glorified version of the contract manufacturer method.

After four long years, in January of 1992, the IRS promulgated Proposed Regulations (1992 Proposed Regulations). Even though much of the analysis contained in the White Paper was discredited, the 1992 Proposed Regulations generally followed the approach of the White Paper. The 1992 Proposed Regulations provided for three methods of determining the arm's length rate of royalties:

1. *The matching transaction method.* The application of this method was enormously restricted since it could be applied only if there was evidence of comparables involving the *same* intangibles and the same or substantially similar economic conditions and contractual terms as the licensing involving a controlled company.

2. The *comparable adjustable transaction method* which could be applied when there was evidence regarding the same or similar intangibles under adjustable economic conditions and contractual terms.

3. The *comparable profits method* which was based on the use of the so-called "comparable profit interval", or "CPI".[5]

These three methods were supposed to be applied in the above indicated order of priority. However, the CPI would have been also used as a check on the application of method 2 (the comparable adjustable transaction method) so that, in final analysis, because of this and because of the fact that method 1 (the matching transaction method) could in fact almost never be applied, in practically all cases the arm's

5. Prop. Reg. §§1.482-2(d)(1)-(5)(1992).

© 1993 International Bureau of Fiscal Documentation

length rate of royalty would have been determined under the CPI method.

The 1992 Proposed Regulations would have pushed the super royalty concept to its ultimate extreme application. In practice, all controlled licensees would have been limited to a modest return normally realized by contract manufacturers and the rest of the profit would have been allocated to the parent corporation owning the intangibles in the form of very high royalties. One example in the 1992 Proposed Regulations[6] indicated a reallocation from the controlled party of royalty equal to 66 percent of its sales of licensed products.

There was a tremendous outpouring of objections against the 1992 Proposed Regulations. Representatives of many foreign governments indicated that the basic approach of such regulations was in conflict with the general principle of the arm's length rule adopted by practically all economically developed countries, that they would not accept the determinations made by the IRS on the basis of the CPI method and that the regulations were in conflict with provisions of existing income tax treaties. US Treasury officials then indicated that the proposed regulations would have to be substantially revised.

The next development was the issuance by the IRS, on 13 January 1993, of new Temporary and Proposed Regulations under Sections 482 and 6662 (dealing with penalties).

The new Temporary Regulations replace the provisions of the 1968 Regulations governing intercompany licensing completely and they also completely replace the 1992 Proposed Regulations (except for the chapter on research and development cost sharing). Since the Temporary Regulations are quite different from the 1992 Proposed Regulations, it would have been more appropriate to issue them in form of proposed regulations. The fact that they have been issued in form of temporary regulations means that they have the force of law from their effective date. They will continue to have the force of law until final regulations will be issued or for a period of three years from their effective date, whichever occurs first.

The 1993 Proposed Regulations contain rules on the profit split method (with the expectation that such provisions will be subsequently inserted in the Temporary Regulations), rules regarding the application of the accuracy-related penalties imposed by Section 6662 in the event of Section 482 adjustments (such as adjustments to the royalty rates) and rules relating to the so-called blocked income issue.

The Temporary Regulations[7] and the Proposed Regulations under Section 6662 are effective for taxable years beginning after 21 April 1993. Thus, in the case of taxpayers using a calendar year, they will become effective as of 1 January 1994.

The 1993 Proposed Regulations dealing with the profit split method[8] do not have a determined effective date, the expectation being that the effective date of such provisions will be determined when the regulations will be finalized.

The 1968 Regulations have been renumbered as Reg. §§1.482-1A and 1.482-2A. They are now effective for taxable years beginning on or before 21 April 1993. Thus, for example, again in case of a taxpayer using a calendar year, such regulations will remain in effect through 31 December 1993.

Even though the super royalty rule of the Tax Reform Act of 1986 applies to taxable years beginning after 31 December 1986, technically, there are now no new Section 482 regulations applicable to past taxable years (with respect to calendar year taxpayers through 31 December 1993), other than the 1968 Regulations. However, the Temporary Regulations state that "any reasonable method not inconsistent with the statute" could be used during the interim period of time (1987-1993) and further that the rules set forth in the Temporary Regulations will constitute a "reasonable method" for this purpose.[9]

IV. NEW METHODS OF DETERMINING ARM'S LENGTH RATE OF ROYALTY

The new regulations provide for four methods of determining the arm's length rate of royalty in a controlled transaction. These four methods are as follows:[10]

(a) comparable uncontrolled transaction method,
(b) comparable profits method,
(c) profit split method, and
(d) "other methods".

Although the regulations list these several methods of determining the arm's length rate of royalty, they do not provide for any strict priority rules. Instead of providing for any priority rules, the regulations adopt a new approach referred to as the "best method rule". Under this rule, the arm's length rate of royalty must be determined by using the method which provides the *most accurate* arm's length result under the relevant facts and circumstances.[11]

A. *Comparable uncontrolled transaction method*

The comparable uncontrolled transaction method ("CUT method") is similar to the basic principle of determining an arm's length rate of royalty contained in §1.482-2(d)(2)(ii) of the 1968 Regulations and Section 91 of the OECD Report. The regulations state that, for purposes of applying the best method rule, "the comparable uncontrolled transaction method, when it can reasonably be applied on the basis of available information, ordinarily will provide the most accurate measure of an arm's length charge for the transfer of intangible property".

Thus, even though the regulations do not provide for an order of priorities in which the various methods should be applied, this provision, coupled with the fact that the CUT method is mentioned in the first place, gives some edge to the CUT method over the other methods. It is relevant in this respect that the regulations state that the CUT method will ordinarily provide the "*most*" accurate measure of an arm's length charge for purposes of the best method rule. This should be contrasted with the language used in the regulations describing the comparable profits method which states only that, for

11. Temp. Reg. §1.482-1T(b)(2)(iii)(A).

© 1993 International Bureau of Fiscal Documentation

purposes of the best method rule, the comparable profit method ordinarily will provide an "accurate" measure of an arm's length result.

B. *Comparable profits method*

The regulations list the comparable profits method as the next method for determining the arm's length of royalty payable by the controlled licensee. The comparable profits method is described in Temp. Reg. §1.482-5T. It is a simplified version of the comparable profits method which was contained in the 1992 Proposed Regulations (based upon the CPI). However, unlike the comparable profits method of the 1992 Proposed Regulations, the comparable profits method of the Temporary Regulations does not serve as a check on the validity of the other methods such as the CUT method. Thus, the comparable profits method is now simply another method of determining the arm's length rate of royalty.

Under the comparable profits method, the arm's length rate of royalty is determined by calculating profit level indicators from the financial information of comparable uncontrolled parties and applying the profit level indicators to one of the parties involved in the controlled transaction so as to determine the arm's length operating profit of such party. As already mentioned, the regulations[12] state that for purposes of applying the best method rule, the comparable profits method will ordinarily provide an accurate measure of an arm's length result.

The first step in applying the comparable profits method is to determine the "tested party". This would normally be the licensee unless the licensee also uses valuable, non-routine intangibles that it either acquired from uncontrolled taxpayers and with respect to which it bears significant risks and possesses the right to significant economic benefits or it has developed itself, in which case probably the profit split method of the 1993 Proposed Regulations would be a more appropriate method of determining the arm's length rate of royalty.[13]

Ordinarily, the comparable profits method should be applied separately to each "industry segment" of the tested party. This means a product or product line.[14] When it comes to the standard of comparability required under the comparable profits method, it is rather lax. The regulations[15] state that in applying the comparable profits method "the controlled and uncontrolled taxpayers need be only broadly similar, and significant product diversity and some functional diversity between the controlled and uncontrolled transactions is acceptable". In other words, even though the products are quite different and the functions performed by the uncontrolled licensee might be different from the functions performed by the controlled licensee, the information may still be used under the comparable profits method. However, the greater the similarity between the tested party and the comparable party, the more reliable would be the evidence under this method. If reliable data relating to comparable parties that operate within the same industry segment as the tested party are available, such data are required to be employed for purposes of the application of the comparable profits method.

The regulations describe a number of adjustments that should be (but are not required to be) made with respect to the comparable parties. Such adjustments are made only to the extent that they have a definite and reasonably ascertainable effect on operating profits. Accounting reclassification also may be made to ensure that various items are measured consistently.

The regulations state, in effect, that the rate of the royalty paid by the licensee will be considered arm's length under the comparable profits method if the licensee's reported operating profits are within the arm's length range consisting of a range of constructive operating profits derived from comparable parties.[16] Constructive operating profits are calculated by applying profit level indicators derived from the comparable parties to the tested licensee's financial data.

The regulations indicate several types of profit level indicators.[17] Among the various possible profit level indicators, one single profit level indicator must be selected. Such selection should be based on the nature of the activities of the licensee, the reliability of data available with respect to uncontrolled parties and the extent to which a particular profit level indicator is likely to produce a reasonable determination of the income that the licensee would have earned had it paid royalty at an arm's length rate.

The regulations mention three particular profit level indicators by name, namely the rate of return on assets, ratio of operating profit to sales and ratio of gross profit to operating expenses. The regulations seem to favor the return on assets profit level indicator provided the licensee does have substantial fixed assets or working capital which play a significant role in generating operating profit. When financial ratios, such as the above mentioned ratios of operating profit to sales or ratios of gross profit to operating expenses are used, more stringent comparability will be required than when the rate of return on assets is used as a profit level indicator.

In making the computations under the comparable profits method, interest, dividends or extraordinary gains and losses are excluded from the computation of "operating income" and interest expense and income taxes are excluded from "operating expenses". The term "operating assets" which is relevant when the return on assets profit level indicator is used does not include excess cash, portfolio investments or investments in subsidiaries.

Under the comparable profits method, the results of the controlled licensing arrangement will be considered arm's length if the licensee's operating profits will be within the range of the constructive operating profits derived from comparable parties. Normally, all such calculations should be made on the basis of several years, consisting of the taxable year and the preceding two taxable years.[18]

12. Temp. Reg. §1.482-5T(a).
13. Temp. Reg. §1.482-5T(a),(b)(1).

17. Temp. Reg. §1.482-5T(d).
18. Temp. Reg. §1.482-5T(d)(1).

© 1993 International Bureau of Fiscal Documentation

If the comparability standards of the comparable profits method are met and adjustments to reflect the differences between the controlled licensee and the uncontrolled parties are made, the arm's length range will include all of the constructive operating profits derived from the comparable parties. By way of illustration, in the event the return on assets profit level indicator is properly used and it shows that comparable unrelated licensees derived an operating profit equal to 4, 6 and 8 percent of their respective assets, and the controlled licensee's operating profits are equal to 7 percent of its assets, then the royalty actually paid by the controlled licensee will be considered arm's length.

If, on the other hand, the comparability standards are not met, or the adjustment for the mentioned differences are not made, then the arm's length range will consist of the interquartile range from the 25th to the 75th percentile of the constructive operating profits derived from the profit level indicators of the comparable parties (assuming the existence of at least four comparable parties).

In practice, it is likely that the use of the comparable profits method will result in reducing the profit of the controlled licensee to modest amounts. The preference of the profit level indicator based on return on assets is likely to further reduce the controlled licensee's profits. The fact that it may be almost impossible for the taxpayer to obtain reliable business segment or product line financial data relating to uncontrolled parties which would be somewhat comparable to the controlled licensee will not make the matter any easier for the taxpayer. Normally, financial data for business segment of product lines are not separately shown in publicly available financial documents. Therefore, usually, broad industry averages will have to be used in applying the comparable profits method, which could produce highly distorted results. Of course, there is the danger that the IRS would be using such data, based on broad industry averages, and sometimes even involving operations in other countries than in the country in which the controlled licensee operates.

The regulations do not contain any illustration of how the comparable profits method would be applied in connection with licensing of intangibles, except for the example contained in Temp. Reg. §1.482-5T(g), Example 3, which, for some reason, uses an extreme case of a "round-trip" transaction. In this example, a US parent corporation grants a manufacturing license to its foreign subsidiary to produce some high-tech products. The foreign subsidiary manufactures such products and sells them to a US subsidiary of the parent corporation for distribution in the United States. The price charged by the foreign subsidiary to its US sister company is arm's length. The foreign subsidiary also pays a royalty to its parent corporation at the rate of 5 percent of sales. In the example, the IRS increases the 5 percent royalty to 56 percent so that the operating profit of the foreign subsidiary becomes $ 3,750 which is 15 percent of its operating assets and 12.5 percent of its sales.

No explanation is given how the results would differ if the foreign subsidiary would not sell its products to the United States, but to sister companies abroad, or if it would sell them directly to unrelated customers, although the greater functions and risks assumed by the foreign subsidiary would then hopefully require the finding of profit level indicators of other companies dealing with unrelated parties and performing such more substantial functions and assuming such additional risks and such profit level indicators would show higher profits.

Many foreign manufacturing subsidiaries do not require large capital in form of fixed assets or working capital. Thus, for example, if the operating assets of the foreign licensee are $ 1 million and the arm's length rate of return on assets is 15 percent, this would mean that the operating profit of the licensee could be only $ 150,000.

In most cases, the application of the comparable profits method will cut back the profit of the controlled licensee very substantially. In this manner, the practical operation of the comparable profits method can be compared with the approach which Thrasybulus, Prince of Miletus, suggested some 2,500 years ago. Herodotus, *The History*,[19] describes this as follows:

> "At the beginning Periander [King of Corinth] was gentler than his father had been. But afterwards, when he had dealt, by messengers, with Thrasybulus, prince of Miletus, he became yet bloodier than Cypselus. For he sent a herald to Thrasybulus inquiring about the safest political establishment for administering the city best. Thrasybulus led out Periander's messenger, outside the city, and with him entered a sown field; then he walked through the corn, questioning, and again questioning, the herald about his coming from Corinth. And ever and again as he saw one of the ears of corn growing above the rest he would strike it down, and what he struck down he threw away, until by this means he had destroyed all the fairest and strongest of the corn. So he passed through the whole place and, having added no suggestion, sent the herald away.
>
> When the herald came back to Corinth, Periander was anxious to know what suggestion Thrasybulus had made. But the man said that Thrasybulus had made no suggestion at all, and indeed he wondered what sort of a man this was he had been sent to, a madman and a destroyer of his own property; for he recounted all that he had seen Thrasybulus do. But Periander understood the act of Thrasybulus and grasped in his mind that what he was telling him was that he should murder the most eminent of the citizens."

Thrasybulus' advice to Periander was to cut back on all outstanding people so that all folks would be simple and modest people. The message of the comparable profits method is to cut back the profit of the foreign manufacturing licensee, preferably to a modest rate of return on assets. Such matters as business efficiencies or talent and competence of the management of a controlled foreign licensee are not likely to get consideration when such approach is used.

One additional danger inherent in the comparable profits method for the taxpayer is the enormous relaxation, and perhaps the complete waiver, of the comparable uncontrolled transaction requirement. The absence of comparables would only reduce the reliability of the comparable profits method under the best method rule, but the comparable profits method could still be applied even though the relevant data would fail to meet the comparability standards of the comparable profits method and this result could be prevented only by showing

19. Chicago: University of Chicago Press, 1987. Herodotus was a 5th century BC Greek historian; he is generally referred to as the "father of history".

© 1993 International Bureau of Fiscal Documentation

that some other method, such as particularly the CUT method, would be more reliable under the best method rule.

It should be noted that the profit level indicators offered by the new regulations could have been considered also under the "other facts and circumstances" factor of the 1968 Regulations.

C. *Profit split method*

Another method of determining the arm's length rate of royalty in controlled licensing arrangements is the profit split method. This method is described in the Proposed Regulations issued by the IRS in conjunction with the Temporary Regulations.[20]

In order to be entitled to use the profit split method, several conditions must be satisfied. The application of the profit split method must, first of all, satisfy the best method rule. Furthermore, each party to the controlled licensing arrangement must own valuable, "non-routine" intangibles acquired from a third party or developed by itself. In other words, it is necessary to show that the controlled licensee owns some valuable, non-routine intangibles which it acquired from a third party (the controlled licensee possessing the burdens and benefits associated with the intangible) or that the licensee has developed such valuable, non-routine intangibles itself. Intangibles developed pursuant to a qualified cost sharing agreement to which the controlled licensee is a party, will qualify for this purpose.[21]

The ownership of such valuable, non-routine intangibles by the controlled licensee is thus a very basic condition to using the profit split method. Unfortunately, the regulations do not explain what is meant by "valuable, non-routine intangible". The Preamble to the regulations requests comments on the possible precise definition of such term. Thus, the regulations make the ownership of "valuable, non-routine intangibles" by the controlled licensee a prerequisite for the use of the profit split method, but they do not explain what such term means and, in effect, tell the taxpayers: "Should you know a person who knows what this means, please let us know."

For the time being, the only indication what intangibles could qualify as "valuable, non-routine intangibles" is in two examples contained in the Proposed Regulations. The first example is in Prop. Reg. §1.482-6T(c)(2)(iii). This example involves a US intangible which is a formula for a detergent that causes less water pollution. This US intangible contributes 30 percent of the combined profit of the controlled group. In addition, there are four European intangibles that, in total, contribute 60 percent of the total combined profit. These European intangibles consist of European marketing network, European brand name, alteration of the detergent formula for the European market and development of a fragrance for the European market. These are useful illustrations of intangibles which may be acquired by the licensee from a third party or developed by the controlled licensee and which would constitute "valuable, non-routine" intangibles.

The second example is set forth in Prop. Reg. §1.482-6T(c)(3)(iii). In this example, the US parent and its European subsidiary both conduct product development, process development and sales promotion. The product development includes adaptation of the other company's products to its own market. The evidence shows that the European subsidiary's marketing intangibles represent 1.7 percent of the estimated total asset value (including tangible and intangible properties), its product R&D represents 3 percent of such asset value and its manufacturing R&D represents another 2 percent of such asset value, so that the total intangible asset value of the European subsidiary represents 6.7 percent of the total asset value (while the US parent's intangibles represent 18.3 percent of the total asset value). The example indicates that if the controlled licensee's intangibles represent at least 6.7 percent of the total assets, then this will satisfy the "valuable, non-routine intangible" ownership requirement of the regulations so that the taxpayer could then use the profit split method provided it has complied with the other requirements described for the application of such method.

Of course, the uncertainty regarding the meaning of this term will make it difficult for the taxpayer to try to use this method or risk making an election to use the method since they could not be sure that they will be able to prove that the controlled licensee does own valuable, non-routine intangibles.

The "valuable, non-routine intangible" of the controlled licensee must contribute significantly to earning the combined profit from the business activity to which the controlled transactions are attributable, and there must be significant transactions between the controlled taxpayers (the parent corporation and its controlled subsidiary licensee), and the activities of each controlled party related to the controlled transactions must contribute significantly to the combined profit or loss derived from the relevant business activity.

A further, and most devastating, requirement is that the taxpayer must make a binding election to use the profit split method. This election is made by attaching a statement to the US income tax return electing to use the profit split method. The statement must define the relevant business activity to which the profit split method will apply, identify all of the participants in such activity and define the allocation method to be used in determining each participant's proportionate share of the profits or losses from such activity. The election to use the profit split method would be effective for the taxable year with respect to which the return containing such election is filed and all subsequent taxable years. It cannot be revoked without the consent of the IRS.

It seems that if the taxpayer makes the election to use the profit split method, it could preclude itself from using other methods such as particularly the CUT method. There does not seem to be any reason why there should be such a harsh restriction. To the contrary, the administration of justice and the objective of proving what is truly the arm's length rate of royalty in intercompany licensing would require that all relevant evidence, information and arguments could be put on the table. In the past, the taxpayers and the IRS did often have pertinent information under both what is now called the CUT method and the profit split method. All of such information

20. Prop. Reg. §1.482-6T.
21. Prop. Reg. §1.482-6T(b)(1).

© 1993 International Bureau of Fiscal Documentation

was relevant and useful in the final determination of the arm's length rate of royalty.

It seems unreasonable to put the taxpayer in the predicament that the only way it could rely on evidence qualifying under the profit split method would be for it to give up on evidence and arguments it would have under some other method, such as particularly the CUT method. For example, the taxpayer could very well have information that would seem to qualify under the CUT method and it could also have evidence that could qualify under the profit split method. In view of the uncertainties of all of these rules, the taxpayer could not be sure which of the methods will be given greater weight and it would be in an impossible situation if the only way it could preserve its rights to claim the evidence qualifying under the profit split method would be by electing the profit split method as the exclusive method determining the arm's length royalty it could rely on. The harshness of this requirement is likely to discourage taxpayers from daring to make an election under the profit split method and this is likely to result in reducing the extent to which this method would in fact be used under the new regulations.

In addition to filing the above mentioned written statement with its US corporate tax return, the taxpayer must document the combined profit or loss attributable to the relevant business activity and that the profit split method provides the most accurate measure of an "arm's length result".[22]

The Proposed Regulations provide for three specific profit split methods. All of such methods divide the profit between related parties on the basis of the relative value of their contribution to that profit.[23] In applying these methods, the role of comparables is substantially diminished or sometimes even completely eliminated.

The three specific methods described in the regulations are as follows:

1. Residual allocation method

This method is similar to the basic arm's length return method that was described in the White Paper. In applying this method, two separate steps must be taken. In the first step, it is necessary to allocate operating income to each related party (i.e. licensor and licensee) to provide a "market return" for its contributions to the relevant business activity other than valuable non-routine intangibles. These "market returns" must then be subtracted from the combined profit of the licensing activity. What remains is called "residual profit". The residual profit must be allocated between the licensor and licensee on the basis of (a) market value of intangible assets; (b) capitalized value of the intangible development expenditures; or (c) where the intangible development expenditures of the related parties are relatively constant over time, the relevant value of actual expenditures in recent years may be used to estimate the relative value of intangible contributions (rather than capitalizing such expenditures). Where the relevant intangible development expenditures are difficult to identify or where the facts and circumstances indicate that a comparison of such expenditures does not satisfactorily approximate the relative values of the related party's contributions, other methods may be considered. It should be noted that the residual allocation method does not require reference to the profitability of any comparable intangibles.

2. Capital employed allocation method

Under this method, the parties' combined income is divided between them by allocating an equal return to each party's capital employed. Capital employed is defined as the sum of operating assets and intangible assets. This method does not require reference to any comparable at all.

3. Comparable profit split rule

Under this method, the combined profit of the parties to the licensing arrangement may be apportioned based on the same percentages of the operating profit earned by unrelated parties participating in a similar licensing arrangement. A controlled licensee must be functionally comparable to the licensee involved in the unrelated transaction.[24] An illustration of this method would be if the evidence would show that a comparable licensor had made arrangements with an unrelated licensee dividing the combined profit from such business by allocating 75 percent of the profit to licensee and 25 percent to licensor. If such evidence is available, the rate of the royalty in the intercompany licensing contract could be fixed at a percentage that would produce allocating 75 percent of the combined profit income to controlled licensee and 25 percent of the combined profit to licensor. Reliable financial data must be available regarding the parties involved in the uncontrolled transaction. Finally, the combined profit split method may not be used if the combined return on capital earned by the uncontrolled parties varies significantly from the combined return on capital earned by the parties to the controlled licensing arrangement.

V. US PARENT CORPORATION LICENSING ITS FOREIGN SUBSIDIARY

Which particular method of determining the arm's length rate of royalty should the licensor US parent corporation prefer may depend on many circumstances, including the rate of foreign corporate tax imposed on the profits of its licensee subsidiary. Normally, it can be expected that the parties to the intercompany licensing arrangement would prefer to use the CUT method. This is so partly because, of course, the CUT method is more like the traditional method, similar to the traditional basic principle of determining the arm's length rate of royalty as described in the OECD Report and the 1968 Regulations. Thus, the US parent corporation will generally be more familiar with the meaning of the CUT method. In addition, no matter how difficult it is to find reliable comparables, it may still be easier to find reasonable comparables under the CUT method rather than under the novel approach of the comparable profits method.

If the manufacturing operations of the controlled licensee are located in a country with relatively low corporate tax rates such as Ireland, Singapore, Hong Kong, Thailand or Puerto

22. Prop. Reg. §1.482-6T(d).

Rico, then the US parent corporation can even hope to achieve some tax savings by keeping the rate of royalty payable by its foreign subsidiary at some reasonable level. Many foreign countries grant complete or partial exemptions or reduced tax rates for local manufacturing operations, particularly when the products are shipped for export.

Let us take the example of Able Corporation which is a California corporation manufacturing and selling disc drives. It is a privately owned company. The principal shareholder and President of the company is John Able. Able Corporation hopes that it could develop a market for its products in Europe and particularly in the EEC. It is planning to establish a manufacturing subsidiary in Ireland. The Irish subsidiary would manufacture one particular type of disc drive in Ireland and would ship the products to customers throughout Europe. John knows that the labour costs in Ireland are much lower than in the United States and that the Irish Government would furnish the Irish company with valuable financial and other assistance. Among other things, a suitable factory could be leased at a very favorable rent. John already has found four very capable Irishmen who will run the Irish operations. These people know how to do business in Europe which would be helpful. The profits of the Irish company would be further increased since the cost of freight of shipping the disc drives from the United States to Europe will be saved and it will not be necessary to pay the EEC customs duty. As a matter of fact, careful studies indicate that the only way Able Corporation would be able to develop a market for its products in Europe would be through the Irish facility.

Of course, Able Corporation would have to grant a license to the Irish subsidiary to use the corporation's patents and related industrial property rights in Ireland and the rest of Europe. The question would then arise as to what should be the rate of royalty payable by the Irish subsidiary to Able Corporation.

There are many excellent disc manufacturing companies in California. One such company is Brown Corporation which is a publicly held corporation. Its founder and President is Sam Brown. Even though Able Corporation and Brown Corporation are competitors, John and Sam became friends some time ago. Some 20 years ago, they used to work together for IBM. Since then, they have established their respective companies and both of them have been quite successful. John meets Sam from time to time on the golf course.

Brown Corporation entered the European market two years ago. It has done so by granting a license to an unrelated Irish company which manufactures two types of Brown Corporation's disc drives for sale to customers in Europe. Information regarding the licensing arrangements between Brown Corporation and its unrelated Irish licensee is set forth in a report filed by Brown Corporation with the Securities and Exchange Commission. From such report, John learned that the Irish company pays Brown Corporation a 10 percent royalty and that Brown Corporation also furnishes the Irish company with certain parts at a price equal to cost plus 35 percent mark-up. Able Corporation will probably furnish its Irish subsidiary with similar parts also. John obtained some further relevant information from Sam regarding Brown Corporation's Irish operations. John, Sam and others in the industry know that the two types of disc drives licensed by Brown Corporation to its unrelated Irish licensee include a somewhat more advanced, efficient and valuable technology than the technology incorporated in the disc drive which Able Corporation's Irish subsidiary will manufacture and sell in Europe. The difference is perhaps 10 percent. Therefore, if the arm's length rate of royalty payable for the industrial property rights relating to Brown Corporation's disc drive is 10 percent, the arm's length rate of royalty for the license to manufacture Able Corporation's disc drive should be 9 percent. John concludes that, to be on the conservative side with the IRS, Able Corporation should be using a 10 percent rate. Also, if certain components or parts will be supplied by Able Corporation to its Irish subsidiary, they will be sold at cost plus 35 percent mark-up.

John feels that this arrangement should be as arm's length as humanly possible. Tax saving is not John's main objective. He wants to enter the European market and be able to remain in competition in this business. He does hope, however, that the Irish subsidiary will do well. In view of the good management of the Irish company, its efficiency, savings in labour and transportation costs, it is possible that the Irish subsidiary will end up with a profit equal to 25 percent of its sales even after paying the 10 percent royalty to Able Corporation.

John is a person who likes to do business and is willing to take such substantial risks as are involved in establishing manufacturing operations abroad. He is not a person who likes to spend much time with tax advisors, attorneys, economists and similar professionals and incur large expenses in connection with the services of such professionals.

Under these circumstances, would John be well advised to proceed with his plans, have Able Corporation grant a license to the disc drive to the Irish subsidiary for a 10 percent royalty, based on a short contract between the two companies?

The answer to this question under the tax laws of many other countries would most likely be positive. Able Corporation would seem to have a strong comparable and the arrangements would seem to be reasonable. There would be a good chance that the auditing agents in such countries would not take serious issue with such arrangements.

However, in the United States, under the new regulations, the answer to the question would be a definite "No." John would have to realize that, under the new regulations, Able Corporation would not have assurance that the 10 percent rate of royalty would hold up on audit. If the rate of royalty would be increased to, say, 21 percent, Able Corporation would expose itself to the risk of being subject to the 20 percent nondeductible penalty imposed by Section 6662. If at that time the basic rate of US corporate tax would be 36 percent, the 20 percent penalty would amount to 7.2 percent which, in effect, would increase the effective rate of US corporate tax imposed on the reallocated royalty income to 43.2 percent. If, on audit, the rate of the intercompany royalty would be increased to, say, 41 percent, Able Corporation could be subject to penalty at the rate of 40 percent which would amount to 14.4 percent (40 percent of 36 percent), thus increasing the effective rate of total US taxes imposed on reallocated royalties to 50.4 percent!

© 1993 International Bureau of Fiscal Documentation

These would be too high risks for John to take. At least, he would have a much better chance of eliminating the Section 6662 penalties by having his homework done in detail, which would include obtaining tax opinions from professionals, making a detailed analysis of complying with the new Section 482 regulations and conducting the relevant economic studies.

In the above analysis, we were assuming that Able Corporation is establishing a manufacturing subsidiary in a relatively low-tax country. What would be the situation if the manufacturing subsidiary would be established in a high-tax country? Would then the analysis of the tax considerations be different?

By way of illustration, let us assume that Able Corporation is also planning to establish a manufacturing subsidiary in Japan to manufacture the same disc drive which the Irish subsidiary would manufacture for the European market. The Japanese subsidiary will manufacture and sell the disc drive in Japan, mainly to customers in Japan and perhaps also to customers in other countries of the Far East. Again, Able Corporation may find that the only way to develop a market for its products in Japan is to establish a local manufacturing subsidiary and to license such subsidiary to manufacture the disc drives in Japan.

What should be the rate of royalty to be charged to the Japanese subsidiary?

This time, John would not mind if the Japanese subsidiary could pay a higher royalty, perhaps as high as 30 percent of sales. The Japanese corporate tax burden is likely to be in the area of 55 percent. Royalties are subject to only a 10 percent Japanese withholding tax. Since the Japanese tax burden is much higher than the US corporate tax rate, this would be a preferable arrangement. However, John would realize that this would be difficult to accomplish. First of all, he would know that 10 percent is more likely to be the arm's length rate of royalty. Able Corporation would already have a licensing arrangement with its Irish subsidiary providing for a 10 percent royalty. How could then a 30 percent rate of royalty be justified to the Japanese tax inspector when the operations of the Japanese subsidiary in Japan would be quite similar to the operations of the Irish subsidiary in Europe? Therefore, Able Corporation might be content to use the 10 percent rate of royalty with respect to the Japanese subsidiary also. In this manner, at least, the arrangements are consistent.

However, this would not be the end of Able Corporation's problems. When, in connection with the audit of Able Corporation's intercompany licensing arrangements, the IRS would determine that the arm's length rate of royalty, perhaps under the comparable profits method, is equal to 30 percent of sales, then a substantial reallocation of additional royalty income would be made both from Ireland and Japan. However, of course, the Japanese tax inspector would be under no obligation to accept such reallocation. He would say that this is a purely domestic matter between the IRS and Able Corporation and that, for Japanese tax purposes, the additional 20 percent royalty will not be allowed as a deduction. This would mean that the amount represented by such royalty would remain fully taxable in Japan. If the moneys have been in fact paid out as royalties by the Japanese subsidiary to Able Corporation, such distribution would most likely be treated as dividends, not deductible, but subject to an additional 10 percent Japanese withholding tax. In this case, Able Corporation could easily find itself in a situation where it would be subject to what one could call "triple taxation". First, the amount reallocated by the IRS would remain subject to Japanese corporate taxes, at the effective rate of approximately 55 percent. The same amount would also be subject to the 10 percent Japanese withholding tax. The reallocated amount would also be taxable, of course, in the United States where the combined effective rate of US and state corporate taxes is likely to be in the area of 45 percent. Thus, the total tax burden would be approximately 110 percent.

Of course, normally, Able Corporation should be entitled to claim a credit against its US corporate tax liability for the Japanese corporate tax and for the 10 percent withholding tax (under IRC Sections 901 and 902). However, particularly if Able Corporation has substantial interest expense, the requirement that a portion of such interest expense and certain other expenses be allocated against the foreign source gross income in determining the amount of foreign source taxable income, could very substantially reduce Able Corporation's ability to obtain credit for a substantial portion of Japanese taxes.[25]

Able Corporation could also seek assistance under the so-called "Competent Authority Procedure" referred to in the income tax treaty between the United States and Japan, but would have no assurance whatsoever that such procedure would eliminate or reduce any of the mentioned taxes.

The above computation does not include yet the 20 or 40 percent penalties that could be imposed by the IRS under IRC Section 6662.

It should be noted in this connection that the regulations do not contain an exception to this harsh treatment merely because the foreign subsidiary is subject to high foreign corporate taxes.

As can be seen, the result would be disastrous. The principal losers in this tragic situation would be the US corporations trying to maintain markets for their products abroad. The losers would not be the Japanese, German or other foreign governments because they would not have to give credit to the novel approaches contained in the new Section 482 regulations. If the result would be that the US corporations could not compete in the Japanese, European or other foreign markets, this would not be a tragedy for the governments of such countries or for the Japanese, European or other foreign competitors. A German company operating in Japan would not be exposed to the same problem. A Japanese company operating in Germany would not be exposed to the same problem either. Thus, the damage would be to the US corporations which would eventually be forced to withdraw from the foreign markets. This would weaken the US corporations' overall world competitive position which could then further lead to the foreign competitors gaining the upper hand over US corporations even in the US market. The final result would be

25. IRC Sec. 904.

© 1993 International Bureau of Fiscal Documentation

the increasing control and dominance of US economy by foreign-controlled businesses.

Even though John would be fairly confident about the chances of the 10 percent royalty arrangement satisfying the arm's length test, Able Corporation would be well advised to conduct studies to see whether it could develop additional arguments and evidence under the other methods specified in the new regulations, such as the comparable profits method and the profit split method. Since the results under the comparable profits method are likely to be rather arbitrary, it is possible that evidence of profit level indicators of unrelated licensees could be found showing a relatively high rate of profit realized by such unrelated licensees.

Even gathering information under the profit split method would not be a waste of time, even though Able Corporation would not technically make the election to use such method. The fact that the taxpayer has not made an election to use the profit split method would not prevent the IRS from using such method. Usually, even the profit split method is likely to produce higher profits at the Irish subsidiary than the application of the comparable profits method. Therefore, it would be prudent for Able Corporation to have some helpful evidence available under the profit split method. A situation could develop that even the auditing IRS agent would consider it too harsh to use the results of the comparable profits method and would be inclined to do justice to the matter on the basis of some reasonable evidence under the profit split method in which case the information and evidence the taxpayer would have available might help to bring the audit to a reasonably favourable conclusion.

VI. HOW TO PREVAIL WITH THE CUT METHOD

Going back to the example of Able Corporation, John would now inquire how could he ensure that Able Corporation would be able to sustain the validity of the 10 percent royalty charged to the foreign subsidiaries under the CUT method. Of course, the very first rule, which is to the effect that normally the CUT method would produce the "most accurate" measure of arm's length royalty, is helpful. However, the approach of the new regulations is to impose numerous requirements for the actual application of the CUT method. The taxpayer must overcome a large number of hurdles to be able to prevail with the CUT method. Thus, the company will have to review a list of such "hurdles" or requirements to strengthen the chances that the CUT method will actually be applied. The checklist of factors to be considered in this connection is like a checklist of battle grounds in which Able Corporation will have to perform and prevail. Able Corporation could feel like a professional boxer facing a 12 (or more) rounds bout. It is important for the champ to score well in every round. If he goes down in round 5 for a minute, and also gets shaken up in rounds 8 and 9, he may lose. As the taxpayer's position and evidence would be shaken up in connection with some of these factors, the shadow of Thrasybulus' sword would grow.

While, as a rule of thumb, the CUT method may still be the preferred method, the approach of the regulations is to make the application of the method contingent on proving that it is the best method considering the various factors listed in the regulations. If the taxpayer does not succeed in proving that the CUT method is the best method under the regulations, considering the mentioned factors, then the IRS could assert that the comparable profits method should be applied and the profit of the Irish licensee should be cut back in accordance with the evidence presented pursuant to such method. For example, when the audit of Able Corporation's return for the taxable year commences, Able Corporation may feel that its 10 percent royalty arrangement with its foreign subsidiaries is 90-100 percent strong and safe under the CUT method, 100 being the maximum for certainty. However, if the IRS can cast doubt on whether the CUT method should be recognized as the applicable method pursuant to the best method rule, insofar as one or several factors are concerned, then it could take the position that some evidence available under the comparable profits method should be applied. The IRS could point out that even though the comparables it has in applying the comparable profits method are not very strong (perhaps the financial statements presented are of companies operating not in Ireland, but in Brazil and Argentina), but nevertheless, on the scale of 100, such evidence under the comparable profits method deserves a rank of 70 and since the somewhat discredited evidence the taxpayer has under the CUT method has now been reduced to 60, the comparable profits method should be applied. If the taxpayer then can discredit somewhat the evidence submitted by the IRS, for example, by pointing out that the financial statements of the Brazilian and Argentinian companies applied by the IRS involve sales of power supplies and similar products and not disc drives at all, this could reduce the value of evidence offered under the comparable profits method to, say, 50, on the scale of 100, in which case the evidence under the CUT method would still be better and more qualified under the best method rule and therefore the taxpayer should prevail with its position that the 10 percent royalty is arm's length under the new regulations.

VII. FACTORS TO BE CONSIDERED IN ASCERTAINING WHETHER THE CUT METHOD COULD BE USED TO DETERMINE THE ARM'S LENGTH RATE OF ROYALTY

There are numerous factors listed in the regulations that must be considered in determining whether the CUT method would prevail under the best method rule and therefore could be used to determine the arm's length rate of royalty in the particular case. Some of these factors are mentioned in Temp. Reg. §1.482-1T which summarizes some general principles applicable to all intercompany transactions. Other factors are mentioned in Temp. Reg. §1.482-4T which contains the provisions relating specifically to licensing of intangible properties.

For the sake of convenience, I shall list here the factors in the chronological order in which they appear in the regulations. As we go over these factors, we may briefly check to see how well would Able Corporation do under these factors which would determine whether its reliance on the CUT method to support the 10 percent intercompany royalty is justified.

© 1993 International Bureau of Fiscal Documentation

1. *Completeness and accuracy of data used to apply the method.* In order to make the CUT method applicable, one would have to show that it qualifies under the "best method rule".[26] The first factor to be considered under this rule is completeness and accuracy of data used to apply the particular method.

In the case of Able Corporation, the taxpayer would, of course, have information concerning the Irish subsidiary's operations and financial performance. It would also have the financial statements of the Irish subsidiary and data from its own financial statements and information regarding the arrangements between Brown Corporation and its unrelated Irish subsidiary, including the statements submitted by Brown Corporation to the SEC. To John, this would indicate that the company would be able to comply with the completeness and accuracy data requirement.

2. *Degree of comparability.* The second factor mentioned under the best method rule is the degree of comparability between controlled and uncontrolled transactions.

Here again, John would feel that the degree of comparability is extremely high since the technology relating to Brown Corporation's disc drives and Able Corporation's disc drive licensed to its Irish subsidiary are very comparable, the two Irish companies will receive about the same degree of support from the California licensors and will basically perform the same functions and assume the same risks.

3. *Number, magnitude and accuracy of adjustments.* The third factor mentioned under the best method rule is the number, magnitude, and accuracy of the adjustments required to apply to a particular method.

Here again, John would feel fairly confident. The only adjustment that would be required to be made, if any, would be a downward adjustment, from 10 percent to 9 percent, in the rate of royalty. To make the arrangements simpler and, in effect, to favour the IRS, and be on the conservative side, Able Corporation is using a 10 percent royalty.

4. *The majority of methods rule or the tie-breaker rule.* The regulations make it clear that the mere fact that the taxpayer is claiming that it has evidence under the CUT method would not prevent the IRS from putting on the table and considering evidence under other methods at the same time.[27] The regulations state:

> An arm's length result may be determined under any of the available methods without first establishing the inapplicability of any other method. If additional evidence becomes available permitting the application of another method that is more accurate, the district director will apply such method to determine an arm's length result.

As a result of this approach, several methods would be considered at the same time. For example, the taxpayer would maintain that the CUT method is applicable and furnish evidence under such method, while the IRS would take the position that the comparable profits method is applicable or perhaps the profit split method is applicable (even though the taxpayer has not made an election to use the profit split method).

The regulations then go on to state that:

> If two or more methods produce inconsistent results, the best method rule will be applied to select the method that provides the most accurate determination of an arm's length result under the facts and circumstances, without establishing a priority or presumption of correctness to any one method. If the best method rule does not *clearly indicate* which method should be preferred, an additional factor that may be taken into account in selecting a method is whether any of the complete methods produce results that are consistent with the results obtained under another appropriate method. Further, in choosing between two or more applications of the same method that produce different results, the fact that another method produces results that are consistent with one or more of the competing applications may be taken into account (emphasis added).

Thus, while Able Corporation may have fairly good evidence under the CUT method, showing that the 10 percent rate of royalty was arm's length, the IRS could submit data and other information showing that, applying the comparable profits method, the rate of royalty should be 30 percent and applying the profit split method, the rate of royalty should be 29 percent. Since the results under the latter two methods (30 percent and 29 percent) would be more consistent with each other, these two methods could gang up on Able Corporation and destroy the possibility of using the CUT method unless the best method rule would clearly indicate that the CUT method should be preferred.

At this point, Able Corporation could feel somewhat less confident and John less comfortable. Indeed, it would be quite unfair that the rate of royalty could be increased to 30 percent as a result of rather questionable "evidence" under the comparable profits method and the profit split method, but the question would be how could Able Corporation make sure that the best method will "clearly indicate" that the CUT method is applicable.

5. *Comparability of results.* Throughout the regulations, the emphasis is on results and comparability of results. The comparability of results would make sense in case of such methods as the comparable profits method or the profit split method. When such methods are applied, one looks at the "bottom line figures", i.e. final financial "results". However, what is the meaning of the emphasis on results when the CUT method is applicable?

Temp. Reg. §1.482-1T(c)(1) states the general rule that:

> The arm's length character of a controlled transaction is tested by comparing the results of that transaction with the results of uncontrolled taxpayers engaged in comparable transactions under comparable circumstances.

What does the requirement of comparing results mean in the case of Able Corporation? Is the "result" which should be compared the rate of royalty received by Brown Corporation from its unrelated licensee (which is 10 percent) to be compared with the rate of royalty received by Able Corporation from its Irish subsidiary (which is also 10 percent), so that the comparability test would be satisfied, or does it mean comparing the "results" achieved by the two licensees? The regulations do not clarify this matter. If the requirement would be to compare the profits realized by the two licensees, it would

26. Temp. Reg. §1.482-1T(b)(2)(iii)(A).
27. Temp. Reg. §1.482-1T(b)(2)(iii)(A).

© 1993 International Bureau of Fiscal Documentation

be difficult for Able Corporation to satisfy this requirement. It is very unlikely that Able Corporation could even ask Brown Corporation for such information, but if Able Corporation would try, Brown Corporation would most likely answer that it does not have such information itself (since it is proprietary information of its Irish licensee).

6. *Functions*. The regulations state that the comparability of transactions and circumstances must be evaluated using five factors, namely functions, risks, contractual terms, economic conditions and property or services.[28]

The regulations require performance of a functional analysis. This functional analysis would identify and compare the economically significant activities actually undertaken or to be undertaken by the taxpayers in both controlled and uncontrolled transactions. The regulations indicate that particularly the following functions will have to be reviewed: research and development, product design and engineering, manufacturing or process engineering, product fabrication, extraction and assembly, purchasing and materials management, marketing and distribution functions including inventory management, warranty administration, advertising and marketing activities, transportation and warehousing, managerial, legal, accounting and finance, credit and collection, training and personal management services.[29]

Of course, the functional analysis approach has been used by the IRS for many years. The IRS Internal Revenue Manual places much emphasis on the functional approach. Thus, the functional analysis approach would not be a new development, although this is the first time that it gets its blessing in the regulations.

The regulations indicate that in the event the CUT method is applied in determining the arm's length rate of royalty, the emphasis is more on product comparables than on functional comparables. This would lessen somewhat the emphasis on the functional analysis with respect to the CUT method used by Able Corporation based on the comparison of the arrangements between Brown Corporation and its unrelated Irish licensee. Nevertheless, the regulations state also that "each method ordinarily requires analysis of all of the factors that affect comparability under that method. In particular, the analysis of functions and risks will be essential to the application of any method".[30]

Accordingly, Able Corporation will be required to do its best in performing the functional analysis in this case. This may not be easy since Able Corporation may not have the information on the exact functions performed by Brown Corporation's unrelated Irish licensee.

7. *Comparability of risks*. An analysis must also be made of the risks borne by the parties to the controlled and the uncontrolled licensing transaction. The more important risks to be considered are listed specifically in the regulations: market risks, including fluctuations in costs, demand, pricing and inventory levels; risks associated with the success or failure of research and development activities, financial risks including fluctuations in foreign currency rates of exchange and interest rates; credit and collection risks, product liability risks; and business risks relating to the ownership of property, plant and equipment.[31]

Even though Able Corporation's Irish subsidiary may expressly assume certain risks, the IRS could, in effect, take the position that such risks were borne by Able Corporation on the ground that the Irish company would not be financially capable of funding any losses that would be expected to occur as a result of the risk.[32] In addition, the Irish subsidiary would also have to have a reasonable opportunity to realize an economic benefit that is commensurate with the risk assumed and would have to be engaged in the active conduct of a trade or business to which the risk relates. Finally, Able Corporation and its Irish subsidiary would have to document in writing their allocation of the risk before the result of the risk would become known or knowable.

8. *Contractual terms*. This factor requires that the terms of the licensing contract between Able Corporation and its Irish subsidiary be comparable to the terms of the contract between Brown Corporation and its unrelated Irish licensee. Needless to say, it might be difficult to comply with this requirement since normally a company would not have in its files the contracts of its competitors. The regulations require the comparison of significant contractual terms that could affect the rate of royalty. With respect to licensing arrangements, such contractual terms listed in the regulations include payment terms, rights to updates, revisions or modifications, the duration of the relevant contracts and related termination or renegotiation rights and arrangements for the provision of ancillary or subsidiary services.[33]

Of course, if Able Corporation would be able to get hold of the licensing agreement between Brown Corporation and its unrelated Irish licensee, it would be well advised to copy much of such agreement verbatim in its licensing contract with the Irish subsidiary. In this manner, Able Corporation would have a particularly strong position to support the applicability of the CUT method insofar as this particular factor is concerned.

9. *Economic conditions*. This factor requires a comparison of the significant economic factors that could affect the royalties that would be charged or paid, or the profit that would be earned, in the two licensing transactions.

The regulations list the following factors to be considered in comparing the economic conditions present in the licensing arrangement with the controlled subsidiary and in the licensing arrangement between unrelated parties.

(a) "alternatives realistically available to a buyer and seller, respectively";
(b) similarity of geographic markets;
(c) relative size of each market and the extent of the overall economic development in each market;
(d) level of the markets;

28. Temp. Reg. §1.482-1T(c).
29. Temp. Reg. §1.482-1T(c)(3)(i).
30. Temp. Reg. §1.482-1T(c)(1)(ii).
31. Temp. Reg. §1.482-1T(c)(3)(ii)(A).
32. Temp. Reg. §1.482-1T(c)(3)(ii)(B)(2).
33. Temp. Reg. §1.482-1T(c)(3)(iii).

© 1993 International Bureau of Fiscal Documentation

(e) relevant market share for the products, properties or services transferred or provided;
(f) location – specific costs of the factors of production and distribution; and
(g) extent of competition in each market with regard to the property or services under review.

10. *Comparability of property or services.* This factor requires a comparison of the property or services transferred or licensed in the transactions.

11. *Consideration of the alternatives available to the licensor or the "make-or-license" analysis.* The regulations indicate that the IRS could consider the alternatives available to the taxpayer (licensor) in determining whether the terms of the controlled transaction would be acceptable to an uncontrolled taxpayer faced with the same alternatives and operating under comparable circumstances.[34] The example set forth in Temp. Reg. §1.482-1T(d)(3)(iv) illustrates the meaning of this particular factor. Pursuant to this example, Able Corporation would have to check the profit it could make if it would manufacture the disc drives (which it proposes to license to the Irish subsidiary) itself and ship the products to the customers.

Under the actual circumstances of Able Corporation, probably it would be rather easy to demonstrate that Able Corporation would not be able to conduct such business at all (because of the prohibitive cost of transportation, foreign customs duty, etc.) or that the profit realized by Able Corporation would be smaller if it would conduct the business in such a manner as compared with the profit realized by it if it licenses the manufacture of the disc drives to the Irish subsidiary.

The problem would become more serious, however, if the Irish subsidiary would sell a part of its products back to Able Corporation (or a US subsidiary of Able Corporation) for resale in the US market, as illustrated in the example set forth in Temp. Reg. §1.482-4T(c)(2)(iv). This "realistic alternative" rule in effect overrules the decision of the Tax Court in *Bausch & Lomb, Inc. v. Commissioner*.[35] In such a case, it would be helpful for Able Corporation to document the fact that it does not have excess manufacturing capacity that would allow it to produce such additional products, if this is in fact the case.

12. *Evidence of contemporaneous comparable transaction.* Now we turn to the additional factors and requirements described in Temp. Reg. §1.482-4T(c) which deals specifically with the CUT method. Thus, the factors mentioned in this particular regulation apply most directly in determining whether the evidence of comparable would qualify under the CUT method.

The regulation states:

> Factors to be considered in the application of this method include access to relevant pricing and other financial information and the existence of an active market, including contemporaneous transactions involving comparable property between uncontrolled taxpayers.

The emphasis on "contemporaneous transactions" is likely to mean that the taxpayer should have evidence, for purposes of the CUT method, of a comparable transaction between two unrelated parties in the same taxable year.

If this rather harsh interpretation of the regulatory language would be used, it could mean that even though Able Corporation would be able to use the CUT method in 1994 and 1995, it could no longer use the CUT method in 1996 when, at the beginning of 1996, Brown Corporation and its unrelated Irish licensee would terminate their contract. It would seem unreasonable that such unfortunate event would have such a negative and immediate impact on determining the arm's length rate of royalty to be used between Able Corporation and its Irish subsidiary. Would it not be more reasonable to allow Able Corporation a grace period, such as a year or two, to find other evidence of comparables to support the use of the CUT method?

13. *The comparable must relate to the same class of intangible.* This requirement is contained in Temp. Reg. §1.482-4T(c)(2)(ii)(A)(1). The general requirement is that the intangible property involved in the transaction between two unrelated parties must be a "comparable intangible property". In order to qualify as a "comparable intangible property", three requirements must be met, the first of which is that the intangibles must fall into the same class of intangibles. The classes of intangibles for this purpose are determined in Temp. Reg. §1.482-4T(b). For example, patents, inventions, formula, processes, designs, patents or know-how all fall into the same class. Thus, insofar as this particular requirement is concerned, it would seem that the intangible properties would qualify as "comparable" even if the licensing agreement between Able Corporation and its Irish subsidiary would involve patents, while the licensing agreement between Brown Corporation and its unrelated Irish licensee would cover only know-how.

14. *Same types of products, processes or know-how.* The second requirement to make the intangible properties involved in the two transactions comparable is that the intangibles must relate to the same type of products, processes or know-how within the same general industry or market.

15. *Comparable profit potential requirement.* Finally, the last requirement to make the intangibles involved in the two transactions comparable is that two intangibles should have "substantially the same profit potential". The regulations add that:[36]

> For this purpose, the profit potential of an intangible is measured by the net present value of the benefits to be realized (based on prospective profits to be realized or costs to be saved) through the use or subsequent transfer of the intangible, taking into consideration the capital investment and start-up expenses required, the risk to be assumed, and other relevant considerations.

This particular requirement could be troublesome to the US taxpayer. For example, Able Corporation, in our case, would have to be able to demonstrate that the intangibles it licensed to its Irish subsidiary and the intangibles which Brown Corporation licensed to its unrelated Irish licensee had substantially the same profit potential. It is very unlikely that Able

Corporation would be able to obtain any data or financial information from either Brown Corporation or its unrelated Irish licensee regarding the profit potential considered by such two companies. Able Corporation could obtain the opinion or report of an expert economist who would have appraised the profit potential of the intangibles involved and would have concluded that the intangibles licensed by Able Corporation to its Irish subsidiary had substantially the same profit potential as the intangibles licensed by Brown Corporation to is unrelated Irish licensee.

16. *Comparable circumstances*. In addition to the factors listed above in items 6 and 10, Reg. §1.482-4T(c)(2)(ii)(B) states certain specific factors which must be considered in determining whether the CUT method could be applied in determining the arm's length rate of royalty.

The more important factors listed include the terms of the license, including the exploitation rights granted in the intangible, the exclusive or non-exclusive character of the license, any restrictions on use, or any limitations on the geographic area in which the rights may be exploited, stage of the development of the intangible, any rights to receive periodic updates or improvements to the intangible by uniqueness of the intangible and the period for which the intangible will remain unique and the duration of the license.

17. *Periodic adjustments*. If the US licensor has prevailed in fighting on so many battle fields, there is still the danger that whatever was established as an arm's length rate of royalty could be adjusted in a subsequent taxable year. The regulations specifically provide for such possibility in Temp. Reg. §1.482-4T(e)(2). The regulations state, in effect, that the rate of royalty may be adjusted in a subsequent taxable year "to ensure that it is commensurate with the income attributable to the intangible". For example, let us assume that Able Corporation established its licensing arrangement with the Irish subsidiary on the basis of a 10 percent royalty and that such royalty rate was even approved by the IRS on audit of Able Corporation's corporate tax returns for 1994 and 1995 under the CUT method. At that time, the Irish subsidiary realized a net profit of 20 percent of sales after the payment of the 10 percent royalty. In connection with the audit of Able Corporation's corporate tax returns for 1996 and 1997, the facts indicate that the Irish subsidiary ended up with a net profit of approximately 40 percent of sales after payment of the 10 percent royalty to Able Corporation. In such audit, the IRS would most likely take the position that the increased profitability of the Irish subsidiary required commensurately increased rate of royalty.

In order to prevent the increase of the rate of royalty, Able Corporation would have to establish each of the following six facts:[37]

(a) Able Corporation entered into a written agreement (controlled agreement) with the Irish subsidiary which provided for the royalty with respect to each taxable year covered by such agreement, the rate of royalty was arm's length under the CUT method for the first taxable year in which substantial royalty was required to be paid under the agreement, and such agreement remains in effect for the taxable year under review.

(b) There is a written agreement setting forth the terms of the comparable uncontrolled licensing arrangement relied upon to establish the arm's length rate of royalty (uncontrolled agreement), which contained no provision that would have permitted any change to the amount of the royalty, a renegotiation or a termination of the agreement, in circumstances comparable to those of the controlled transaction in the taxable year under review (or that contained provisions permitting any specified, noncontingent, periodic changes to the amount of royalty). Obviously, it would be difficult for Able Corporation to get hold of the written agreement between Brown Corporation and its unrelated Irish subsidiary to demonstrate this particular fact.

(c) The controlled agreement was substantially similar to the uncontrolled agreement with respect to the time period for which it is effective and the provisions described in the preceding point (b).

(d) The controlled agreement limited the use of the intangible to a specified field or purpose in a manner that was consistent with industry practice and any such limitation in the uncontrolled agreement.

(e) There were no substantial changes in the functions performed by the controlled licensee (the Irish subsidiary) since the controlled agreement was executed, except for changes necessitated by events that were not foreseeable.

(f) The aggregate profits actually earned or the aggregate cost savings actually realized by the controlled taxpayer from the exploitation of the intangible in all open years are not less than 80 percent and no more than 120 percent of the prospective profits or cost savings that were foreseeable when the comparability of the uncontrolled agreement was established.

As can be seen, the regulations impose an enormous burden on the taxpayer to be able to qualify to use the CUT method in determining the arm's length rate of intercompany royalty. There are so many factors, requirements, conditions, restrictions, surprising limitations and arbitrary distinctions that the taxpayer is bound to slip on one or more of such factors, conditions, etc. or that at least it may not be able to fully comply with the requirements. As this occurs, the chances of applying Thrasybulus' sword to the taxpayer's arrangement with its foreign licensee subsidiary will greatly increase. It is reasonable to assume that when there are so many conditions and prerequisites in applying a certain rule, the application of such rule, such as the CUT method in this case, becomes very uncertain. Therefore, the new regulations are likely to increase the degree of uncertainty in applying the arm's length standard very substantially.

If the IRS would in fact insist on using the Thrasybulus sword, this would make it more difficult for US corporations to compete in foreign markets through local manufacturing subsidiaries. One hope would be that, as in the past, auditing IRS agents themselves would find such approach too drastic and unreasonable and the cases would in fact be settled on some other reasonable grounds.

37. Temp. Reg. §1.482-4T(e)(2)(ii).

VIII. FOREIGN PARENT CORPORATION LICENSING ITS US SUBSIDIARY

In many cases, the impact of the new regulations on foreign parent corporations operating in the United States through US manufacturing subsidiaries would be the opposite to that of the impact on US corporations operating abroad through foreign manufacturing subsidiaries. The exact impact would depend on several other circumstances, including particularly whether there is an income tax treaty between the country of the foreign parent corporation and the United States, which treaty is likely to reduce the rate of the US withholding tax imposed on royalties to a small percentage, such as 10 percent, or perhaps it might even completely eliminate any US withholding tax on such royalties (which is the case, for example, with respect to royalties paid by a US licensee to licensors in England, Germany, France and many other European countries).

For example, if the foreign parent corporation is interested in reducing the US tax burden imposed on its US manufacturing subsidiary and there is a favorable tax treaty between the United States and the country in which the foreign parent corporation is incorporated, the company would prefer to use the comparable profits method rather than the CUT method. The use of the comparable profits method is likely to increase the rate of royalty payable by the US manufacturing subsidiary to the parent corporation. Since such royalties would be allowed as deduction to the US subsidiary, the effective rate of US taxes could be substantially reduced.

The basic idea behind the comparable profits method was that much of the overall profit should belong to the party which owns the valuable intangibles. Congress was thinking about a large US pharmaceutical company which has a substantial R&D department inventing highly profitable new drugs at the cost of large R&D expenditures. The company also owns patents, know-how, trademarks, trade names and other valuable industrial property rights used in connection with its business. The company may have manufacturing subsidiaries in Ireland, Singapore or Puerto Rico and it may also have sales subsidiaries in various other countries, but all of those "deserve" only a modest profit on their costs or functions and the bulk of the profit should properly belong to the "owner of the intangibles" which is the US pharmaceutical company. The problem is that there are now many foreign corporations which own valuable intangibles and the number of such corporations is steadily growing. Thus, when they come to the United States and establish a manufacturing subsidiary in this country, the Thrasybulus rule may start working in the other direction. Much of the profit should belong to the foreign corporation (in form of large royalties) which owns the valuable intangibles and only a modest profit should be allocated to the US manufacturing subsidiary.

This means also that many foreign corporations already operating in the United States through a US manufacturing subsidiary may now find that they would be able to charge higher royalties to the US subsidiary for the use of their intangibles and this, of course, would reduce the US tax payable by the US subsidiary. Royalties remitted to the foreign parent corporation are likely to be subject to a very modest US withholding tax or be completely exempt from tax as a result of the provisions of the applicable income tax treaty.

There could be, of course, some evidence of comparable licensing arrangements with third parties, but, as indicated above, in many cases it should not be too difficult to prevent the application of the CUT method because of the failure to satisfy one or several of the numerous requirements and conditions of the application of such method.

A good illustration of this development would be the case of *Ciba-Geigy Corp. v. Commissioner*.[38] Ciba-Geigy is a large and reputable Swiss pharmaceutical company. It is engaged in the business of inventing, manufacturing and selling pharmaceutical products. It does not focus on producing profits by avoiding tax rules. In the 1960s Ciba-Geigy established a wholly-owned US subsidiary to manufacture and sell some of its products in the United States. The US subsidiary paid a 10 percent royalty to the Swiss parent corporation. The IRS audited the tax returns of the US subsidiary for the years 1965-1969 and determined that such rate was too high. The IRS claimed that the arm's length rate of royalty was lower, perhaps 6 percent. After much litigation, the Tax Court determined that the taxpayer was correct and that the arm's length rate of royalty was 10 percent.

It is quite likely that, under the new regulations, the comparable profits method could be applied in determining the arm's length rate of royalty. Using such method would most likely result in a royalty rate in the range of 30-35 percent or several times higher than what the Swiss parent corporation has been charging to its US subsidiary. This means that, in the future, Ciba-Geigy could increase the rate of royalty to a much higher percentage. The royalties would be exempt from US withholding tax under the US–Swiss income tax treaty. Thus, the net result would be a substantial reduction of taxes payable to the US Government. Indeed, Ciba-Geigy, and many similarly situated licensors, could also consider filing amended tax returns for those taxable years which are still open and claim refund of the US taxes unnecessarily paid, in view of the provisions of the new regulations.

The use of the new methodology introduced by the new regulations and particularly the comparable profits method could prove beneficial from the standpoint of preserving US tax revenues in those extreme cases where the foreign parent corporation was perhaps too greedy and allowed no profit or extremely low profit to its US manufacturing subsidiary. In such a case, the application of the comparable profits method could assure that at least a modest profit would be allocated to the US manufacturing subsidiary and be subject to US tax in the hands of the subsidiary.

14. Total and particular tax ratios for 1990 compared to 1991 estimates

I. INTRODUCTION

As indicated by its title, this article is divided into two parts: the first describes and the second more shortly prescribes. The objective of the first part is to update my recently published book[1] and to supplement it by providing a commentary on recent trends in government tax revenue levels and structures, sub-central government tax revenues and general government financial balances.[2] The second part gives more subjective reactions to the fiscal policy implications of these revenue developments, mainly in the so-called G7 countries (Canada, France, Germany, Italy, Japan, United Kingdom, United States), with special reference to what should be government reactions to the increase in fiscal deficits that are predicted to continue over the next few years in most of these countries.

The author was Head of the OECD Fiscal Affairs Division from 1971 to 1991. *He thanks Sijbren Cnossen and Verity Russell for some useful comments on an earlier draft, which does not commit them to agreement with anything that is written here.*

II. RECENT TAX REVENUE DEVELOPMENTS

A. *Preliminary remarks*

1. Scope and summary of findings

A first question to resolve in an article with this title is when should 'recent' begin and end. On the starting date, if one goes too far forward, there will in many coun-

1. K. Messere, *Tax Policy in OECD Countries: Choices and Conflicts* (Amsterdam: IBFD, 1993).
2. This part is also intended to be self contained for those without my book, which leads to some repetition with my book particularly in Section II.A.2.

© 1993 International Bureau of Fiscal Documentation

tries be no developments to describe, and if too far back it is not recent. 1985 seemed a good solution in this regard, except that 1986 proved a more convenient starting year for providing information on general government financial balances. The end date is evidently the last for which firm data or estimates are available, which varies among the four topics discussed.[3]

There is not very much of a coherent story to tell about trends in recent tax developments in these four areas, because the very diverse movements among OECD countries were almost certainly due to the special circumstances prevailing in each country. While international considerations have had a great influence on certain tax developments (e.g. rate lowering and base broadening of income taxes, the move to VAT) there is no reason to believe that these have affected countries' choices in their tax levels, tax structures, local government financing and deficit financing.

Within this country diversity, however, a few overall trends can be identified which are later commented on in greater detail:

- the end of the almost automatic annual growth of total tax receipts to GDP ratio;
- a much greater convergence in tax level and tax structure developments than existed during earlier years;
- an almost universal increase over recent and forthcoming years in deficit financing.

On the other hand, it is impossible to detect any trend in major shifts from one tax to another either at general or local government level, or major changes between the tax share of federal/central and state/local government.

Though there have been many advocates of a move from income towards consumption taxation and of a greater share of tax revenues for sub-central levels of government, neither change has taken place over recent years in most OECD countries.

2. Methodology and concepts

This section refers briefly to some of the methodological problems and concepts used in the analysis, and also stresses that international tax revenue comparisons require heroic assumptions and simplifications which inevitably involve limitations on their validity, as set out in detail in Chapter 2E of Messere (1993). Nevertheless, as I have frequently argued, they do have value for policymakers.[4]

To be able to make any international comparisons of tax levels and structures it is necessary to agree on what counts as a tax and to have a standardized classification of taxes. This has been done since the early 1970s by the OECD on an annual basis and Table 1 reproduces the standardized OECD classification of taxes[5] together with unweighted averages of receipts from each of the main revenue sources as a percentage of total tax receipts. This table indicates that in 1990 around 82 percent of total tax revenues derive from personal income taxes (1100), social security contributions (2000) and consumption taxes levied directly on goods (5110 general plus 5120 specific), so the analysis that follows focuses mainly on these four kinds of taxes. If corporation income taxes (1200 = nearly 8 percent) and the various taxes on property 4000 (5.4 percent), on which some comments are also made, are added, around 95 percent of OECD tax revenues are covered, so no attention is paid in this article to the other very small tax revenue sources.

The following abbreviations are used:
'*Total tax ratio*' (henceforth TTR) refers to the ratio of total tax revenues to gross domestic product (GDP) at market prices.
'*Personal income tax ratio*', '*social security ratio*', etc. refers to the ratio of receipts from these specified revenue sources to GDP at market prices.
'*Tax structures*', '*tax mix*' and '*tax share*' each refers to the relative importance of receipts from particular kinds of tax to those from total tax receipts.
'*VAT, etc.*' refers to 5110 and includes not only value added taxes existing in 21 of the 24 OECD countries but also various kinds of sales taxes levied by subordinate levels of government in Canada and the United States, and by federal levels in Australia and Switzerland.
'*Excises, etc.*' refers not only to 5121 (excises) but to all the subheadings of 5120 (Table 1).

Although comparisons of tax levels and structures are designed to answer two separate questions (how much tax revenue and what tax mix, respectively), data on tax structures could be simply derived from those on tax levels by some multiplication and division. However, it is useful for a number of reasons to have some separate information on tax structures. If total tax receipts rather than GDP at market prices is chosen as the denominator, trends as between different kinds of tax are more clearly revealed: for example, though the unweighted average corporation tax ratio increased slightly between 1965 and 1990 and that of the property tax remained stable, the share of receipts from both of these kinds of tax decreased as a percentage of total tax receipts; and while the unweighted average of employees' social security ratio increased, its share of total tax receipts remained stable. Also tables providing data solely on tax levels would obscure country choices on their tax mix, since Denmark and Sweden would appear near the top and Turkey and the United States near the bottom of most particular tax ratios, simply because of the extreme difference in their total tax ratios. However, the snag about tax structure statistics is that they are not very helpful in indicating revenue trends of particular taxes, since they may indicate more about what has

3. For tax levels and structures the last firm data are for 1990, though estimates are available for 1991, and since these estimates are incomplete and subject to change they are not covered in the commentaries in Sections B and C, but in an Appendix to this article which compares 1990 data with 1991 estimated data.
For sub-central tax revenues in Section D the last year is 1990.
For general government financial balances in Section E, estimates extend to 1994.
Sources are *Revenue Statistics of OECD Countries (1965-91)* - referred to subsequently as OECD RS (1992) - for the first three topics and tables 8 of OECD Economic Outlook N° 51 and 52 (respectively, OECD June 1992 and December 1992) for data on general government financial balances.

TABLE 1

THE OECD CLASSIFICATION OF TAXES

		Unweighted OECD average percentage of total tax receipts	
1000	Taxes on Income, Profits and Capital Gains	1985	1990
1100	Taxes on income, profits and capital gains of individuals	38.2	38.3
1110	On income and profits	30.6	30.1
1120	On capital gains		
1200	Corporate taxes on income, profits and capital gains	7.9	7.7
1210	On income and profits		
1220	On capital gains		
1300	Unallocable as between 1100 and 1200		
2000	Social Security Contributions	23.5	23.5
2100	Employees	7.8	9.6
2200	Employers	13.7	13.2
2300	Self-employed or non-employed		
2400	Unallocable as between 2100, 2200 and 2300		
3000	Taxes on Payroll and Workforce	1.2	1.1
4000	Taxes on Property	5.1	5.4
4100	Recurrent taxes on immovable property		
4110	Households		
4120	Other		
4200	Recurrent taxes on net wealth		
4210	Individual		
4220	Corporate		
4300	Estate, inheritance and gift taxes		
4310	Estate and inheritance taxes		
4320	Gift taxes		
4400	Taxes on financial and capital transactions		
4500	Other non-recurrent taxes on property		
4510	On net wealth		
4520	Other non-recurrent		
4600	Other recurrent taxes on property		
5000	Taxes on Goods and Services	31.1	30.3
5100	Taxes on production, sale, transfer, leasing and delivery of goods and rendering of services	29.4	28.6
5110	General taxes	15.6	17.3
5111	Value added taxes		
5112	Sales taxes		
5113	Other general taxes on goods and services		
5120	Taxes on specific goods and services	13.7	11.3
5121	Excises		
5122	Profits of fiscal monopolies		
5123	Customs and imports duties		
5124	Taxes on exports		
5125	Taxes on investment goods		
5126	Taxes on specific services		
5127	Other taxes on international trade transactions		
5128	Other taxes on specific goods and services		
5130	Unallocable as between 5110 and 5120		
5200	Taxes on use of goods, or on permission to use goods or perform activities	2.0	1.7
5210	Recurrent taxes		
5211	Paid by households in respect of motor vehicles		
5212	Paid by others in respect of motor vehicles		
5213	Other recurrent taxes		
5220	Non-recurrent taxes		
5300	Unallocable as between 5100 and 5200		
6000	Other taxes	0.9	1.4
6100	Paid solely by business		
6200	Paid by other than business or unidentifiable		

happened to the levels of other kinds of tax and for this reason more attention is devoted to tax levels than to tax structures.

Useful concepts for the analysis of tax revenue developments are 'convergence' and 'divergence'. *Convergence* occurs over a period of time if the deviation of a country from an average OECD tax ratio is less in the second year than the first and *divergence* when the reverse is the case. In practice, convergence entails that *either* a country with a below average tax ratio increases it by more than the average tax increase between the two periods *or* that a country with an above average ratio increases it by less than average: likewise, divergence occurs when above average tax ratio countries increase the ratio by more than the average or below average tax ratio countries increase it by less than the average. Trends in convergence and divergence regarding total tax ratios can give some indication as to whether governments which rely less on the public sector are compelled to catch up (convergence), or alternatively whether a particular attitude to public expenditure gathers momentum, so that spending-prone governments are compelled to spend even more and tax even more, while those governments relying more on the private sector continue to do so (divergence). An analysis of the convergence and divergence of *particular* tax ratios, as distinct from *total* tax ratios illuminates the different question of whether governments can continue to rely more and more on those taxes which have brought them most revenues in the past and/or to continue to neglect those revenue sources which they have neglected in the past (divergence) or whether they are obliged to diversify their sources of revenue towards an OECD average (convergence).

B. *Tax level developments (1985-90)*

1. Total tax ratios (TTRs)

Recent TTR trends exhibit two contrasts with those in earlier years: first, the almost inevitable annual increase in unweighted average TTR that occurred between 1965 and 1987 came to an end in that latter year (Table 2),[6] and second the divergence in TTR developments that mostly predominated between 1965 and 1985, especially in the earlier years, has been replaced by an almost total convergence since 1985 (Table 3).

The decline or stagnation of TTRs in many countries since 1987[7] has a multitude of causes such as the recession, the predominance of governments wishing to tax less, and the reduction of former buoyant revenue sources (e.g. North Sea oil in Norway and the United Kingdom). It is true that overall ratios increased between 1989 and 1990 but 1991 estimates suggest there is likely to be little change between the 1990 and the 1991 average (see Appendix). On the other hand, it may be noted (last column Table 2) that the total tax ratio has peaked in most OECD countries since 1987, the exceptions being Austria (1985), Belgium (1985), Finland (1986), France (1984), Luxembourg (1983), Norway (1986), United Kingdom (1982) and United States (1981).

It is interesting to speculate what will happen to TTRs during the 1990s. My own guess is that they will continue to stagnate during 1992 and perhaps 1993 as OECD countries gradually climb out of the recession, but thereafter will increase in most OECD countries; first because of the trade cycle, second because of changes in political and economic fashion where Keynesianism looks like becoming respectable again after so long a domination by monetarists and supply-siders, and third because governments are increasingly recognizing as an imperative the need to reduce their deficits – of which more in the final section of Part II and most of Part III.

6. Table 2 also shows the ranking order of countries' TTRs for 1985 and 1990. Whilst the same eight countries inevitably top the list, elsewhere there are many changes: e.g. Italy from 12th to 9th, New Zealand from 15th to 10th, Germany from 9th to 12th, United Kingdom from 11th to 15th and United States from 20th to 23rd.

7. Since 1985, the average unweighted TTR has been:
1986: 38.0
1987: 38.5
1988: 38.6
1989: 38.4
1990: 38.8.

TABLE 4

SHIFTS IN TAX RATIOS BETWEEN 1985 AND 1990 OF 0.5 PERCENTAGE POINTS OR MORE

	Personal income tax	Corporation tax	Social security contributions	VAT etc. taxes	Excises etc.	Property taxes

Sweden	+2.2		+3.2	+1.3	−0.7	+0.8
Switzerland						
Turkey[2]	+2.0		+2.7	+1.0		
United Kingdom		−0.8			−0.7	−1.4
United States						
Unweighted coverage						
1985	11.5	2.9	8.9	5.9	5.0	1.8
1990	11.7	2.9	9.3	6.7	4.4	2.0
1990 minus 1985	+0.2	zero	+0.4	+0.8	−0.6	+0.2

1. Until 1990 Portugal could not distinguish between personal and corporate income tax.
2. Turkey increases probably understated, since unidentifiable taxes of 6000 represent 4.6 of GDP in 1990.

© 1993 International Bureau of Fiscal Documentation

Table 3 contrasts the almost total convergence of TTRs with the predominance of divergence prevailing[8] in earlier years, especially 1965 to around 1975 to 1980. Broadly the picture during these earlier years was that TTRs were increasing most in those countries which already had high ratios (industrialized Europe) moderately in countries with medium ratios (non-Europe less Japan) and least of all in those countries with the lowest ratios (less-industrialized Southern Europe plus Japan). Between around 1975 and 1985 most industrialized European countries continued to increase their TTR quite considerably, the medium non-European countries hardly at all, but less industrialized Greece, Portugal and Spain most of all. Since 1985 there has been much less homogeneity among geographical groupings, but as Table 3 shows, nearly all high TTR countries have increased their ratio below the average or even decreased it, and nearly all low TTR countries have increased their ratio above the average between 1985 and 1990. Sweden is the only high TTR country to increase it above (considerably above) average, but a sharp fall is predicted for 1991 (see Appendix). Of the low TTR countries only Greece, Switzerland and the United States have increased the TTR less than average. As a consequence of these recent changes New Zealand from 1965 to 1988 a below average TTR country became an above average TTR country in 1989 (though not in 1990), and in 1990 for the first time since 1965, Italy also became an above average TTR country. On the other hand, Germany and the United Kingdom both from 1965 to 1985 above average TTR countries have become below average since then.

2. Some particular tax ratios

Table 4 summarizes major changes (taken to be at least 0.5 of GDP) in six particular tax ratios between 1985 and 1990. Such major changes have occurred in at least one tax ratio in all OECD countries except for Switzerland and the United States; in Luxembourg they have occurred in all six ratios, and in Greece and Sweden in five of the six.

The following sub-table summarizes the number of countries significantly increasing or decreasing each of the six ratios between 1985 and 1989.

Personal income tax ratio:	inc 10	dec 6	little change 8
Corporation tax ratio:	inc 7	dec 5	little change 12
Social security ratio:	inc 8	dec 3	little change 13
VAT etc. ratio:	inc 11	dec 1	little change 12
Excises etc. ratio:	inc 1	dec 15	little change 8
Property tax ratio:	inc 4	dec 1	little change 19

Among the two kinds of income tax, increases in both the personal and corporate tax ratio occurred in Italy, Japan and Spain, decreases in both ratios in Germany and Luxembourg and increases in the personal and decreases in the corporation ratio in Denmark and Norway. Of the main components of the social security ratio, the increase is predominantly in the employers' ratio in Canada, Italy and Portugal and in the employees' ratio in Norway, while the large decrease in the Netherlands' social security ratio was in respect of the employers' share.[9] Of the general consumption taxes, there were large increases in VAT, etc. ratios of many countries, including the five countries (Greece, New Zealand, Portugal, Spain and Turkey) adopting VAT in the mid-1980s, and a fall only in France, but large decreases in most countries in the excises, etc. ratio which increased only in Italy, so the average 5000 taxes on goods and services ratio barely changed (11.5 in 1985 and 11.8 in 1990). The relative smallness of property tax ratios makes it more convenient to refer to changes in such taxes in the next section on tax structures.

Without an examination of policy statements and tax legislation in each country it is difficult to know how far changes (or lack thereof) in various tax ratios have been a result of governments' intentions, how far due to exogenous factors having nothing to do with tax policy objectives. There follows short comments on changes in certain tax ratios where the reasons for them are believed to be known or where other reflections are provoked.

Denmark: Already with the highest OECD personal income tax ratio in 1985, Denmark increased it by another percentage point between 1985 and 1990. A partial explanation is that outside Australia and New Zealand Denmark has the lowest social security ratio in the OECD, since employees' earmarked contributions are levied on an income tax base and are classified in 1000, not 2000, of the OECD list, as is also the case in Finland and Sweden.

France: Already with the lowest OECD personal income tax ratio (save Greece, Iceland and Turkey) in 1985, there has been a further decline of 0.5 percentage points between 1985 and 1990, when at 7.5 percent France in 1990 was above only Greece (7.4 percent). One explanation is that the French central government income tax on earned income is the only such tax in the OECD not to be automatically withheld at source, another that the threshold is so high that nearly half the population do not pay income tax.

Netherlands: The decline in social security ratios and increase in income tax ratios was the consequence of a tax reform which partially integrated these two levies.

New Zealand: A rare case of a deliberate switch from income taxation to consumption taxation with the adoption of a VAT type tax.

Norway: Loss of revenues from North Sea oil was responsible for the sharp fall in the corporation tax ratio and perhaps contributed to the need to raise the personal income tax and social security ratios, but it does not explain the drop in the 5000 (all taxes on goods and services) ratio from 17.8 to 16.4.[10]

8. For a more detailed description and discussion and possible explanations see Chapters 2, 3 and 4 of Messere (1993), *supra* note 1.

9. Social security ratio breakdowns are not reproduced here; see Tables 16 and 18 of OECD RS (1992), *supra* note 3. However, Table 1 suggests that the much lower employees' share has been increasing on average and the employers' share declining.

10. One explanation could be that Norway is the only country where there has been pressure to replace VAT by a retail sales tax, and though this pressure was resisted, it may be why unlike nearly all other VAT countries, Norway has never increased the VAT rate.

United Kingdom: The drop in the property tax ratio occurred between 1989 and 1990 when the poll tax replaced the rates.

United States: The avowed objective of the 1986 tax reform to reverse the burden of previous years from corporations to individuals worked for 1988, but 1990 personal and corporate income tax ratios resemble those of 1985.

	1985	1986	1987	1988	1989	1990
Pers. income tax ratios	10.4	10.2	10.9	10.2	10.6	10.7
Corp. income tax ratios	2.1	2.0	2.4	2.5	2.5	2.2

It involves many calculations to establish the convergence and divergence of particular tax ratios, but out of curiosity I did it several times during the 1970s and early 1980s.[11] For most of the main tax ratios (personal and corporation income tax and VAT, etc.), the results were not too interesting, convergence and divergence being roughly equal, but changing somewhat over time and between countries – the consequences of adopting VAT being the only general explanation

11. K Messere, *Recent and Prospective Trends in Tax Levels* (Institute of Fiscal Studies, 1975); "Tax levels, structures and systems: some intertemporal and international comparisons", from proceedings of the 32d IIPF Congress of the International Institute of Public Finance, Edinburgh 1976 (Editions Cujas Paris, 1978), and "Quantitative Developments in OECD Tax Levels and Structures (1965-1981)", *Intertax* (August 1985).

© 1993 International Bureau of Fiscal Documentation

that could be offered. However, there were two interesting exceptions: no matter what periods were being considered social security ratios were almost invariably divergent, increasing in all OECD countries but most in those with high ratios in the earlier of the two years being compared. On the contrary excises, etc. ratios were almost invariably convergent, decreasing in virtually all countries, but decreasing most in those countries which had high excises, etc. ratios in the earlier year. It is for this reason that in Table 5 I have revisited only these two last tax ratios to see what has happened between 1985 and 1990.

Table 5 results show that the divergence of social security ratios, though much abated nevertheless continued in many countries between 1985 and 1990 (Italy, Luxembourg, Norway and Sweden being high ratio countries increasing them by more than average and Denmark, Finland, Iceland, Ireland, United Kingdom and United States being below average reducing them or increasing them by less than average), while Australia and New Zealand remain without social security contributions. Convergence predominates over this period more than ever before with excises, etc. ratios, only Luxembourg (low excise ratio country reducing it by very slightly more than average) being a divergent country.

This very slight Luxembourg deviation recalls that a major limitation of the Table 5 type analysis is that countries have to be forced into the convergence/divergence dichotomy, irrespective of whether such convergence/divergence is very heavy or very slight. Table 6 provides a sort of corrective by

TABLE 6

© 1993 International Bureau of Fiscal Documentation

concentrating on those countries which have either exceptionally high or exceptionally low particular tax ratios. Evidently what constitutes 'exceptionally' as defined in the second column of that table has to be a subjective choice and little commentary is provided on the table.

It is, however, worth pointing out that under the criteria applied recent convergence is manifested in another way in that the number of extreme cases has been reduced from 41 to 34 between 1985 and 1990.

Another observation is that some countries have typical tax ratios (Canada, Ireland, Switzerland, United Kingdom) and others eccentric tax ratios (Australia, Denmark, Finland, New Zealand, Sweden) – see last column of Table 6.

C. *Tax structure developments (1985-90)*

For the reasons already indicated, less is said about changes in countries' tax structures than has been said about changes in their tax levels. Table 7 echoes Table 4 in providing details of major shifts between 1985 and 1990 and Table 8 echoes Table 6 in providing examples of extreme high reliance and low reliance on particular sources of revenue for the years 1985 and 1990. For these tables, taxes on goods and services (5000) are considered as a whole, no split being made between their main components – VAT, etc. (5110) and excises, etc. (5120) since the usual situation is a heavy VAT, etc. increased share accompanied by a heavy decreased excises, etc. share and what is perhaps more interesting is to see what changes there have been in the tax mix between consumption taxes as a whole and income taxes and social security contributions.

TABLE 7

SHIFTS IN PARTICULAR TAX STRUCTURES BETWEEN 1985 AND 1990

Number and high deviations	7	7	7	5	10	6	7	7	4	3	35	28

Table 7 suggests an absence of any clear trend in the tax mix of the major revenue sources between 1985 and 1990 as the following sub-table brings out:

Changes of one or more percentage points between 1985 and 1990 in shares of total tax receipts

	Personal Income	Corporation	Social Security	Consumption	Property
No. of countries with increases	8	4	7	7	7
No. of countries with decreases	7	8	6	10	3

One trend worth commenting on is the rise in the share of property tax receipts since 1985, which had been consistently declining until then. In addition to the countries referred to in Table 7, where the share rose by at least one percentage point, there were also increases in the property tax share of 0.9 percentage points in Belgium, 0.8 in France and 0.7 in Ireland and the United States, though a decline of 0.7 in Japan.

Although for many years there has been much advocacy of switching from income and payroll taxation to consumption taxation, this rarely seems to have happened except in some of the countries newly introducing VAT (Greece, New Zealand and Portugal). Rather the reverse has more often happened.

Table 8 concludes this brief survey of tax structure developments by indentifying countries with very heavy or very light reliance on the main revenue sources in 1985 and 1990. It calls for only two observations: first, countries with extreme tax structures are by no means identical to those with extreme tax ratios (e.g. compare Tables 6 and 8 for Greece and Sweden) even if sometimes there is a positive correlation (e.g. Australia many deviations in both and the United Kingdom

© 1993 International Bureau of Fiscal Documentation

few); second, the number of cases of extreme tax structures were fewer in 1990 than in 1985 (28 instead of 35).

D. *Developments in sub-central government taxes between 1985-90*

The wider questions and issues arising in financing expenditures of sub-central levels of government and country practices between 1965 and 1989 were dealt with in Chapter 9 of Messere (1993). This section merely notes changes between 1985 and 1990 in two respects: how far have there been changes in the percentage of tax revenues allocated to sub-central levels of government (Table 9) and how far have there been changes in the kinds of tax allocated to them (Tables 10 and 11).

TABLE 9

SHARE OF TOTAL TAX REVENUES ACCRUING TO SUB-CENTRAL LEVELS OF GOVERNMENT IN 1985 AND 1990*

Federal Countries

	State Government			Local Government			
	(For reference 1990 federal government share)	1985	1990	Difference	1985	1990	Difference	Other changes of more than one percentage point
Australia	74.6	14.9	16.8	+1.9	3.7	3.5	–0.2	Federal –1.8
Austria	50.3	13.1	10.7	–2.6	10.7	11.2	+0.5	Federal +1.4
Canada	41.9	36.0	35.1	–0.9	9.3	8.9	–0.4	
Germany	32.9	22.0	21.1	–0.9	8.9	8.3	–0.6	Federal +1.3

* Personal and corporate tax receipts cannot be disaggregated. ** Adapted from table 128 of OECD (RS) 1992.

© 1993 International Bureau of Fiscal Documentation

Federal and unitary countries are treated separately because data are divided into federal, state and local for the former and only into central and local for the latter. Whilst it is mostly the case that state governments in federal countries have greater taxing powers than local government in unitary countries this is not necessarily so, local government authorities in the Nordic countries having greater taxing powers than the Australian or German intermediate governments for example. Ideally one would like to separate out 'own taxes' where sub-central government has some control over the rate and/or base of the tax from shared taxes where revenues are divided between federal/central and subordinate levels of government according to a negotiated formula, but the OECD RS (1992) data do not permit this, and in the tables that follow sub-central taxes include both receipts from own taxes and the shared portion of receipts accruing to such sub-central levels of government.

1. Changes in the share of tax revenues

Leaving aside the relatively small amounts of tax revenues allocated by EC member countries to the EC Commission, rival candidates to state and/or local government are not only the claims of central/federal government but also social security funds. Where there are large changes (defined as more than plus or minus one percentage point of total tax revenues) between 1985 and 1990 in the proportion of tax revenues allocated to state or local government, some indication is given in Table 9 as to how far this is combined with changes in the central government and how far in the social security fund share.

Among federal countries, intermediate (state) government gained most in Australia and lost most in Austria, and local government gained most in the United States and lost most in Switzerland, where it nevertheless continues to have a greater share of total tax revenues than in any other federal country.

Over the same period in unitary countries, local government has gained most in Denmark, where its share has been well above the average for many years, and lost most in the United Kingdom. Other local government gains of one percentage point or more occurred in Portugal and Spain and losses in Belgium, Turkey, Japan and Sweden, though in the last two countries the local government share remains well above average.

There appears no apparent correlation between changes in the sub-central government share and political demands for greater decentralization as has occurred in recent years, for example, in Belgium, Canada, France and Spain. Nor does there appear to be any general recent trend towards an increased or decreased share of revenue for sub-central governments, since it increases in about as many countries as it decreases, and apart from the countries referred to above shifts are relatively slight.

2. Changes in local tax structures

Table 10 (federal countries) and Table 11 (unitary) display the large variety of tax instruments used by governments to finance sub-central government and the great changes that have taken place between 1985 and 1990.

Because federal countries both at state and local level tend to diversify their revenues more than is usually done in unitary countries, and because from a constitutional point of view changing the structures in a federal country is likely to be more complicated, one would expect changes in revenue structures to be less volatile than in unitary states, and a comparison of Tables 10 and 11 shows this is indeed the case. However, though there are no great changes in local taxation in federal countries, at state level large shifts have occurred between 1985 and 1990 in Australia, Austria, Canada and Germany, as summarized below, though not in Switzerland and the United States.

Australia: An increase of five percentage points in the share of property taxes, together with smaller reductions in the share of payroll taxes, excises and use taxes.

Austria: A five percentage point decrease in the personal income tax share and two percentage points in the corporate tax share together with a six percentage point increase in the VAT, etc. share.

Canada: An increase of nearly seven percentage points in the income tax share, with a corresponding decrease in use taxes.

Germany: A five percentage point increase in business income taxes, with smaller adjustments to other kinds of state taxes.

In unitary countries large shifts in the composition of local government revenues between 1985 and 1990 are so frequent that it seems simplest to indicate changes in percentage points by the following sub-table:

	1100	1200	4000	5110	5120	5200	Other
Belgium	+9	+5				−16	+4
France			+4				
Greece	−9		−9			+4	+19
Italy	−5					+4	
Japan			+3			−4	
Luxembourg			+4				−5
Spain			+25	−20	+8		
United Kingdom	−73						+73

1100 = personal income tax
1200 = corporation tax
4000 = property tax
5110 = VAT etc.
5120 = excises etc.
5200 = use taxes

Except for a 4.5 percentage point decline in the unweighted personal income tax share and a six percentage point increase in the residual heading share (due to the British change from the rates to the poll tax and the high proportion of unidentifiable local taxes in Greece) there is not much change in unweighted averages, confirming what is shown in the above sub-table, that there is no clear international trend in types of tax used to finance local government.

E. *Developments in general government financial balances (1986-94)*

Table 12 records general government financial balances between 1986 and 1991 with estimates for 1992, 1993 and

© 1993 International Bureau of Fiscal Documentation

1994. Not only do the revised estimates for 1992 (column 8) indicate record deficits but 1994 estimates (column 10) suggest that these will be little better. Indeed they may be worse, since recent estimates have generally been on the optimistic side (e.g. compare columns 7 and 8 of Table 12), reflecting governmental wishes to let the rest of the world know that things are not as bad as they seem. Moreover, every OECD country except Japan is likely to remain in deficit over the next two years.

Average of above OECD countries	–3.2	–2.3	–1.7	–1.0	–1.7	–2.4	–3.2	–5.1	–2.6	–4.2

During most of the 1980s governments were generally successful in their fiscal consolidation objectives but as Table 12 shows, since 1989 things have got worse in nearly all OECD countries. There is a consensus that deficit financing may be a valid short-term strategy in times of recession, and provided that it remains relatively moderate even in the longer term, given normal growth assumptions, but the level of long-term deficits now prevalent is generally regarded as unacceptable.

Two methods of reducing budgetary deficits are privatization of government assets and introducing or increasing user charges (e.g. road tolls), but both have their limits and drawbacks. It would seem that a reduction of budgetary deficits has also to require a cut in government expenditure, increased taxation or some combination of both. Cutting the deficit over the next few years is becoming an increasingly important priority of OECD governments, as exemplified by the maximum 3 percent of GDP deficit objective enshrined in the Maastricht treaty, as well as innumerable government statements over the last few years to this effect. It seems unlikely that sufficient cuts in government expenditures to realize this target will be feasible in most OECD countries. The 'peace dividend' may help to reduce government expenditure in some OECD countries (especially the United States) and many OECD countries are currently examining the possibility of cutting back on universal welfare benefits paid to pensioners and parents who have sufficiently high incomes or capital assets not to need them. However, for most OECD countries cutting government expenditures significantly in real terms scarcely seems a realistic option over the next years when unemployment is likely to remain high and economic growth low, while longer-term demographic trends entail an increase in the ratio of elderly non-producers to the total population.

© 1993 International Bureau of Fiscal Documentation

Thus it seems that in many OECD countries during the 1990s a major problem for governments will be how to increase TTRs (and reduce expenditures) in a way that does the least economic and social damage and alienates voters as little as possible. Part III of this article discusses this, in relation to the G7 countries[12] but only on the tax side, not the spending side, though it is recalled that the abolition or reduction of tax relief for certain qualifying expenditures can be seen as either cuts in government expenditures or increases in taxation or both.

III. SOME POLICY IMPLICATIONS

A. *Presuppositions*

It is henceforth assumed that the G7 governments mean what they say when most of them announce that their main priority for the next few years is to reduce, or at least stabilize, their fiscal deficits and that this cannot be done in practice without some increase in TTRs.

It is under this presupposition that provocative and normative language is deliberately used in the headings of Table 13, which introduces Part III. Though such language will displease many readers who regard tax-cutting as a virtue rather than a vice, under the presuppositions made, which have been echoed by many fiscal conservatives in favour of reduced government expenditure, if tax-cutting is a virtue it is one that can no longer be afforded.

12. Space limitations restrict the discussion to the Group of 7 -G7 countries - but evidently some of the points made apply to other OECD countries.

TABLE 13

TAX ECCENTRICITIES, TAX EFFORT AND MAIN CONSTRAINTS ON IMPROVING TAX EFFORT IN THE G7 COUNTRIES

COUNTRY	MAIN TAX ECCENTRICITIES	EVALUATION OF TAX EFFORT 1985-1992	MAIN CONSTRAINTS ON IMPROVING TAX EFFORT
Canada	i) General consumption taxes at federal and provincial level uncoordinated ii) No death or gift taxes	Good. Increases in TTR over recent years suggests that deficit is under greater control than in most countries (see tables 12 and 14)	Federal/provincial competition for tax revenues
France	i) Lowest income tax ratio of any industrialised country due mainly to antiquated collection methods and exemption of nearly half the population from income tax ii) Greater reliance on social security contributions than any other industrialised country	Good. TTR has fallen slighly in recent years, but is appreciably higher than that of the other six and until very recently the deficit has remained stable and relatively small	Once a pioneer in tax reform (inventors of VAT), over the last two decades successive French governments have been too afraid of taxpayer resistance to undertake serious tax reform
Germany	No great tax eccentricity, but lowest VAT rate in industrialised Europe and well below average European VAT and income tax ratio	Bad. TTR has fallen in recent years at a time when more revenues are needed for reunification costs as well as for the deficit	i) The disproportionate influence of anti-tax business pressure groups on the governemnt ii) Tax sharing formulae between federal and länder government
Japan	Absence of rational and consumption taxation	Very good. Recent increases in TTR have enabled Japan to remain the only OECD country not in deficit	Opposition of business to a proper invoice VAT system, generally believed to be to hide their tax evasion
Italy	No great tax eccentricity, but no great tax administration	Good but inadequate. TTR has risen greatly in recent years, but not enough to reduce the very heavy deficit	The underground or informal economy and mafia
United Kingdom	i) The narrowest VAT tax base in Europe ii) Ways of financing local government expenditure never considered outside the UK	Very bad. TTR has consistently fallen since 1985, and since 1989 deficits have increased considerably	An ideological government which neither seeks consensus with non-government, nor pays attention to solutions adopted in other countries
United States	i) Absence of sufficient consumption taxation at federal level (especially under-taxation of gasoline and lack of federal VAT or retail sales tax). ii) Only OECD country to allow deductability of mortgage interest on secondary residence without taxing rental value	Very bad. No recent increase in TTR and budget deficit does not abate. (In 1991 has probably overtaken Turkey as the OECD country with the lowest TTR).	i) Exceptional aversion of citizens to tax increases ii) Separation of powers between executive and legislative and congressional pressure groups iii) Federal/state competition for tax revenues

© 1993 International Bureau of Fiscal Documentation

The left hand column of Table 13 attempts to identify some of the reasons why most of the G7 are in deficit, by drawing attention to under-taxation *vis-à-vis* other OECD countries from particular revenue sources; the middle column notes how these countries have coped with their usually increasing budgetary deficits over the last few years; and the last column indicates some of the constraints that are likely to inhibit reduction of budget deficits in the future.

As to terminology, in the left hand column 'tax eccentricity' for excessive under-taxation – or occasional over-taxation like French employers' social security contributions – will be unacceptable to many who would prefer to talk of 'subsidiarity', 'tax sovereignty', or 'tax diversity', but as argued in the next section if governments are really serious about reducing deficits, one approach would be to consider whether they should continue to neglect substantially under-taxed revenue sources, that is to say, under-taxed in relation to what other OECD countries are doing. Likewise, in the present context where it is presupposed that increasing TTRs is a priority the unambiguously normative 'tax effort' is used rather than the more ambivalent 'tax consolidation'.[13]

B. *General recommendations*

In deciding how they can increase TTRs governments have to take account not only of rational tax policy, but also of a number of other factors, such as the economic situation, their political commitments, the expected reaction among fellow politicians, the media, the business community and voters at large. As Table 13 suggests, different decisions are likely to be taken by different governments for these reasons, but there do seem three areas where a number of countries might seek similar solutions:

- an increase in consumption taxation;
- an increase in personal income tax rather than social security contributions;
- a reduction of tax eccentricity.

1. Increasing consumption taxation

Over the last 15 years there have been many statements from governments and the academic world that expenditure should be taxed more and income less, but it has happened only in a few countries (see II.C. above). There are many reasons for this: increasing consumption taxes probably contributes to inflationary pressures – partly because of their transparency, partly because of shifting effects – more than equivalent revenue increases in any other form of tax; consumption taxes are perceived as, and are to some extent, regressive; they are unpopular with voters.[14] On the first two problems there are many ways in which the potentially inflationary and inequitable effects of increased consumption tax can be reduced or eliminated[15] and on the last point governments just have to enact consumption tax increases as long as possible before the next election. Most of the recommendations that follow involve increases in general consumption taxes – in France and Germany to increase the rate, in Italy to improve the collection mechanism, in the United Kingdom to widen the base and in the United States to introduce such a tax.

Whilst increases in general consumption taxes (mostly VAT) are probably the most important means of increasing TTRs, the 'sumptuary' or 'sin' taxes on motoring above all, drinking and smoking are also potential candidates for such an increase in all the G7 countries. They were in practice increased in the late 1970s and early 1980s, but, gasoline apart, yields have generally declined in real terms since then for various reasons (pressure group lobbying on the potential effect on employment levels and export performance, as well as the inflation and unpopularity constraint): nevertheless rational tax policy as well as environmental and health considerations would suggest that such products should be more heavily taxed.

Taking consumption tax ratios as a whole, it is interesting to note, that France apart, there is very little difference in TTR in the G7 if the taxation of consumption is discounted, as the following subtable shows for the year 1990.

	TTR ratio OECD heading 5000	Consumption tax Consumption tax ratio	TTR minus
Canada	37.1	10.2	26.9
France	43.7	12.3	31.4
Germany	37.7	10.3	27.4
Italy	39.1	11.0	28.1
Japan	31.3	4.1	27.2
UK	36.7	11.1	25.6
US	29.9	4.9	25.0
OECD average	38.8	11.8	27.0

2. Increasing personal income taxes rather than social security contributions

If consumption tax increases cannot reduce the deficit sufficiently, a choice has to be made between raising personal income taxes and/or social security contributions – the only other two important sources of revenue.

Some governments (notably the French and German, but others when it suits them) continue to argue that social security contributions are insurance premiums and not taxes. This is a complex issue, which I have discussed at length in Chapters 5F, 8 and 10 D6 of Messere (1993) but I believe the OECD is correct in classifying these unilateral, compulsory levies to the State as taxes,[16] and in practice they compete with the personal income tax as a source of revenue, for high contribution countries are almost always low personal income tax coun-

13. 'Tax effort' was the expression used in the IMF literature in the 1960s and 1970s to exhort developing countries for various reasons to increase their TTR: 'tax consolidation' is used by the OECD in "Economic Outlook" and the annual country studies and is more descriptive than normative, for whether 'tax consolidation' or 'deficit financing' is the more desirable, may depend on conjunctural factors.

14. For example, the threefold rejection of VAT by Swiss referenda and the result of the March 1993 Australian election was generally believed to have been heavily influenced by the opposition commitment to introduce a VAT type tax.

15. For example, on the inflation problem by temporary price controls or by timing the introduction of or increase in VAT to a deflationary period in the business cycle, and on the redistribution problem by providing non-wastable tax credits for those with low incomes for amounts of extra VAT on essentials and/or increasing child allowances, pensions or other welfare benefits, all of which have been applied in countries introducing or increasing VAT.

16. See the annual publication, *Revenue Statistics of OECD Member Countries* (Paris: OECD).

© 1993 International Bureau of Fiscal Documentation

tries and conversely, and there may be major changes in the mix between these two levies, as occurred in Italy and Spain.

When the economy is overheated, there is much to be said for increasing contributions, but not in the present era of high unemployment levels which are one of the main causes of the deficits. On the employers' side such increases will be an additional disincentive to taking on unskilled or part-time labour while potential workers are likely to fall into the 'unemployment trap' under which the earnings they could expect to secure on becoming employed may be little more than their present unemployment benefits plus the contributions which are usually payable on total earnings. Because there are thresholds which ensure that unskilled and part-time workers pay little or no income tax, the tax unemployment trap does not apply to this tax. It thus seems more efficient as well as more fair to prefer an increase in personal income tax to an increase in contributions. (Another alternative is to integrate the personal income tax with contributions as a few countries have done, rather than to charge in an uncoordinated way progressive income tax on net income and regressive contributions on gross income, as often happens.)

3. Reducing tax eccentricities

Any watcher of revenue developments over the last 30 years can hardly fail to be struck by the irrationality of countries' tax policies over most of this period, even if understanding the reasons why such irrationality has prevailed. One irrationality is that until recent years, most OECD countries have paid very little attention to what other OECD countries were doing in trying to solve similar problems to their own, except where EC coordination could be involved or where there are neighbouring countries one of which is economically predominant (United States/Canada, United Kingdom/Ireland, Australia/New Zealand.) A second irrationality has been the earlier predominance of divergence over convergence (see II.B.1. and II.B.2. above) in attempts to squeeze more revenue from revenue resources already over-exploited, for there are limits to the milk which one cow can yield. As has been increasingly, though by no means universally, recognized over the last decade, it is sensible to diversify sources in increasing TTRs, if only because diversification is likely to reduce taxpayer discontent, since income tax and employees' social security contributions are deducted at source, consumption taxes are charged when shoppers buy goods and employers' social security contributions and corporation taxes are paid initially by business.

C. *Relevance to tax policy in France, Germany, the United Kingdom and the United States*

Nothing is said here about Canada and Japan, for I have nothing to add to what is shown in Table 13. Evidently cures for the Italian malaise have to be outside the realm of tax policy, and 1993 political developments provide some grounds for optimism. On the tax side it is worth noting that there is empirical support for what is said about Italy in Table 13.[17] There follow some remarks on taxation in the other four G7 countries.

France: As noted in various tables, the main French anomaly *vis-à-vis* the OECD as a whole is excessive reliance on employers' social security contributions and neglect of the

17. For example, in 1990 Italy had a standard VAT rate of 18% with an additional higher rate of 36% on certain luxury items and it applied to most consumer expenditure, whereas the UK VAT rate was 15% and covered not much more than 50% of consumer expenditure: yet as regards VAT actually collected for 1990, in Italy the VAT ratio was 5.7% and in the United Kingdom it was 6.1%. "In this context A. Pedrone observed that reliable estimates of evasion are difficult to make. Under any plausible interpretation, however, evasion is pervasive and large, reducing value added tax collections by as much as two-thirds in some broad sectors and two-fifths overall." The Value Added Tax: Lessons from Europe (Brookings Institutions, 1981).

TABLE 14

TOTAL AND PARTICULAR TAX RATIOS FOR 1990 COMPARED TO 1991 ESTIMATES[1]

	TTR		1000 Income taxes		2000 Social security		4000 Property		5000 Goods and services	
	90	91	90	91	90	91	90	91	90	91
Austria	41.6	42.0	10.6	11.2	13.7	13.7	1.1	1.2	13.1	12.9

© 1993 International Bureau of Fiscal Documentation

personal income tax. A move away from employers' payroll taxes to personal income taxes would seem to be sensible, but is not helped by the French government's assumption that the former are not taxes.[18] The obvious way of increasing the personal income tax ratio is to follow the example of other OECD countries by withholding it at source along with social security contributions and to reduce the threshold to bring more people into the income tax net. It would seem that France would do well to follow the examples of Italy and Spain which in earlier years had a French type tax structure and method of collection.

While Table 12 suggests that the French deficit has over recent years been relatively small and stable, it has in practice already reached 4 percent of GDP and is likely to continue to increase over the next years partly as a result of the decline of consumption tax ratios and stagnation of others. Modernizing the personal income tax system would seem the first priority, but increasing the relatively low rates of excises on alcoholic drinks and cigarettes would also seem rational. The decline in the VAT ratio from 8.9 in 1985 to 8.2 in 1990 is due in part to a reduction in higher rates on luxury goods to meet EC objectives without any increase in the standard rate which it might now be necessary to increase.

Germany: Over recent years Germany has had a very lax fiscal policy, somewhat surprisingly in view of the need to pay for the costs of reunification. TTRs have remained virtually unchanged since 1976 while in recent years deficits have been increasing, and as everyone knows this lax fiscal policy has necessitated a tight financial policy with in particular high interest rates which has had an adverse effect on currency stabilization in the EC area. Obvious candidates for increasing TTRs would be to raise the VAT rate which at 15 percent is the lowest in industrialized Europe (VAT ratio for 1990 10.0 percent against a European average of 11.1 percent) and also personal income tax ratios (personal income tax ratio 10.3 percent against a European average of 11.4 percent). A special difficulty in making such increases may be due to the revenue sharing formulae between federal and länder government, whereby each gets a predetermined share of income tax and VAT yields.

The March 1993 agreement to impose a 7.5 percent income tax surcharge on higher income groups from 1995 is evidently a step in the right direction, but could be seen as too little and too late.

United Kingdom: Whilst it may be economically prudent to delay until 1994 increases in the UK TTR, there is now a consensus that it should be increased in the near future to reduce the heavy deficit. Since the United Kingdom is virtually alone among European VAT countries in excluding nearly half consumer expenditure from the base, which itself has many disadvantages,[19] an obvious way of increasing TTRs, is to bring in food, books, newspapers, children's clothing, etc. into the VAT net, realistically at a reduced rate of around 5 to 10 percent. Such a move would have some regressive distributive effects and should be accompanied by other offsetting measures.[20] In the March 1993 budget statement a first step was taken to widen the VAT base by ending the zero rating of gas and electricity as from 1994, with compensation promised[21] to low income groups. Whilst rational tax policy would suggest a similar approach to other zero-rated items it seems unlikely to happen for a long time, mainly because both the two main British political parties have become prisoners of their own rhetoric.

Another UK eccentricity is for ideological or voter appeal reasons to avoid at all costs increasing personal income tax rates, now well below the OECD average and that accounts for the 1993 budget statement which provided for an increase in social security contributions instead of in income tax. It also accounts for the fact that unlike 17 of the 24 OECD countries the United Kingdom does not use a local income tax as the main source for financing local government.[22] Indeed along with Australia, Greece, Ireland, the Netherlands and New Zealand it does not use it at all: instead the United Kingdom goes in for bizarre instruments like the poll tax and council tax, never contemplated in any other OECD country. If, for understandable political reasons, the British government cannot *appear* to increase income tax rates, it may be able to increase the ratio by phasing out tax expenditures such as the mortgage interest relief.

As suggested in my book,[23] the insularity and irrationality of British tax policy may be due to the fact that the British electoral system usually provides governments with a sufficiently large majority not to have to seek a consensus with non-government. The belated coordination in 1993 of taxing and expenditure decisions plus the eventual abandonment of budgetry secrecy for which there is growing pressure, could make for greater rationality in the future.

United States: The February 1993 statement of President Clinton that the US Administration is willing to increase TTRs in order to reduce the US budget deficit is good news. Newspaper reports have focused on a higher marginal rate of tax for the wealthier plus the proposed new energy tax, but as the left hand column of Table 13 suggests, there are three other routes that could be taken in ascending order of political difficulty:

– First, increasing the federal gasoline tax. There is an obvious environmental rationale for doing so and even assuming the energy tax under-taxation of gasoline in the United States in relation to other OECD countries is likely to remain quite

18. For example, when sending out income declaration forms in 1993 the French tax authorities informed taxpayers that French tax revenues consisted of 45% VAT, 21% personal income tax, 10% corporation tax and 24% other taxes, whereas under the OECD classification – for 1990 – the figures would be 42% social security contributions, 19% VAT, 12% personal income tax, 8% excises, 5% corporation tax, 5% property tax, 9% other taxes – a very different story.
19. Distortion of producers' and consumers' choices, facilitation of tax evasion.
20. See *supra* note 15.
21. The form of compensation remaining to be decided and in view of the regressive tax/benefit policies of British conservative governments since 1979, much sceptism has been expressed on whether this compensation will be adequate.
22. British unawareness of what happens elsewhere is typified by a remark in an article in *The Economist* (22 August 1992) which usually does better. It stated that "as a source of local government revenue in Britain *as in most of Europe* (emphasis added) only taxing property works". As Table 11 shows, this is untrue. Among European countries property tax represents more than 20% of local taxation only in France, Ireland, the Netherlands, Portugal and Spain.
23. Chapters 4F and 9E7.

© 1993 International Bureau of Fiscal Documentation

large. The tax component in the price of gasoline at end 1991 was above 65 percent in half of the OECD countries, and above 54 percent in the remainder with the exception of New Zealand 48 percent, Canada 45 percent and the United States 33.5 percent.[24]

– Second, the economic and social case for granting mortgage interest relief beyond a limited amount on even the *principal* place of residence is doubtful and OECD practice over the last years has generally been to reduce considerably or even abolish this particular tax privilege. To give such mortgage interest relief for a *secondary* place of residence has even less justification and is clearly regressive and exploitable as a tax avoidance device, so its abolition would clearly be an equitable way of increasing TTRs, especially as unlike other countries granting mortgage interest relief for secondary residences, the United States does not even tax their rentable value.[25]

– Third, the most important, and politically and constitutionally difficult, way of reducing the deficit would be to introduce a general consumption tax for national government, as every other OECD country does. Though there are some federal excises, the right to tax consumption generally has always been reserved to state and local government. However, the introduction of a VAT or RST seems a rational way of trying to tackle the budget deficit in the longer term, even if it may have to begin with a modest general consumption tax (Japanese style) of around 3 percent. Whether such a tax would initially take the form of VAT or RST and apply to food and services would seem of secondary importance.[26]

IV. SUMMARY AND CONCLUSION

It has to be accepted that first there will never be total agreement on what constitutes rational tax policy, because too many subjective factors arise, such as what is the optimal size of the public sector, and second, even to the extent that technical agreement can be reached on what is rational tax policy under common presuppositions, other considerations may be held more important by governments taking decisions on changes in tax laws, for example, apart from what is politically possible, the limitations imposed by the domestic and global economic situation.

The foregoing paragraphs assume that in most of the G7 countries reducing budgetary deficits has to be the priority and that this necessitates an increase in TTRs over the next few years. They further offer three suggestions on how this might rationally be done, namely to increase consumption taxation and also income tax in preference to social security contributions and at a different level of generality to rely more on any major tax source which has been substantially neglected in relation to what most other OECD countries do.

At the implementational level a more rational tax policy would be greatly facilitated if governments, politicians, pressure groups, etc. reversed their propaganda in perpetuating the following two myths: that increased consumption taxation has to be inflationary and regressive (for any such effects can be offset by other measures), and that social security contributions are different in any fundamental way from personal income taxes except in their greater regressivity.

In a few small countries, such as some of those in Northern Europe and New Zealand, these myths have been dispelled, with the consequence that their tax systems have become more efficient and more equitable in recent years. Little progress seems to have been made in this direction in the G7, except perhaps to some extent in Canada and Italy.

24. See *Energy Prices and Taxes* (Paris: OECD, 1991).

25. It has been alleged that the reason for this is that Congressmen require two residences. Apart from the fact that they could rent in Washington D.C., if this is the justification, such relief could be restricted to Congressmen, even if they found such a provision embarrassing, for the impact on government spending and TTRs would be negligible, whereas its availability for all US citizens is extremely expensive in revenue forgone.

26. An excellent analysis of how to get a rational general consumption tax at federal level in countries such as Canada and the US is provided in Richard Bird, "Cost and Complexity: the GST in International Perspective" (paper presented to Canadian Tax Foundation, November 1992).

APPENDIX

Changes between 1990 and 1991 in tax levels and tax structures

Too much significance should not be given to changes in tax levels or structures between adjacent years which may be a result of special circumstances, including the 'correction' of atypically large movements in the opposite direction in the previous two adjacent years. This applies even more so to comparisons between data for the last firm year and estimated data, since experience has shown that estimates are often substantially changed, especially tax ratios because of revisions to GDP figures. Table 14, nevertheless compares 1990 TTRs and the main particular tax ratios to those estimated for 1991. The following subtable draws attention to apparent major shifts:

	Total tax ratios	1000 Income tax ratios	2000 Social Security ratios	5000 Consumption ratios
Belgium	–2.9		–1.2	
Canada	+2.3 (also +1.7 89-90)			+0.8
Germany	–1.1		–1.3	
Iceland			+1.3	
Italy	+1.4 (also +1.2 89-90)			
Netherlands	+2.1	+1.4(a)		
Sweden	–5.1	–3.9	–1.0(b)	
Turkey	+2.2 (also +1.2 89-90)			+0.7

(a) also plus 1.6 89-90. (b) but plus 1.1 89-90

Tax structure data for 1990 and estimates for 1991 are not reproduced here, but the following subtable shows estimated shifts in tax structures exceeding two percentage points:

	1000 Income taxes	2000 Social security	5000 Consumption taxes
Belgium	-3.3	+2.1	
Germany	-2.4		
Iceland	+3.8		
Portugal	+2.7	-2.1	
Sweden	-5.4	-1.0	+3.8

THE US–NETHERLANDS INCOME TAX TREATY: TAX COLLECTION ASSISTANCE AND EVIDENCE-GATHERING

Bruce Zagaris

This paper was presented at a tax seminar held in New York on 9 February 1993 entitled "The New US–Netherlands Tax Convention".

Mr Zagaris is a partner in the Washington, D.C. firm of Cameron & Hornbostel. Mr Zagaris received a BA, JD, and LL M (tax) from the National Law Center of the George Washington University, and an LL M. in comparative law from Stockholm University in Sweden and in international law from the Free University in Brussels. Mr Zagaris' practice includes structuring international business transactions and especially international tax aspects. He has also represented 12 governments and three international organizations in international tax matters. He has authored and edited five books and many articles on international law and frequently lectures. From 1989-92, he was chair, Committee on International Tax Law, Section of International Law & Practice, American Bar Association. His practice also includes counseling and participating in litigation of international white collar crime matters, especially those involving the regulation of international money movement. He is chair, Committee on International Criminal Law, Criminal Justice Section, American Bar Association and founder and editor-in-chief, International Enforcement Law Reporter. He is an adjunct professor at the Fordham Law School, New York City.

I. INTRODUCTION

On 18 December 1992, the US Department of Treasury released the proposed income tax treaty between the Netherlands and the United States. With respect to international tax enforcement, the treaty is significant in that the two signatory countries, in addition to the standard agreement to engage in exchange of information and administrative assistance,[1] have agreed to provide comprehensive assistance and support to each other in the collection of the taxes that are the subject of the present treaty, together with interest, costs and additions to the taxes and fines not being of a penal character.[2] Although several income tax treaties provide for more limited assistance in tax collection, none of them are as broad or can be invoked as early by law enforcement authorities as the US–Netherlands treaty. In addition, none of the provisions are as detailed as the treaty and the Memorandum of Understanding (MOU) exchanged.

This article discusses the Dutch-US collection assistance provisions in the new treaty. In particular, it discusses how the provisions operate generally and the requirements to exhaust the treaty evidence-gathering prior to the right of the US government to invoke the controversial evidence-gathering techniques under Section 6038 of the Internal Revenue Code (IRC). The procedural aspects of the exchange of information and tax collection assistance are discussed. To indicate the unique nature of some of the provisions in the protocol, the tax collection assistance provisions in other US treaties are discussed. The article also considers the OECD/Council of Europe (COE) Convention on Mutual Administrative Assistance in Tax Matters since both the United States and the Dutch governments are signatories and will be a party to the OECD/COE Convention once it takes effect, even though for the time being the United States has reserved on the tax collection portion. Finally, to bring the US-Netherlands treaty into proper perspective, the article looks at other means to gather evidence to collect taxes, namely the Mutual Legal Assistance in Criminal Matters Convention between the two governments.

VIII. Summary and Conclusion

II. DUTCH-US COLLECTION ASSISTANCE PROVISIONS IN GENERAL

Applications for assistance and support can be made for revenue claims of each of the states which have been finally determined. A requesting state must submit with any application documents establishing that under the laws of the state making the application the taxes have been finally determined.[3] In particular, the request for administrative assistance in the recovery of a tax claim must be accompanied by: (a) an official copy of the instrument permitting enforcement in the applicant state; (b) where appropriate, certified copies of any other document required for recovery; (c) a certification by the competent authority of the applicant state that, under the laws of that state, the revenue claim has been finally determined.

The majority of US tax treaties that provide for assistance in collection do so only to ensure that exemptions and reduced tax benefits claimed pursuant to the tax treaty in question are proper. Applications for assistance may be accepted for enforcement by the other state and collected in that state in accordance with the laws applicable to the enforcement and collection of its own taxes. The state to

1. For background on the exchange of information and administrative assistance provisions, see Art. 30 of the treaty.
2. Treaty Art. 31(1). The competent authorities can grant assistance in collecting any capital gains tax deferred by operation of Art. 14(8) of the treaty. MOU, para. XXX(9).
3. Treaty Art. 31(3). A revenue claim is finally determined when the applicant state has the right under its internal law to collect the revenue claim and all administrative and judicial rights of the taxpayer to restrain collection in the applicant state have lapsed or been exhausted. Understanding, para. XXX.

© 1993 International Bureau of Fiscal Documentation

which application is made does not have to enforce executory measures for which there is no provision in the law of the state making the application.[4] A major development in these provisions is that under existing treaties with tax collection assistance provisions, it is necessary for a requesting state to reduce the claim to a judicial judgement. The additional step can be time-consuming and can provide ample opportunity for a delinquent taxpayer to remove assets and prevent collection.

Tax collection assistance will not be made with respect to citizens, corporations or other entities of the state to which application is made, except in cases where the exemption or reduced rate of tax granted under the treaty to such citizens, corporations or other entities has, according to mutual agreement between the competent authorities of the states, been enjoyed by persons not entitled to such benefits.[5] Hence, if the United States is the requesting state and a Dutch person is the taxpayer, the United States would have to show that the application is made for a case in which such Dutch person claimed an exemption or reduced rate (such as for dividends, interest or royalties) to which he was not entitled.

III. REQUIREMENTS TO EXHAUST THE TREATY EVIDENCE-GATHERING PRIOR TO INVOKING IRC SECTION 6038A

The MOU exchanged between the signatory countries addresses the controversial evidence-gathering techniques in the United States under IRC Section 6038A.[6] The Understanding provides that, if a US "reporting corporation" as defined for purposes of Section 6038A, has neither possession of nor access to records that may be relevant to the US income tax treatment of any transaction between it and a foreign "related party", and such records are under control of a Dutch resident and are maintained outside the United States, the United States will request such records from the Netherlands through an exchange of information under Article 30 (Exchange of Information and Administrative Assistance) before issuing a summons for such records to the US "reporting corporation". However, the provision is conditioned on being able to obtain the records through the request on a timely and efficient basis. Records will be considered to be available on a timely and efficient basis if they can be obtained within 180 days of the request or such other period agreed upon in mutual agreement between the competent authorities, except where the statute of limitations may expire in a shorter period. Similar principles will apply with respect to the application of Section 6038C.[7]

The MOU also limits applications made for purposes of applying the conduit base reduction test in Article 26(d)(5) of the treaty. As an initial matter, the requesting state must confine its requests for information with respect to a resident of the other state to the information necessary to determine whether such resident is a conduit company as defined in Article 26(8)(m). The requesting state will request additional information required to determine whether the conduit base reduction test has been satisfied only after determining that a company is a conduit company.[8]

IV. PROCEDURAL ASPECTS OF EXCHANGE OF INFORMATION AND COLLECTION ASSISTANCE

The MOU states that, with respect to exchange of information and administrative assistance, persons concerned with the "administration" of taxes include in the United States, the "tax-writing committees of Congress" and the "General Accounting Office". Information exchanged under the treaty that is otherwise confidential under the treaty can be received under the same requirement of confidentiality by these bodies and can be used only in the performance of their role of overseeing the administration of US tax laws. Furthermore, it states that Congress' and the General Accounting Office's role in overseeing the administration of US tax law is understood to be limited to ensuring that the administration of the tax law by the executive branch is honest, efficient and consistent with legislative intent.[9]

The MOU explains that in applying the assistance provisions, the requested state will not be obliged to accede to the request of the applicant state:

- if the applicant state has not pursued all appropriate collection action in its own jurisdiction;
- in those cases where the administrative burden for the requested state is disproportionate to the benefit to be derived by the applicant state.[10]

A revenue claim of the applicant state that has been finally determined may be accepted for collection by the requested state and, if accepted, will be collected by the requested state as though such revenue claim were the requested state's own revenue claim finally determined in accordance with the laws applicable to the collection of the requested state's own laws.[11] The treaty provides that a taxpayer does not have any rights of administrative or judicial review of the applicant state's finally determined revenue claim by the requested

4. Treaty Art. 31(2).
5. *Id.* Art. 31(4).
6. Sec. 6038A requires a domestic corporation that is 25% foreign owned to provide certain information to the IRS on Form 5472 (Information Return of a Foreign-Owned US Corporation or a Foreign Corporation Engaged in a US Trade or Business). A corporation required to file Form 5472 must also maintain records or cause another party to maintain records necessary to determine the correct treatment of transactions with related parties. In addition, any foreign related party must agree to authorize the domestic reporting corporation to act as its agent for purposes of the IRS examination of books and records and for the service and enforcement of a summons with respect to any transaction that it has with the reporting corporation. If the related party does not make the requisite agency authorization or substantially comply with a summons for records or testimony, a non-compliance penalty may apply.
7. The enactment of Sec. 6038C provides the IRS with greater tax information-gathering authority over foreign investors and the foreign corporations they own. Sec. 6038C provides for reporting responsibility if a foreign corporation is engaged in a trade or business within the United States. These corporations are required to identify their principal foreign investors (i.e. foreign investors who own at least 25% of a corporation) and to report transactions that occur between them and the investors. The corporations must maintain tax records, an obligation not generally found in foreign law. Compliance with these obligations will permit the IRS to determine the part of a foreign corporation's income and deductions that is effectively connected to a US trade or business. The IRS has the power to impose penalties, starting at $ 10,000 annually for the failure to maintain or provide information.

state based on any such rights that may be available under the laws of either state.[12] However, if at any time pending execution of a request for assistance under the treaty, the applicant state loses the right under its internal law to collect the revenue claim, the applicant state must promptly withdraw the request for assistance in collection.[13]

Amounts collected by the requested state must be sent to the applicant state. Unless the competent authorities agree otherwise, the ordinary costs incurred in providing collection assistance will be met by the requested state, save that any extraordinary costs so incurred will be borne by the applicant state.[14]

If its laws or administrative practice allow it in similar circumstances, the requested state can permit deferral of payment or payment by instalments, provided it first informs the applicant state. Any interest obtained by the requested state as a result of the allowance of a deferral of payment or payment by instalments must be sent to the applicant state.[15]

A revenue claim of an applicant state accepted for collection does not have in the requested state any priority accorded to the revenue claims of the requested state.[16]

The competent authorities will agree on the mode of application of the tax collection assistance provisions. They may further agree to modify or supplement the provisions in the treaty and MOU, but will continue to be bound by the general principles established in the treaty.

V. TAX COLLECTION ASSISTANCE IN OTHER US TREATIES

A. *In general*

Some of the more recent income tax treaties have a provision requiring assistance in collection. Such provisions are found either in the exchange of information article or in a separate article on assistance in the collection of taxes. The bulk of these provisions are limited and provide that each of the signatory countries will endeavour to collect on behalf of the other signatory country amounts equal to such taxes imposed by the other state as will ensure that any exemption or reduction in the rate of tax granted under this treaty by that other state will not be enjoyed by persons not entitled to such benefits.[17]

Some treaties have a similar provision followed by a paragraph that states that in no case will the article be construed so as to impose on a signatory country the obligation to implement administrative measures at variance with the regulations and practices of either signatory country or which would be contrary to the first-mentioned signatory country's sovereignty, security or public policy.[18]

B. *US–Finland treaty*

The assistance in collection provisions in the US–Finland tax treaty are slightly more comprehensive, but essentially the same.[19] They provide that the signatory countries must endeavour to collect such taxes imposed by the other signatory country as will ensure that any exemption or reduced rate of tax granted under the treaty by the other signatory country will not be enjoyed by persons not entitled to such benefits. The signatory country making such collections will be responsible to the other signatory country for the sums thus collected. The competent authority of each of the signatory countries will consult with the competent authority of the other signatory country for the purposes of cooperating with and advising that other signatory country in respect of any action taken by it within the former signatory country to collect its tax. The US-Finland treaty also has the same preceding paragraph as the other treaties limiting the obligations of the requested signatory country.[20]

C. *US–Danish treaty*

The provisions in the US–Danish income tax are very broad.[21] They provide as follows:

- the signatory countries undertake to assist and support each other in the collection of taxes which are the subject of the treaty, together with interest, costs and additions to the taxes;
- in cases of applications for enforcement of taxes, revenue claims of each of the signatory countries that have been finally determined may be accepted for enforcement by the other signatory country and may be collected in that country pursuant to the laws applicable to the enforcement and collection of its own taxes;
- any application will include a certification that under the laws of the country making the application, the taxes have been finally determined;
- the assistance provided for will not be accorded with respect to citizens, corporations or other entities of the country to which application is made, except as is necessary to insure that the exemption or reduced rate of tax

granted under the present treaty to such citizens, corporations or other entities will not be enjoyed by persons not entitled to such benefits.

There is a second article in the Danish-US income tax treaty which provides that the signatory country to which application is made for information or assistance must comply as soon as possible with the request addressed to it, except that such country may refuse to comply with the request for reasons of public policy or if compliance would involve violation of a trade, business, industrial or professional secret or trade process.

D. *US–France treaty*

The US–France income tax treaty has an unusually broad assistance in collection provision.[22] It states:

- the signatory countries undertake to assist and support each other in the collection of taxes to which the present treaty relates, together with interest, costs and additions to the taxes and fines not being of a penal character according to the laws of the country requested, in the cases where the taxes are definitively due according to the laws of the country making the application;
- in the case of an application for enforcement of taxes, revenue claims of each signatory country which have been finally determined will be accepted for enforcement by the country to which application is made and collected in that country pursuant to the laws applicable to the enforcement and collection of its own taxes;
- the application will be accompanied by such documents as are required by the laws of the country making the application to establish that the taxes have been finally determined;
- if the revenue claim has not been finally determined, the country to which application is made will take such measures of conservancy (including measures with respect to transfer of property of non-resident aliens) as are authorized by its laws for the enforcement of its own taxes;
- the assistance provided for in this article will not be accorded with respect to citizens, corporations or other entities of the country to which application is made.

E. *Existing US–Netherlands treaty*

The US–Netherlands treaty now in force has similar provisions on assistance in collection.[23] Paragraph 2 provides that the requested country need not enforce executory measures for which there is no provision in the requesting country's law in lieu of the fourth paragraph in the US–France article. The US–Netherlands Antilles provisions are almost identical.[24]

F. *US–Sweden treaty*

The US–Sweden treaty has provisions similar to the US-France treaty although the assistance in collection is limited to citizens, corporations or other entities of the requesting state.[25]

The US–Sweden treaty has an additional article which provides that a requested country is not required to carry out administrative measures at variance with the regulations and practice of either country or to furnish particulars that are not procurable under its own legislation or that of the requesting country. Further, it provides that the requested country must comply as soon as possible with the request. However, a requested country may refuse to comply with the request for reasons of public policy or if compliance would involve violation of a business, industrial or trade secret or practice. In such case it must inform the requesting country as soon as possible.[26]

G. *US–Greece treaty*

The US–Greece treaty has similar provisions to those of the US-France treaty although a protocol states that the article is confined and limited as granting authority to each signatory country to collect only such taxes imposed by the other signatory country as will insure that the exemption or reduced rate of tax granted under the treaty by the other country will not be enjoyed by persons not entitled to such benefits.[27] The US–Greece treaty also provides that the requested country will not be required to enforce executory measures for which there is no provision in the law of the requesting country.

VI. OECD/COE CONVENTION ON MUTUAL ADMINISTRATIVE ASSISTANCE IN TAX MATTERS

In 1988, the Council of Europe and the Organization of Economic Cooperation and Development (OECD) concluded the Convention on Mutual Administrative Assistance in Tax Matters,[28] a multilateral convention that will affect the ability of the United States and the other parties to obtain information regarding investors in those countries.[29] The parties began negotiating the Convention in order to improve cooperation in tax matters, reduce the incidence of tax evasion and otherwise enhance tax administration. The Convention will substantially affect investor confidentiality because of its provisions for multilateral administrative assistance with respect to income, capital (wealth), social security and other taxes.[30] Administrative assistance will include exchanges of

information and simultaneous tax service of documents.[31] The Convention should eventually result in standardized procedures for information exchanges and enhanced worldwide cooperation in tax matters.

Before the Convention can enter into force at least five governments must consent to be bound by its provisions.[32] Three Nordic countries and the United States have signed and deposited their instruments of ratification. The Netherlands has signed. Once the Dutch government deposits its instruments of ratification the Convention will be in force. Hence it is expected to go into effect shortly. The Convention provides for the exchange of tax information either on request, automatically or spontaneously.[33] Two or more parties can examine the tax liabilities of a taxpayer simultaneously and examinations can occur abroad.[34] However, the Convention allows signatory countries, through reservations, to limit its applicability to certain types of taxes (e.g. social security or local taxes) and to limit the duty to assist either in collecting taxes or serving tax documents.[35] A party may also refrain from actions that are at variance with its own public policy or laws, and decline to furnish information regarding trade secrets or processes.[36] Information obtained through the Convention may be used only for tax enforcement purposes and must be treated as a secret according to the most restrictive secrecy laws among the particular countries exchanging information.[37]

The Convention covers a broad variety of taxes – far beyond the coverage of bilateral tax treaties – including income, capital gains, net wealth, state and local, social security contributions, estate, inheritance, gift and other taxes.[38] The Convention's scope is not restricted by the residence or nationality of the taxpayer.[39]

The Convention provides for rendering assistance in the recovery of tax claims. At the request of an applicant state, the requested state must take the necessary steps to recover tax claims as if they were its own tax claims.[40] The assistance provisions will apply only to tax claims that form the subject of an instrument allowing their enforcement in the applicant state and, unless otherwise agreed between signatory countries, that are not contested.[41] If the claim is against a person who is not a resident of the applicant state, the requested state must only give assistance if the claim may no longer be contested.[42]

The obligation to assist in the recovery of tax claims concerning a deceased person or his estate is limited to the value of the estate or of the property acquired by each beneficiary of the estate, according to whether the claim is to be recovered from the estate or from the beneficiaries thereof.[43]

At the request of the applicant state, the requested state must, with a view to the recovery of an amount of tax, take measures of conservancy even if the claim is contested or is not yet the subject of an instrument allowing enforcement.[44]

The Convention sets forth the documents that must accompany the request for tax collection assistance.[45] The statutes of limitations are governed by the applicant state, which must provide the particulars concerning that period.[46] The requested state must not comply with a request for assistance that is submitted after a period of 15 years from the date of the original instrument permitting enforcement.[47]

The tax claim in the recovery of which assistance is provided will not have in the requested state any priority specially accorded to the tax claims of that state even if the recovery procedure used is the one applicable to its own tax claims.[48]

The requested state may permit deferral of payment or payment by instalments if its laws or administrative practice allow it to do so in similar circumstances, but it must first inform the applicant state.[49]

The United States has reserved on the section of the Convention dealing with assistance in recovery. However, it is expected that shortly after the Convention is ratified, the US government will take up the matter of acceding to the assistance in recovery portion.

VII. OTHER MEANS OF COLLECTION ASSISTANCE

A tax official, prosecutor of tax offences, counsel for taxpayer-defendant and third-party recordkeeper must be aware of the various mechanisms by which to collect evidence and obtain assistance in tax collection.

An important mechanism between the United States and the Netherlands is the Mutual Legal Assistance in Criminal Matters Convention (MLAT). The MLAT obligates the signatory countries to provide a broad range of mutual assistance to the requesting country. It specifically includes tax offenses to the extent and under the same conditions that they would be available in criminal investigations and proceedings in the requested state.[50] Search and seizure provisions are available for violations of IRC Section 7203, which is a misde-

31. *Id.* Art. 28(2). The following countries are eligible to sign the Convention: Australia, Austria, Belgium, Canada, Cyprus, Denmark, Finland, France, Germany, Greece, Iceland, Italy, Japan, Liechtenstein, Luxembourg, Malta, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States. The Convention may also be extended to cover some or all of the overseas territories of these countries. Art. 28(1). It seems likely that once the United States and United Kingdom sign the Convention, they will extend its coverage to their overseas territories, i.e. American Samoa, Bermuda, the Cayman Islands, the Commonwealth of the Northern Mariana Islands, Guam, Puerto Rico, the Turks & Caicos, and the US Virgin Islands, respectively.

meanour, although the Dutch government in a note has asserted that it will only execute such requests in a discretionary manner and under a policy of restraint.[51] Prosecutors who are investigating criminal violations can utilize the MLAT to obtain a broad range of information and to immobilize and require forfeiture of the proceeds of offenses. Several of the recent MLATs, such as the ones with the Bahamas, the Cayman Islands, Panama and Uruguay do not include tax crimes in the covered offenses unless they are connected to drug trafficking. The inclusion of such offenses in the US-Netherlands treaty indicates the importance given to selected tax crimes in the context of the US-Netherlands MLAT, especially since the Netherlands is an important centre for holding companies and other entities seeking to maximize their global tax planning opportunities.

Letters rogatory and many unilateral compulsory measures are additional means to gather information that may be useful to collect taxes. In addition, when a government is investigating or prosecuting a tax crime together with a money laundering offense, it can use anti-money laundering enforcement treaties to obtain information that may be useful in prosecuting and/or collecting taxes as well as in prosecuting the money laundering case. Another effective evidence-gathering technique, especially in the United States, is to hire a private investigator and merely search the public records and other avenues to find assets and evidence upon which a collection case may be based. These methods are beyond the scope of this article.[52]

VIII. SUMMARY AND CONCLUSION

The provisions in the US–Netherlands tax treaty on collection assistance and evidence-gathering demonstrate a trend towards enhanced cooperation in tax enforcement among tax authorities and may well presage increased emphasis on such cooperation in the Clinton Administration. One of the likely contested issues with respect to the tax collection provisions will be whether they are of a penal nature and therefore not within the treaty's scope.

The requirement that a requested state must give assistance to applications for enforcement and assistance in collection of revenue claims that have been finally determined in the applicant state will be the most significant advance under the treaty.[53] The other tax collection provisions require that there be a judgment or are unclear about the extent to which the applicant state must have finally gone.

The detail with which the cooperation provisions are contained will also help set the stage for improved cooperation.

The OECD/COE Convention will provide enhanced momentum to assistance in tax collection.

The ability of tax authorities and prosecutors to use both the enhanced tax collection assistance provisions together with the MLAT provide the two governments with strengthened tax collection assistance provisions that may be a model for the future.

FINLAND:

FUNDAMENTAL TAX REFORM:

25 PERCENT RATE ON CAPITAL INCOME AND CORPORATE INCOME

Kari S. Tikka*

Professor of Fiscal Law at University of Helsinki

I. INTRODUCTION

Finland launched a comprehensive income tax reform effective from 1 January 1993. The laws comprising the reform (Nos. 1535-1550/1992) were enacted on 30 December 1992. The reform covers the taxation of capital income of individuals and the taxation of business profits.

Through the enactment of this reform, Finland follows Sweden (1991) and Norway (1992). All three countries currently impose a fairly low flat rate of tax on capital income, and one can speak of a Nordic model of taxation of capital income. Other main features of the reform include a broadening of the tax base of capital income and business and a significant lowering of the corporate tax rate.

These changes in the tax system are more far-reaching than the changes carried out in Finland in 1989-90.[1] The 1989-90 reform followed the international trend of the late 1980s towards broader tax bases and lower tax rates, but because of the conservative reduction of marginal tax rates, it was not as fundamental as the reforms in the United States and the United Kingdom. The 1993 reform gives a new structure to the Finnish income tax system, and the extent of the radical revision is particularly apparent in the departure from the progressive taxation of capital income.

X. Conclusion

II. BACKGROUND OF THE REFORM

For decades the Finnish individual income taxation has been characterized by steeply progressive and high tax rates.[2] In 1992, the tax rate for individuals ranged from zero to about 63 percent. The threshold for the highest marginal rate of 63 percent was at the modest level of 275,000 Fmk. The formal tax rates were unrealistically high in order to cover all kinds of capital income, and consequently, many items of capital income were subject to reduced taxation. For example, interest income from bank deposits and bonds was subject to a final withholding tax of 15 percent. Capital gains were taxed as ordinary income but with considerable exemptions and other forms of relief, which made the system very complicated.

The main problem with the old system was the inconsistent treatment of different types of income and investments. These deviations from neutrality were thought to result in efficiency losses in the financial market, and it was considered especially important to achieve more neutrality in the tax treatment of different methods of financing business (equity vs. debt) and the tax treatment of various methods of saving. Deviations from neutrality gave rise to diversity of tax planning operations (e.g. the transformation of various kinds of income into capital gains).

The deductibility of interest payments from taxable income gave rise to substantial problems in a system where tax rates were high and the fisc carried a large share of a taxpayer's interest cost. Despite complicated restrictive rules, the interest deductions produced generous benefits to taxpayers and were the main explanation for the fact that the taxation of capital income of individuals yielded no net tax revenue to the fisc. Additionally, the benefits derived from interest deductions encouraged heavy taxpayer borrowing, and unfavourably impacted on the national economy. Therefore, one of the most important aims of the reform was to reduce the value of

1. For a discussion of this reform see Kari S. Tikka, "Business Tax Reform in Finland", 29 *European Taxation* (April 1989), at 107-112.

2. For the background of the Finnish reform, see Kari S. Tikka, "Taxation of Capital in Finland and International Tax Competition – Survey of the Situation and Development Trends" in *Nordic Perspectives on European Financial Integration*, ed. Pekka Timonen (Helsinki: University of Helsinki, Institute of International Economic Law, 1992), at 333-347.

© 1993 International Bureau of Fiscal Documentation

interest deductions for taxpayers, while at the same time introducing a low flat rate to determine the benefits of deductions.

Furthermore, the reform of the taxation of capital income can also be seen as a reaction to international tax competition. The liberalization of exchange controls in Finland in the latter half of the 1980s placed great emphasis on this factor, and the reforms in Sweden and Norway have been particularly influential in the evolution of Finnish tax policy. Disappearing frontiers for financial capital offer no realistic opportunities to apply high nominal rates to income from financial assets.

In principle, the total tax burden on the foreign investments of a domestic investor is determined by the level of domestic taxation. A significant condition here is an effective international tax control. In Finland, this problem has been discussed mainly in connection with bank deposits and insurance carried abroad, especially in tax havens. It is a sad commentary that owners of wealth can be dishonest and find it easier to conceal their foreign than their domestic interest and other capital income. In addition, wealthy individuals will not find it very difficult to change their country of residence.

It was believed that the challenge of international tax competition was more effectively met by a system where capital income is taxed without progressiveness, and with a fairly low tax rate. Likewise, the tax competition argument was a compelling reason for the adoption of a low corporate tax rate.

III. UNDERLYING PRINCIPLES

Until 1993, the structure of the Finnish income taxation was fairly typical: both capital income and earned income of individuals were included in the tax base, and were taxed at progressive rates. One can perhaps speak of a uniform system. The 1993 reform, however, is based on a differentiated income tax system in which capital income and earned income are treated differently.

The main features of the new system are as follows:

- individual income is classified as capital income or as earned income;
- capital income is subject to to a flat rate, while earned income remains subject to a progressive schedule;
- capital income comprises any yield on capital assets, including interest income, dividends, rental income, capital gains, timber sales proceeds and a share of business and agricultural income representing an appropriate return on the capital of an enterprise;
- expenses to acquire income are allocated to the two categories and, for example, the tax value of the debt interest deduction is determined by the flat rate;
- a fairly significant difference between the flat rate on capital income and the highest progressive rates for earned income is tolerated (see below).

The relatively low flat rate on capital income is justified on the ground that it indirectly takes into account the effects of inflation. Therefore, no special inflation adjustments are needed in the new system.

Under proportional taxation of capital, income and deductions can be treated symmetrically. The pre-reform system was vulnerable to tax arbitrage. For example, a taxpayer utilized large debt interest deductions, but took the profits of investment in the form of a preferentially taxed capital gain. Chances for tax planning are also reduced in other ways. In the former system it was profitable to divert capital income to family members whose other taxable income was relatively low, but the flat rate system does not encourage tax-induced redistribution arrangements of assets.

IV. TAX RATES

With respect to the taxation of individuals, the flat rate of tax levied on capital income is 25 percent, and this tax is paid only to the State. The rate structure for earned income is more complicated. Earned income is subject to a municipal tax of approximately 17 percent, social security levies of approximately 5 percent, and a possible church tax of approximately 1.3 percent (1993). State tax is levied on earned income exceeding 40,000 Fmk., and the tax rises step-by-step to 39 percent for earned income in excess of 275,000 Fmk. The highest marginal rate thus exceeds 62 percent.[3]

The corporate tax rate is the same (25 percent) as the tax on capital income. This is an intentional symmetry in the income tax system. Beginning in 1993, corporate tax will be paid only to the State, which in turn will remit a portion of the revenue to municipalities and churches. Under the pre-reform system, corporations paid a State tax of 19 percent and a municipal tax of approximately 17 percent, resulting in an overall tax rate for corporations of 36 percent (1992). The lowering of the corporate tax rate under the 1993 reform is combined with a broadening of the tax base in business taxation.

It is hardly a coincidence that the flat rate for capital and corporate income is lower in Finland than in Sweden and Norway. Sweden started the race with 30 percent, Norway followed with 28 percent, and Finland was the last country to complete its reform.

To a large extent, the reform is supposed to be revenue neutral. After a transition period, the new taxation of capital income and of businesses is likely to slightly increase tax revenue.

V. THE TAXATION OF DIFFERENT KINDS OF CAPITAL INCOME

A. *Interest income*

In principle, the tax base for capital income which is taxed at the 25 percent rate covers an individual's interest income. In

3. Unlike the reforms in Sweden and in Norway, the Finnish reform did not encompass a reduction of the tax rates for earned income.

© 1993 International Bureau of Fiscal Documentation

practice, most items of interest income are taxed under a separate withholding system, or are fully tax-exempt.

A final withholding tax is levied on interest income from bank deposits and bonds. Finland introduced this tax in 1991 (at the rate of 10 percent). The withholding tax system has not been abolished under the 1993 reform, nor will it be abolished in the future. In 1992, the final withholding tax was 15 percent, in 1993 and 1994 it is 20 percent, and as from 1995 it will be 25 percent. Certain bank deposits will be tax-exempt during a transition period, including 36 month deposits with interest rates not exceeding the Bank of Finland's discount rate less one percentage point. As of 15 February 1993, this provision allows a tax-exempt interest of 6.5 percent for such deposits.

B. *Dividends*

Dividends are generally not subject to double taxation in Finland. The imputation system was introduced in 1990 to avoid double taxation of distributed corporate income, and this system has been retained under the 1993 reform. Corporate tax paid on distributed income is fully credited to domestic shareholders. The capital income tax rate and the corporate tax rate are equal, and therefore in general no tax is payable by the shareholder. The overall tax rate on distributed corporate income is thus only 25 percent.

The tax treatment of dividends and the function of the imputation system may be illustrated as follows:

COMPANY	
Profit before taxes	100
Corporate tax (25%)	(25)
Distributed profit	75
SHAREHOLDER	
Dividend	75
Credit for corporate tax	25
Taxable income	100
Shareholder's tax (25%)	25
Credit for corporate tax	(25)
Taxes owed	0

Under the reform, the tax treatment of distributed corporate profits is much more favourable than before. In the pre-reform system, the overall tax burden of dividends received by individuals could exceed 60 percent. The substantial difference between the treatment of interest income (maximum tax 15 percent) and dividends (maximum tax 63 percent) was considered a formidable obstacle to the use of equity financing through the issuing of shares, thus resulting in a serious problem in capital taxation.

The imputation credit granted to the shareholder is based on the idea that the distributing company has paid corporation tax in full on the profits distributed as dividends. Therefore, the distributing company must pay a minimum tax equal to the imputation credit (⅓ of the dividend) in order to safeguard a single taxation. If the tax paid by the company on the basis of its taxable income (comparison tax) is less than the minimum tax, the difference is levied as a complementary tax. If the comparison tax exceeds the minimum tax (e.g. profit but no distribution), the excess can be carried forward to the following ten years (previously five years).

The complementary tax can cause double taxation when a Finnish parent company receives dividends from abroad and distributes the dividends as part of its profit to its own shareholders. Thus, paying dividends out of dividend income from foreign subsidiaries can be quite burdensome. This problem is partially eased by the reform because the withholding (source) tax paid by the Finnish parent company in the subsidiary's country of residence is taken into account when determining the comparison tax and the possible complementary tax.

In the Finnish system, dividends are only taxed once, but that does not exclude the possibility of double taxation of undistributed corporate income. On the assumption that retained profits increase the price to be paid for a corporation's shares, the corporate tax on these profits and the shareholder's tax on the capital gains from the sale of the shares result in double taxation. Contrary to the situation in Norway, the deductible basis in calculating the capital gain is not increased by the shareholder's share of the taxed undistributed profits of the corporation.

C. *Capital gains and capital losses*

The removal of capital gains preferences is a major base-broadening feature of the reform. Like other items of capital income, capital gains are generally subject to taxation at the 25 percent tax rate. However, capital gains are still accorded special treatment in certain cases, i.e. capital gains on the sale of a permanent home remain tax exempt as are generation shifts of farms and business enterprises.

Other rules limit the taxable gain by replacing the actual acquisition cost with a higher deemed basis. When calculating taxable capital gains, the taxpayer has the option of deducting either the acquisition cost of the property or 30 percent of the sales proceeds. The maximum presumed cost is 50 percent if the property was acquired before 1989, and 80 percent if real estate is sold to the State or a municipality.

A natural counterpart to a broad-based taxation of capital gains is the broad deductibility of capital losses. Nevertheless, capital losses are not generally deductible in the computation of capital income. Capital losses may only be offset against capital gains arising in the same and three following years (previously offset was only allowed in the same year).

D. *Income from forestry*

A special, if not unique feature of the pre-reform system, was the tax treatment of income from forestry. This kind of income was taxed on an estimated, rather than on an actual basis. Estimates of net income were made for various categories of forest land in different rural districts, and the forestry income of an individual farmer or landowner was determined according to the area and classification of his forest land.

© 1993 International Bureau of Fiscal Documentation

This system has been abolished under the reform, but with a long transition period. As a general rule, timber sales proceeds are taxed as capital income. However, an individual farmer may choose to be taxed on the basis of the old system during 1993-2005, and if so, the estimated income is taxed as earned income.

VI. DEDUCTIONS IN THE CAPITAL INCOME TAXATION

A. *General remarks*

In a differentiated income tax system, expenses for acquiring income must be allocated to capital income and earned income. The actual tax rate determines the tax value of a deduction.[4]

Some personal allowances are granted for social policy reasons, e.g. child care, and are deducted from earned income.

The deductibility of voluntary pension insurance payments was curtailed to some extent under the reform in order to achieve more neutrality between different forms of saving.

B. *Interest payments*

Significant problems with deductions arise in the treatment of interest payments. The previous complicated interest deduction system has been replaced by a new system in which interest payments are generally deducted from capital income.

In its Bill (200/1992), the Government proposed legislation which provided for the deduction of interest payments at the capital income tax rate, regardless of the use of the loan. The Ministry of Finance argued against the earmarking of loans, but Parliament did not accept this argument.[5] Many modifications were made in the interest deduction rules during the enactment process in Parliament. The outcome produced a set of rules, favourable to a large number of taxpayers, to be valid during a transition period, and a set of permanent rules where interest payments are divided into numerous categories according to the purpose of the loan. Apart from interest paid on loans connected with business or agriculture, the categories of deductible interest include loans to purchase a permanent residence, loans to buy shares in a company or a partnership where the taxpayer is working as an entrepreneur, loans used for other income-generating purposes, and study loans. The idea is to exclude the deductibility of interest paid on consumer loans, other than permanent residences (e.g. loans to purchase a car, yacht, leisure residence, etc.).

It is not uncommon for taxable capital income to be negative when interest payments are deducted from capital income. This typically results from interest connected with the acquisition of a permanent residence while the taxpayer has no capital income. If there were no offset in the taxation of earned income, only taxpayers with capital income could receive a tax deduction for interest on their home loans. This would not be socially acceptable.[6]

To alleviate this situation, a deficit of capital income gives rise to a credit against tax payable on earned income. In general, the tax value of the credit is limited to the capital income tax rate, i.e. the credit is 25 percent of the deficit. The maximum credit for a single taxpayer is 8,000 Fmk. For a family of four or more, the maximum credit is 20,000 Fmk., corresponding to a deficit of 80,000 Fmk. For interest paid on a loan for acquisition of a first permanent residence, the credit is 30 percent of the deficit for ten years, but maximum amounts of the credit remain the same. The possible excess deficit of capital income is carried forward to be deducted from capital income later during the ten-year period.

VII. TAXATION OF SMALL BUSINESSES AND THEIR OWNERS

The tax treatment of partnerships has been unique in Finland. A general or limited partnership conducting business has been treated partly as a separate taxable entity: half of the partnership profit has been taxed as the partnership's income and the other half as income of the individual partners. This anomaly was abolished by the reform. Now all partnership income is taxed at the partner level, as in most countries.[7]

A complex issue in the differentiated income tax system is the treatment of income generated by enterprises where the entrepreneur has worked in his business and the profit consists in part of the value of the work performed by the entrepreneur. In principle, the yield on the capital should be taxed as capital income, whereas the yield on the owner's labour should be taxed as earned income. The problems presented by this distinction concern all forms of business enterprises, including private firms, partnerships and corporations.

Finland has established schematic rules to deal with the problem. Business income is regarded as capital income up to 15 percent of the taxpayer's share of the net worth of the enterprise. According to this formula, there is no need to define categories such as closely-held companies or active shareholders. Dividend income of an individual shareholder can be taxed as earned income, even if the shareholder is a passive shareholder. In practice, this may occur in cases where the distributed profit of the corporation is produced mainly by the work contribution of the shareholder. Dividends received from corporations listed on the Helsinki stock exchange or on a foreign stock exchange are always treated as capital income.

4. For example, costs of acquisition of professional literature are deductible from earned income (tax value 0->62), and a landlord can deduct the costs of maintenance of a rental unit from rental income (tax value 25%).
5. The deductibility of debt interest has long been a controversial tax policy issue in Finland. See Kari S. Tikka, "Deductibility of Interest Payments in the Finnish Income Taxation", *Scandinavian Studies in Law 1982* (Stockholm Institute for Scandinavian Law), at 229-242.
6. It should be noted that as of 1993 Finland does not impose a tax on imputed income from owner-occupied housing.
7. During the legislative process, it was discussed whether a partnership should be permitted the option of being taxed as if it were a corporation. When presenting the Bill to Parliament the Government announced that this issue will be examined in the near future.

© 1993 International Bureau of Fiscal Documentation

Complicated transition rules provide tax relief to owners of private firms, farms and partnerships. These rules were considered necessary because the net worth of many small businesses is negative and, according to the main rule would not produce any capital income, and because the pre-reform taxation of partnerships was lenient.

Capital gains can not be taxed as earned income upon the disposal of the business, so the yield of the entrepreneur working in his own company can be realized as a capital gain, which is taxed as capital income at the 25 percent rate. The company may also have been taxed on its retained profits at the 25 percent rate, but the overall tax burden can be lower than in a case where the value of the work had been taxed as earned income.

VIII. TAX BASE IN BUSINESS TAXATION

A. *General remarks*

In making an international comparison, the corporate tax rate of 25 percent is significantly low. A major lowering of the tax rate must be compensated by a broadening of the tax base. Despite the base broadening reforms in 1989-90, Finnish business tax law included special reserve rules, reliefs for capital gains and generous depreciation rates, causing a major discrepancy between the formal and the de facto tax rate of enterprises.

There was room for further broadening of the tax base. Furthermore, an underlying principle in the reform of business taxation has been to eliminate disparities in calculating the taxable profit and the accounting profit of an enterprise. Business taxation and accounting have traditionally been closely attached to each other. The most important changes in the tax base are discussed in the following paragraphs.

B. *Capital gains*

Before the 1993 reform, capital gains on real property and shares included in the fixed assets of an enterprise were subject to a partial exemption, i.e. only 60 percent of the sale proceeds were taxed if the real property was owned for at least ten years and shares for at least five years. This exemption has been abolished, and all capital gains are now taxed as ordinary income. There are no presumed cost rules in business taxation as there are in the taxation of personal capital income.

C. *Reserves*

A special feature of Finnish business taxation has been the taxpayer's right to reduce the taxable profit by creating different kinds of reserves. For example, an enterprise could create an inventory reserve on the basis of its stock of goods, not exceeding 25 percent of the acquisition cost (10 percent in the case of securities). This reserve has been abolished.

In addition to the inventory reserve, an operation reserve has been an economically important reserve. Taxpayers engaged in business (other than banks and insurance companies) were allowed to create an operation reserve not to exceed 30 percent of the amount of wages paid by the taxpayer during the 12 months preceding the end of the fiscal year.

For corporations, a maximum operation reserve not to exceed 10 percent is allowed in 1993, and thereafter the reserve is abolished for corporations. Private firms and partnerships may make transfers to the reserve in future years (such transfers not to exceed 30 percent of wages). This can be seen as compensation for the fact that the profit of such enterprises can be taxed as earned income (when the profit exceeds 15 percent of the net value of the enterprise), while retained profits of corporations are taxed at the rate of 25 percent.

The transition rules for old (but in the future disallowed) inventory and operation reserves are fair and flexible. Enterprises need not book these dissolving reserves as income for 1993. They may form a so-called transition reserve, which must be deducted from the acquisition cost of new machines or buildings or must be directly added to the taxable income of the enterprise not later than 1997. However, these untaxed reserves can not be added tax free to the equity capital of companies.

Enterprises have also been entitled to create a bad debt reserve, which could not exceed 2 percent of the amount of business claims outstanding at the end of the fiscal year. This reserve has been repealed. Enterprises may still deduct provisions for bad but unrealized sale claim losses according to accounting principles. Other bad debts may be deducted only as realized.

A guarantee reserve is allowed to taxpayers engaged in a qualifying construction or metal industry for possible costs arising from product guarantees. Such taxpayers were allowed to deduct from profits up to 3 percent of the price of products delivered during the fiscal year. Now, a guarantee reserve cannot be made on such a schematic basis, but rather on the basis of the likely cost of guaranteed work of which the taxpayer has given sufficient proof.

There are also rules for a replacement reserve. Under the pre-reform system, an enterprise deriving a gain on depreciable fixed assets was allowed to place the gain in the books as a replacement reserve. The reserve must be deducted from the acquisition cost of new assets taken into use during the following three years. Under the new rule, the reserve cannot be made in the case of a sale but only in the case of fire or similar involuntary losses, and the time limit is two years. However, the right to create a replacement reserve in the case of a sale of main business premises has been maintained.

Many changes to Finnish business taxation accord with the proposals of the Ruding Committee. The considerable curtailing of the possibilities to create replacement reserves is an exception to those proposals. As regards reinvestment of realized gains, the right to rollover the tax base of the old assets into the new assets are not as generous as those proposed in the Committee Report.[8]

8. See Report of the Committee of Independent Experts on Company Taxation, Commission of the European Communities, 1992, at 217-218.

© 1993 International Bureau of Fiscal Documentation

D. *Depreciation*

As a part of the broadening of the tax base, the taxpayer's right to depreciation allowances has been somewhat curtailed. Buildings may be depreciated only by the declining-balance method in Finland. The maximum rates of annual depreciation on buildings have been lowered as follows:

- industrial and commercial (shops, warehouses) buildings, 7 percent (previously 9 percent); and
- office and residential buildings, 4 percent (previously 5 percent).

The pre-reform maximum rate of depreciation for machinery and equipment was 30 percent, and this has not been changed. However, a new rule applies to leisure boats and yachts. If such a vessel can be classified as a business asset, the maximum rate of depreciation is 10 percent (previously 30 percent).

E. *Entertainment expenses*

Entertainment expenses have been deductible, but only up to a fair and reasonable amount. In tax practice, expenses not exceeding a certain percentage of turnover, varying according to the type of business, were accepted as deductible, and many enterprises were able to deduct the full amount of their entertainment expenses. A more rigorous restriction has now been introduced, i.e. only 50 percent of the total amount of entertainment expenses is deductible.

F. *Losses*

For the treatment of losses, the carry-forward method is used in Finland. Under the pre-reform system, losses could be carried forward to the following five years. The 1993 reform provides for a ten-year period. No provisions for carry-back of losses were introduced.

IX. PROBLEMS WITH THE NEW SYSTEM

Two commonly accepted targets of tax policy are efficiency and equity. The fairly low flat rate on capital income emphasizes efficiency and, in a way, relinquishes the goal of redistributing income. The change is perhaps not so dramatic.

There has been a wide gap between effective and formal progressiveness in the Finnish system. It is difficult to ascertain the fundamental justification for capital income being taxed proportionately while earned income is taxed progressively. Further, it is evident that the distribution of capital income before taxes is more uneven than the distribution of earned income. The future decrease in the progressiveness in the tax system could place more emphasis on distributional effects of public spending.

A serious weakness in the Finnish system is the large disparity between the tax burden on capital income and earned income. In many cases, the gap between the two tax rates may be close to 40 percentage points. The marginal tax rates on earned income should, at least in the long run, be reduced significantly. This is a difficult budgetary problem because of the large existing deficit. It is feared that a new profession will emerge in the society: alchemists who perform magic by transforming earned income into capital income.

Finland has applied for membership of the European Community. No EC country has a differentiated tax structure such as those in Sweden, Finland and Norway. The Ruding Committee has proposed a minimum corporate tax rate of 30 percent.[9] However, the adoption of such a minimum rate in the EC is improbable, and the EC is not likely to exert any pressure to impose a uniform income tax structure on its members. EC membership as such would hardly pose a threat to the corporate tax rate of 25 percent or to the Nordic model of income taxation. Another question arises if the future of the flat rate tax on capital income becomes an international success story.

X. CONCLUSION

The differentiated income tax system with its fairly low flat rate on capital income is not an ideal model wholeheartedly welcomed by Finnish experts and politicians. Rather it is a more defensive than offensive reaction to international tax competition.

Finland is a small open economy as well as a Nordic welfare state. As a domicile for wealthy individuals and a target country for investment, Finland must be attractive enough, even from a tax perspective. A remarkable change has taken place here, thanks to the tax reform. For example, if a subsidiary's profit before taxes is 100 Fmk., the foreign parent company gets 75 Fmk., while the corporate tax rate is 25 percent and the withholding tax on inter-group dividends is in many cases zero, under the provisions of a tax treaty. Compared internationally, this may be a quite favourable figure.

On the other hand, Finland can not compete as a low-tax country, due to the established levels of public spending and total tax revenues. Finland is among those countries who should favour a collectively planned harmonization, in order to set limits on international tax competition.[10] For welfare states, it would not be a desirable if the impact of taxation on capital flows would lead to international tax competition, with zero rate as the result.

9. Report of the Committee of Independent Experts on Company Taxation, at 209-210.

10. Hans-Werner Sinn concludes: "With a collectively planned harmonization, rather than one enforced by the competition of tax systems, Europe would not have to give up its social achievements...." See Sinn, "Tax Harmonization and Tax Competition in Europe", *European Economic Review* (1990), at 489-504.

BIBLIOGRAPHY

The publications listed in this bibliography have recently been acquired by the Bureau's library which will gladly supply further information upon request (please quote the reference numbers). They should, however, be ordered through a bookseller or direct from the publisher indicated, and not through the Bureau.

To facilitate ordering, a list of addresses of the main publishing houses is included on pages 53-56 of the January 1993 issue. Addresses of publishers which do not appear in this list are indicated in the item concerned.

Books

AFRICA

South Africa

BLERCK, Marius Cloete van.
Mining tax in South Africa. 2nd Edition.
Rivonia, Taxfax CC., P.O. Box 5186, Rivonia 2128, South Africa. 1992, pp. 550. 250.- R.
Second edition of a comprehensive review of taxation principles for the mining industry in South Africa. The book is of special interest as these principles (and their stability) have contributed to South Africa's dominance in international mining. Also included are discussions of financial and accounting matters. A chapter on international factors will be of great interest to offshore parties seeking to invest in S.A. mines. Case references include decisions by Australian, British and Canadian courts. The book has a comprehensive index and contains useful tables and figures.
(B. 13.469)

INCOME TAX ACT 1992-1993.
Cross referenced to Meyerowitz and Spiro on Income Tax.
Cape Town, The Taxpayer. 1992, pp. 286.
Consolidated text of Income Tax Act No. 58 of 1962 as amended to 1 October 1992 with reference to Income Tax by Meyerowitz and Spiro.
(B. 13.468)

ASIA & THE PACIFIC

9TH ASIAN-PACIFIC TAX
Conference. Singapore 23 and 24 November 1992. Organized by Asian-Pacific Tax and Investment Research Centre (APTIRC).
Singapore, Asian-Pacific Tax and Investment Research Centre (APTIRC). 1992.
Conference papers containing the following contributions: "The United States and Japan: will Japan ever match the US rate of change?" by J. Lanman; "Transfer pricing – the European viewpoint" by H. Hamaekers; "Trends in international taxation" by R. Heyde; "The new OECD Model Tax Treaty" by J. Kooi; "The revised US/Netherlands double taxation agreement" by J. Teeuwen; "Financial risk management in the Asian-Pacific region" by R. Jackson; "Financial transactions: Australia" by S. Towers; "Financial centres: Hong Kong" by Ian Harris; "Singapore as a financial centre" by A. Ahkong; "Self-assessment and tax audits in Australia" by S. Towers; "Self-assessment in Indonesia" by R. Mansury; "Tax audits in Hong Kong" by Ian Harris and "Developments in tax administration in Singapore" by Alan S.S. Ow.
(B. 57.823)

Australia

AUSTRALIAN TAX REPORTS.
Volume 23. Court/AAT 1992.
North Ryde, Butterworths Pty., Ltd. 1992, pp. 1296.
Reports of cases heard before the Administrative Appeal Tribunal for the year of decisions 1992.
(B. 57.828)

JAMES, Denis W.
Intergovernmental financial relations in Australia.
Sydney, Australian Tax Research Foundation. 1992.
Information Series, No. 3. pp. 120.
The book outlines the current pattern of intergovernmental relations in Australia, describes its historical evolution and highlights some of the major issues arising from the present arrangements. Chapters include: Federal and state taxation and the development of vertical fiscal imbalance; general revenue assistance; Federal-state co-ordinating bodies; local government; micro-economic reform and other issues in Federal-state relations.
(B. 57.820)

Bangladesh

VALUE ADDED TAX IN BANGLADESH.
A taxpayers' manual.
Dhaka, The Dhaka Chamber of Commerce & Industry, 65-66 Motijheel Commercial Area, Dhaka 1000, Bangladesh. 1992, pp. 220.
(B. 57.829)

New Zealand

STAPLES' GUIDE TO NEW ZEALAND
income tax practice 1991-92. 52nd Edition.
Reviewed and updated by C.J. Mancer.
North Ryde, The Law Book Company Limited, 44-50 Waterloo Road, North Ryde, NSW 2113, Australia. 1992, pp. 928.
Guide containing full commentary on: income tax, residency rules, double taxation agreements, international tax regime for controlled foreign corporations, foreign investment funds, non-resident withholding tax laws, accounting, bankruptcy, bad debts and taxation, Matrimonial Property Act, imputation system, company taxation, superannuation, annuities, pensions and gratuities, fringe benefits, estate planning and estate and gift duty, goods and service tax, foreign exchange.
(B. 57.819)

1993 NEW ZEALAND MASTER
Tax Guide.
Auckland, CCH New Zealand Limited. 1993, pp. 1031, £ 42.60.
The guide provides extensive coverage of New Zealand's income tax laws and includes all tax developments to 1 January 1993, plus references to proposed 1993 amendments. GST and estate and gift duty are also covered. This edition is designed to help taxpayers prepare their tax returns for the 1992/1993 income year.
(B. 57.830)

EUROPE

GRAPPERHAUS, Ferdinand H.M.
De pelgrimstocht naar het draagkrachtbeginsel. Belastingheffing in West-Europa tussen 800 en 1800. Rede uitgesproken op 26 januari 1993 bij de aanvaarding van het ambt van bijzonder hoogleraar in de geschiedenis van het belastingrecht aan de Rijksuniversiteit Leiden en als zodanig benoemd door de Stichting Belastingmuseum "Prof. Dr. van der Poel". Deventer, Kluwer. 1993, pp. 88.
Printed text of speech held on the occasion of accepting the office of Special Professor in Tax History at the University of Leyden. The topic deals with the pilgrimage study on the principles of paying income tax on the basis of bearing-power. Taxation in Western Europe from 800 to 1800.
(B. 112.509)

HEADQUARTERS LOCATIONS IN EUROPE.
Madrid, Arthur Andersen. 1992, pp. 26.
Brief overview of the tax treatment of companies' headquarters in some of Europe's favoured locations for this type of entity.
(B. 112.543)

HOLDING COMPANIES IN EUROPE.
Madrid, Arthur Andersen. 1992, pp. 20.
Booklet providing brief overview of the current tax treatment of holding companies in eight European countries. It highlights the main features, conditions and tax treaty rates

© 1993 International Bureau of Fiscal Documentation

which currently apply in each country in an easy-to-use, comparative format.
(B. 112.545)

A TAX GUIDE TO EUROPE.
Madrid, Arthur Andersen, Raimundo Fdez. Villaverde 65, 28003 Madrid, Spain. 1992, pp. 206.
This publication provides a country-by-country guide to the tax regimes in 32 nations across Europe. For each country, the outline of the tax system has sections on: corporate taxation, individual taxation (including any special provisions for foreign nationals), other taxes (e.g. VAT and capital taxes) and withholding taxes. Tables of comparative tax rates are included.
(B. 112.544)

Austria

GRÖHS, Bernhard; POLAK, Peter M.
Austrian business taxation. Vienna, Manz Verlags- und Universitätsbuchhandlung. 1992, pp. 697. 1470.- AS.
A translation of the Austrian Corporate Income Tax Act and the business-related provisions of the Individual Income Tax Act plus Austria's Double Taxation Agreements with English-speaking countries. (Loose-leaf publication.)
(B. 112.272)

WALDMANN, Ludwig; WALDMANN, Dieter.
Das Rechnungslegungsgesetz. Ein Kurz-kommentar für den Praktiker.
Vienna, Linde Verlag Wien GmbH. 1992, pp. 164. 290.- AS.
The Accounting Law. Brief commentary for the practitioner. This commentary gives a good introduction into the contents and provisions of the 1990 Accounting Law for those who until now are not yet familiar with this law and also professionals.

QUINTARD, Aimable; DE RONGE, Yves.
Filialisation d'activités d'entreprises. Stratégie et gestion.
Brussels, De Boeck-Wesmael S.A., Avenue Louise 203, B-1050 Brussels. 1992, pp. 277. 1315.- Bfrs.
Strategy and management of the process of transferring a company's activities into separate subsidiaries. Two chapters are devoted to taxation.
(B. 112.510)

DILLEN, Ludo; HUYBRECHTS, Leo; Vande VELDE, Ivo.
Jaarboek Personenbelasting 1992.
Deurne, Kluwer Rechtswetenschappen. 1992, pp. 1183. 7825.- Bfrs.
Extensive and detailed overview of Belgian individual income tax for residents in 1992 assessment year (income year 1991).
(B. 112.431)

FISCAAL VERMOGENSBEHEER.
Deurne, Kluwer Rechtswetenschappen. 1992, 4875.- Bfrs.
Extensive loose-leaf publication on the Belgian tax aspects related to the acquirement, management and transfer of capital in all its forms by individuals.
(B. 112.430)

STURTEWAGEN, Bart.
De belegerde belegger.
Groot-Bijgaarden, De Standaard. 1992, pp. 104.
Reprints from De Standaard newspaper dealing with investment funds activities to attract investors.
(B. 112.538)

Denmark

INVESTMENT IN DENMARK.
3rd Edition.
Amsterdam, P.O. Box 74111, 1070 BC Amsterdam. 1992, pp. 115.
Third edition of booklet containing information of interest to those considering making investments or doing business in Denmark. Chapters include: foreign investment, VAT, businesss taxation, taxation of individuals, labour regulations, business entities, etc.
(B. 112.470)

EEC

EC INITIATIVES IN DIRECT TAXATION and the national responses. Edited by Coopers & Lybrand.
Deventer, Kluwer Law and Taxation Publishers. 1992, pp. 213. 100.- Dfl.
Monograph prepared by members of the Coopers & Lybrand European Tax Network reviewing the EC Directives on direct taxes (Mergers Directive, Parent/Subsidiary Directive and the Arbitration Convention), the national responses by the member countries as well as prospective developments. The texts of the Directives implemented so far are also reproduced.
(B. 112.468)

THE INTERNATIONAL GUIDE TO Mergers and Acquisitions. Editors Eric G. Tomsett and Rijkele Betten.
Amsterdam, IBDB – International Bureau of Fiscal Documentation. 1992, 1200.- Dfl.
Loose-leaf publication in 2 binders, updated twice per year, providing detailed information on tax regulations, legislation and practice affecting national and transnational acquisitions, mergers and reorganizations. The guide will cover 28 major jurisdictions using a common approach to facilitate comparison, with each country (and the EC) being dealt with in separate chapters. Chapters include: company law, exchange control and foreign investments, anti-trust law, tax law.
(B. 112.268)

Von der HEYDT, Karl-Eduard; Frhr. Von RECHENBERG, Wolf-Georg.
Die Europäische Wirtschaftliche Interessenvereinigung. Unter besonderer Berücksichtigung gesellschafts-, steuer- und kartellrechtlicher Aspekte.
Stuttgart, Schäffer-Poeschel Verlag, Kernerstrasse 43, 7000 Stuttgart 1, Germany. 1991, pp. 400. 96.- DM.
The authors deal with this EC transborder and neutral vehicles available for all kinds of activities and considers its company law, tax law and anti-trust law aspects. Moreover, they deal with national peculiarities in the various Member States while comparing the national laws implementing the regulation on EEIGs. The authors strive to describe the potential EEIG for small and medium-sized companies.
(B. 112.172)

HILTEN, Mariken E. van.
Bancaire en financiële prestaties in de Europese BTW.
Deventer, Kluwer. 1992.
Europese Fiscale Monografieën, No. 3.
pp. 339.
This book discusses the taxation of banking and financial services under Article 13B(d) of the Sixth VAT Directive (i.e. the exemption from taxation of the granting and negotiation of credit and the management of credit by the person granting it). Although it is written in Dutch, there is a brief summary at the end of the book in English. The study focuses on the supply of financial transactions in the Community system of levying a turnover tax in compliance with the provisions of the Sixth VAT Directive. It includes an extensive bibliography of sources, a listing of cases cited and an index of keywords.
(B. 112.499)

France

MEMENTO PRATIQUE
Francis Lefebvre: Agriculture 1992-1993.
Juridique – fiscal – social – comptable. A jour au 1er avril 1992. Paris, Editions Francis Lefebvre. 1992, pp. 1440, 412.- Ffrs.

© 1993 International Bureau of Fiscal Documentation

Monograph dealing with the taxation of agriculture from legal, social, taxation and accounting aspects as of 1 April 1992.
(B. 112.477)

Germany

Von der HEYDT, Karl-Eduard; Frhr. Von RECHENBERG, Wolf-Georg.
Die Europäische Wirtschaftliche Interessenvereinigung. Unter besonderer Berücksichtigung gesellschafts-, steuer- und kartellrechtlicher Aspekte.
Stuttgart, Schäffer-Poeschel Verlag, Kernerstrasse 43, 7000 Stuttgart 1, Germany. 1991, pp. 400. 96.- DM.
The authors deal with this EC transborder and neutral vehicles available for all kinds of activities and considers its company law, tax law and anti-trust law aspects. Moreover, they deal with national peculiarities in the various Member States while comparing the national laws implementing the regulation on EEIGs. The authors strive to describe the potential EEIG for small and medium-sized companies.

(B. 112.509)

RUSSO, Ronald.
Vervangingsreserve. Aspecten van de belastingheffing van boekwinsten op bedrijfsmiddelen.
Dordrecht, Ronald Russo. 1992, pp. 252.
Dissertation for the acquisition of the doctor's degree in which the author analyses the replacement reserve as provided for in the Netherlands income tax law. Attention is paid to the historical background, the concept of "asset", the position of capital gains on assets within the concept of profit, the concept of exchange and the legal provisions. Furthermore, the application of these provisions in case the asset is located in a permanent establishment abroad, or in the head office but replaced by an asset in a permanent establishment abroad, is dealt with. Finally, an international comparison is made with the law in Germany, Belgium and the UK.
(B. 112.444)

CORNELISSE, R.P.C.
Enige fiscale aspecten van goodwill.

KANDIR, Antonio.
The Dynamics of Inflation. An analysis of the relations between inflation, public-sector financial fragility, expectations and profit margins.
Notre Dame, University of Notre Dame Press, Notre Dame, Indianapolis 46556, USA. 1991, pp. 166.
Theoretical book which examines the monetarist, new classical and neostructuralist approaches of inflation and new developments. The author develops a number of new chapters such as public sector financial fragility. The financial situation of the public sector is an important variable in determining inflation.
(B. 112.514)

THE GLOBAL FINANCIAL HANDBOOK.
New York, The Economist Intelligence Unit, 215 Park Avenue South, New York, N.Y. 10003, USA.; London, The Economist Intelligence Unit Limited. 1992, pp. 465.
£ 125.-.
The handbook gives financial executives current economic and financial data as well as five years of past data for 22 countries. It presents essential information about laws and regulations on banking systems and services, borrowing and investing, corporate taxes, currency and exchange controls and international trade for those countries. It provides key contacts and comparative tables on economic growth, interest rates, taxes, leading currencies and banks and foreign investment regulations. Apart from the main countries in Europe and North and South America, Japan, Korea and Taiwan are also dealt with.
(B. 112.516)

HOCKLEY, Graham C. 9
Fiscal policy. An introduction.
London, Routledge. 1992, pp. 277.
The book looks initially at the role of the state, public choice, government expenditure, taxation and debt. It then goes on to analyse in greater depth the aims and principles of public finance, covering the various ways the budget impacts on the economy, ability to pay, wealth, poverty and social security. The book concludes with an assessment of the European monetary system and community budget. By offering a variety of approaches to the key topics, the author provides a stimulating analysis of the essentials of fiscal policy.
(B. 112.457)

Developing countries

PUROHIT, Mahesh C.
Principles and practices of value added tax. Lessons for developing countries.
Delhi, Gayatri Publications, P.O. Box 8495, Ashok Vihar, Delhi 110 052, India. 1992, pp. 235.
(B. 57.827)

IMPROVING TAX ADMINISTRATION
in developing countries. Edited by Richard M. Bird and Milka Casanegra de Jantscher.
Washington, IMF – International Monetary Fund. 1992, pp. 403.

CONTENTS

VOL. 47 NO. 7/8 **JULY/AUGUST 1993**

TAX DEVELOPMENTS IN THE UNITED KINGDOM OF INTEREST TO US TAX ADVISERS — 363 — *Guy Brannan*
The UK Inland Revenue has announced proposals to change the tax code in a number of areas, particularly as regards foreign exchange gains and losses and as regards the tax treatment of financial instruments intended to hedge interest rate risk. Mr Brannan considers these issues as well as thin capitalization rules and unitary taxation issues.

FRENCH INCOME TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS — 367 — *Olivier Delattre and Clothilde Fournier*
This paper highlights some recent tax legislation and court decisions affecting corporations. Also discussed are changes to the tax treatment of financial instruments in France.

NETHERLANDS: INCOME TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS — 371 — *Paul Sleurink*
Mr Sleurink takes a look at the measures implementing the parent-subsidiary and mergers directives in the Netherlands, the effects of the proposed directives on interest and royalties and losses of permanent establishments and subsidiaries, and updates the rules regarding the 35 percent concession. Last year's information note of the Under-Secretary of Finance on the fiscal climate for enterprises in the Netherlands is also summarized.

GERMANY: ADMINISTRATIVE AND LEGISLATIVE DEVELOPMENTS OF INTEREST TO US TAX ADVISERS — 383 — *Friedhelm Jacob*
Mr Jacob looks at both inbound and outbound investment issues, including the effects of the parent-subsidiary and mergers directive, changes to the fiscal unity rule, introduction of a withholding tax on interest, tightening of German CFC rules and rules on deductibility of foreign losses from domestic profits. Finally, Mr Jacob overviews some trends – proposals for relief from personal and corporate income tax and the introduction of a "solidarity surcharge".

CANADA: TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS — 389 — *Nathan Boidman*
A number of developments in Canadian tax law which may be of interest to US tax advisers have arisen over the last year of two. This article addresses matters from both the US outbound/Canada inbound context and from the US inbound/Canada outbound context. The author's comments seek to place in a workable perspective the Canadian response to certain recent US developments as well as other US developments affecting cross-border Canada-US practice.

MEXICO: TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS — 407 — *Juan Pablo de la Calle Pardo*
This article looks at recent changes in Mexico directed at modernizing the tax system, strengthening public finances and improving internal finances through increased tax collection and taxpayer compliance.

KNOWLEDGE AND TECHNOLOGY TRANSFERS TO AND FROM THE UNITED STATES – CHARACTERIZATION OF TRANSFERS OF COMPUTER SOFTWARE — 414 — *Melvin S. Adess and Barbara M. Angus*
Sale vs. licence: the characterization of transfers of technology has significant tax implications. This paper briefly describes the tax principles underlying the sale vs. licence characterization of patent, know-how and copyright transfers. The focus then shifts to the current debate regarding the proper characterization of transfers of copyrighted computer software, an issue which has global tax implications and could potentially have significant implications well beyond the tax law.

INTERNATIONAL: HOW DO REVENUE AUDITS AFFECT TAXPAYER COMPLIANCE? — 424 — *John Hasseldine*
This article assesses, from previous interdisciplinary research, the impact of audit strategies on compliance in two broad areas. The first area is the impact of audits on voluntary compliance, and the second area is the types of audit, strategies and features most effective in detecting non-compliance. The main findings are that all research methods reach the same conclusion – specific audits do promote compliance behaviour and, further, they provide both an education and a deterrent effect.

INTERNATIONAL: ISSUES RAISED BY INTERNATIONAL COOPERATION IN REVENUE ENFORCEMENT: DIRECTIONS FOR THE FUTURE — 436 — *Vicki L. Beyer*
This article examines the ways in which nations cooperate to enforce their revenue legislation. Focusing in particular on Australia's double taxation agreements with the United States and Japan, the article studies the provisions that mandate cooperation between the parties and considers the ways in which that cooperation takes place in light of those provisions. Finally, the future direction of information exchange is discussed.

KAZAKHSTAN AND RUSSIA: TAX FOUNDATION SIGNS AGREEMENTS WITH KAZAKHSTAN AND RUSSIA — 444 — *Charles E. McLure, Jr.*
In March the Tax Foundation led a delegation of representatives of American and British business to Kazakhstan to discuss with government officials tax aspects of improving the investment climate of the country. The delegation later met with various Russian officials in Moscow. The delegation concluded a joint protocol calling for adherence to generally accepted principles of tax policy and for specific measures needed to improve the investment climate in Russia and Kazakhstan.

UNITED STATES/ISRAEL: NEW INCOME TAX TREATY – AN ANALYSIS AND PROGNOSIS — 450 — *Leif Weizman*
On 26 January 1993 the United States and Israel signed a long overdue income tax treaty, which is based on the unratified 1975 treaty and amended by two protocols. This article discusses the provisions of the new treaty and examines its similarities and divergences from the US, UN and OECD models.

TAX DEVELOPMENTS IN THE UNITED KINGDOM OF INTEREST TO US TAX ADVISERS

Guy Brannan

Guy Brannan graduated with a law degree from Trinity Hall, Cambridge University in 1977 and received an LL.M. degree from the University of Virginia in 1979. He joined Linklaters & Paines' corporate tax department in 1981, becoming partner in 1987. Since 1989 he has been the resident tax partner in Linklaters & Paines' New York office.

I. INTRODUCTION

The economic scene in the United Kingdom makes familiar reading for those who have had to grapple with the prolonged recession in the United States. The UK economy has been in recession for at least the last 18 months and the gap between government spending and its income (and consequently the budget deficit) is increasing. The UK's Conservative government has long been committed to lowering direct taxation rates (both individual and corporate) and, indeed, much of the tax reform effort that has been seen in Europe and the United States was in part inspired by Margaret Thatcher's radical tax reforms (lower rates but wider base) in 1984. With this ideological background, and bearing in mind that opposition to income tax increases formed one of the major planks in the Conservative party's campaign platform in the last election in April 1992, it will be politically difficult for the UK government to tackle the growing budget deficit by making significant increases in individual tax rates. It seems more likely that additional revenues will be raised by the extension of indirect taxation (VAT) to areas which were previously outside the scope of the tax, by decreasing certain standard tax reliefs and by increasing social security contributions (national insurance) by means of abolishing ceilings on contributions. It is thought that significant increases in corporate taxes are unlikely, not least because corporate profits are already under considerable pressure as a result of the recession. Moreover, the government recently introduced enhanced depreciation allowances (capital allowances) for a one-year period starting on 1 November 1992 and ending on 31 October 1993. These allowances (40 percent in the first year and 25 percent thereafter on a reducing balance basis) were intended to spur on capital investment and will, in any event, significantly reduce revenues from corporation tax.

The Government's fiscal strategy was set out in the annual Budget on 16 March (thereafter the annual Budget is moved to the end of each calendar year), and it will be interesting to see how the budget deficit issue is to be tackled.[1]

On a more detailed level, the UK Inland Revenue has announced proposals to change the tax code in a number of areas, particularly as regards foreign exchange gains and losses and also as regards the tax treatment of financial instruments intended to hedge interest rate risk. The rest of this paper will consider these and other more detailed topics of interest to international tax advisers.

II. TAXATION OF FOREIGN EXCHANGE GAINS AND LOSSES

The UK tax treatment of foreign exchange gains and losses was widely regarded as unsatisfactory. There were many different tax issues which arose, but essentially the major difficulty was that a gain arising on a foreign currency asset could be taxable whilst the corresponding foreign currency loss on a borrowing to finance the asset was often not tax deductible. The effect was that many transactions which were perfectly matched both in economic and accounting terms turned out to be unmatched for tax purposes. Often, the tax result would depend on artificial distinctions such as whether a borrowing was on capital or on revenue account and bore no relation to economic and commercial reality. The general dissatisfaction with this regime resulted in a Consultative Document being published by the Inland Revenue in March 1991 containing proposals for the reform of the taxation of foreign exchange gains and losses. As a result of representations made during the consultative process, a further Consultative Document was issued in February 1993 containing draft

1. In the event, the UK budget contained few immediate tax increases, although some measures which would have the effect of raising the tax burden on certain taxpayers in subsequent years were introduced. One significant example was the reduction in the rate of Advance Corporation Tax ("ACT"). This will reduce the amount of tax which tax-exempt investors (e.g. pension funds and charities – major investors in the UK equity market) can reclaim. It will also result in a reduction in the amount of the tax credit which will be repayable to treaty-entitled investors in UK companies under the terms of many current UK double tax treaties. Finally in a Consultative Document, the Inland revenue has asked for comments on proposals to help UK companies avoid the "ACT trap" which penalizes the distribution of taxed foreign income by UK corporates. The proposal would enable a UK corporate to pay "foreign income dividends" which will be paid out of foreign income without incurring irrecoverable ACT (any surplus ACT would, broadly, be reclaimable by the company). In addition, regardless of the outcome of this first proposal, the Inland Revenue have given a commitment to introduce a new regime for international headquarter companies in the United Kingdom. This regime would allow the UK headquarter company to pass on foreign-source dividends to its foreign parent/shareholders without incurring ACT – thus removing the problem that conventionally prevented the United Kingdom from being a suitable location for an international holding company.

© 1993 International Bureau of Fiscal Documentation

legislation. The draft legislation covers over 45 pages and is of great complexity, which is only to be expected since foreign exchange gains and losses raise many intractable issues. There are also a number of areas where legislation will confer power on the Revenue to make regulations at a future date (particularly as regards matching a foreign exchange borrowing with certain foreign currency assets).

The main features of the proposed legislation are as follows:

- Exchange gains and losses on qualifying assets and qualifying liabilities and on forward contracts to buy or sell currency are recognized as they accrue between one "translation time" and the next. Qualifying assets include currency in the form of cash, and debts. Generally, shares in a corporation are not regarded as qualifying assets (except in certain cases where the shares are regarded as part of trading inventory and also where exchange differences on the shares are included in the profit and loss account on a translation basis). Qualifying liabilities include debts and, in some circumstances, provisions for contingent liabilities.
- Exchange gains and losses on trading account are taken into account in the computation of trading of profits or losses.
- Net non-trading exchange gains are taxed as income (previously they were taxed as capital gains) and there are special rules for non-trading exchange losses.
- There is a deferral mechanism where unrealized exchange gains on long-term capital items exceed 10 percent of the profit of an accounting period. In such a case, the excess can be deferred until the following year.
- Regulatory powers are given to the Revenue in order to make provision for the "matching" of exchange differences on borrowings with exchange differences in certain non-qualifying assets (e.g. shares in overseas subsidiaries, the net investment in an overseas branch, and ships and aircraft).
- Qualifying assets cease to be subject to capital gains tax.
- There are extensive anti-avoidance provisions to prevent the artificial manufacturing of exchange losses.
- There are special rules for insurance companies.

The effect of these rules will be to remove many of the anomalies and unexpected tax charges that bedevilled UK companies when dealing with foreign exchange gains and losses. For example, UK holding companies were effectively prevented from undertaking currency swaps to hedge foreign currency borrowings because of the mismatch in tax treatment between the currency swap (on which any gain would be taxable) and the foreign currency borrowing on which any currency loss would be non-tax deductible. The effect of these proposals (which taken together with the proposals regarding financial instruments described below) will be to eradicate the tax mismatch and to make it easier for UK companies to borrow in foreign currency and to hedge their currency exposure.

The consultation process for the proposed rules is continuing, and it is unlikely that legislation will be brought into effect until 1994 at the earliest. The proposed legislation is not retrospective, and, therefore, exchange gains and losses incurred during the past several months of upheaval in the currency markets will be subject to the old tax regime.

III. FINANCIAL INSTRUMENTS (MANAGEMENT OF INTEREST RATE RISK)

The Inland Revenue issued another important Consultative Document in 1991. There was concern that a variety of financial instruments used to reduce or eliminate a company's exposure to interest rate risks were being used against the background of a tax system which was devised long before these instruments existed. The financial markets were a long way ahead of the tax code. In some cases, the Inland Revenue had published extra-statutory concessions (e.g. in relation to interest swaps) in order to provide some certainty as to the tax treatment of some instruments. However, it was thought that the tax treatment of swaps, caps, collars, interest rate options and forward rate agreements (to name but a few of the more common examples) ought to be put on a statutory basis. In setting out this statutory framework, it was hoped to eliminate uncertainties as to whether certain payments and receipts would be dealt with under the UK rules for taxing income or under the separate rules for taxation of capital gains. Other anomalies that were intended to be removed were the uncertainties as to when payments or receipts should be recognized for tax purposes and, generally, to alleviate many of the problems or anomalies that investment companies, particularly those with a treasury management function, might experience. Most of these difficulties resulted from the fact that these companies generally are not treated as carrying on a trading activity, even though such companies constitute the main users of these financial instruments.

Draft legislation is expected shortly (but has not been published at the time of writing). The key elements of the proposals put forward in the 1991 Consultative Document were as follows:

- The new regime will cover a wide range of financial instruments used for managing interest rate risk by contracts involving notional principal amounts. It is not intended that the new law will cover financial instruments used for handling risk attaching to equities or commodities (or related indexes).
- The basic approach favoured in the Consultative Document is to tax all payments and receipts as income (so that all payments are relieved as deductions against profits and all receipts are taxed as income). This would remove such payments and receipts from the capital gains tax regime.
- The financial instruments that will be covered by the legislation will include the great majority of swaps and other instruments that involve payments which are determined by reference to the application of an interest rate to a notional principal amount (e.g. caps, collars and floors) and single payment instruments where the payment is determined by applying the interest rate to the notional principal amount (e.g. forward rate agreements and interest rate futures and options).
- As regards the question when payments and receipts are to be recognized for tax purposes, the proposal is that this

© 1993 International Bureau of Fiscal Documentation

would be determined in accordance with the method used by companies in preparing their audited accounts. For example, where a "mark-to-market" method is used in preparing accounts, this would *always* be followed for tax purposes. The same would be true where the accounts were prepared on an accruals basis (provided the basis is "acceptable", i.e. where the costs of the instrument are allocated to different periods in proportion to the benefits which at the outset might reasonably be expected to accrue).

The proposals contain anti-avoidance rules which would apply to deny tax relief where the payments exceed those that would have been paid between independent parties at arm's length; and to impose a withholding tax on payments (except those made by a UK bank of financial trader) to tax haven-resident recipients.

It will be necessary to wait for the draft legislation to discover whether the consultative process resulted in any major deviations from the proposed regime. However, care will need to be taken that the financial instrument in question falls clearly within the new regime and this will no doubt be one of the key areas for debate. In general, however, the proposals are to be welcomed since they clarify a previously obscure area of law and practice and provide a sound statutory base for these financial instruments.

IV. EQUITY NOTES AND THIN CAPITALIZATION

Many international US tax practitioners will already be aware of the fundamentally different approaches taken by the US tax system from those of the UK and other European tax systems. The US tax system often adopts an approach which is more concerned with the economic substance of a transaction or a structure than that of the UK system where the emphasis is rather more on the transaction's form. Consequently, it has been possible to "arbitrage" between the two tax systems to produce an advantageous result. The best known example of this tax arbitrage was the use of dual resident companies. More recently, a number of groups exploited the difference in US and UK definitions of debt and equity. As a result, some US parents financed their UK subsidiaries by hybrid instruments which were characterized as debt (the interest thereon being deductible) in the UK but which were regarded in the United States as equity ("dividends" thereon carrying foreign tax credits).

In 1992, the UK Revenue introduced legislation to counteract the tax advantages of these hybrid instruments (known as "equity notes"). New Subsections (9) and (11) were inserted into the "distribution" provisions of Section 209 Income and Corporation Taxes Act (ICTA) 1988. The effect of this provision is that interest payments on an equity note held by a 75 percent affiliate or by a "funded company" (i.e. a company put in funds by the issuer or a company associated by the issuer) are treated as non-deductible distributions (i.e. a quasi-dividend). However, this legislation is quite narrowly based, and there still seem to be some opportunities in this area.

In addition to changes made to the distribution legislation, the Inland Revenue also clarified the "thin capitalization" rules which are contained in many of the UK's double tax treaties. The background to this change was a court decision involving equity notes (a decision of the Special Commissioner – the proceedings and decision are private, although the Revenue announced the substance of the decision) which held that Article 11 of the US/UK double tax treaty did not impose a thin capitalization requirement as regards UK subsidiaries of US parents. This ruling took many commentators (and certainly the Inland Revenue) by surprise. The Revenue moved swiftly to close this unintended loophole and introduced Section 52 of the Finance (No. 2) Act 1992.

The concept of thin capitalization in UK law is somewhat complex and involves the interaction of domestic UK law and double tax treaties to which the United Kingdom is a party. Section 209(2)(e)(iv) and (v) ICTA 1988, in very broad terms, treats interest paid by a UK company to a non-resident 75 percent associated company as a distribution (i.e. a quasi-dividend). Article 11(7) of the US/UK double tax treaty (an article typically found in UK treaties) disapplies this treatment. However, the protection of Article 11(7) is itself lost where, in accordance with Article 11(5):

> "... owing to a special relationship between the payer and the person deriving the interest or between both of them and some other person, the amount of the interest paid exceeds *for whatever reason* the amount which would have been paid in the absence of such relationship...." (emphasis added)

In the Special Commissioners' decision mentioned above, it was held that the words "for whatever reason" were not sufficiently broad to allow a thin capitalization argument to be raised by the UK Revenue. It had previously been believed (and it was certainly the UK Revenue's view when the treaty was negotiated) that this wording was sufficiently broad to enable not merely the rate of interest but also the amount of indebtedness and other factors to be taken into account in determining whether the payer of the interest was thinly capitalized. Accordingly, Section 52 Finance (No 2) Act 1992 (introducing a new Section 808(A) ICTA 1988) provides that a "special relationship" provision in the treaty (such as Article 11(7) of the US/UK treaty) shall be construed as requiring account to be taken of *all* factors, including (a) the question whether the loan would have been made at all in the absence of the relationship; (b) the amount which the loan would have been in the absence of the relationship; and (c) the rate of interest and other terms which would have been agreed in the absence of the relationship.

Moreover, the onus of proof is on the taxpayer to show the amount of interest which would have been paid in the absence of the special relationship. However, the new rules do not apply to "special relationship" provisions which expressly require that regard must be had to the debt on which the interest is paid in determining the amount of interest to be treated as distribution.

V. USE OF LEGISLATIVE HISTORY IN STATUTORY INTERPRETATION

Very recently, the UK legal system took the first tentative steps along a path already familiar in the United States. The

© 1993 International Bureau of Fiscal Documentation

House of Lords in *Pepper v. Hart*[2] held that where legislation was ambiguous or obscure, or its literal interpretation could lead to an absurdity, a court could refer to proceedings in Parliament, provided that the statements relied on were made by a Minister or other promoter of the legislation and that the statements relied on were clear. *Pepper v. Hart* was in fact a tax appeal, although the decision will apply in every area of English law.

US observers will note that the circumstances in which reference can be made to legislative history are narrower than those in the United States. It should also be understood that the implications of this decision have not yet been fully worked out. In particular, there are a number of important earlier decisions which have followed a strict literal rule of statutory interpretation which must now be regarded as of questionable authority when viewed in the light of relevant legislative history. The decision has also opened up the possibility of law firms and other tax experts briefing Members of Parliament on behalf of their clients to question Ministers on the effect of new statutory provisions during debates on proposed legislation. Any ministerial confirmations or undertakings given in Parliament might be used at a later stage in interpreting the legislation.

VI. UNITARY TAXATION

The UK Government continues to keep a close watch on the Barclays Bank litigation in California concerning the propriety of unitary taxation. The Government has indicated that it will await the outcome of this and associated litigation before deciding whether to invoke Section 812 ICTA 1988. This provision, if brought into effect, would deny the benefit of the tax credit refunds, usually available under the US/UK treaty, where dividends are paid to a company which has or is associated with a company which has a qualifying presence in a unitary tax state.

2. (1992) STC 898.

Hubert Hamaekers Appointed Professor of International Tax Law

The IBFD's Chief Executive, Hubert Hamaekers, has been appointed professor of European and international tax law at the Law Faculty of the University of Nijmegen (Netherlands) from 1 September 1993. The chair was established by the International Bureau of Fiscal Documentation to stimulate teaching and research in the field of international tax in cooperation with universities in Europe and abroad.

Mr Hamaekers received his law degree from the University of Nijmegen and worked at the Ministry of Finance from 1975 to 1985. He assumed the position of Chief Executive of the IBFD in 1985. Mr Hamaekers is also a member of the Permanent Scientific Committee of the International Fiscal Association, a member of the Committee on Fiscal Affairs of the OECD, chairman of the Working Party on Transfer Pricing of the CFA and advisor to the Ministry of Finance of the People's Republic of China. His publications are largely in the field of EC tax law and transfer pricing.

FRENCH INCOME TAX DEVELOPMENTS OF INTEREST TO US TAX ADVISERS

Olivier Delattre and Clotilde Fournier

This article looks at some of the most significant tax events which took place during 1992 and the beginning of 1993. The implementation of EC law has already received much attention and will only be briefly discussed. The focus will be on recently enacted legislation and some court decisions affecting corporations, and on the marked evolution in the area of financial instruments.

Olivier Delattre is the head partner at the New York office of Bureau Francis Lefebvre, the Paris-based law firm. Mr Delattre holds a Diplôme d'Études Supérieures de Fiscalité from the Université de Paris. He furthered his studies of international tax law at the Boston University Law School for one year after which he joined the New York law firm, Davis Polk & Wardwell. In 1983, Mr Delattre joined the international tax department at Bureau Francis Lefebvre in Paris, and in 1987, established their New York branch.

Mr Delattre holds membership in the International Bar Association, the French branch of the International Fiscal Association and the American Tax Institute.

Clotilde Fournier, a member of the New York bar, has been a tax associate at the New York office of Bureau Francis Lefebvre since 1991, and was a tax associate at the New York law firm of Davis Polk & Wardwell for two years. Clotilde received a Diplôme d'Études Approfondies from the University of Paris, an LL.M. from the London School of Economics and Political Science and an LL.M. from Cornell University Law School.

IV. Update on France/US tax treaty

I. IMPLEMENTATION OF EC LAW

A. *EC directives*

The beginning of 1992 witnessed the effort, not only in France but also in the other EC member states, to meet the deadlines for implementation of two EC directives.

While no successful attempt has been made, as of yet, to achieve a common EC regime of taxation, and, in all likelihood, this will not be achieved for a long time, two important areas of corporate taxation have attained a greater degree of conformity following the enactment on 23 July 1990 of two EC directives, i.e. the parent-subsidiary directive and the merger directive. The parent-subsidiary directive concerns the taxation of dividend distributions between parent and subsidiary companies located in different member states, which brings a full exemption from withholding tax on qualifying dividend distributions, and the merger directive affects the tax regime applicable to reorganizations, i.e. mergers, transfers of assets and exchanges of stock between companies located in different member states, which generally allows postponing the taxation of capital gains realized on the reorganization.

The degree of uniformity that has been achieved, however, is tempered by the fact that the practical aspects of the implementation of these two directives have been left to each member state. In any event, anticipating implementation of the parent/subsidiary directive, some member states had been competing for some time to provide a more attractive tax regime for holding companies. Such is the case, for example, in Luxembourg with the SOPARFI regime, in Denmark which grants full exemption from tax on both dividend and capital gains and in France with the foreign participation regime which results in a full exemption from tax for the French holding company upon receipt and redistribution of dividends received from its foreign qualifying subsidiaries.[1]

B. *Common VAT regime*

Some uniformity has also been achieved with the creation on 1 January 1993 of a single market for VAT purposes. In effect, with respect to qualifying internal EC transfers of goods, VAT is no longer imposed in the member state of origin but rather in the member state of destination of the transferred goods. This regime applies regardless of the citizenship of the parties and hence, a US corporation that ships goods from its plant in France to the German office of a Japanese corporation falls within the scope of the new rules.

C. *Transfer pricing*

In the area of transfer pricing, a treaty was signed on 23 July 1990 between the 12 member states; it was ratified by France on 8 January 1992. The treaty provides some measure of relief from the risk of double taxation that may result when a

1. In addition, although not fully exempt (unless realized in a qualifying reorganization), capital gains realized by the holding company on its participation can benefit from a reduced rate of taxation (18%) provided the corresponding stock has been held for at least two years before disposition, and the balance of the gain is set aside in a special reserve. Upon redistribution of the balance of the gain, the corporation tax is levied in the amount of the difference between the 33.33% rate that should have been imposed, and the 18% rate.

© 1993 International Bureau of Fiscal Documentation

member state adjusts the price charged or paid by an affiliated company located in another member state.

In effect, when the price charged by a corporation located in country A to an affiliated corporation located in country B is adjusted by the tax administration of country A, the second corporation is entitled to claim the benefit of a corresponding adjustment from the tax administration of country B. The requested corresponding adjustment can be obtained in one of the following ways: (i) after notification of the adjustment that is envisaged, country B agrees to correspondingly adjust the taxable income of the corporation located therein; (ii) if such an adjustment is denied, an agreement is concluded between the tax administrations of country A and country B within two years of the date the tax administration was informed of the request; and (iii) in the absence of an agreement, an advisory committee is set up to render an opinion. If the tax administrations of the countries involved cannot agree on a method to avoid double taxation, they must comply with the opinion rendered by the advisory committee.

Thus, the treaty does not provide methods to determine an arm's length transfer price, but rather some grounds to obtain relief. However, it may be some time before the treaty will enter into force since it is provided that it will enter into force only when it has been ratified by all member states.

II. CORPORATE TAXATION

The Finance Law for 1993 and the Technical Correction Law for 1992 both contain important measures affecting corporations.

A. *Standard corporation tax rate*

Since the corporation tax was enacted in 1949, the rate has long remained unchanged at 50 percent. Since 1986, however, it has been progressively lowered to its current 33.33 percent for 1993. This new rate is likely to be the last development instigated by the French government in that sense at least for a while. In addition, simultaneously with this rate reduction, the additional tax ("supplément d'impôt") which was created in 1989 to bring the level of corporation tax on distributed income up to 42 percent has been totally eliminated. Accordingly, the rate of the French corporation tax is now one of the lowest in the EC.

This is reinforced by the fact that this single reduced rate does not affect the amount of "avoir fiscal" (a tax credit available upon redistribution of the dividend) which remains equal to 50 percent of the dividend. As a result of these two factors, the portion of the profits entitled to the "avoir fiscal" upon distribution is now entirely free of corporation tax. Moreover, the "précompte mobilier" (an equalization tax levied on amounts that have not borne corporation tax at the standard rate or that are paid out of profits realized more than five years before distribution) also remains unchanged in the amount of 50 percent of the net dividend.

B. *Parent-subsidiary regime*

The parent-subsidiary regime of Sections 145 and 216 of the French Tax Code has also been subject to significant changes. This regime grants exemption from tax on dividends received by French qualifying parent companies, except for the reintegration of a service charge which is fixed at 5 percent of the gross dividend (i.e. the amount distributed plus the "avoir fiscal").

Among these changes, two are of particular interest.[2] The first change concerns the elimination of the service charge. This allows full exemption of the dividend received and hence, tax treatment on a par with the ordinary regime of dividend distribution. Indeed, as we have seen, under the ordinary regime of dividend distribution, the corporation tax paid by the distributing corporation is now completely eliminated.

As an example, we will assume a distribution of 66.66 by a French subsidiary, that is, profits of 100 minus 33.33 corporation tax. If the parent-subsidiary regime applies, the French parent company will receive a net dividend of 66.33 and will not be subject to corporation tax upon receipt.[3] If the ordinary regime applies, the parent company will receive a net dividend of 66.66 with the benefit of 33.33 of "avoir fiscal" and will pay on that grossed-up amount 33.33 of corporation tax. Thus, in both cases, the parent corporation is entitled to a net dividend of 66.33.

Under certain circumstances, however, it will remain more advantageous to elect to apply the parent-subsidiary regime. This will be the case when the corporation receiving the dividend is in a loss situation since the dividend will reduce the amount of its losses and the "avoir fiscal" cannot be used; or in the case of foreign-source dividends since the avoir fiscal is not granted with respect to such dividends and, hence, in the absence of exemption, they are effectively subject to tax in the hands of the French corporate recipient.

The other important modification is the exclusion from the parent-subsidiary regime of all non-voting shares. This will especially affect foreign non-voting stock since foreign stock is not entitled to the "avoir fiscal".

C. *Stock redemptions and liquidations*

The Conseil d'Etat rendered a decision in the context of a redemption of stock that substantially narrows the definition of dividend distribution for purposes of granting the "avoir fiscal".[4]

This decision excludes from the scope of dividend distribution amounts received by one shareholder in (total or partial) redemption of his stock, even if the corporation has retained earnings at the time of redemption and treats such income as capital gain. Consequently, it is now clear that, with respect to the redeeming corporation, the "précompte" can no longer be imposed since the benefit of the "avoir fiscal" is denied. The controversial aspect remains the tax treatment of the redeemed shareholder. Although not expressly stated in the decision, it appears more certain, from the wording of the
